**Purification of galactin, the lactogenic hormone.** W. H. MCSHAN and C. W. TURNER (Proc. Soc. Exp. Biol. Med., 1935, 32, 1655—1656).—The isoelectric ppt. at  $p_H$  5.5—6.5 from the alkaline digest, after dehydration with  $\text{COMe}$ , and drying, is extracted repeatedly with  $\text{AcOH}$  and the extract poured into  $\text{Et}_2\text{O}$ , the ppt. being washed with  $\text{COMe}$ , and dried. The ppt. gives the biuret reaction and is active in pigeons in doses of 3 mg. daily. R. N. C.

**Insulin and blood-lactic acid.** J. A. COLLAZO and J. ALMELA (Ann. Med., 1935, 38, 371—382).—The rise in blood-lactic acid (I) in the dog after lactate ingestion was increased by simultaneous insulin (II) injection. (II) injection alone produced a rise in (I) > that after lactate ingestion alone. This (II) effect is attributed to a compensatory secretion of adrenaline. NUTR. ABS. (m)

**Role of insulin in metabolism in non-diabetic patients. I. Transitory hyperglycæmia and**

**glycosuria following discontinuation of insulin.** B. B. CLARK, R. B. GIBSON, and W. D. PAUL (J. Lab. Clin. Med., 1935, 20, 1008—1016).—Effects are ascribed to the action of administered insulin in causing a compensatory inhibition of the normal islet secretion. CH. ABS. (p)

**Continuous intravenous injection of insulin in man: limiting dose.** A. BAUDOUIN and J. LEWIN (Compt. rend. Soc. Biol., 1936, 121, 1594—1596).—The limiting hypoglycæmic dose in man is 0.01—0.02 international unit per kg. per hr. R. N. C.

**Preparation of crystalline insulin free from vagotonin.** D. SANTENOISE, T. BRIEU, G. FUCHS, and E. STANKOFF (Compt. rend. Soc. Biol., 1936, 121, 1565—1567).—Commercial insulin (I) is dissolved in  $\text{HCl}$  at  $p_H$  3, impurities are removed by centrifuging, and (I) and vagotonin (II) are pptd. with  $\text{LiCl}$  and dried. (I) is then repeatedly pptd. isoelectrically at  $p_H$  5.2. (II) is finally destroyed by incubation for 12 hr. in  $\text{HCl}$  solution at  $p_H$  1 and  $55^\circ$ , after which  $p_H$  is restored to 5.2 with  $\text{LiOH}$ ; after another pptn. at  $p_H$  5.2 (I) is dehydrated and crystallised by Scott's method. R. N. C.

**Electrometric titration of insulin. Iodinated insulin.** C. R. HARRINGTON and A. NEUBERGER (Biochem. J., 1936, 30, 809—820).—Titrations of cryst. insulin in aq. and 80%  $\text{EtOH}$  solution indicate acid- and base-binding capacities of respectively  $43 \pm 2$  and 60—70 groups per mol. (cf. Harvey *et al.*, A., 1934, 602). Iodination gives a product [15.4% I, corresponding with 24 tyrosine (I) groups] in which the (I) groups only are substituted (probably in the 3:5 position) and exhibiting 5—10% of the initial hypoglycæmic action (mice, rabbits); partial removal of I by hydrogenation ( $\text{Pd}-\text{BaSO}_4$  in 50% aq.  $\text{C}_2\text{H}_5\text{N}$ ) produces reactivation approx.  $\propto$  the amount of I removed. F. O. H.

**Action of various reagents on insulin.** H. JENSEN, E. A. EVANS, jun., W. D. PENNINGTON, and E. D. SCHOCK (J. Biol. Chem., 1936, 114, 199—208).—Treatment with 0.033N- $\text{NaOH}$ , aldehydes,  $\text{HNO}_2$ ,  $\text{Ac}_2\text{O}$ , acid- $\text{EtOH}$ ,  $\text{CH}_3\text{N}_2$ ,  $\text{MeI}$ , or I caused partial or complete inactivation of insulin (I) and a change in either cystine (II) or  $\text{NH}_2$ -N content, with the exception of acid- $\text{EtOH}$  which had no effect on (II). The physiological activity of (I) cannot be attributed to a localised portion of the mol., but the hypoglycæmic property may be associated with certain  $\cdot\text{S}\cdot\text{S}\cdot$  groups, and also with certain  $\text{NH}_2$  groups, both being present probably as (II). J. N. A.

**Mechanism of the action of parathormone on urinary elimination of phosphorus.** L. BRULL (Compt. rend. Soc. Biol., 1936, 122, 76—77).—Parathormone (I) increases P excretion in the urine of the dog without affecting plasma- $\text{PO}_4'''$ . Isolated normal kidneys perfused with the blood of a (I)-injected dog also excrete more P, but if this is interrupted for 3 hr. with perfusion from a control animal, the isolated kidneys do not re-establish the high P excretion if perfusion from the injected animal is resumed, although the latter's kidneys still show a high P excretion, being no doubt saturated with (I). R. N. C.

**Influence of parathormone on the magnesium, calcium, and phosphorus content of human blood.** G. MELLI and N. KORADIMOVA (Policlinico, 1935, 42, 629—636).—The average effects of 200 units of parathormone on the blood constituents of 10 patients were: Ca rose after 4 hr. to a max. of 13.4 mg. per 100 ml. at the 9th and returned to normal at the 15th hr.; Mg rose from the 1st hr. to a max. of 4.8 mg. at the 3rd and fell to normal at the 4th hr.; P remained practically const. NUTR. ABS. (m)

**Influence of infection on action of parathyroid hormone in man.** G. C. LINDER (Quart. J. Med., 1935, 4, 131—137).—Serum-Ca was low and the response to injection of parathyroid hormone small during typhoid fever but increased on recovery. In pulmonary tuberculosis serum-Ca was normal and response to the hormone was greater in active than in quiescent phases, but increased when basal metabolism was raised by thyroid extract. CH. ABS. (p)

**Effect of thyroxine on glycolysis of muscular tissue.** P. E. GREGOIRE (Compt. rend. Soc. Biol., 1936, 122, 103—105).—Thyroxine (I) depresses glycolysis by tissues in presence of glucose alone, but if glycogen (II) is added, glycolysis increases to vals. of the same order as the increased vals. due to addition of (II) to normal tissue without (I). The max. limit of carbohydrate concn. for glycolysis to occur is raised to infinity by (I). R. N. C.

**Site and manner of action of thyroxine in the organism.** G. MANSFELD (Orvosi Hetilap, 1935, 79, 491—497).—Thyroxine migrates through the nerves into muscular cells and increases their O<sub>2</sub> consumption. CH. ABS. (p)

**Action of the thyroid on blood formation.** J. VON BOROS and G. CZONICZER (Klin. Woch., 1935, 14, 573—575). R. N. C.

**Metabolism of isolated surviving tissues from animals rendered hyperthyroid with thyroxine.** D. McEACHERN (Bull. Johns Hopkins Hosp., 1935, 56, 145—179).—Tissue from hyperthyroid animals showed increased O<sub>2</sub> consumption but < that anticipated from the total consumption of the animal. Increased tissue glycolysis was not the cause of the increased O<sub>2</sub> consumption. CN', F', and CH<sub>2</sub>I-CO<sub>2</sub>' reduced the respiration of hyperthyroid tissue without affecting the mechanism which necessitates an increased O<sub>2</sub> supply. I had no effect. In hyperthyroid animals hepatic and renal tissues retained their ability to oxidise lactate, pyruvate, and succinate. The oxidising capacity of muscle was > normal. CH. ABS. (p)

**Thyroglobulin. II. The Van Slyke nitrogen distribution and tyrosine and tryptophan analyses for normal and goitrous human thyroglobulin.** J. W. CAVETT (J. Biol. Chem., 1936, 114, 65—73).—The NH<sub>2</sub>-acid content of thyroglobulin with the exception of thyroxine (I), di-iodotyrosine (II), and tyrosine (III) is the same in all cases. (III) in the mol. is capable of conversion into (I) or (II), being observed during I medication in pathological cases. H. G. R.

**Analyses of thyroglobulin.** A. WHITE (Proc. Soc. Exp. Biol. Med., 1935, 32, 1558—1560).—Vals. are given. R. N. C.

**Non-thyroid substances with thyroid action. IV. Thyroid-like substances from artificially iodinated protein.** J. ABELIN (Arch. exp. Path. Pharm., 1936, 181, 250—258; cf. A., 1934, 814, 1409).—Iodinated proteins, like active thyroid gland substance, are separable into < two fractions. Removal of inactive material is achieved by hydrolysis with alkalis (but not with enzymes or acids), especially with 40% Ba(OH)<sub>2</sub>. Thus iodinated caseinogen (5.17% I) yields preps. (42.2% I), 2 × 10<sup>-5</sup> g. of which has an action on the metabolism and resistance to MeCN poisoning of mice characteristic of thyroid preps. F. O. H.

**Reid Hunt reaction and the thyrotropic hormone.** H. WIESBADER (Endocrinol., 1936, 20, 100—102).—The resistance of mice to MeCN is not increased by normal serum, but it is increased by pregnancy serum, follutein from pregnancy urine, and thyrotropic hormone. R. N. C.

**Anti-thyrotropic activity.** I. W. ROWLANDS and A. S. PARKES (Proc. Roy. Soc., 1936, 120, B, 114—125).—Normal serum of goat, horse, sheep, cow, or rabbit does not show any anti-thyrotropic activity. This may be induced in rabbits in 4 weeks by daily injection of thyrotropic extract and rises to a max. in 10 weeks. H. G. R.

**Vitamin deficiency, passage of infection, and resistance to disease.** L. OELRICHS (Z. Hyg., 1935, 117, 684—710). R. N. C.

**Experimental calcification in avitaminosis-A.** A. ESCUDERO and P. BOSQ (Semana méd., 1935, 42, 1283—1286; Chem. Zentr., 1935, ii, 1572).—Microscopic intraparenchymatous calcification of the kidneys occurs in avitaminosis-A in the rat. R. N. C.

**Effect of vitamin-A deficiency on development of the retina and on the first appearance of visual purple.** K. TANSLEY (Biochem. J., 1936, 30, 839—844).—Only a moderate deficiency of vitamin-A could be developed in young rats during the suckling period. The development of visual purple was retarded and in some cases prevented, whilst the effect on the structure and development of the rods was not so marked. The part played by -A in the visual purple system is discussed. J. N. A.

**Vitamin-A metabolism and liver in experimental phosphorus poisoning.** F. LASCH (Klin. Woch., 1935, 14, 1070—1073).—Vitamin-A (I) in the liver of rats and guinea-pigs is unaffected by fatal P poisoning. Parenteral administration of (I) to guinea-pigs simultaneously with poisoning by P results in quant. storage of (I) in the injured liver as in normal animals. R. C.

**Carotene and vitamin-A contents of human serum.** E. SCHNEIDER and E. WIDMANN (Klin. Woch., 1935, 14, 670—673).—Carotene (I) and vitamin-A (II) can be demonstrated in serum, but not in corpuscles. A life-curve of serum-(II) can be defined, from which the presence of hypovitaminosis can be determined; such hypovitaminosis when

the diet is complete is due to liver injury. (I) and (II), but not ascorbic acid, increase glycolysis.

R. N. C.

**Vitamin-A content of West Indian shark (*Carcharinus* sp.) liver oil.** C. F. ASENJO, L. M. DALMAU, and J. H. AXTMAYER (Puerto Rico J. Publ. Health, 1935, 11, 158—162).—The vitamin-A val. of the oil from sharks caught during July was about 13,300 Sherman units per g. NUTR. ABS. (m)

**Determination of vitamin-A by means of its influence on the vaginal contents of the rat.** W. HOHLWEG and M. DOHRN (Biochem. J., 1936, 30, 932).—Claim of priority as to this method over Coward *et al.* (this vol., 253). P. W. C.

**Determination of vitamin-A.** G. BALASSA and G. SZANTÓ (Z. physiol. Chem., 1936, 240, 29—32).—Addition of guaiacol may be omitted from Rosenthal's test for vitamin-A (A., 1934, 225, 1145), 0.2% aq. para-brown Z extra being a suitable comparison standard. Cholesterol and tissue extracts give unstable red solutions with the  $\text{SbCl}_3$  reagent. Photometric data of light absorption by the reacted solution are discussed. F. O. H.

**Correlation of vitamin-A and -B with the calcinosis factor.** F. WIDENBAUER (Klin. Woch., 1935, 14, 901).—Calcinosis poisoning in mice by vigantol or "A.T. 10" is checked by simultaneous large doses of vitamin-A and -B. R. N. C.

**Avitaminosis-B and muscular glycolysis.** P. E. GRÉGOIRE (Compt. rend. Soc. Biol., 1936, 122, 101—103).—Total inorg. and hydrolysable  $\text{PO}_4^{4-}$  in the rat are both depressed in avitaminosis-B. Mg is increased in avitaminosis-B but not in starvation. R. N. C.

**Variations of the respiratory quotient and basal metabolism during avitaminosis-B.** J. M. JOLY (Compt. rend. Soc. Biol., 1936, 122, 196—199).—The R.Q. in pigeons is lowered, but basal metabolism is increased. R. N. C.

**Production of avian polyneuritis by the addition of lactic acid to diets rich in sugar, protein, or fat, containing considerable quantities of the B vitamins.** R. LÉCOQ (Compt. rend., 1936, 202, 1304—1307).—Even with an excess of vitamin-B, development of polyneuritis is caused by accumulation of lactic acid in the tissues, when 10% is present in the diet. H. G. R.

**Requirements of the flour-beetle (*Tribolium confusum*, Duval) for vitamins in the B group.** H. R. STREET and L. S. PALMER (Proc. Soc. Exp. Biol. Med., 1935, 32, 1500—1501).—The larvae require vitamin-B<sub>1</sub> and also a thermostable factor which is destroyed by autoclaving at  $p_H$  13. R. N. C.

**B-Vitamins in human urine.** M. H. ROSCOE (Biochem. J., 1936, 30, 1053—1063).—Vitamin-B<sub>1</sub> and -B<sub>2</sub> were determined in the urine of 3 controls and one case of "alcoholic" polyneuritis. All cases received a known diet for 12 days, and then the same diet + a known daily amount of B-vitamins for 12 days. The conc. urine was fed to rats deprived of -B<sub>1</sub> and -B<sub>2</sub>, respectively. -B<sub>1</sub> was determined by the power to cure neuritis and -B<sub>2</sub> by promoting growth. -B<sub>1</sub> was not present in the urine of the controls in the first

period, but addition of 720 international units daily caused a daily excretion of 167—333 units. -B<sub>2</sub> was present in small amounts, and feeding of -B<sub>2</sub> increased the amount excreted. In the case of "alcoholic polyneuritis," the initial excretions of -B<sub>1</sub> and -B<sub>2</sub> were comparable with those of the controls. With added -B<sub>1</sub> and -B<sub>2</sub> the retentions were respectively slightly < and slightly > those of the controls.

J. N. A.

**Effect of some reagents on the "filtrate factor" (water-soluble vitamin belonging to the vitamin-B complex and preventing a dietary dermatitis in chicks).** S. LEPKOVSKY and T. H. JUKES (J. Biol. Chem., 1936, 114, 109—116).—The factor can be conc. from aq. rice bran extract by pptn. of inert matter with fuller's earth and MeOH. It is slightly inactivated by warming with NaOH and completely with NaOH and  $\text{FeCl}_3$  and is not appreciably adsorbed from acid solution or pptd. by  $\text{Pb}(\text{OAc})_2$ . H. G. R.

**Distribution of the "filtrate factor" (water-soluble vitamin belonging to the vitamin-B complex and preventing a dietary dermatitis in chicks) in certain feeding stuffs.** T. H. JUKES and S. LEPKOVSKY (J. Biol. Chem., 1936, 114, 117—121).—On suboptimal levels the growth of the chicks approx.  $\propto$  the quantity of the factor fed. The relative vals. of common feeding stuffs are given. H. G. R.

**Biochemical lesion in vitamin-B<sub>1</sub> deficiency. Application of modern biochemical analysis in its diagnosis.** R. A. PETERS (Lancet, 1936, 230, 1161—1165).—A lecture. L. S. T.

**Vitamins in human nutrition. Excretion of vitamin-B<sub>1</sub> in human urine and its dependence on the dietary intake.** L. J. HARRIS and P. C. LEONG (Lancet, 1936, 230, 886—894).—The daily excretion of vitamin-B<sub>1</sub> in human urine has been measured by the Harris bradycardia method. Healthy adults on normal diets excrete 12—35 international units with an average of 20 per day (approx. 5—8% of the daily intake). The proportion of -B<sub>1</sub> excreted is markedly < that of -C under comparable conditions. With a diet containing comparatively large or small amounts of -B<sub>1</sub> the amounts excreted increase or decrease proportionally. In hypovitaminosis-B<sub>1</sub> in rats the amount excreted is negligible. In avitaminosis (beri-beri) in man excretion of -B<sub>1</sub> may almost cease. A daily intake of 200 units for a man of 10 stone wt. may be fixed as a provisional min. allowance and an excretion of < 12 units indicates a diet containing < the normal allowance of -B<sub>1</sub>. -B<sub>1</sub> is absorbed from urine by shaking with acid clay and if dried, the activated clay retains its full activity after 3 months' storage in a refrigerator. L. S. T.

**Adsorption and elution of vitamin-B<sub>1</sub>.** W. H. SCHOPFER (Arch. Sci. phys. nat., 1936, [v], 18, Suppl., 6—10).—Vitamin-B<sub>1</sub>, adsorbed on fuller's earth as in the international standard powder, is eluted but slightly when treated at 115° for 15 min. with buffer solution of low  $p_H$ , but is extracted at higher  $p_H$  with a max. at  $p_H$  6—7. When the powder is added to a culture of *Phycomyces* growth is stimu-

ated apparently as a result of the elution and utilisation of the vitamin in the cold. W. O. K.

**Measurement of vitamin- $B_1$  activity by means of a micro-organism (*Phycomyces*).** W. H. SCHOPFER and A. JUNG (Arch. Sci. phys. nat., 1936, [v], 18, Suppl., 22—25).—Assay of vitamin- $B_1$  preps. by means of their action on the growth of *Phycomyces* yields results in general agreement with those obtained by the usual rat method. Divergences sometimes occur, more especially in the case of crude preps. W. O. K.

**Crystalline torulin (as vitamin- $B_1$ ) and the international vitamin- $B_1$  standard.** H. W. KINNERSLEY and R. A. PETERS (Biochem. J., 1936, 30, 985—991).—1 International unit of vitamin- $B_1$  is approx. equiv. to  $2 \times 10^{-6}$  g. of cryst. - $B_1$  hydrochloride, the val. being the same whether given orally or by injection. The day dose method for pigeons by injection may be used for impure but not for cryst. specimens. H. G. R.

**Vitamin- $B_1$  and - $B_2$  content of Arizona-grown grapefruit and broccoli.** G. H. ROEHM (J. Home Econ., 1935, 27, 663—666).—Grapefruit peel and pulp contained  $\approx 0.28$  Sherman units of - $B_1$ , but the fresh peel contained 1.0 unit of - $B_2$  and the boiled peel 0.5 unit. Broccoli leaf and flowers contained 4.0 and 3.0 units, respectively, of - $B_2$  and 0.66 and 0.5 unit, respectively, of - $B_1$ . NUTR. ABS. (m)

**Water-soluble B-vitamins. V. Two types of skin lesion occurring in vitamin- $B_2$  deficiency in the rat in relation to deficiency of flavin and vitamin- $B_6$ , respectively. VI. Flavin and vitamin- $B_6$  in cereals.** A. M. COPPING (Biochem. J., 1936, 30, 845—848, 849—856; cf. A., 1935, 544).—V. With young rats maintained on diets lacking only one constituent of vitamin- $B_2$ , those deprived of flavin (I) developed the (b) type of skin lesions, whilst those deprived of - $B_6$  developed the florid (a) type of dermatitis. Cures were effected in the first case by feeding pure (I), and in the second by administration of - $B_6$  as an EtOH extract of whole maize or wheat.

VI. Wheat and maize are good sources of vitamin- $B_6$ , 25—33% of which could be extracted by cold 80% EtOH. Wheat contains more (I) than maize, but none is extracted by cold 80% EtOH. The germ and integuments of wheat and maize contain more - $B_6$  than the endosperm. Maize and its extracts may contain a deleterious substance which is extracted by cold 80% EtOH, and this possibly is related to endemic pellagra. J. N. A.

**(A) Vitamin- $B_2$  complex in distiller's yeast, No. 12. V. V. EFREMOV and N. JARUSOVA. (B) Vitamin- $B_2$  complex in millet. V. V. EFREMOV (Problems of Nutrition, Moscow, 1935, 4, No. 6, 137—139, 139—141).—(A) The yeast contained about 40,000 Sherman units of - $B_2$  per kg. (B) The amount of - $B_2$  per kg. in millet was  $> 300$  and  $< 1000$  Sherman units. NUTR. ABS. (m)**

**Vitamin- $B_2$ .** W. VON DRIGALSKI (Klin. Woch., 1935, 14, 773—775).—Vitamin- $B_2$  (I) is present in cow's, goat's, and human milk, in "campolon" (II), but not "hepracton" liver extract, and in cerebrospinal fluid; it is frequently demonstrable in blood-

serum, in which it is increased by (II) treatment. It is probably not identical with the exogenous factor for pernicious anaemia therapy. Contrary to -A, blood-(I) exhibits only small upward fluctuations. R. N. C.

**Effect of *Capsicum annuum* on serum-protein.** S. LEE (J. Severance Union Med. Coll., 1935, 3, 31—32).—The feeding to rabbits of 1 g. daily of *C. annuum*, which is very rich in vitamin-C, reduced the protein content of the serum. NUTR. ABS. (m)

**Action of ascorbic acid on metabolism and on blood.** L. ARMENTANO, A. BENTSATH, A. HAMORI, and A. KORANYI (Z. ges. exp. Med., 1935, 96, 321—327; Chem. Zentr., 1935, ii, 1573).—Ascorbic acid does not play an essential part in carbohydrate metabolism, and does not affect the composition, catalytic effect, or basal exchange of blood. R. N. C.

**Ascorbic acid and blood-catalase. III. Hormonal relations.** G. TOROK, M. HEDRY, and R. NEUFELD (Klin. Woch., 1935, 14, 673—675).—Ascorbic acid (I) reduces the temporary increase of blood-catalase (II) caused by unilateral adrenalectomy, and increases the fall of (II) caused by thyroidectomy in rabbits. Its effect after removal of the sex glands or spleen is variable. (I) does not increase (II) in animals given vitamin-free diets after removal of any of the above glands. R. N. C.

**Ascorbic acid as a precursor of serum complement.** E. S. HORGAN (Nature, 1936, 137, 872).—The results of Marsh (this vol., 765) are supported. L. S. T.

**Effect of incomplete diets on the concentration of ascorbic acid in the organs of rats.** S. S. ZILVA (Biochem. J., 1936, 30, 857—867; cf. A., 1935, 262).—The total amounts of ascorbic acid (I) in the liver and intestines of rats on a stock diet increased as the rats grew, but the concns. remained approx. the same. In rats starved for 48 hr. the concn. of (I) in the liver was the same, but the intestines showed a rise, due possibly to a loss in wt. of the intestine. A carbohydrate diet had a detrimental effect, but the concn. of (I) in the livers and intestines was similar to those for normal rats. Rats on a protein-fat diet thrive worse than on a carbohydrate diet, but there was no increase of (I) in the liver or intestines. The hypothesis of Hopkins and Slater (this vol., 254) is not fully supported by experimental evidence. J. N. A.

**Histochemistry. VII. Concentration of vitamin-C in the thymus in relation to its histological changes at different stages of development and regression.** D. GLICK and G. R. BISKIND (J. Biol. Chem., 1936, 114, 1—7).—The concns. in the whole gland for the foetus and calf, steer, and cow and bull are 0.35—0.52, 0.23—0.36, and 0.04—0.17 mg. per g., respectively. These vals. are approx. the same on the fat- and connective tissue-free basis. H. G. R.

**Amount of vitamin-C required to maintain the normal reducing power of animal tissues.** L. DE CARO (Z. physiol. Chem., 1936, 240, 179—190). In guinea-pigs on scorbutic diets, ascorbic acid (I) disappears almost completely from the adrenals in 10—13 days, the curve expressing the rate of

disappearance being approx. exponential. The amounts (12 mg. or 10 g. of cabbage) of (I) which must be given daily in order to maintain normal reducing power in the adrenals and liver are much > those required for prevention and cure of scurvy. Naturally-occurring (I) in food is better utilised than isolated (I) and injected (I) than (I) given orally. The preventive and curative effects of daily injections of 12 mg. of "Maurer's acid" (A., 1933, 936) are equiv. to daily injections of 5 mg. of (I). The (I) of tissues not required for prevention of scurvy is less a reserve than a factor for maintaining optimal functioning of the cells.

W. McC.

**Ascorbic acid content of blood.** C. J. FARMER and A. F. ABT (Proc. Soc. Exp. Biol. Med., 1935, 32, 1625—1629).—To determine ascorbic acid (I) oxalated blood is centrifuged and the plasma deproteinised with  $\text{H}_2\text{WO}_4$  and titrated with 2:6-dichlorophenol-indophenol. Oxidised (I) cannot be determined by reduction with  $\text{H}_2\text{S}$ , as colloidal  $\text{WS}_2$  interferes.  $\text{CCl}_3\cdot\text{CO}_2\text{H}$ -deproteinisation gives slightly higher vals. owing to a less definite end-point, but permits the determination of oxidised (I). R. N. C.

**Content of vitamin-C in normal and pathological [human] cerebrospinal fluid.** G. MARINESCO, G. ALEXIANU-BUTTU, and I. OLTEANU (Bull. Acad. Sci. Roumaine, 1936, 17, 129—137).—The normal content increases with increasing age; considerable variations occur in pathological conditions.

H. G. R.

**Vitamin-C in saliva.** O. H. STUTEVILLE (Proc. Soc. Exp. Biol. Med., 1935, 32, 1454—1455).—The vitamin is present in concn. 0.0025 mg. per c.c.

R. N. C.

**Ascorbic acid content of the ovary and corpus luteum at different stages of the oestrous cycle.** A. A. POLICARD and M. FERRAND (Compt. rend. Soc. Biol., 1936, 122, 200—202).—The ascorbic acid content of the corpus luteum at various stages of formation is approx. const. and equals that of the ovary. The content of the residual ovarian tissue is also relatively const.

R. N. C.

**Fresh vegetables rich in vitamin-C.**—See B., 1936, 568.

**Vitamin-C content of apples and its relation to human welfare.** W. F. DOVE and E. MURPHY (Science, 1936, 83, 325—327).—As with the fruits, the vitamin-C content of the leaves of the Northern Spy apple is > that of the McIntosh apple.

L. S. T.

**Vitamin studies on apples.** I. A. MANVILLE, A. S. MCMINIS, and F. G. CHUINARD (Food Res., 1936, 1, 121—140; cf. A., 1935, 414).—The vitamin-A and -C contents of Arkansas Black apples were 36 and < 2.5 units per oz.; of Baldwin, 15 and 2.5—3.0; of Jonathan, 24 and 1.5—2.0; of Winesap, 36 and 3.0; of Delicious, 24 and < 2.5; of Gravenstein, 14—17 and 3.75; of Spitzenberg, 36 and 7. The three last-named do not form a good source of -B. During storage, -A is destroyed < -C, the decomp. of the latter varying with the type of apple. Careful removal of the peel does not markedly decrease the -C content. A new (biological) method for the determination of -A is proposed. E. C. S.

**Specific reaction for the detection and determination of ascorbic acid in serum.** H. LUND and H. LIECK (Nature, 1936, 137, 784).—The addition of small amounts of ascorbic acid to a solution of methylene-blue results in complete decolorisation in < 30 sec. on exposure to strong light. This reaction is not produced or inhibited by glutamine, ergothionine, creatine, creatinine, urea, adenine, guanine, hypoxanthine, xanthine, uric acid, cystine, haemoglobin, and PhOH.

L. S. T.

**Determination of vitamin-C in various foods and in human urine.** R. CASAZZA (Arch. Ist. Biochim. Ital., 1936, 8, 39—62).—Data are given and discussed for the ascorbic acid (I) content (determined iodometrically) of *Citrus* fruits and of human urine following ingestion of (I)-free and -rich meals and intravenous injection of (I).

F. O. H.

**Influence of milk constituents on the effectiveness of vitamin-D.** G. C. SUPPLEE, S. ANSBACHER, R. C. BENDER, and G. E. FLANIGAN (J. Biol. Chem., 1936, 114, 95—107).—A "symplex" (A., 1934, 913) of vitamin-D and lactalbumin is formed when the latter is pptd. from solution containing the vitamin. The biological activity of the system is > that of its components and is increased still further if lipin-free lactalbumin is used.

H. G. R.

**Colour reaction for the detection and determination of vitamin-D.** W. HALDEN (Naturwiss., 1936, 24, 296—297; cf. following abstract).—A solution of the prep. (oils are first saponified and extracted) in anhyd. petrol,  $\text{C}_6\text{H}_6$ , or  $\text{CHCl}_3$  is treated with 1% pyrogallol in abs. EtOH, 10%  $\text{AlCl}_3$  in abs. EtOH is added to the conc. solution, and the mixture is heated at 100° for 4 min.

W. O. K.

**Colour reaction for the detection and determination of vitamin-D.** W. HALDEN and (Mrs.) H. TZONI (Nature, 1936, 137, 909; cf. preceding abstract).—The reaction detects < 0.002 mg. of vitamin-D. -A and related products must be absent, but cholesterol, ergosterol, and lumisterol do not react. Suprasterol II gives a fainter tint.

L. S. T.

**Vitamin-E. III.** S. UENO, Y. OTA, and Z. UEDA (J. Soc. Chem. Ind. Japan, 1936, 39, 110—112b).—Feeding experiments (albino rats) with a basic sterility diet to which the vitamin-E fraction from rice oil (A., 1935, 1037) had been added confirm the anti-sterility action of the latter.

J. W. B.

**Vitamin-E and the gonads.** W. SAPHIR (Endocrinol., 1936, 20, 107—108).—Commercial preps. of wheat-germ oil exhibit no oestrogenic, gonadotropic, or luteinising effects in rats.

R. N. C.

**Mode of action of vitamin-K.** H. DAM, F. SCHÖNHEYDER, and E. TAGE-HANSEN (Biochem. J., 1936, 30, 1075—1079; cf. this vol., 907).—Prothrombin (I) can be pptd. from the plasma of normal chicks by  $\text{COMe}_2$  or  $\text{AcOH}$ , whilst the ppts. from the plasma of K-avitaminous chicks are inactive. The ppt. of (I) from normal chicks is still active after removal of lipins by  $\text{COMe}_2$  and  $\text{Et}_2\text{O}$ , and the lipins so obtained are inactive. A concentrate of -K does not accelerate *in vitro* clotting of plasma+thrombokinase. (I) pptd. by  $\text{AcOH}$  and washed with  $\text{COMe}_2$  and  $\text{Et}_2\text{O}$  contains -K.

J. N. A.

**Occurrence and chemical nature of vitamin-K.** H. DAM and F. SCHÖNHEYDER (Biochem. J., 1936, 30, 897—901).—The vitamin-K (antihæmorrhagic factor) content of numerous substances is determined and green vegetables are shown to be a particularly rich source. Cold saponification of hog-liver fat destroys one third and hot the whole of the -K content. The fatty acid fraction is inactive but enhances the activity of the unsaponifiable fraction. -K is thermostable.  $\text{COMe}_2$  is the most efficient solvent for extraction of -K from lucerne leaves. Various methods of purification of the extracted material were tried.  $\text{Al}_2\text{O}_3$  adsorbed -K but elution was unsuccessful. Using the  $\text{CaCO}_3$  and cane sugar methods, concns. of  $6 \times 10^5$ — $10^6$  units per g. were obtained. P. W. C.

**Purification of the antihæmorrhagic vitamin.** H. J. ALMQUIST (J. Biol. Chem., 1936, 114, 241—245; cf. A., 1935, 1401).—The hexane extract of lucerne meal is treated with MgO and C to remove pigments, then conc., fats and sterols are separated by chilling, the filtrate is evaporated to dryness, and the residue extracted with MeOH; further impurities are removed by chilling. A yellow oil, active in a daily dose of 2 mg. per kg. of diet, was separated by dilution with  $\text{H}_2\text{O}$ . The residue from the aq. MeOH solution was inadequate at twice this level. The vitamin is stable to heat and light but is alkali-labile. H. D.

**Determination of vitamin-K.** I. F. SCHÖNHEYDER (Biochem. J., 1936, 30, 890—896; cf. Dam, A., 1935, 903).—The delay in clotting is not due to lack of thrombokinase, insufficiency of fibrinogen, or accumulation of anti-coagulants. In diseased chicks serum-Ca is usually low and inorg. P always high. Addition of  $\text{Ca}^{++}$  to the plasma of diseased chicks does not shorten the clotting time. The  $p_{\text{H}}$  and salt content of the plasma are normal. After addition of thrombokinase, the amount of thrombin produced in diseased is much < in normal plasma. Normal plasma contains excess of material which accelerates clotting in the blood of chicks deficient in -K. K-Avitaminosis is prevented by giving dried pig's liver as 20% of the diet (10% affords partial protection) and is cured by giving 11.3 mg. of the liver per g. of chick daily for 3 days. Degree of -K deficiency is expressed by the ratio of the concns. of coagulant (1 drop to 5 drops of plasma) required to clot diseased and normal plasma in 3 min. at  $40^\circ$ . 1 unit of -K is contained in the min. daily dose of substance per g. of chick which reduces the ratio to 1 in 3 days. W. McC.

**Photochemical reaction of chlorophyll with ferrous ions.** K. WEBER (Nature, 1936, 137, 870).—Critical (cf. this vol., 11). The bleaching action of  $\text{FeSO}_4$  on chlorophyll (I) in neutral and in  $\text{H}_2\text{SO}_4$  solution is not affected by irradiation with a strong C arc. The photochemical reaction between (I) and  $\text{FeSO}_4$  does not occur according to the equation given by Weiss, and it is not analogous to the photochemical reduction of vat dyes. L. S. T.

**Number of chlorophyll molecules acting as an absorbing unit in photosynthesis.** H. I. KOHN (Nature, 1936, 137, 706).—Measurements of the  $\text{O}_2$  liberated by a thin suspension of *Chlorella pyrenoidosa*

in intermittent light from a Ne discharge tube indicate that the absorption unit within the plant is equiv. to approx. 500 chlorophyll mols. per quantum. The unit is not a rigid structure, and quanta absorbed by a no. of units are pooled in order to reduce 1 mol. of  $\text{CO}_2$ . L. S. T.

**Photoperiodism and changes in the enzymic system [of plants].** N. KRASSINSKI, A. A. KONDRASHOVA, and N. I. VINOGRADOVA (Ann. Bot., 1936, 50, 293—304).—An artificially shortened day period increased the catalase and peroxidase activity of bean leaves and pods and of chrysanthemum leaves, decreased that of amylase (I) and invertase (II) in beans, and decreased (I) and increased (II) in chrysanthemum. No definite changes occurred in cineraria leaves. Relations between these changes and photoperiodic effects are discussed. A. G. P.

**Rate of increase of fluorescence of living leaves.** H. KAUTSKY and A. MARX (Naturwiss., 1936, 24, 317).—The fluorescence in the leaves of *Ageratum mex.*, *Parietaria officinale*, and *Piper nigrum* following illumination after being kept in the dark has been accurately measured with a photo-electric cell. The activation of the chlorophyll- $\text{O}_2$  complex by light follows a unimol. course. W. O. K.

**Isotopic fractionation of water by physiological processes.** M. DOLE (Science, 1936, 83, 351).—A correction applied to Washburn and Smith's data indicates a preferential rejection rather than selection of D (cf. A., 1934, 570). L. S. T.

**Absorption and accumulation of solutes by living plant cells. VIII. Effect of oxygen on respiration and salt accumulation.** F. C. STEWARD, W. E. BERRY, and T. C. BROYER (Ann. Bot., 1936, 50, 345—366; cf. A., 1934, 708).—The previously observed influence of  $[\text{O}_2]$  on the absorption of  $\text{K}^+$  and  $\text{Br}^-$  by potato discs is confirmed in carrot and artichoke. Respiratory changes are affected only when the  $[\text{O}_2]$  of the air current is < that of the atm. Aerobic but not anaerobic metabolic processes are concerned in salt accumulation. A. G. P.

**Vital oxidation of plant cells by complex cobaltamines.** A. WATANABE (Iwata Inst. Plant Biochem., Publ. 2, 1936, 88—96).—The oxidation of various natural OH-compounds, such as myricetin, quercetin, etc., in presence of complex Co ammine salts, is accompanied by a rise in  $p_{\text{H}}$  due to the liberation of  $\text{NH}_3$ . The increasing alkalinity causes an autocatalytic increase in reaction velocity. M. S. B.

**Transport of nitrogenous substances under the influence of differences of humidity.** M. P. BOTH (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 531—540).—Transport from leaf to leaf through the sieve tubes is established. A. G. P.

**Nitrogen metabolism of the pea seedling.** P. MCKIE and J. BARNETT (Biochem. J., 1936, 30, 1010—1013).—During 32 days' growth from seed, insol., protein-, and  $\text{NH}_2\text{-N}$  represent > 95% of the total N in the plant of *P. sativum*.  $\alpha\text{-NH}_2$ -acids increase from 2% in the seed to 25% on the 18th day. After an initial decrease, protein-N rises to a const.

val. of 40%. In etiolated seedlings, amide is produced at the expense of  $\text{NH}_2$ -acids. H. D.

**Plant nutrition. IV. Nitrogen metabolism in relation to nutrient deficiency and age in leaves of barley.** F. J. RICHARDS and W. G. TEMPLEMAN (Ann. Bot., 1936, 50, 367-402; cf. A., 1936, 3, 249-265).

Comparison of the N contents of successively developing leaves of sand-cultured barley indicates that deficiency of N supplies although lowering the general N level of the plants involved no fundamental change in the N cycle. Deficiency of P causes a decline in the protein content of leaves from the early stages of development, marked accumulation of amide-N, and smaller accumulation of  $\text{NH}_2$ -N and of  $\text{NO}_3$  in later leaves. Protein synthesis is probably checked at the stage of asparagine production. Deficiency of K is marked by disappearance of protein from older leaves, increased proportions of amide- and  $\text{NH}_2$ -N, and, in later leaves, an accumulation of  $\text{NO}_3$ . K is not primarily concerned in protein formation, but is essential to the maintenance of the protoplasmic complex, the breakdown of which leads to rapid proteolysis. Relations between the increase in  $\text{NO}_3$  following P and K deficiency, the proportion of  $\text{NH}_2$ -N, and reductase activity in leaves are discussed. A. G. P.

**Changes in the nitrogenous fractions in stored apples.** J. P. HOWARTH, W. R. PHILLIPS, and R. WRIGHT (Proc. Leeds Phil. Soc., 1936, 3, 249-265). Structural breakdown in stored apples follows the period when the sol. N content is a min., and hence cannot be related to hydrolysis of protoplasmic protein. Loss of N from the cortex is considerable in the early period of storage. Changes in N fractions are retarded at low temp. A. G. P.

**Phosphorus metabolism of aconia during germination in la knes** E. MICHEL-DURAND (Compt. rend., 1936, 202, 503-505). At the beginning of germination 2/3 of the total P of the seed is in acid-sol. forms of which a half is inorg. After 80 days 70% of the total P has passed into the seedling. Translocation of all forms of P occurs, but that of phytin P is the most complete. (I) and inorg. P are localised mainly in roots, and lipin-P in the aerial organs. A. G. P.

**Fat metabolism in plants, with special reference to sterols. II. Differential changes in the cotyledons, roots, stems, and leaves.** P. L. MACHLISIAN (J. Biol. Chem., 1936, 114, 185-191; cf. this vol., 1936, 3, 249-265). During germination of soya beans, the total fat of the cotyledons decreased, the effect being more marked in light than in darkness. The roots, stems, and leaves synthesised fat equally well in the light and dark. The degree of saturation of the fatty acids was the same in cotyledons and seeds, but was greater in the newly formed acids of roots, stems, and leaves. There was an increase of sterol (I) in roots, stems, and leaves, whilst (I) esters were present in the cotyledons. A close relation probably exists between the metabolism of (I) and the utilisation of fat in the cotyledons. (I) is a vital constituent of roots, stems, and leaves. J. N. A.

**Metabolism of the colourless alga, *Prototheca zopfii*, Krüger.** H. A. BARKER (J. Cell. Comp. Physiol., 1935, 7, 73-93).—The alga cannot develop in absence of complex org. compounds such as are present in yeast autolysate. It can utilise N from both  $\text{NH}_3$  and more complex N compounds, the N content of the cells varying from 1 to 10% according to the amount of N available. The alga can utilise fatty acids, hexoses, and some alcohols, but not OH-, keto-, or dibasic acids. Glucose is converted aerobically into cell material and  $\text{CO}_2$ ; anaerobically it is fermented quantitatively to lactic acid. R. N. C.

**Vitamins and plants.** A. I. VIRTANEN (Nature, 1936, 137, 779-780).—Vitamin-C is essential to the growth of pea seedlings. By removing the cotyledons at a suitable stage, the seedlings are deprived of 90% of their -C and die or remain dwarfed. The addition of -C to the cotyledon-less seedlings assists development and the production of normal blossoms. L. S. T.

**Formation of vitamin-C in germinating seeds.** A. I. VIRTANEN and L. V. EEROLA (Suomen Kem., 1936, 9, B, 13).—Production of vitamin-C by germinating seeds is independent of light, but is greater when the temp. of germination is relatively low, and is inversely  $\propto$  the rate of germination. The -C content of seedlings is relatively high when the  $\text{H}_2\text{O}$  supply is low, is influenced by the  $p_{\text{H}}$  of the seed (optimum 6.3-6.6), and is increased by addition of  $\text{PO}_4^{3-}$  (but not by that of sugar) to the nutrient medium. A. G. P.

**Germination of leguminous seeds and urease activity.** B. N. SASTRI and B. A. S. IYENGAR (Current Sci., 1936, 4, 107).—The activities of germinated are always > those of the ungerminated seed extracts. In powdered seed materials differences are small. Part of the urease exists in seeds in an unextractable condition (desmo-urease), converted during germination into an extractable lvo-form. H. G. M.

**Physiology and chemistry of the plant hormones.** K. V. THIMANN (Current Sci., 1936, 4, 716-721).—A review.

**Influence of glucose on auxin production by the root-tip of *Vicia faba*.** M. H. VAN RAALTE (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 261-265).—Glucose favours the accumulation of auxin and may also induce the formation of additional auxin in the root-tips. A. G. P.

**Interaction of factors in growth of *Lemna*.** H. L. WHITE (Ann. Bot., 1936, 50, 403-417; cf. this vol., 1936, 3, 249-265).—The effects of varying levels of N supply on the rates of multiplication and of respiration, on dry matter production, and on the starch, protein, and chlorophyll contents are examined. Accumulation of carbohydrates in N-deficient plants results from retarded multiplication associated with lowered carbohydrate consumption in growth, and is accentuated by decreased respiration leading to a high net assimilation rate. Decreasing N supply is associated with low amylolytic activity. Changes during recovery from N-starvation are examined. A. G. P.

**Action of alkaline extract of the anterior pituitary on A. growth of plants, B) germin-**

ation. E. C. D. PASCAL (Rev. soc. argentina biol., 1935, 11, 57—67, 68—94).—(A) Small doses of the extract accelerated the growth of some but not all plants examined. Large doses caused root damage and inhibited growth.

(B) Pre-soaking seeds in the extract accelerated germination in some cases. The extract probably contains two active factors. Chr. Ans. (p)

Effect of X-irradiation on auxins and plant growth. F. SKOOG (J. Cell. Comp. Physiol., 1935, 7, 227—270). Auxin (I) in solution is inactivated by moderate irradiation in presence of  $O_2$ , which is required for formation of the oxidisers responsible for the inactivation. Inactivation also takes place in white light in presence of eosin. Extracted hetero-auxin and indolylacetic acid are also inactivated in aq. solution. Irradiation inactivates the (I) normally present in plants; it inhibits (I) formation in young *Pisum* and *Vicia*, but not in *Avena* coleoptile, and does not affect (I) transport. (I) applied to irradiated plants causes renewed growth. Lateral bud development caused by irradiation is correlated with loss of (I). The inhibition of growth is due largely to interference with (I) formation. R. N. C.

Effects of ethylene on the plant growth hormone. F. F. NORD (Science, 1936, 83, 284).—A Discussion. L. S. T.

Effect of ascorbic acid and indolylacetic acid on regeneration of willow branches and germination. W. DAVIES, G. A. ATKINS, and P. C. B. HUDSON (Nature, 1936, 137, 618).—Dil. solutions of ascorbic (I),  $\beta$ -indolyl-acetic (II) and -propionic (III) acids stimulate root and shoot regeneration in willow branches, but at concns. of 1 in 2500 regeneration is retarded by (I) and practically prevented by (II) and (III). (II) and (III) apparently retard the germination and growth of oats and mustard and cress seeds, but (I) stimulates in dil. solutions. At higher concns. (1:10<sup>3</sup>), (I) shows a retarding effect, whilst (II) and (III) are practically lethal. L. S. T.

Stimulation of root-hair growth in legumes by sterile secretions of nodule bacteria. H. G. THORNTON and H. NICOL (Nature, 1937, 137, 494—495).—Addition of a sterile filtrate containing secretions of nodule bacteria deforms and increases the no. and length of the root hairs of lucerne seedlings. L. S. T.

Stimulation of development of plants and of ripening of their fruit by ethyl alcohol and by temporary asphyxia of the roots.—See B., 1936, 467.

Factors affecting nodule formation on seedlings of leguminous plants. C. A. LUDWIG and F. E. ALLISON (J. Amer. Soc. Agron., 1935, 27, 895—902).—In sand cultures nodulation of lucerne and soya bean was increased in many cases by the presence of other plants, including maize and wheat. In the absence of older plants additions of sugar and, in some instances, of small amounts of available N were beneficial. Cold- $H_2O$  extracts of sand in which lucerne, maize, or wheat seedlings had been growing did not affect nodulation of lucerne when added to sand cultures. Presence of other plants may produce con-

ditions in the rhizosphere (including liberation of bacterial growth-promoting substance) more favourable to bacterial development. A. G. P.

Growth, chemical composition, and efficiency of normal and mosaic potato plants in the field. W. E. STONE (J. Agric. Res., 1936, 52, 295—309). Infected plants had lowered % of sugar and starch and an increased % of ash (dry matter basis). Assimilation per unit leaf area was smaller. A. G. P.

Determination of potassium carbonate in sunflower ash. V. K. ZOLARENCH (J. Appl. Chem. Russ., 1936, 9, 552—554). 1 g. of ash is extracted with 150–200 ml. of boiling  $H_2O$  for 10 min., the cooled solution is diluted to 250 ml., and 50 ml. of the filtered solution are titrated with 0.1N-HCl. A deduction of 0.3 ml. of acid per 100 ml. of solution is made, to correct for solubility of  $CaCO_3$ . R. T.

Comparison between the Benedict Denis and Parr bomb methods for determining total sulphur in plants and proteins. P. PAINTNER and K. W. FRANKE (J. Biol. Chem., 1936, 114, 235—239). The Parr bomb method gave higher vals. for total S in cereal and proteins than the Benedict Denis method (A., 1911, ii, 66); the latter gave particularly low vals. with cystine and methionine. The  $Na_2O_2$  fusion method gave good vals. in all cases. H. D.

Cyanophoric plants of the Maquiling region. V. J. B. JULIANO and M. GUERRERO (Philippine Agric., 1935, 24, 22—26). HCN is recorded in a large no. of species. Chr. Ans. (p)

Recovery of hydrocyanic acid from fumigated Citrus leaves. E. T. BARTHOLOMEW and E. C. RANX (J. Biol. Chem., 1936, 113, 655—660). HCN was determined by a photo-electric nephelometric method sensitive to  $5 \times 10^{-5}\%$ . Part of the HCN which enters the leaves during fumigation is rapidly and permanently fixed, probably not entirely by aldehydes, sugars, or citral. HCN could not be recovered from the leaves by distillation with 2% tartaric acid owing to combination with some substance in the distillate. J. N. A.

Determination of the forms of calcium and oxalic acid in leaves of sugar-beet. A. P. LEHNEDEVA and K. N. PORCHENOK (Nauch. Zap. Sakh. Prom., 1931, 11, Book 46—48, No. 8, 10, 31—40). A small portion of Ca in the leaves is not extractable by HCl. This fraction is higher in younger leaves. No  $H_2O$ - or  $AcOH$  sol. Ca is present. The  $H_2O$  sol.  $CaC_2O_4$  varies in different parts—the leaf is greater in the younger leaves, and is 1.5–2 times the quantity of  $CaC_2O_4$  present. Chr. Ans. (p)

Subtropical fruit trees of Azerbaidzhan. A. KERIMOV (Bull. Appl. Bot. U.S.S.R., 1934, [III], No. 5, 325—347). Juice of cultivated pomegranates contains 11–19% of sugars and 0.4–0.6% of citric acid. Wild varieties have 12–18 and up to 8–9%, respectively. In olives the sugar content decreases as ripening progresses and again increases in over-ripe fruit. Changes in oil content are in the reverse order. The 1 val. of the oil increases with advancing ripeness. The oil content of almonds and pistachio nuts grown in different localities is recorded.

Chr. Ans. (p)

**Flavour of shoyu. II.** K. SHOJI (Bull. Inst. Phys. Chem. Res. Japan, 1936, 29, 166—170; cf. A., 1935, 1540).—A  $\text{CHCl}_3$  extract after treatment with 10% NaOH affords hexoic acid,  $\text{C}_1$  to  $\text{C}_6$  primary alcohols, methyl-*n*-nonylcarbinol, and an unidentified product with the odour of shoyu. J. L. D.

**Flavour of shoyu. III.** K. SHOJI (Bull. Inst. Phys. Chem. Res. Japan, 1936, 15, 223—229).—An  $\text{Et}_2\text{O}$  extract of shoyu (not sterilised) yielded  $\text{CH}_2\text{Ph}\cdot\text{CO}_2\text{H}$ , guaiacol, and Et vanillate. J. N. A.

**Coumarins of root of *Heracleum sphondylium*, L.**—See this vol., 860.

**Kuromannin, shisonin, and nasunin.**—See this vol., 861.

**Constituents of bark of *Zanthoxylum americanum*.**—See this vol., 859.

**Oroxylin-A.**—See this vol., 860.

**Limonin, the bitter principle of orange kernels.**—See this vol., 857.

**Change of hesperidin content of peel of the mandarin orange during ripening:** hesperidin content of juice, embedded fibre (white fibre on segments), and endocarp of ripened fruit. Y. IWASAKI (J. Agric. Chem. Soc. Japan, 1936, 12, 279—280).—Hesperidin (I) was determined by extraction of the dried substance with MeOH. The amount of (I) in the peel gradually decreased with advancing maturity; that in the dried white fibre of the segments was < that of the dried peel. Juice contained only a very small amount. J. N. A.

**Preparation of sinigrin.** S. MORELL and K. P. LINK (J. Biol. Chem., 1936, 114, 123—124).—Sinigrin cannot be obtained from *Brassica nigra* by Gadamer's method (A., 1897, i, 360), but good results can be obtained by the methods of Herissey and Boivon (A., 1928, 207) and of Sandberg and Holly (A., 1932, 776). J. N. A.

**Active principle of *Myrsine africana*, Linn.** S. KRISHNA and B. S. VARMA (J. Indian Chem. Soc., 1936, 13, 115—116).—Embelic acid (embelin) is extracted (yield 3%) by  $\text{CHCl}_3$  from the fat-free berries; subsequent extraction with EtOH affords quercitol (I) (1%) and colouring matter. (I) is also isolable from the berries of *Embelia ribes*. H. B.

**Constituents of *Evodia danielli*, Hemsl.** S. MAYEDA (J. Pharm. Soc. Japan, 1935, 55, 531—537).—The following are isolated from the  $\text{COMe}_2$  extract: a substance, m.p. 80—80.5°, not reacting with  $\text{BzCl}$  or  $\text{NH}_4\text{OH}$ ; *evodin*,  $\text{C}_{26}\text{H}_{30}\text{O}_8$ , m.p. 292—293°,  $[\alpha]_D^{25}$  —129.4° in  $\text{CHCl}_3$ , also from *E. ruteacarpa*, Benth and Hook; *evodol*,  $\text{C}_{26}\text{H}_{30}\text{O}_8$  or  $\text{C}_{26}\text{H}_{30}\text{O}_{10}$ , m.p. 281° (*Me* derivative, m.p. 279°). a terpenic oil. CH. ABS. (r)

**Presence of norstictic acid in the tree lichen *Lobaria pulmonaria* (L.), Hoffm.** H. SCHINDLER (Ber. deut. bot. Ges., 1936, 54, 240—246).—Production of red crystals with alkali is characteristic of norstictic (I) and  $\alpha$ -methylethylsalazic as well as of salazic acid (A., 1934, 189, 891). (I) and stictic acid occur in *L. pulmonaria*. Asahina's diamine reaction is more sensitive than the KOH test. A. G. P.

**Aromatic compounds of "Kasutorishochu."** K. SHOJI (Bull. Inst. Phys. Chem. Res. Japan, 1936, 15, 230—233; cf. B., 1933, 328).—Treatment of Kasutorishochu with NaOH yielded  $\text{CH}_2\text{Ph}\cdot\text{CH}_2\cdot\text{OH}$  (*phenylurethane*, m.p. 79—80), octoic acid, and *p*-cresol. J. N. A.

**Formation of potassium eugenoxide crystals during examination of plant ashes in violet oil.** H. TZONI (Mikrochem., 1936, 19, 208—213).—During use of violet oil as a medium for the microscopic investigation of the structure of the ash of plant tissues, crystals of K eugenoxide (I) form, especially along the leaf nerves. Highly siliceous tissues give no (I) crystals, owing to the formation of  $\text{K}_2\text{SiO}_3$  during ashing. J. S. A.

**Determination of carbohydrates in the leaves of *Euphrasia stricta* and of *Trifolium pratense*.** N. SALAGEANU (Compt. rend. Soc. Biol., 1936, 121, 1531—1533).—Analytical vals. are given. R. N. C.

**Hexose phosphates produced by higher plants.** B. TANKÓ (Biochem. J., 1936, 30, 692—700).—The nature of the hexose phosphates produced by incubation of pea flours with added inorg. P is investigated. > 90% of the phosphorylated product consisted of 1:6-diphosphofructofuranose; the monophosphate complex was purified with brucine and was similar to the Robison ester but had a lower  $[\alpha]$ ; oxidation with Br left a non-aldose residue, possibly fructose 1-phosphate. Phosphohexokinase (A., 1935, 660) is present in pea flour and converts fructose 6-phosphate into a mixture of 62% of aldose and 38% of non-aldose esters. H. D.

**Glucoside in *Pardanthus chinensis*, shekanin.** Y. H. WU (J. Chinese Chem. Soc., 1936, 4, 89—92).—Extraction of resin-free roots with 96% EtOH affords *shekanin*, m.p. 245—250° (*Ac* derivative, m.p. 182°, contains 4 *Ac* and 1 *OMe* groups), which is hydrolysed to a pentose and *shekangenin*,  $\text{C}_{16}\text{H}_{16}\text{O}_8$ , m.p. 257° (decomp.). J. L. D.

**A new digitalic: *Menabea venenata*, Baillon.** R. HAMET (Compt. rend. Soc. Biol., 1936, 121, 1327—1329).—The roots contain two glucosides with digitalin-like action; the name *menabein* is applied to the (apparently) more active of the two. R. N. C.

**Gum from lemon trees.** E. ANDERSON, F. H. RUSSELL, and L. W. SEIGLE (J. Biol. Chem., 1936, 113, 683—690).—The purified gum,  $[\alpha]_D^{25}$  +20.7°, is a compound of methylated uronic acid (2 mols.) + *d*-galactose (4 mols.) + *L*-arabinose (4 mols.)— $\text{H}_2\text{O}$  (10 mols.). The gum, the structure of which is discussed, is not formed from pectic substances or hemicelluloses, but from sugars or polysaccharides in the inner part of the bark. J. N. A.

**Separation of hydratopectin into calcium and magnesium pectinates and araban by means of water-alcohol-ether.** T. K. GAPONENKOV and V. N. MIMRIKOVA (J. Appl. Chem. Russ., 1936, 9, 505—508).—Ca and Mg pectinates are pptd., whilst araban remains in solution, when 100 ml. of EtOH and 16.5 ml. of  $\text{Et}_2\text{O}$  are added to 50 ml. of 2% aq. hydratopectin. R. T.

**Tea tannin.** M. NIERENSTEIN (Analyst, 1936, 61, 294).—The constitution of tea tannin is discussed in relation to the products of hydrolysis after methylation, and also to those resulting from the action of tannase (cf. B., 1922, 907A). E. C. S.

**Constitution of tannins including those of tea and coffee.** P. MATTLAND (Analyst, 1936, 61, 288—293).—The probable constitution of a no. of hydrolysable and condensed tannins is discussed.

E. C. S.

**Tannin from the Indian gooseberry (*Phyllanthus emblica*) with a protective action on ascorbic acid.** M. DAMODARAN and K. R. NAIR (Biochem. J., 1936, 30, 1014—1020).—A tannin, m.p.  $> 360^\circ$ , containing gallic and ellagic acids and glucose, which inhibits the oxidation of ascorbic acid in air is prepared from the Indian gooseberry by extraction with MeOH and pptn. with EtOAc. A second tannin, decomp.  $120^\circ$ , without this inhibiting effect was also isolated.

H. D.

**Constituents of seeds of *Blepharis edulis*,** Pers. I. J. B. LAL (J. Indian Chem. Soc., 1936, 13, 109—114).—Extraction of the oil-free ( $C_6H_6$ ) seeds with EtOH gives *dl*-allantoin (2.1%), a bitter glucoside (*blepharin*) (1.2%),  $C_{15}H_{20}O_{11}$ , m.p.  $222^\circ$  (softens at  $220^\circ$ ), glucose,  $\alpha$ - $C_6H_4(OH)_2$ , tannins, and saponins.

H. B.

**Failure of iodine-starch reaction.** E. MANGOLD and H. JANSCH (Sitzungsber. Ges. naturf. Fr. Berl., 1935, Feb., 35—40).—Potato that had been treated with saliva gave no blue colour but there was a yellow or brown coloration which could be removed by washing. Thereafter (I) produced a blue colour which could not be washed out.

NUTR. ABS. (m)

**Diastatic decomposition of intercellular cement.** H. COLIN and A. CHANDUN (Compt. rend., 1936, 202, 973—975).—Digestion of sugar-beet pulp at  $15^\circ$  with the digestive juice of *Helix* effects 50% greater decomp. of pectic substances than hot  $H_2O$  extraction, as measured by the reducing-sugar content.

P. G. M.

**Biochemical characteristics of variety in vegetables.** B. A. RUBIN and L. I. NAUMOVA (Compt. rend. Acad. Sci., U.R.S.S., 1935, 4, 341—344; cf. A., 1935, 658).—In roots and leaves of early radishes the catalase (I), invertase (II), and amylase contents are  $>$  those in late radishes, the differences being very pronounced in the cases of (I) and (II). Differences in wt. and sugar content between early and late varieties are also observed.

W. McC.

**Influence of climatic conditions on the resin content of the needles of coniferous trees.** G. V. PIGULEVSKI (J. Gen. Chem. Russ., 1935, 5, 1634—1638).—The resin content of the needles of different species of pine, larch, and fir is greatest in those growing in cold or temperate climates.

R. T.

**Properties of the secretion of *Primula obconica*.**

HOCQUETTE (Compt. rend., 1936, 202, 1089—1091).—Differences (solubility in org. and inorg. solvents, colour reactions) between the fluid in the cells and the excreted matter may be due to the presence in the latter of fatty acids and/or neutral fats.

W. McC.

**Composition of the secretion of *Primula obconica*,** Hance. M. HOCQUETTE (Compt. rend., 1936, 202, 436—438).—The secretion of the hairs of *Primula obconica* probably contains saponosides or related compounds and phytosterols.

H. G. M.

**Composition of the oil of *Primula auricula*, L.** A. GORIS and H. CANAL (Compt. rend., 1936, 202, 1351—1352).—Steam-distillation of the crushed and steeped roots of this plant give 0.8% of distillate consisting of paeonol and some *Me methoxyquinol-carboxylate*, an oil. The acid, m.p.  $143^\circ$ , therefrom gives 2 : 5- $C_6H_3(OH)_2 \cdot CO_2H$ , m.p.  $200^\circ$  [obtained from  $p$ - $C_6H_4(OH)_2$ ,  $CO_2$ , and  $KHCO_3$  in glycerol at  $180^\circ$ ], and is prepared from this acid by  $Me_2SO_4$  (2 mols.) and boiling NaOH (2 mols.).

R. S. C.

**Essential oil of parasite-infested flower stems of marjoram.** R. SALGUES (Compt. rend. Soc. Biol., 1936, 121, 1074—1076).—Phenols, particularly thymol, in the oil are decreased by infection of the stems with *Eriophyes thomasi*.

R. N. C.

**Constituents of flowering dogwood (*Cornus florida*).** C. E. SANDO, K. S. MARKLEY, and M. B. MATLACK (J. Biol. Chem., 1936, 114, 39—45).—The fresh flowers and bracts (79.6—16.3 kg. dry) of dogwood yielded 825 g. of Et<sub>2</sub>O-sol. extract (I) and then a further EtOH-sol. extract (II). Ligroin (b.p.  $30$ — $60^\circ$ ) removed 330 g. from (I); after being shaken with 25% HCl, this was saponified by 3% KOH-EtOH, yielding palmitic and stearic (3 : 7), oleic, and some linolenic acids, a crude hydrocarbon, m.p.  $62$ — $62.5^\circ$ , setting point  $61.2$ — $60.9^\circ$  (probably a ternary mixture containing much  $C_{25}H_{50}$ ), and a phytosterol,  $C_{26}H_{43} \cdot OH$ , +  $H_2O$ , m.p.  $124^\circ$  (acetate, m.p.  $110$ — $111^\circ$ ). The ligroin-insol. part of (I) gives ursolic acid. (II) yields inositol, scyllitol, campherol, gallic acid, and quercitin.

R. S. C.

**Chemical examination of seed of *Abies balsamea* (L.),** Miller. S. R. BENSON and H. N. CALDERWOOD (J. Amer. Chem. Soc., 1936, 58, 523—525).—The seeds contain crude fibre 35.13, protein 9.42, ash 1.88, oleoresin (I) (extracted by 75% EtOH at room temp.) 19.1, and oil (by extraction of the (I)-free endosperm with light petroleum) 11.7% on a  $H_2O$ -free basis. The oil has  $d_{25}^{25}$  0.9279,  $n_D^{25}$  1.4783, f.p.  $-37^\circ$ , acid val. 0.88, I val. (Hanus) 141, sap. val. 185.6, Ac val. 15.4, Reichert-Meissl val. 0.53, Polenske val. 0.21, contains 4.8% of unsaponifiable matter, and consists of the glycerides of stearic (small amount), oleic 33—40, linoleic (II) 54.6—59.7, and linolenic ( $\Delta^{9,12}$ -octadecatrienoic) 3.1—5% acids. (II) appears to be a mixture of two isomerides, which when oxidised (aq.  $KMnO_4$ ) give tetrahydroxystearic acids of m.p.  $152^\circ$  and  $173^\circ$ .

H. B.

***Sium latifolium*, L., seeds.** G. V. PIGULEVSKI and E. L. KARASIK (J. Appl. Chem. Russ., 1936, 9, 284—286).—The seeds contain monoses 3.48, cellulose 21.31, protein 16.84, fatty oils 24.2, essential oils 7.01%. The fatty oil contains 2.2% of saturated acids; linoleic and oleic acids were also identified.

R. T.

**Constitution of certain nutshells. I. Seed-coat of *Bertolletia excelsa* (Brazil nut).** J. G. BOSWELL (Biochem. J., 1936, 30, 971—976).—The

fat of the shell was identical with that of the endosperm, and the hemicellulose and lignin were similar to those of other lignified tissues. The cellulose (furfuraldehyde yield high) was similar to that of peanut hull.

H. G. R.

**Unsaturated acid of kernel fat of "akarittom."**  
—See this vol., 822.

**Chemical constitution and biological properties of lipins in the carrot.** D. ROMOLI-VENTURI and A. PUGLIESE (Biochim. Terap. sper., 1935, 22, 421—457).—The carrot, *Daucus carota*, contained: protein 1.2, fat 0.6, sugar reducing substances 6.5, non-N extractives 3.3, cellulose 1.6%. From the oil there were isolated a phospholipin with vitamin-A and -D reactions and containing Ca, N, and org. P, carotene, and material with the physicochemical properties of -A and -E.

NUTR. ABS. (m)

**Relation between ascorbic acid and carotenoids [in plants].** A. GIROUD, A. R. RATSEMAMANGA, C. P. LEBLOND, CHALOPIN, and RABINOWICZ (Bull. Soc. Chim. biol., 1936, 18, 573—589; cf. this vol., 391).—With few exceptions, in plants where carotenoid compounds are present, significant quantities of vitamin-C are also found.

A. L.

**Lipins of wheat embryo.** I. Fatty acids. II. Unsaponifiable fraction. B. SULLIVAN and C. H. BAILEY (J. Amer. Chem. Soc., 1936, 58, 383—390, 390—393).—I. EtOH-extracts of the fresh germ yield a mixture of carbohydrates containing sucrose, a little glucose, and an unidentified sugar (*acetate*, m.p. 229°,  $[\alpha]_D^{25}$  —16.7° in  $\text{CHCl}_3$ ). The oil (13.68% of germ) has  $d_{20}^{25}$  0.9326,  $n_D^{20}$  1.4800, acid val. 6.95 sap. val. 184, I val. (Rosenmund) 125, SCN-val. 84.7, Ac val. 16.7, Reichert-Meissl val. 0.77, Polenske val. 0.44, Hehner val. 89, ester val. 177.05, and contains 1.44% of sol. acids (as  $\text{Pr}^{\text{C}}\text{CO}_2\text{H}$ ). Hydrolysis gives palmitic 11.76, stearic 3.05, lignoceric 1.19, oleic 28.14,  $\alpha$ -22.32 and  $\beta$ -29.99 -linoleic, and  $\alpha$ -1.83 and  $\beta$ -linolenic acid 1.72%. Little or no fully saturated glyceride is present. Oxidation (1%  $\text{KMnO}_4$ , dil. NaOH) of the mixed unsaturated acids gives di-,  $\alpha$ -, m.p. 155—155.5° (lit. 153—157°), and  $\beta$ -, m.p. 172.5°, -tetra-, and hexa-, m.p. 173° and 201—202°, -hydroxystearic acids.

II. The unsaponifiable matter (4% of oil) consists of about 70% of free (56.2%) and combined (43.8%) sterols (sitosterols, dihydrositosterol, and a sterol with  $\leq 2$  double linkings) and an almost N-free oil containing (cf. Drummond *et al.*, A., 1935, 418) polyene hydrocarbons, xanthophyll, and an alcohol. Determination of the unsaturation of sterols by I vals. (Hanus; Rosenmund) is untrustworthy.

H. B.

**Occurrence of ergosterol and vitamin-D in reindeer lichen.** G. BLIX and H. RYDIN (Upsala Läkeforen Forhandl., N.F., 1932, 37, 333—340; Chem. Zentr., 1935, ii, 1398).—*Cladonia rangiferina*, L. Hoffm., contains small quantities of ergosterol, the content increasing in autumn. The vitamin-D content of the lichen is insignificant.

R. N. C.

**Sulphur-containing pigments of plant origin.** P. HAAS, T. G. HILL, and B. RUSSELL-WELLS (Nature, 1936, 137, 783—784).—The blue compound formed

on drying the actively growing shoots of *Mercurialis perennis* changes on keeping, or more rapidly on heating aq. solutions, into a red product which can be separated into a series of glucosidic pigments containing N and S.

L. S. T.

**Red gossypol.** M. PODOLSKAJA (Biochem. Z., 1936, 284, 401—411).—Cotton seeds contain, in addition to a yellow pigment (I), a red cryst. compound (II),  $\text{C}_{30}\text{H}_{30}\text{O}_8$ , containing 2  $\cdot\text{CO}_2\text{H}$  groups; (I) and (II) are distinguished by pleochroism and extinction and absorption spectra but both yield the same derivative with  $\text{AcOH}$  and  $\text{NH}_2\text{Ph}$ . In EtOH, (II) changes to (I) whilst  $\text{CHCl}_3$  solutions are relatively stable (cf. B., 1935, 732; Schmid and Margulies, A., 1935, 984).

F. O. H.

**Pigment of the flowering currant (*Ribes sanguineum*, vars. *splendens* and *atrosanguineum*).** T. J. NOLAN and T. G. BRADY (Proc. Roy. Irish Acad., 1936, 43, B, 1—12).—The pigment of these two varieties is isolated and identified as antirrhinin (kercyanin) (cf. A., 1930, 967).

E. W. W.

**Mandarin pigment.** II. L. ZECHMEISTER and P. TUZSON (Z. physiol. Chem., 1936, 240, 191—194; cf. A., 1934, 121).—The fruit contains carotene, cryptoxanthin in the proportion 1:10—25, xanthophyll, and probably violaxanthin and zeaxanthin.

W. McC.

**Carotenoids of fresh-water algæ.** I. *Euglenarhodone* and other carotenoids of a red *Euglena*. J. FISCHER (Z. physiol. Chem., 1936, 239, 257—269; cf. Kylin, A., 1927, 703).—In addition to chlorophyll-a and -b,  $\beta$ -carotene, esterified zeaxanthin and lutein, xanthophyll, fatty acids (palmitic), and glycerol, *E. heliorubescens* contains two esters of *euglenarhodone* (I),  $\text{C}_{40}\text{H}_{48}\text{O}_4$ , m.p. 227—228° (corr.) [*dioxime* (II) (absorption max. at 512 m $\mu$  in  $\text{C}_5\text{H}_5\text{N}$ ); *tetraoxime*]. (I), which is probably 4:6:4':6'-tetra keto- $\beta$ -carotene, exhibits an absorption band at 480—535 m $\mu$  (max. at 505 m $\mu$ ) in  $\text{C}_5\text{H}_5\text{N}$  and when pure is very stable in air. (I) and (II) yield salts with heavy metals.

W. McC.

**Awobanin and awobanol.**—See this vol., 860.

**Colouring matter in the wood of "Hinoki" tree.** I.—See this vol., 857.

**Tanganyika arrow poisons.**—See B., 1936, 475.

**Chemical investigation of Indian medicinal plants.** V. *Cryptocoryne spiralis*. S. N. CHAKRAVARTI and T. S. KUPPUSWAMY (J. Annamalai Univ., 1936, 5, 269—270).—No org. active principle is detected in the root of this plant.

E. W. W.

**Detection of scopoletin in gelsemium and belladonna roots.** R. FISCHER and H. EHRLICH (Arch. Pharm., 1936, 274, 268—273).—The method of isolating scopoletin from gelsemium and its extract is improved. Micro-sublimation at 125°/12 mm. (2—3 mm. distance) gives stable, m.p. 204—205° (mostly six-sided; angle 137°), and unstable forms, m.p. 193—195° (often twinned; shape variable). Partly purified extracts, but not the powdered roots, give recognisable sublimates.

R. S. C.

**"Lofout," a Saharan lily containing colchicine.** E. PERROT (Compt. rend., 1936, 202,

1088—1089).—All parts of the plant (*Androcymbium gramineum*) contain colchicine (seeds 0.37, bulbs, 0.29, flowers 0.1%). W. McC.

**Alkaloid content of infusions and decoctions of seeds of *Lupinus albus*.** D. TORRISI (Boll. Soc. ital. Biol. sperim., 1935, 10, 807—809).—Prolonged roasting slightly reduces the lupanine (I) content of the seeds, and, by increasing the imbibing power of the seeds, increases the quantity of (I) that can be extracted by decoction or infusion. R. N. C.

**Presence of alkaloids in *Sambucus*.** H. YARDIN (Compt. rend. Soc. Biol., 1936, 122, 155—156).—Choline and other bases giving alkaloid reactions are present in extracts of the bark; cicutine is absent. R. N. C.

**Nicotinamide methiodide.**—See this vol., 862.

**Alkaloids of white hellebore.**—See this vol. 870.

**Alkaloids of *Holarrhena antidysenterica*.** IV. —See this vol., 870.

**Amino-acid content of root nodules.** A. I. VIRTANEN and M. TORNIAINEN (Suomen Kem., 1936, 9, B, 13—14).—Proteins of nodules yielded tryptophan, arginine, tyrosine, aspartic acid (I), and  $(\text{NH}_4)_2$ -acids. Excretion of (I) and lysine by nodules is not due to fission of protein. These  $\text{NH}_4$ -acids represent primary products of N fixation. A. G. P.

**Non-protein-nitrogen of pulses.** K. BHAGVAT and M. SREENIVASAYA (Current Sci., 1936, 4, 651—652).—Differentiation of the non-protein-N indicates that *P. mungo* is very rich in proline, whilst *P. aconitifolius* (I) and *C. arietinum* are rich in arginine and arginine-like compounds. The % of dicarboxylic N in (I) is high. F. A. A.

**Constituents of mulberry leaves, especially proteins.** XI. Distribution of amino-acids in leaf proteins. XII. Solubility of leaf proteins and its application. Y. KISHI (J. Agric. Chem. Soc. Japan, 1936, 12, 348—362, 363—378; cf. A., 1935, 1146).—XI. The N distribution of the protein sol. in 60% EtOH containing 0.3% of NaOH is examined. This fraction constitutes the major portion of the protein in dried leaves and is distinct from globulin, glutelin, and albumin present.

XII. The N distribution of the  $\text{H}_2\text{O}$ -sol. protein of dried leaves differs from that of fresh leaves. The latter consists largely of the alkaline-EtOH-sol. protein obtained from dried leaves. Fractionation of the proteins with other solvents is examined. A. G. P.

**Globulin from the cashew nut (*Anacardium occidentale*).** M. DAMODARAN and T. G. SIVASWAMY (Biochem. J., 1936, 30, 604—608).—The fat-free seed yields 17—18% of a globulin, *anacardein* (N 19.3, S 0.75—0.78%; P nil; Molisch test negative). W. O. K.

**Proteins of Indian foodstuffs.** VII. Globulins of the aconite bean (*P. aconitifolius*, Jacq.). VIII. Heat-coagulation of globulins from *Vigna catieng*, Walp., and *P. aconitifolius*, Jacq. K. BHAGVAT. IX. Digestibility of globulins from cow-pea and aconite bean. K. BHAGVAT and M. SREENIVASAYA (J. Indian Inst. Sci., 1935, A, 18,

137—144, 145—151; 1936, A, 19, 9—18).—VII. The globulins (I) of aconite bean were fractionated by  $\text{COMe}_2$  and  $(\text{NH}_4)_2\text{SO}_4$  pptn. and by a dilution technique.  $\text{CHCl}_3$  extracted more org. P than other lipin solvents.

VIII. The (I) were fractionated by heat-coagulation.

IX. The tryptic digestion of (I), measured by direct N determinations and by a dilatometric technique which gave good agreement, was much slower than that of caseinogen. Preliminary treatment of (I) with pepsin increased the rate of digestion. The viscosimetric determination of digestibility was obscured by ppt. formation. H. D.

**Methylene-blue technique for permanent preparations.** E. C. COLE (Stain Tech., 1936, 11, 45—47).—Tissues stained intravitaly with methylene-blue are best fixed with  $(\text{NH}_4)_2\text{MoO}_4$ , washed in  $\text{H}_2\text{O}$ , and dehydrated with EtOH—Bu<sup>o</sup>OH (1:1) followed by pure BuOH and finally by Me salicylate-xylene (1:4). W. O. K.

**Physical chemistry of silver staining.** L. ZON (Stain Tech., 1936, 11, 53—67).—Silk fibres in aq.  $\text{NH}_3$ -AgOH adsorb Ag, but the amount of Ag deposited in the fibres on addition of  $\text{CH}_2\text{O}$  is > that originally adsorbed. It is concluded that during Ag staining actual deposition of Ag takes place in the tissues as opposed to simple reduction of Ag already adsorbed. Various factors influencing Ag reduction, e.g., adsorption of AgOH and  $\text{NH}_3$ , affinity of Ag for proteins, and the protective power of the gel structures, are discussed and the conclusions reached are applied to modified methods of Ag staining. W. O. K.

**[Differential] staining with safranin and fast-green FCF.** J. A. MOORE (Stain Tech., 1936, 11, 69—70). W. O. K.

**Feulgen reaction.** J. A. DE TOMASI (Stain Tech., 1936, 11, 70).—Improvements in the Feulgen staining reaction (cf. A., 1924, i, 905) are described. W. O. K.

**Micro-extraction apparatus for determining alcohol-ether-soluble lipins.** J. ERDOS and L. POLLAK (Mikrochem., 1936, 19, 245—247).—The material is supported on a filter cone beneath the reflux condenser. J. S. A.

**Sensitivity and stability of the nickel nitroprusside reaction for reduced glutathione.** D. ZIMMET and H. D. FERRIERE (Arch. Sci. phys. nat., 1936, [v], 18, Suppl., 44—48).—When one or two drops of a solution containing  $\text{NiCl}_2$  (5 g.) and  $\text{Na}_2\text{Fe}(\text{CN})_5\text{NO}$  (0.5 g.) in  $\text{H}_2\text{O}$  (100 c.c.) are added to a solution of reduced glutathione a rose-violet ppt. is formed, a greenish turbidity being obtained with distilled  $\text{H}_2\text{O}$ . The reaction is highly sensitive, being positive with 0.25 p.p.m., and is not given by  $\text{COMe}_2$ , creatinine, or cysteine. W. O. K.

**Determination of paraldehyde (A) in the tissues and fluids after intravenous injection of this substance, (B) in the respiratory air of paraldehyde-anæsthetised animals.** I. I. NITZESCU, I. D. GEORGESCU, and D. TIMUS (Compt. rend. Biol., 1936, 121, 1657—1659, 1660—1661).—(A) Paraldehyde (I)

is determined by boiling the tissue in 10%  $\text{H}_2\text{SO}_4$ , the depolymerised  $\text{MeCHO}$  being absorbed in aq.  $\text{NaHSO}_3$ , excess of which is determined iodometrically. (I) injected into the dog is stored in most organs, particularly the heart, but a large quantity remains in the blood and is eliminated in the urine and expired air.

(B) The expired air is passed through hot 10%  $\text{H}_2\text{SO}_4$  to depolymerise (I), and then through aq.  $\text{NaHSO}_3$  in which  $\text{MeCHO}$  is absorbed and determined. R. N. C.

**Determination of fats in biological material.** P. A. SESHAN (Indian J. Vet. Sci., 1935, 5, 355—363).—With ragi straw, earthnut cake, and dried faeces, extraction with  $\text{Et}_2\text{O}$  or light petroleum for 16 hr. is inadequate. The extract in the later stages differs materially (e.g., in sap. val. and fatty acid content) from that obtained in the early stage of the extraction. The alkali hydrolysis method also gives unsatisfactory results owing to its destructive nature.

NUTR. ABS. (m)

**Enzymic histochemistry. XVII. Micro-determination of nitrogen.** M. LEVY (Z. physiol. Chem., 1936, 240, 33—42).—A method, applicable to approx. 0.1 mg. of N and based on digestion of the tissue-extract with  $\text{H}_2\text{SO}_4$ — $\text{K}_2\text{SO}_4$ —Se and subsequent nesslerisation, is described. F. O. H.

**Adsorption of nitrogenous substances from aqueous solutions.** D. ACKERMANN and H. G. FUCHS (Z. physiol. Chem., 1936, 240, 198).—Lloyd's reagent (in 5%  $\text{H}_2\text{SO}_4$ ) is as effective as, and in some ways preferable to, phosphotungstic acid as an adsorbent for substances containing N. Adsorbed material is recovered by long-continued elution with aq.  $\text{Ba}(\text{OH})_2$ . W. McC.

**Micro-determination of uric acid.**—See this vol., 873.

**Microchemical detection of arsenic in forensic investigations.** A. MARTINI and B. BERISSO (Mikrochem., 1936, 19, 181—182).—Animal tissues etc. are decomposed with alkaline  $\text{H}_2\text{O}_2$ . The solution is acidified with  $\text{HCl}$ , and treated with conc. aq.  $\text{NaI}$  + a drop of quinoline. In presence of  $> 4 \times 10^{-10}$  g. of As a microscopically characteristic yellow cryst. ppt. is obtained. Alternatively, 20% aq.  $\text{CsCl}$ , saturated aq.  $\text{Na}_2\text{HPO}_4$ , and  $\text{C}_5\text{H}_5\text{N}$  are added, giving a characteristic ppt. J. S. A.

**Determination of boron in soils and plants.** E. V. BOBKO and T. V. MATVEEVA (J. Appl. Chem. Russ., 1936, 9, 532—540).—Bertrand and Agulhon's method (A., 1914, ii, 217) is preferred. The B content of moist is < that of dry soils. The B content of apple leaves is < that of the blossoms, in which the stigmata are richest in B. The B content of plants may be increased 3—4-fold by raising the B content of the nutritive solution. R. T.

**Determination of halogen absorption of oils.**—See B., 1936, 461.

**Bromine in the body.** H. UCKO (Biochem. J., 1936, 30, 992—1000).—A colorimetric method for determination of Br and of the Br and Cl content of

various tissues (normal and after Br intake) is described. H. G. R.

**Determination of bromine.** G. E. BATRAK (Med. exp. Ukraine, 1935, No. 2, 100—104).—In the colorimetric method using Schiff's reagent, the depth of colour of the lilac rings developing when drops of aq.  $\text{Cl}_2$  are added is measured by ocular observation.

NUTR. ABS. (m)

**Determination of iodine in biological material.** G. J. FASHENA and V. TREVORROW (J. Biol. Chem., 1936, 114, 351—355; cf. A., 1935, 1182).—Reduction of  $\text{IO}_3^-$  by  $\text{HPO}_3^{2-}$  is increased by dilution of the reaction mixture. H. D.

**Ionisable iron in foods.** L. SHACKLETON and R. A. McCANCE (Biochem. J., 1936, 30, 582—591).—The ionisable Fe in various foodstuffs, determined by the 2:2'-dipyridyl method and expressed as a % of the total Fe, appears more const. and characteristic of the foodstuff than the total Fe. Cereals contain 75—100, vegetables and fruits 50—100, beef and mutton 10—25, other flesh foods > 25, most white fish 100, and herring, mackerel, and sardines about 60% of their Fe in ionised form. W. O. K.

**Micro-determination of potassium in substances of biological origin.** A. CAHEN (Bull. Soc. chim., 1936, [v], 3, 640—643).—The substance is oxidised by  $\text{HNO}_3$ — $\text{HClO}_4$ , and K obtained as  $\text{K}_2\text{PtCl}_6$  by evaporation with  $\text{PtCl}_4$ .  $\text{K}_2\text{PtCl}_6$  is reduced by  $\text{H}_2$ , and the KCl titrated by standard methods. The error is < 2%. E. S. H.

**Micro-determination of potassium.**—See this vol., 812.

**Colorimetric determination of inorganic sulphate in serum and urine.** T. V. LETONOFF and J. G. REINHOLD (J. Biol. Chem., 1936, 114, 147—156).—A method based on the colour-producing reaction between benzidine sulphate and Na  $\beta$ -naphthoquinone-4-sulphonate is described.  $\text{PO}_4^{3-}$  and proteins are removed simultaneously by uranyl acetate prior to the analysis. The inorg. S of normal human serum is approx. 1.04 mg. per 100 c.c. Additional  $\text{SO}_4^{2-}$  is liberated when serum is treated with  $\text{CCl}_3\text{CO}_2\text{H}$ .  $\text{SO}_4^{2-}$  added to serum is rendered partly non-precipitable by benzidine. J. N. A.

**Determination of sulphur for sulphur-balance experiments with cattle and sheep.** F. J. WARTH and T. S. KRISHNAN (Indian J. Vet. Sci., 1935, 5, 210—215).—The method, which is applicable to urine, faeces, and foodstuffs, consists in oxidation with  $\text{HNO}_3$  followed by fusion of the evaporated filtrate with  $\text{NaOH}$  in a Ag basin. NUTR. ABS. (m)

**Sulphur metabolism. Sulphur and protein metabolism in infants and children.** A. BLAZSO (J. Physiol. Path. gén., 1935, 33, 1076—1092).—S is determined in urine, faeces, serum, and milk, by oxidising with fuming  $\text{HNO}_3$  and removing phosphates with  $\text{Ca}(\text{OH})_2$ . After neutralisation, excess of  $\text{BaCrO}_4$  is added and then  $\text{Ca}(\text{OH})_2$  to ppt. the excess. The  $\text{H}_2\text{CrO}_4$  liberated is determined colorimetrically in the filtrate with *s*-diphenylcarbazide. NUTR. ABS. (m)

# BRITISH CHEMICAL ABSTRACTS

## A.—PURE CHEMISTRY

AUGUST, 1936.

### General, Physical, and Inorganic Chemistry.

**Dissymmetry of intensity in the longitudinal Stark effect of the Balmer series.** H. BOMKE (Physikal. Z., 1936, 37, 417—427).—The effect of pressure and application of a magnetic field on the dissymmetry of intensity of the longitudinal Stark components of the Balmer series has been investigated. The dissymmetry is different for the different components and varies with pressure, being a max. at approx.  $8 \times 10^{-3}$  mm. An additional magnetic field affects the intensity distribution in a manner dependent on the relative directions of the electric and magnetic fields. A. J. M.

**Dependence of polarisation of light emission of positive rays [on pressure etc.].** J. STARK and M. SCHÖN (Physikal. Z., 1936, 37, 431—435).—The effect of pressure, nature of gas, and the type of series of the lines emitted by the positive rays on the polarisation of the light from such rays has been investigated. The polarisation of the  $H_\alpha$  and lines obtained from H positive rays varies considerably with the pressure, and with the nature of the gas in the tube, being much smaller for H positive rays in  $O_2$  and in  $N_2$  than in He. The polarisation of He lines of different series, obtained from He positive rays in  $H_2$ , was determined. A. J. M.

**$1X$ -level of the hydrogen molecule.** G. H. DIEKE (Nature, 1936, 137, 944—945).—Observations on the near infra-red spectra of  $H_2$ , HD, and  $D_2$  are discussed. Effective moments of inertia are 0.871, 1.156, and  $1.725 \times 10^{-40}$ , respectively, and the effective internuclear distance is  $1.019 \times 10^{-8}$  cm. L. S. T.

**Emission spectrum of  $D_2$  in the extreme ultra-violet.** C. R. JEPPESEN (Physical Rev., 1936, [ii], 49, 797—803; cf. A., 1934, 575).—Full data are tabulated and analysed for 37 bands in the  $2p^1\Sigma-1s^1\Sigma$  system and 29 bands in the  $2p^1\Pi-1s^1\Sigma$  system photographed in the extreme ultra-violet with a grazing-incidence vac. spectrograph. Consts. for the three observed electronic states of the mol. are given and data are compared with those for  $H_2$ . Electronic shifts of 4 and 23  $cm^{-1}$  are observed in the respective systems. N. M. B.

**Simultaneous action of electrical and magnetic fields on line spectrum of helium.** W. STEUBING (Sitzungsber. preuss. Akad. Wiss., 1935, 150—159; Chem. Zentr., 1935, ii, 1830).—Data are given for parallel and perpendicular observation under parallel and crossed fields for the region 3800—5100 Å. J. S. A.

**Effect of magnetic field on the polarisation of stationary and moving light emission of positive rays.** J. STARK, R. RITSCHL, and H. BOMKE (Physikal. Z., 1936, 37, 427—431).—A magnetic field up to 30,000 gauss exerts no appreciable effect on the polarisation of the stationary light emission of He lines in the transverse Stark effect. There is, however, some effect on the polarisation of the moving light emission for both H and He positive rays. A. J. M.

**Zeeman effect of induced lines in the helium spectrum.** L. JANSON (Bull. Acad. Polonaise, 1935, A, 16—21).—Combined Zeeman and Stark effects of the forbidden He lines  $2^1P_1-5^1P_1$ ,  $2^1P_1-5^1F_3$ , and  $2^1P_1-5^1G_4$  are described. O. D. S.

**Band spectrum of sulphur.** E. OLSSON (Z. Physik, 1936, 100, 656—664).—The energy of dissociation of the ground level is probably  $<3.6$  volts. A. B. D. C.

**Nebular spectra due to elements of the second period.** H. A. ROBINSON (Nature, 1936, 137, 992).—The singlet systems of S III and K VI have been partly classified from new data in the Schumann region which also show the presence of S III and A V in nebulae. L. S. T.

**Band spectra of halogens in point discharge.** A. CAMPETTI (Atti R. Accad. Sci. Torino, 1934—1935, 70, I, 618—631; Chem. Zentr., 1935, ii, 2026).—The emission spectra of the point discharge in Cl, Br, and I consist of 2, 4, and 3 somewhat ill-defined bands, respectively. The position of the bands moves from short to longer  $\lambda$ , and their breadth decreases regularly from Cl to I, following the decrease in ionisation potential. The spectra are considered to be recombination spectra between ions, or between ions and neutral atoms. J. S. A.

**Absorption spectrum of rare gases at the limit of the argon spectrum.** U. FANO (Nuovo Cim., 1935, [ii], 12, 154—161; Chem. Zentr., 1935, ii, 1830).—Theoretical. The intensities in the absorption spectrum, in presence of superposed Rydberg terms, are calc. Agreement is found with Beutler's experimental data (A., 1935, 271). J. S. A.

**Na I-like spectra of the elements potassium to copper, K IX—Cu XIX.** B. EDLÉN (Z. Physik, 1936, 100, 621—635). A. B. D. C.

**New type of absorption bands of potassium vapour.** B. K. CHAKRABORTY (Indian J. Physics, 1936, 10, 155—162).—In the absorption spectrum of K vapour photographed in the range 4100—2800 Å. at temp.  $>600^\circ$  and pressures  $>20$  cm. of Hg, each

principal series line from 4047 to 2894 Å. is associated with diffuse lines on both the short- and long- $\lambda$  sides. The lines corresponding with the 4th, 5th, and 6th members of the principal series form a regular series of band heads; full data and a provisional classification are tabulated, and a probable explanation is given. The bands have no fine structure. A new ultra-violet absorption band extending over 2950–2890 Å. was observed at pressures beyond 20 cm. N. M. B.

**Structure of the *D* and *F* terms in potassium.** O. MASAKI and K. KOBAYAKAWA (J. Sci. Hiroshima Univ., 1936, A, 6, 217–226).—The combined doublet of the first subordinate series and the Bergmann series of K are analysed. From a consideration of the vibrational distances in the Bergmann series, and of the intensity ratios in the doublet, it is shown that the *F* and *D* terms are all inverted. W. R. A.

**Structure of the spectrum of neutral cobalt.** M. A. CATALAN and M. T. ANTUNES (Anal. Fis. Quím., 1936, 34, 103–145).—An extension of earlier work (A., 1928, 338). The classification of the spectrum of Co I is critically considered and 96 new levels are discovered. The spark limit determined by three methods is 63,312–14 cm.<sup>-1</sup> F. R. G.

**Arc spectrum of cobalt between 2450 and 1960 Å.** M. T. ANTUNES (Anal. Fis. Quím., 1935, 33, 319–349).—The lines observed have been compared with those previously recorded and are assigned to Co I and Co II (cf. this vol., 769). F. R. G.

**Spectrum of doubly-ionised zinc.** K. C. MAZUMDER (Indian J. Physics, 1936, 10, 171–187; cf. Basu, A., 1935, 1437; Bloch, A., 1934, 1051).—Full data and classifications for 222 new lines of Zn III, in the range 2600–400 Å., and identifications of 53 new terms are tabulated. Term vals. are calc. The ionisation potential is approx. 40 volts. N. M. B.

**Arc and spark spectra of niobium.** W. F. MEGGERS and A. S. KING (J. Res. Nat. Bur. Stand., 1936, 16, 385–419).—The  $\lambda\lambda$  of 5700 lines of the arc and spark spectra of Nb in the region 2100–12,000 Å. are recorded, with an average probable error <0.005 Å. From comparisons of intensity the lines are separated into the Nb I, Nb II, Nb III, and Nb IV spectra. J. W. S.

**Measurement of the spark spectrum of molybdenum between 2195 and 2000 Å.** M. A. CATALAN and J. H. ROMAN (Anal. Fis. Quím., 1936, 34, 146–164).—Mo powder on C electrodes was used. Known lines and 181 new lines between 2195 and 2081 Å. are recorded, and 156 lines are recorded between 2081 and 2000 Å. The lines of Mo I are separated from those of Mo II. F. R. G.

**Hyperfine structure of the resonance lines of silver.** D. A. JACKSON and H. KUHN (Nature, 1936, 137, 1030).—The nuclear spin of <sup>107</sup>Ag and <sup>109</sup>Ag is  $\frac{1}{2}$ . L. S. T.

**Influence of temperature on the absorption of excited cadmium vapour containing neon.** O. MASAKI, Y. MORIMOTO, and K. SAKUMA (J. Sci. Hiroshima Univ., 1936, A, 6, 227–236).—The absorption of the lines 5086, 4800, and 4678 Å., corresponding with <sup>23</sup>P.,  $^0-2^3S_1$ , is investigated. W. R. A.

**Anomalies in the fine structure of the first spark spectrum of iodine.** K. MURAKAWA (Nature, 1936, 137, 1030–1031). L. S. T.

**New lines in the ultra-violet spectrum of atomic iodine.** J. H. McLEOD (Physical Rev., 1936, [ii], 49, 804–807; cf. Kalia, A., 1935, 272).—Data are tabulated for 250 lines in the range 1900–800 Å. for the arc and first spark spectrum of I photographed with a vac. grating spectrograph. The spectrum was produced in A–I mixture and, eliminating a fluorite window, I was prevented from entering the spectrograph by an outward flow of A circulated through the whole system. N. M. B.

**Mechanical nuclear moment of caesium.** T. FOLSCHIE (Naturwiss., 1936, 24, 297).—Investigation of the Paschen-Back effect with the hyperfine structure of the Cs resonance line  $\lambda$  8943 Å. gives  $\nu = (7/2)h/2\pi$ . A. J. M.

**Spectrum of tungsten I.** F. POGGIO (Anal. Fis. Quím., 1935, 33, 171–202).—The arc spectrum of W between 1980 and 2248 Å. has been measured and new lines observed between 2248 and 8500 Å. One even and 54 odd levels are calc., and from these and the levels calc. by Laporte (A., 1926, 1071), 1066 lines are classified. F. R. G.

**Emissivity of tungsten as a function of wavelength from 0.23–2.0  $\mu$  in the region of temperature 1600–3000° abs.** ANON. (Physica, 1936, 3, 561–562).—Combined data are given in tabular form. The coeffs. determined for W of different origins and heat-treatments show no systematic differences. J. W. S.

**Hyperfine structure of platinum isotopes. II. Hyperfine structure scheme for the platinum isotope 195 and its mechanical nuclear moment.** (FRL.) B. JAECKEL (Z. Physik, 1936, 100, 513–528; cf. this vol., 654).—The nuclear spin of <sup>195</sup>Pt is  $\frac{1}{2}$ . A. B. D. C.

**Luminous discharges [in a gas] at pressures less than 10<sup>-1</sup> mm. of mercury in a magnetic field.** T. V. IONESCU (Compt. rend., 1936, 202, 1842–1843).—Longitudinal magnetic fields >100 gauss cause a violet discharge between an annular grid and the plate of an ionisation tube. J. G. A. G.

**Spectral line intensity in the far ultra-violet and estimation of temperatures and pressures in vacuum arc spectra.** H. A. ROBINSON (Z. Physik, 1936, 100, 636–643). A. B. D. C.

**Electron temperature and daily variation in the *F*-region of the ionosphere.** J. FUCHS (Naturwiss., 1936, 24, 429). A. J. M.

**Corona rotation effect in different gases at various pressures.** A. GÜNTHER-SCHULZE and H. BETZ (Z. Physik, 1936, 100, 269–272).—This effect has been studied for air, CO<sub>2</sub>, H<sub>2</sub>, O<sub>2</sub>, and N<sub>2</sub>. A. B. D. C.

**Spectroscopic investigations on flames in relation to ionisation potentials.** M. PIERUCCI and L. B. SILVA (Nuovo Cim., 1935, [ii], 12, 269–272; Chem. Zentr., 1935, ii, 2343).—In a mixture, the spectrum of the element with the lowest ionisation potential *P* is excited preferentially; where the

difference is great, the spectrum of the element of lowest  $P$  appears alone and intensified. J. S. A.

Dark bands in the spectra from acoustic and optical double gratings. P. CERMAK and H. SCHOENECK (Ann. Physik, 1936, [v], 26, 465—473).—The spectrum of light which has passed through two similar gratings shows dark bands of which the separation is  $\propto$  grating const. and inversely  $\propto$  distance apart of the gratings and the order of the spectra. Similar results are obtained with ultrasonic waves acting as gratings. A. J. M.

Method for obtaining soft X-rays in gases and particularly the  $K$  spectrum of neon. J. M. BACKOVSKY (Compt. rend., 1936, 202, 1671—1672).—A method for determining the  $K$  spectrum of Ne, using Al electrodes and a layer of Li borate on the anticathode, is described.  $\lambda$  for the ray  $K\alpha_{1,2}$  is 14.61 Å., in good agreement with the calc. val. M. S. B.

Intensity of  $L$  lines of gold. L. PINCHERLE (Nuovo Cim., 1935, [ii], 12, 162—170; Chem. Zentr., 1935, ii, 1658).—The intensity of a Röntgen line corresponding with a transition  $m \rightarrow n$  depends on (1) the probability of excitation of the state  $n$ , (2) the Auger effect, (3) the probability of the spontaneous transitions. The intensities so calc. for the Au  $L\alpha_1$ ,  $L\alpha_2$ , lines agree with the similar experimental vals. for Pt. J. S. A.

Number of  $L$ -dispersion electrons. H. NITKA (Physikal. Z., 1936, 37, 445—446).—The effective no. of dispersion electrons in the  $L_I$ ,  $L_{II}$ , and  $L_{III}$  shells can be obtained from the  $L$ -partial absorption coeffs. for X-rays determined by Schwarz (this vol., 262). The vals. obtained are in good agreement with those of Hönl (Z. Physik, 1933, 84, 1). A. J. M.

Form of the Compton line. G. BURKHARDT (Ann. Physik, 1936, [v], 26, 567—584).—The form of the Compton line is calc. from the impulse distribution by means of the semi-classical corpuscular process of du Mond. The impulse distribution is calc. according to the at. models of Thomas and Fermi, Schrödinger and Slater, and Hartree, respectively. The effect of the binding of the electrons and of relativity is to cause a slight asymmetry and displacement of the max. of the line. The calculations are compared with Kappeler's experimental values for Ne. Agreement is good except when the calculation is based on the Thomas-Fermi model. A. J. M.

Auger effects. L. PINCHERLE (Nuovo Cim., 1935, [ii], 12, 81—92; Chem. Zentr., 1935, ii, 1658).—Theoretical. The probability of Auger transitions with excited  $K$  and  $L$  levels is calc. as of the same order of magnitude. Calc. vals. for the fluorescence yield agree with experimental vals. J. S. A.

Determination of the Townsend ionisation coefficient  $\alpha$  for pure argon. A. A. KRUTHOF and F. M. PENNING (Physica, 1936, 3, 515—533).—An apparatus which can be evacuated at high temp. is described and has been used for the determination of  $\alpha$  for A between  $E/p_0$  vals. of 5—400 ( $E$ =electric field in volts per cm.;  $p_0$ =mm. gas pressure reduced to 0°). For low  $E/p_0$  vals.  $\alpha$  is  $\ll$  indicated by Avres (A., 1923, ii, 111). J. W. S.

Determination and analysis of the thermionic constants of thoriated tungsten. A. ROSE (Physical Rev., 1936, [ii], 49, 838—847).—The slopes and intercepts of Richardson plots were obtained for states of activation from a flashed to a completely thoriated surface, and for applied fields up to  $3 \times 10^4$  volts per cm. Observations on the work function, effect of positive ion bombardment, ageing, proportionalities, emission lag effects, and temp. dependence of the anomalous Schottky effect are described and analysed in terms of a patch distribution theory of adsorbed atoms. N. M. B.

Photo-electron effect of white-hot metals. C. M. I. VERCELLI (Atti R. Accad. Sci. Torino, 1935, 70, I, 462—471; Chem. Zentr., 1935, ii, 2180).—Theoretical. J. S. A.

Energy transmission by high-energy electrons. W. F. G. SWANN (Physical Rev., 1936, [ii], 49, 829—830).—Mathematical. Oppenheimer's postulate (cf. A., 1935, 278) follows from previous results (cf. A., 1934, 236). N. M. B.

Velocity distribution of electrons in gas-discharges in helium. J. A. SMIT (Physica, 1936, 3, 543—560).—Mathematical. The velocity distribution of electrons in gaseous discharges is derived and the parts played by each factor changing the velocity of an electron in maintaining this distribution are deduced. Numerical data are calc. for discharges in He. J. W. S.

Time coincidence of secondary rays in the Compton effect. A. PICCARD and E. STAHEL (Naturwiss., 1936, 24, 413—414).—An experiment is described which shows that there is no delay in the emission of secondary electrons in the Compton effect (cf. Shankland, this vol., 265). A. J. M.

At. wt. of hydrogen. E. MOLES (Anal. Fis. Quim., 1935, 33, 721—728).—A revision, taking account of the known amounts of D, in the  $H_2$  used for at. wt. determination. The most probable conversion factor between the chemical scale of at. wts. based on  $O_2$  containing the normal mixture of isotopes and the physical scale of nuclear masses based on  $^{16}O$  is considered to be 1.00022. At. wt. determinations (cf. A., 1925, ii, 346) employing electrolytic  $H$ , probably containing 1 part of D, in 30,000 give the accepted average val. of 1.0078, whence the nuclear mass of H is  $1.0080 \pm 0.00005$ , slightly  $<$  the val. from mass spectroscopy data (Aston, A., 1935, 677). The most probable D:H ratio in distilled  $H_2O$  is considered to be 1:5500 so that the "normal" at. wt. of H (i.e., that of the mixture of H and D in  $H_2O$ ) is  $1.0082 - 0.00005$ , in agreement with vals. previously obtained (cf. Thomsen, A., 1896, ii, 244) for H prepared by the action of metals on acid or alkaline solutions. F. R. G.

Element 87. H. HULTBEI (Compt. rend., 1936, 202, 1927—1929).—Lines attributed to 87  $L\alpha_1$  and 87  $L\alpha_2$  were observed in the alkali concentrate from pollucite. H. J. E.

Isotope effect in evaporation of lithium, potassium, and rubidium ions. A. K. BREWER J. Chem. Physics, 1935, 4, 350—353).—A correction for change in abundance ratios during evaporation of the

source is required in computing the at. wt. of Li, but not for K or Rb. The final vals. are: Li 6.939, K 39.094, Rb 85.46 (cf. this vol., 400). F. L. U.

**Existence of  $^{22}\text{Na}$ .** A. K. BREWER (Physical Rev., 1936, [ii], 49, 856).—Mass spectra observations show a small peak at 22, and approx. abundance ratio  $^{23}\text{Na}/^{22}\text{Na}=5000\pm500$ . N. M. B.

**Isotope corrections in molecular spectra.** J. H. VAN VLECK (J. Chem. Physics, 1936, 4, 327—338; cf. A., 1935, 9).—Small corrections due to various causes are calc. F. L. U.

**Radioactivity of glasses.** A. TROST (Z. Physik, 1936, 100, 549—552).—Counters moulded into glasses show the presence of a readily absorbed radioactive radiation. A. B. D. C.

**Measurement of strong polonium preparations by their ionisation in pure nitrogen.** R. GROSSMANN (Sitzungsber. Akad. Wiss. Wien, 1934, IIA, 143, 563—577; Chem. Zentr., 1935, ii, 1918—1919).—In pure  $\text{N}_2$  the negative carriers are free electrons, and all ions are readily collected by moderate fields. H. J. E.

**Supposed radioactivity of lanthanum, yttrium, and antimony.** Z. KLEMENSIEWICZ and Z. BODNAR (Acta. phys. polon., 1934, 3, 187—190; Chem. Zentr., 1935, ii, 2492—2493).—La and Y compounds show some activity, which is traced to admixed Ac and Th materials. Sb compounds are completely inactive. J. S. A.

**Irregular distribution of thorium-C''.** J. ZIRKLER (Z. Physik, 1936, 100, 203—204).—A fractional separation experiment showed linear distribution of Th-C'' according to the  $\text{Th}^{100}$  mass (cf. this vol., 282, 540). A. B. D. C.

**Emission of  $\gamma$ -radiation during the  $\beta$ -decay of nuclei.** J. K. KNIPP and G. E. UHLENBECK (Physica, 1936, 3, 425—439).—Mathematical. It is shown that most, if not all, of the  $\gamma$ -radiation accompanying disintegration of Ra-E arises from the creation of the electron and its loss of energy as it leaves the nucleus. J. W. S.

**Determination of the energy distribution of recoil atoms during  $\beta$  decay and the existence of the neutrino.** A. I. LEPIENSKI (Proc. Camb. Phil. Soc., 1936, 32, 301—303).—The results suggest that neutrinos are probably emitted during  $\beta$  decay. T. G. P.

**Intensity of the  $\gamma$ -rays emitted by the active deposit of thorium.** F. OPPENHEIMER (Proc. Camb. Phil. Soc., 1936, 32, 328—335).—The energies of the  $\gamma$ -rays from Th-C and Th-Pb have been determined. The excitation probabilities of Th-C and its products have been calc., and a level system for Th-Pb is proposed. T. G. P.

**Scattered and secondary radiation of hard  $\gamma$ -rays.** W. GENTNER (Z. Physik, 1936, 100, 445—455).—Scattered and secondary radiation from Th-C'' rays have been determined for Al and Pb. A. B. D. C.

**Efficiency of neutrons for  $\gamma$ -ray excitation.** Appendix: recoil radiation of slow neutrons. R. FLEISCHMANN (Z. Physik, 1936, 100, 307—320).—The intensity of  $\gamma$ -radiation excited in Cd, Cu, Fe, H.,

Pb, and Ag by slow neutrons has been determined (cf. this vol., 131). A. B. D. C.

**Nuclear spectra of some light atoms.** W. BOTHE (Z. Physik, 1936, 100, 273—285).—Energy spectra of electrons released by nuclear  $\gamma$ -radiation were obtained for Li, F, and Be. A. B. D. C.

**Artificial radioactivity giving continuous  $\gamma$ -radiation.** E. C. G. STUECKELBERG (Nature, 1936, 137, 1070—1071).—Every emission of positive electrons should be accompanied by weak  $\gamma$ -radiation, but in only 1 out of 137 cases of decay is  $\gamma$ -radiation emitted. L. S. T.

**Apparently general rule for nuclear transformations.** B. WALTER (Naturwiss., 1936, 24, 429—430).—The rule states that where the new element formed in a nuclear transformation is an isotope of the bombarded one, slow neutrons (e.g., neutrons which have passed through  $\text{H}_2\text{O}$ , paraffin, etc.) possess sufficient energy to bring about the change. When, however, the new element possesses a different at. no. from the bombarded one, rapid neutrons are necessary. A. J. M.

**$\beta$ -Ray spectra of several slow neutron-activated substances.** E. R. GAERTTNER, J. J. TURIN, and H. R. CRANE (Physical Rev., 1936, [ii], 49, 793—797).—In, Ag, Rh, Mn, and Dy have been rendered radioactive by exposure to slow neutrons from a 200 millicurie Rn-Be source surrounded by paraffin, and their  $\beta$ -ray spectra obtained by the cloud-chamber method. The plots of energy distributions were transformed into straight lines on the Konopinski-Uhlenbeck formula and extrapolated to find the upper energy limits, in good agreement with theory; these limits are In (54 min. period) 1.3, In (13 sec. period) 3.2, Ag 2.8, Rh 2.8, Mn 2.8, and Dy 1.4 m.e.v. N. M. B.

**Lightest nuclei.** H. DOLCH (Z. Physik, 1936, 100, 401—439).—Theoretical. Mass defects of nuclei of masses 2, 3, and 4, and the collision cross-section for disintegration of  $\text{D}^+$  by  $\text{D}^1$  and for elastic collision of neutrons on protons are calc. A. B. D. C.

**Disintegration of  $^7\text{Li}$  bombarded by slow protons.** H. D. DOOLITTLE (Physical Rev., 1936, [ii], 49, 779—782).—The no. of  $^7\text{Li}$  atoms disintegrated by protons in the energy range 23.6—72.5 e.k.v. was determined; results agree satisfactorily with those calc. from the probability formula, and are compared with those at higher voltages (cf. Herb, A., 1935, 1186). There are no indications of resonance or of a min. voltage. N. M. B.

**Variation of range with angle of the disintegration  $\alpha$ -particles of  $^7\text{Li}$ .** A. ROBERTS, T. ZANDSTRA, R. CORTELL, and F. E. MYERS (Physical Rev., 1936, [ii], 49, 783—788).—The range of  $\alpha$ -particles from  $^7\text{Li}$  under 200 and 240 kv. proton bombardment was measured and plotted for various angles relative to the incident proton beam. Results agree with the predictions of the principles of conservation of energy and momentum when the straggling due to the penetration of the target by the proton beam is taken into account, and show that if  $^4\text{He}$  is formed and disintegrates into two  $\alpha$ -particles without the emission of a  $\gamma$ -ray its mean life is  $>3\times10^{-14}$  sec. N. M. B.

**Structures of light nuclei and the existence of Be.** W. H. WELLS and E. L. HILL (Physical Rev., 1936, [ii], 49, 858).—Mechanisms for dispensing with  ${}^6\text{Be}$  as a stable nucleus, for the probable structures of  ${}^{10}\text{B}$  and  ${}^{11}\text{B}$ , and for disintegration reactions giving the observed two-homogeneous groups of  $\alpha$ -particles are proposed and discussed. N. M. B.

**Variation of wave-length and the nuclear photo-effect of beryllium.** R. FLEISCHMANN and W. GENTNER (Z. Physik, 1936, 100, 440—444).—The  $\gamma$ -ray efficiency for disintegration of Be decreases with increasing quantum energy. A. B. D. C.

**Excitation of the  ${}^{17}\text{O}$  nucleus.** G. STETTER (Z. Physik, 1936, 100, 652—655).— ${}^{17}\text{O}$  in an unstable level is obtained from disintegration of N by Ra-C'. A. B. D. C.

**New radioelement.** M. DANYSZ and M. ŻYŹ (Acta. phys. polon., 1934, 3, 485—492; Chem. Zentr., 1935, ii, 2019).—By the irradiation of most elements with  $\alpha$ -rays from Po or Rn, an activity of half-life 1 min. is produced, which is traced to the N of the surrounding air. The action is considered to be  ${}^1_0\text{N} + {}^4_2\text{He} = {}^5_0\text{F} + {}^1_0\text{n}$ , followed by  ${}^{17}\text{F} = {}^{17}_8\text{O} + e^+$ . The same activity is produced intensely by bombardment of  $\text{NaN}_3$ . J. S. A.

**Transmutation of platinum by deuterons.** J. M. CORK and E. O. LAWRENCE (Physical Rev., 1936, [ii], 49, 788—792).—Chemical separation of the radioactive substances induced in Pt by 5 mv. deuterons and analysis of the decay curves show that radioactive isotopes, probably  ${}^{193}\text{Pt}$  and  ${}^{197}\text{Pt}$  and  ${}^{194}\text{Ir}$  and  ${}^{196}\text{Ir}$ , are formed with approx. decay periods 28 min., 8.5 hr., 49 min., and 14.5 hr., respectively. The first pair are formed probably by neutron capture and the second pair by reactions involving deuteron capture and  $\alpha$ -particle emission. The transmutation functions for the reactions leading to Ir isotopes show max. indicating resonance penetration of the Pt nucleus by the deuteron. N. M. B.

**Correlation of nuclear disintegration processes.** R. D. EVANS and S. M. LIVINGSTON (Rev. Mod. Phys., 1935, 7, 229—236).—A summary and discussion. CH. ABS. (e)

**Nuclear chemistry, the neutron, and artificial radioactivity.** W. D. HARKINS (Science, 1936, 83, 533—543).—A lecture. L. S. T.

**Exact measurement of cosmic rays by the uranium compensation method.** K. H. STRAUSS (Z. Physik, 1936, 100, 237—249).—This method utilising  $\beta$ -rays of U is well adapted to prolonged measurement of cosmic-ray intensities. A. B. D. C.

**Statistical derivation of barometer effect on cosmic radiation.** J. A. PRIEBSCH (Sitzungsber. Akad. Wiss. Wien, 1935, II, 144, 65—75; Chem. Zentr., 1935, ii, 1829). J. S. A.

**Variation of cosmic ray intensity with height in the atmosphere.** S. ZIEMECKI and K. NARKIEWICZ-JODKO (Nature, 1936, 137, 944). L. S. T.

**Wilson chamber studies of penetrating radiation on the Hafelkar (2300 m.), near Innsbruck.**

F. RIEDER (Sitzungsber. Akad. Wiss. Wien, 1934, 143, 499—502; Chem. Zentr., 1935, ii, 2493—2494). J. S. A.

**Cosmic-ray measurements at great water depths and radioactivity of dry batteries.** E. REGENER (Z. Physik, 1936, 100, 286—292).—Radioactive impurities in the dry batteries used for Lake Constance measurements (A., 1932, 440) gave false residual ionisation. A. B. D. C.

**Cosmic-ray observations on the Atlantic Ocean.** K. NARKIEWICZ-JODKO and S. ZIEMECKI (Acta. phys. polon., 1934, 3, 297—300; Chem. Zentr., 1935, ii, 2021—2022). J. S. A.

**Soft recoil radiation effects of cosmic rays.** R. HOSEMANN (Z. Physik, 1936, 100, 212—220).—Recoil radiation from cosmic-ray bursts is absorbed by a few mm. of Al. A. B. D. C.

**Properties of cosmic corpuscles of the penetrating group.** P. AUGER and A. ROSENBERG (Compt. rend., 1936, 202, 1923—1925).—After traversing 30 m. of  $\text{H}_2\text{O}$  the cosmic radiation is reduced to a group of ultra-penetrating rays, which produce secondary rays of low penetrating power (several mm. of Pb). H. J. E.

**Specific ionisation of cosmic-ray particles as determined by Geiger-Müller counter efficiency.** W. E. DANFORTH and W. E. RAMSEY (Physical Rev., 1936, [ii], 49, 854).—Efficiency measurements may be used for determining primary ionisation along the path of the particles. Results for air-filled and  $\text{H}_2$ -filled counters at different gas pressures are approx. intermediate between available data by other methods. N. M. B.

**Neutrons and other heavy particles in cosmic radiation of the stratosphere.** L. H. RUMBAUGH and G. L. LOCHER (Physical Rev., 1936, [ii], 49, 855).—Examination of free and shielded photographic plates from a stratosphere balloon shows no primary  $\alpha$ -particles, but proton tracks due to recoils from neutron collisions, indicating that neutrons are primary constituents of cosmic radiation. Results are analysed and discussed. N. M. B.

**Critical review of the present theories of the active modification of nitrogen.** M. N. SAHA and L. S. MATHUR (Proc. Nat. Acad. Sci. India, 1936, 6, 120—127).—Existing theories are regarded as inadequate. It is concluded that at. N has nothing to do with the active modification and that the mol. of the latter is raised a state composed of two  ${}^2\text{D}$  atoms probably located at 9.77 volts. N. M. B.

**Reconstruction of the mass-defect curve and the stability of  ${}^9\text{Be}$ .** N. K. SAHA (Proc. Nat. Acad. Sci. India, 1936, 6, 110—119).—The mass-defect curve for the nuclei  ${}^4\text{He}$ ,  ${}^6\text{Be}$ ,  ${}^{12}\text{C}$ ,  ${}^{16}\text{O}$ ,  ${}^{20}\text{Ne}$ ,  ${}^{24}\text{Mg}$ ,  ${}^{28}\text{Si}$ ,  ${}^{32}\text{S}$ ,  ${}^{36}\text{Ar}$ , and  ${}^{40}\text{Ca}$  is constructed on the new corr. mass scale, and shows that the nuclei of light elements are more stable than by Aston's curve, and that the most stable nucleus is  ${}^{20}\text{Ne}$ . The mass defect of  ${}^9\text{Be}$  is almost zero. The stability of this nucleus and its possible connexion with the origin of He deposits in beryl are discussed. N. M. B.

**Transmutation of phosphorus, sulphur, chlorine, and potassium, and the masses of light**

atoms. E. POLLARD and C. J. BRASEFIELD (*Nature*, 1936, 137, 943—944).—Vals. obtained for the nuclear energy change for the transmutation of S, Cl, and K suggest that the energy levels are closer in nuclei of the type  $4n$  than in those which are more complex. Masses are derived for most of the nuclei from Ne to A. When the departure of mass from whole no. is plotted against nuclear mass no., min. indicating extra stability appear at each repetition of 4 units until  $^{40}\text{A}$ , which is exceptional, is reached. This extra stability is ascribed to the existence of  $\alpha$ -particles in the nucleus and not merely to shells of four particles irrespective of charge. L. S. T.

Theory of the Stern-Gerlach effect. (SR) A. S. EDDINGTON (*Nature*, 1936, 137, 1029).

Radioactive  $\beta$ -decay and nuclear exchange force as a consequence of a unitary field theory. E. C. G. STUECKELBERG (*Nature*, 1936, 137, 1032).—The hypothesis that the positive electron, neutrino, positive proton, and neutron are four different quantum states of one elementary particle is advanced. Permitted transitions are positive electron or proton neutrino or neutron. L. S. T.

Consequences of Fermi's theory of  $\beta$ -radioactivity. B. KAHN (*Physica*, 1936, 3, 495—502).—Mathematical. Wick's explanation (*A.*, 1935, 679) of the magnetic moment of the proton and neutron on the basis of Fermi's theory of  $\beta$ -radioactivity is criticised. With the Fermi interaction "Ansatz" the magnetic moment due to the electron-neutrino field is zero. An estimate is made of the neutron-neutron forces relative to the proton-neutron interaction. J. W. S.

Selection rules in nuclear radiation. H. M. TAYLOR (*Proc. Camb. Phil. Soc.*, 1936, 32, 291—300).—Mathematical. T. G. P.

Constancy of nuclear bond energies. W. M. LATIMER (*J. Amer. Chem. Soc.*, 1936, 58, 1061—1062).—Recent data for the masses of the lighter elements are used to check the assumption that the energies of nuclear reactions can be calc. as the sum of changes in the energies of the nuclear linkings and the coulombic fields. E. S. H.

Analytical form of eigen-functions of electrons in light atoms. S. ROZENTAL (*Bull. Acad. Polonaise*, 1935, A, 501—506).—Mathematical. O. D. S.

Light quantum and neutrino. II. Three-dimensional radiation field. P. JORDAN and R. DE L. KRONIG (*Z. Physik*, 1936, 100, 569—583; cf. this vol., 543). A. B. D. C.

Neutrinos and light quanta. N. S. N. NATH (*Proc. Indian Acad. Sci.*, 1936, 3, A, 448—458).—Theoretical. The introduction of neutrino spin in the neutrino theory of light enables the correct Planck formula for energy density to be derived. R. S. B.

Self-consistent field for tungsten. M. F. MAN-NING and J. MILLMAN (*Physical Rev.*, 1936, [ii], 49, 848—853).—Calc. results are tabulated. N. M. B.

Band spectra of boron hydride and deuteride. S. F. THUNBERG (*Z. Physik*, 1936, 100, 471—477). A. B. D. C.

Band spectra of NiH and CoH. A. HEIMER (*Naturwiss.*, 1936, 24, 413).—A new band system  ${}^2\Delta_{21}$ — ${}^2\Delta_{21}$  has been found in the violet of the NiH spectrum. The bands show isotopic components due to  ${}^{58}\text{NiH}$  and  ${}^{60}\text{NiH}$ . A band system in the blue showing R, P, and Q branches is ascribed to CoH. A. J. M.

The C system of barium hydride. G. W. FUNKE and B. GRUNDSTRÖM (*Z. Physik*, 1936, 100, 293—306).—Two new band systems with predissociation are recorded. A. B. D. C.

Band spectra of CaF and CaCl. K. H. HELL-WEGE (*Z. Physik*, 1936, 100, 644—651).

A. B. D. C.

Absorption spectra of complex compounds of tervalent cobalt. J. KRANIG (*Keem. Teated*, 1934, 2, 4—6; *Chem. Zentr.*, 1935, ii, 2335).—In the series  $[\text{Co}(\text{NH}_3)_6]\text{Cl}_3$ ,  $[\text{Co}(\text{NH}_3)_4(\text{C}_2\text{O}_4)]\text{Cl}$ ,  $[\text{Co}(\text{NH}_3)_3(\text{C}_2\text{O}_4)_2]\text{NH}_4$ ,  $[\text{Co}(\text{C}_2\text{O}_4)_3]\text{K}_3$  the two chief absorption bands show a progressive displacement towards longer  $\lambda\lambda$ . J. S. A.

Absorption spectrum and the ground state of the Ce IV ion. S. DATTA and M. M. DEB (*Indian J. Physics*, 1936, 10, 163—170).—Ultra-violet absorption curves are given for different concns. of  $\text{CeCl}_3$  in  $\text{H}_2\text{O}$ ,  $\text{EtOH}$ , and conc.  $\text{HCl}$ , and absorption max., intensities, and transitions giving rise to the bands are considered. A detailed discussion of the probable ground state of Ce IV leads to  $4F$  rather than  ${}^3\text{d}$ , the absorption bands in the ultra-violet arising from  $4^2F$ — $5^2D$  transitions, and the  ${}^2D$  state being further split up by the inhomogeneous cryst. electric field (cf. Freed, *A.*, 1932, 211). N. M. B.

Rotational constants of SnS. E. N. SHAWHAN (*Physical Rev.*, 1936, [ii], 49, 810—812; cf. *A.*, 1935, 1299).—Vals. for the lowest state of the mol. and for the upper state of the visible system were determined from the (0, 0) and (1, 0) bands of the visible system. N. M. B.

Absorption spectra and linking of inorganic nitrates and sulphates in the vapour state. M. I. HAQ and R. SAMUEL (*Proc. Indian Acad. Sci.*, 1936, 3, A, 487—511; cf. this vol., 661, 775).—The absorption spectra of vapours of the nitrates of H, K, Ag, Mg, Cd, Pb,  $\text{NH}_4$ , and Na, and the sulphates of H, K, Ag, Zn, and  $\text{NH}_4$  have been determined. The transition from covalency to electrovalency is discussed with reference to Franck-Condon diagrams. All compounds are covalent as vapours, presumably because of the small electron affinity of  $\text{NO}_3'$  and  $\text{SO}_4''$ ; nitrites are probably covalent as vapours. In  $\text{NH}_4\text{NO}_3$  both N atoms are quinque-covalent in the vapour state, in agreement with the absorption spectra of  $\text{R}_4\text{NI}$  (cf. this vol., 921) and the existence of  $\text{NF}_5$ . Photo-dissociation processes are discussed. R. S. B.

$\text{A}^1\Pi \rightarrow \text{X}^1\Sigma$  (IV pos.) carbon monoxide bands. II. L. GERO (*Z. Physik*, 1936, 100, 374—388; cf. this vol., 661). A. B. D. C.

Group resonators. XXII. General law of frequencies of the fine structure bands. D. RADULESCU (*Bul. Soc. Chim. Romania*, 1935, 17, 193—222; cf. *A.*, 1935, 1302).—The frequencies of

the fine structure bands for absorption, fluorescence, phosphorescence, and Tesla luminescence spectra of vapours and solutions can be represented accurately by  $F_y = F_0 u^y$ , where  $y$  is an integer (+ or -) and  $\mu$  a universal const. = 1.000110998. The formula is applied to the spectra of the vapours of benzoquinone,  $C_{10}H_8$ ,  $C_6H_6$ ,  $C_6H_2$ , glyoxal, and acraldehyde.

R. S. B.

**Light absorption of adsorbed *p*-nitrophenol.** J. F. H. CUSTERS and J. H. DE BOER (*Physica*, 1936, 3, 407—417; cf. *A.*, 1934, 715).—*p*-Nitrophenol mols. adsorbed on a vac.-sublimed  $BaF_2$  surface form two films. The mols. of the first film are adsorbed electrostatically with the -OH dipoles next the  $F'$  ions of the surface, and yield an absorption spectrum shifted further towards the red than in the case of films on  $CaF_2$ . The second film is held to the first by van der Waals forces and its absorption spectrum also shows a shift towards the red which becomes less with increasing density of adsorbed film.

J. W. S.

**Ultra-violet radiation in the Reboul effect.** O. VIKTORIN (*Coll. Czech. Chem. Comm.*, 1936, 8, 207—218; cf. this vol., 664).—Ultra-violet radiation is emitted only from the positive end of the tablet of semi-conductor subjected to an electric current; the intensity is a function of the voltage and varies irregularly with time and with the thickness of the tablet. Results are given for black paper, NaCl, NaF,  $PbI_2$ , and  $KNO_3$ .

N. M. B.

**Spectra of aromatic hydrocarbons in solution.**—See this vol., 834.

**Absorption spectra of tetra-alkylammonium salts. Theory of the co-ordinate linking.** IX. S. N. ALI and R. SAMUEL (*Proc. Indian Acad. Sci.*, 1936, 3, A, 399—419).—The absorption spectra of 0.00001—0.01*M* and 0.1—1*M* aq. solutions of  $NR_4X$  ( $R=Me, Et, Pr^a, Bu^s$ , and *n*- and *iso*- $C_5H_{11}$ ;  $X=Cl, Br$ , and  $I$ ) have been determined, alone and in some cases in presence of other electrolytes. The absorption max. are interpreted by Franck-Condon diagrams. Selective max. are the stronger the heavier is the radical and the lighter the halogen. There is evidence from the more dil. solutions of  $(C_5H_{11})_4NI$  for decreasing  $[I']$  with increasing concn. of salt owing to the formation of a small amount of the undissociated quinqu-covalent N compound. The five covalent linkings, one of which is more readily polarisable than the other four, are formed from the  $2s^22p^3$  outer electrons of N, in contradiction to the octet theory and in harmony with the authors' views (cf. *A.*, 1934, 1058).

R. S. B.

**Absorption and fluorescence spectra of derivatives of pyrene and 1:2-benzpyrene.** C. SANNIE and V. POREMSKI (*Bull. Soc. chim.*, 1936, [v], 3, 1139—1155).—Characteristic regularities in the structure of the spectra have been noted. The ultra-violet absorption and fluorescence spectra are related as mirror images.

E. S. H.

**Normal frequencies of vibration of benzene compounds in ultra-violet absorption.** K. MASAOKI (*Bull. Chem. Soc. Japan*, 1936, 11, 346—348).—Data for PhMe, PhCl, PhBr, PhOH,  $NH_2Ph$ , PhCHO, and PhCN are recorded.

T. G. P.

**Absorption and fluorescent spectra of naphthalene derivatives.** H. BELA (*Acta Phys. Polon.*, 1932, 1, 339—344).—Absorption bands of  $C_{10}H_8$ , acenaphthene, and diacenaphthylidene, and a new fluorescence band of the last-named substance, are described.

CH. ABS. (e)

**Tautomerism of toluene, from its absorption spectra at different temperatures.** J. J. MICHAILENKO and A. P. KRESCHKOV (*J. Gen. Chem. Russ.*, 1936, 6, 102—106).—The absorption spectrum of PhMe in  $n-C_6H_{14}$  ( $\lambda=2200$ —2780 Å.) has been determined at 18°; at 67° the absorption bands become wider, and a new band appears at 2400—2500 Å. The formation of an extra-nuclear double linking is suggested to account for this.

R. T.

**Nuclear vibration bands of solid hydrogen bromide and iodide near their transition points.** J. ZUNINO (*Z. Physik*, 1936, 100, 335—344).—Nuclear vibration bands of solid HBr and HI appear at 4.1 and 4.7  $\mu$ , displaced towards longer  $\lambda\lambda$  compared with gaseous absorption; this displacement decreases with rising temp.

A. B. D. C.

**Infra-red absorption band in fused quartz.** J. W. ELLIS and W. K. LYON (*Nature*, 1936, 137, 1031—1032).—The band at 2.7  $\mu$  attributed to quartz, is absent from certain specimens, and may be due to traces of impurities such as  $H_2O$  vapour or  $CO_2$ .

L. S. T.

**Infra-red absorption of aqueous solution.** A. CARRELLI (*Nuovo Cim.*, 1935, [ii], 12, 65—72; *Chem. Zentr.*, 1935, ii, 1657).—Aq. solutions of  $NaNO_3$  and  $Na_2SiO_3$  show the same alterations of the 3  $\mu$  absorption band of  $H_2O$  as of the Raman band, the absorption band showing a similar complex structure.

J. S. A.

**Photographic infra-red spectrum of some simple carbon compounds in the gaseous state.** G. HERZBERG and H. VERLEGER (*Physikal. Z.*, 1936, 37, 444—445).—The near infra-red absorption spectra of the vapours of HNCN,  $HCO_2H$ , and MeOH have been photographed. HNCN gives a band with very complicated fine structure, showing the mol. to have an asymmetric structure. The  $\cdot NCO$  group is either considerably bent, or has a triangular structure. The fine structure of the  $HCO_2H$  band is much simpler, and the mol. is therefore probably approx. symmetrical. The evidence is, however, not sufficiently conclusive to decide between the structures  $H\cdot C(\cdot O)\cdot O\cdot H$  and  $H\cdot C(\cdot O\cdot)_2H$ . The MeOH band is also simple, and the mol. is approx. symmetrical.

A. J. M.

**Infra-red absorption spectra and modes of vibration of organic compounds.** J. LECOMTE (*Compt. rend.*, 1936, 202, 1918—1920).—Data for the vibrational frequencies of mols. of the type  $Pr^aX$ ,  $CH_2Cl\cdot CH_2X$ ,  $X\cdot [CH_2]_3\cdot Y$ , and  $Bu^aY$  ( $X, Y=OH, CN, Cl, Br, I$ , etc.) are recorded. The no. of frequencies  $<1100\text{ cm.}^{-1}$  suggests the existence of several mol. forms.

J. E.

**Comparison of the infra-red absorption and Raman spectra of some primary aliphatic and aromatic amines.** (MME.) M. FREYMANN (*Compt. rend.*, 1936, 202, 1674—1676).—Absorption bands have been determined between 0.8 and 1.2  $\mu$ . Three

components have been observed in the NH band for primary aliphatic amines, whilst the Raman spectrum and the first infra-red harmonic have only two components. Except for  $\text{NH}_2\text{Me}$  (determined in  $\text{H}_2\text{O}$ ) the intensities of the components of the NH band are const. in the homologous series for both types of spectrum. The displacement of the NH band towards high frequencies is similar to that observed for both spectra in the case of  $\text{NH}_3$  and  $\text{N}_2\text{H}_4$ . The NH band of aromatic amines is displaced towards higher frequencies. The absorption spectrum of  $\text{CH}_3\text{Ph}\cdot\text{NH}_2$  is almost identical with that of aliphatic amines. The mean distance apart of the lower-frequency components is practically const.

M. S. B.

**Infra-red absorption spectra and Raman spectra of amides and anilides and the structure of these compounds.** (MME.) M. FREYMANN and R. FREYMANN (Compt. rend., 1936, 202, 1850—1852).—Amides and primary and sec. amines have strong absorption bands near  $1.04 \mu$  due to the NH, but in monosubstituted amides the NH band is very feeble.  $\text{NHAcBu}$  does not give a Raman frequency at  $3200\text{—}3400 \text{ cm}^{-1}$ . The absence of frequencies anticipated from classical structural formulæ is interpreted in terms of chelation through H (cf. A., 1935, 563).

J. G. A. G.

**Simple relations between vibrational frequencies of isotopic molecules.** H. TOMPA (Nature, 1936, 137, 951).—Two formulæ relating vibrational frequencies that affect Raman spectra to the masses of isotopic mols. are given.

L. S. T.

**Depolarisation factor of Raman lines in nitrogen, oxygen, and carbon dioxide.** J. CABANNES and A. ROUSSET (Compt. rend., 1936, 202, 1825—1828).—The depolarisation factors of the Raman frequencies  $\text{N}_2$ ,  $2331 \text{ cm}^{-1}$ ,  $\text{O}_2$ ,  $1556$ , and  $\text{CO}_2$ ,  $1286\text{—}1389$ , are  $0.16$ ,  $0.26$ , and  $0.20$ , respectively.

J. G. A. G.

**Raman spectrum of solid hydrogen sulphide at low temperature.** S. C. SIKKAR and J. GUPTA (Indian J. Physics, 1936, 10, 227—231).—At liquid air temp., lines at  $2523$ ,  $2547$ , and  $2558 \text{ cm}^{-1}$  and a broad band at  $80 \text{ cm}^{-1}$ , present also on the anti-Stokes side, were observed. The first line is identified with the fundamental vibrational frequency  $\omega_2$ , and the other two with  $\omega_1$ ; the  $80 \text{ cm}^{-1}$  band is assigned to loosely bound mol. complexes in the solid state. The angle between the two HS linkings is about  $108^\circ$ , compared with  $90^\circ$  in the liquid or gaseous states. Provisional arrangement of the mols. in the unit cell is suggested so that the field of the crystal lattice splits up the vibrational level without splitting up  $\omega_3$ .

N. M. B.

**Raman effect of gaseous and liquid sulphur trioxide and of mixtures of the trioxide with the dioxide.** H. GERDING, W. J. NIJVELD, and G. J. MULLER (Nature, 1936, 137, 1033).—On dilution of liquid  $\text{SO}_3$  with liquid  $\text{SO}_2$ , the relative intensity of the Raman lines ascribed to  $(\text{SO}_3)_1$  increases, whilst that of others ascribed to  $(\text{SO}_3)_2$  decreases. This agrees with the conception of an inner equilibrium in liquid  $\text{SO}_3$  between single and polymerised mols., in the sense of Smits' theory.

L. S. T.

**Raman spectrum of the ice-like form of sulphur trioxide.** H. GERDING and N. F. MOERMAN (Nature, 1936, 137, 1033—1034; cf. preceding abstract).—The presence of a large proportion of  $(\text{SO}_3)_2$  mols. with a small no. of  $(\text{SO}_3)_1$  mols. is indicated.

L. S. T.

**Raman spectrum of gaseous and liquid sulphur dioxide and its solutions in water.** H. GERDING and W. J. NIJVELD (Nature, 1936, 137, 1070).—The Raman spectrum of gaseous  $\text{SO}_2$  at 12 atm. shows only one strong frequency  $1150.5 \pm 0.5$  (cf. A., 1931, 145). With the liquid, only a small displacement of the strong, sharp line occurs at  $30^\circ$  and  $80^\circ$ . For  $\text{SO}_2$  in  $\text{H}_2\text{O}$  no lines attributable to  $\text{SO}_3^{''}$  or  $\text{HSO}_3'$  were found; the majority of  $\text{SO}_2$  mols. in the solution are present as such, the frequency of the stronger Raman line agreeing with that of gaseous  $\text{SO}_2$ .

L. S. T.

**Raman spectrum of sulphuric acid.** M. A. CATALAN and L. YZU (Anal. Fis. Quim., 1936, 34, 26—47).—A review of the literature. The results of Woodward *et al.* (A., 1934, 473) are confirmed. The continuous background is considered to arise partly from suspended and fluorescent matter, and partly from the constitution of the acid.

F. R. G.

**Raman effect and structure of glasses. II.** T. G. KUJUMZELIS (Z. Physik, 1936, 100, 221—236; cf. this vol., 137).—Measurements have been extended to  $\text{SiO}_2\text{—PbO}$  glasses. The continua are ascribed to vibrations of a lattice, whilst the discrete lines cannot be exclusively ascribed to the  $\text{SiO}_4$  group, and indicate the presence of complex groups of definite types.

A. B. D. C.

**Raman spectra of oxalates in solution and the structure of the oxalate ion.** J. GUPTA (Indian J. Physics, 1936, 10, 199—204; cf. this vol., 663).—The Raman spectra of aq.  $\text{H}_2\text{C}_2\text{O}_4$  and aq. K and  $\text{NH}_4$  oxalates show differences from those of the pure substances similar to those previously reported for  $\text{HCO}_2\text{H}$  and formates. Results confirm previous conclusions on the behaviour of the  $\text{CO}_2\text{H}$  group before and after ionisation.

N. M. B.

**Raman effect of two complex borotartrates in solution.** (MLLE.) M. THEODORESCO (Compt. rend., 1936, 202, 1676—1678).—Raman spectra have been determined for aq. solutions of the borotartrates KBT, and KBT, tartaric acid (I),  $\text{H}_3\text{BO}_3$ , K borate, and borax. One new line,  $934 \text{ cm}^{-1}$ , was found in both aq. KBT<sub>2</sub> and KBT. Slightly displaced lines of (I) also appeared in both these solutions. The results support the theory, put forward by other investigators, that KBT, does not exist in aq. solution but is split up into KBT and (I).

M. S. B.

**Interpretation of Raman line of benzene at  $984 \text{ cm}^{-1}$ .** O. SPECCHIA and G. SCANDURRA (Nuovo Cim., 1935, [ii], 12, 129—133; Chem. Zentr., 1935, ii, 1859—1860).—Studies of fine structure support the view that the  $984 \text{ cm}^{-1}$  line corresponds to the  $992 \text{ cm}^{-1}$  line, but is due to mols. containing  $^{13}\text{C}$  in place of  $^{12}\text{C}$ .

J. S. A.

**[Raman] spectra of o-dideuterobenzene and N-deuteropyrrole.** O. REDLICH and W. STRICKS (Monatsh., 1936, 68, 47—50).—Frequencies are

recorded for pyrrole, *N*-deuteropyrrole (from K pyrrole and D<sub>2</sub>O), and *o*-C<sub>6</sub>H<sub>4</sub>D<sub>2</sub> [obtained by distillation of *o*-C<sub>6</sub>H<sub>4</sub>(CO<sub>2</sub>)<sub>2</sub>Ca with CaO + Ca(OD)<sub>2</sub>].

H. B.

**Raman effect of organic substances. V. Raman effect of homocyclic compounds.** K. MATSUNO and K. HAN (Bull. Chem. Soc. Japan, 1936, 11, 321—345).—Data for C<sub>6</sub>H<sub>6</sub>, cyclohexane, phenylcyclohexane, indene, C<sub>10</sub>H<sub>8</sub>, tetralin, decalin, tetra- and deca-hydroacenaphthene, deca- and per-hydro-pyrene, and dicyclohexyl are recorded and discussed.

T. G. P.

**Raman effect and organic chemistry. Comparison of Raman spectra of ethylenic alcohols and their *cis* and *trans* derivatives. Classification of radicals R in compounds CHPh·CHR. (MILE.)** B. GREDY (Bull. Soc. chim., 1936, [v], 3, 1101—1107).—Determinations of Raman spectra reveal a close similarity between the spectra of the alcohols and their derivatives.

E. S. H.

**Raman spectra of molten organic acids and their derivatives.** V. N. THATTE and D. Y. ASKHEDKAR (Z. Physik, 1936, 100, 456—462).—Raman displacements are tabulated for molten NaOAc, CH<sub>2</sub>Cl·CO<sub>2</sub>H, CHCl<sub>2</sub>·CO<sub>2</sub>H, CCl<sub>3</sub>·CO<sub>2</sub>H, citric acid, and BzOH.

A. B. D. C.

**Scattered spectrum of CD<sub>2</sub>Br<sub>2</sub>.** B. TRUMPY (Z. Physik, 1936, 100, 250—252).—The Raman spectrum of CD<sub>2</sub>Br<sub>2</sub> is given; the CD<sub>2</sub> frequencies are 1023, 2195, and 2235 cm.<sup>-1</sup> as compared with 1390, 2988, and 3054 for the CH<sub>2</sub> group.

A. B. D. C.

**Raman spectra of carbon disulphide, benzene, chloroform, and carbon tetrachloride in different states and at different temperatures.** S. C. SIRKAR (Indian J. Physics, 1936, 10, 189—198).—Some new lines in the neighbourhood of the Rayleigh line were observed in the Raman spectra of solid CS<sub>2</sub>, C<sub>6</sub>H<sub>6</sub>, CHCl<sub>3</sub>, and CCl<sub>4</sub> at liquid air temp. Changes in the intensities, widths, and frequency shifts of some of the lines of single mols. of these substances with lowering of temp. were observed. The properties of some of the Raman lines of C<sub>6</sub>H<sub>6</sub> liquid and vapour at different temp. were examined. Results are discussed in relation to theory.

N. M. B.

**Raman spectra of isoeugenol and the safrole series.** B. SZUSZ and E. PERROTTET (Arch. Sci. phys. nat., 1936, [v], 18, Suppl., 29—33; cf. A., 1935, 807).—Raman frequencies are recorded for safrole, isosafrole, and heliotropin. Discrepancies with the results of previous investigators are probably due to the presence of a mixture of isomerides. The frequencies due to the ethylenic linking are particularly intense.

J. W. S.

**Glow of the barrier anodes of aluminium.** K. GUMINSKI (Bull. Acad. Polonaise, 1936, A, 145—163).—The glow at an Al anode in aq. solution shows no direct relation to the chemical nature of the electrolyte, but generally solutions which yield a thick oxide layer give the most intense glow. The glow is very intense in 3% H<sub>2</sub>C<sub>2</sub>O<sub>4</sub> and has a continuous spectrum from 5875 to 3705 Å., with a max. at about 4590 Å. At 111 volts the spectrum tends to spread and its

max. to move towards longer λ, especially in presence of impurity (Cu, Mn, Tl, Bi, or Cd) in the Al.

J. W. S.

**Photo-luminescence of felspar.** S. IIMORI (Sci. Papers Inst. Phys. Chem. Res. Tokyo, 1936, 29, 79—110).—Quant. photoluminographic investigations on Naegi felspars, which exhibit photoluminescence when exposed to the light of a quartz Hg lamp, give results concordant with radioluminescence data on fluorites, and strongly support the transformation theory previously proposed (cf. A., 1931, 1111), and the view of the existence of temporary and permanent luminescence centres.

N. M. B.

**Extinction of the luminescence of phosphorescent substances activated by organic activators.** L. VINOKUROV and V. LEVSHIN (Compt. rend. Acad. Sci. U.R.S.S., 1936, 2, 135—138).—The decay of the phosphorescence of H<sub>3</sub>BO<sub>3</sub> and Al<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>·18H<sub>2</sub>O, heated to 170° and 135°, respectively, and activated by uranine, eosin, erythrosin, aesculin, or naphthionic acid, follows the exponential law (for λλ 4600—4950 and for 5500—6200 Å.). With high activator concns. the luminescence becomes feebler and changes to longer λλ. The spectrum of the fluorescence resembles that of the phosphorescence.

H. J. E.

**Direct proof of the bimolecular process in the luminescence of zinc phosphors.** V. ANTONOV-ROMANOVSKI (Compt. rend. Acad. Sci. U.R.S.S., 1936, 2, 97—100).—Measurements on single crystals of ZnS activated with Cu gave results in agreement with the bimol. law.

H. J. E.

**Purification and fluorescence spectrum of chlorophyll-*b*.** C. DHERÉ and O. BIERNACHER (Compt. rend. Soc. Biol., 1936, 122, 591—594).—The band at 6720 Å., attributed by Zscheile (A., 1935, 905) to chlorophyll-*b*, is due to an impurity.

H. G. R.

**Structure of electrolytic oxide layers.** T. RUMMEL (Z. Physik, 1936, 100, 665—666).—Thin valve layers are porous (cf. this vol., 668).

A. B. D. C.

**Elementary theory of the critical field of a dielectric.** F. CERNUSCHI (Proc. Camb. Phil. Soc., 1936, 32, 276—280).—Theoretical.

T. G. P.

**Continuous absorption and photo-electric effect.** H. RAKSHIT (Z. Physik, 1936, 100, 396—400).—Theoretical.

A. B. D. C.

**Quantum yield of formation of colour centres in KBr crystals.** R. HILSCH and R. W. POHL (Nachr. Ges. Wiss. Göttingen, 1935, [ii], 1, 209—214; Chem. Zentr., 1935, ii, 1663—1664).—The quantum yield of the formation of *U* centres rises from a few % at -100° to 100% at 500° according to an exponential law. The transformation of *U* centres into *F* centres involves electron displacements of mol. dimensions, and so gives rise to no measurable transfer of electricity.

J. S. A.

**Thermo-potential of the element, metal-semiconductor-metal. I. Various samples of cuprous oxide.** G. MONCH (Ann. Physik, 1936, [v], 26, 481—494).—The effect of temp. on the thermo-potential and conductivity of the element

Cu-Cu<sub>2</sub>O-Cu was determined for different samples of Cu<sub>2</sub>O. The theory of the phenomenon is summarised.

A. J. M.

**Breakdown potential of electrolytic barrier layers.** A. GUNTHER-SCHULZE and H. BETZ (Z. Physik, 1936, 100, 539—542).—The breakdown potential of an electrolytic barrier layer increases logarithmically with electrolyte dilution.

A. B. D. C.

**Breakdown of compressed nitrogen in a non-uniform electric field. II.** I. GOLDMAN and B. VUL (Tech. Phys. U.S.S.R., 1936, 3, 16—27).—Data are recorded for the breakdown voltage (*V*) at pressures up to 50 kg. per sq. cm., using electrodes of various shapes. Under certain conditions rise in temp. raises *V*, due to an increase in ionic diffusion.

H. J. E.

**Volta effect and Peltier effect.** F. O'DONE (Nuovo Cim., 1935, [ii], 12, 273—284; Chem. Zentr., 1935, ii, 2500).—A theory of the internal and external Volta effect, and of the Peltier effect, is based on Duhem's theory of metallic conduction.

J. S. A.

**Determination of specific electrical resistance of substances in powder form.** Z. SPECHT (Acta phys. polon., 1934, 2, 393—407; Chem. Zentr., 1935, ii, 2153).—Component factors of the resistance of compressed powders are discussed. The formation of layers between which exist high contact resistances does not occur with sufficiently short columns.

J. S. A.

**Influence of conductivity in determination of dipole moments.** A. PARTS (Keem. Teated, 1934, 2, 27—29; Chem. Zentr., 1935, ii, 2337).—Expressions are derived for calculating the error in dipole moment measurements due to neglect of conduction, and for calculating the conductivity of the fluid.

J. S. A.

**Experimental determination of quadrupole moments.** O. FUCHS (Z. ges. Naturwiss. Naturphil. Gesch. Naturwiss. Med., 1935, 1, 69; Chem. Zentr., 1935, ii, 2509).—For a mol. containing quadrupoles  $\epsilon$  in a non-homogeneous field is  $> \epsilon$  in a homogeneous field, owing to orientation. The difference depends, *inter alia*, on the magnitude of the quadrupole moment and it may be possible to determine this in such a manner. Data are given per C<sub>2</sub>Cl<sub>4</sub>.

H. N. R.

**Dielectric constants of gases and vapours. IV.** M. KUBO (Sci. Papers Inst. Phys. Chem. Res. Tokyo, 1936, 29, 122—128; cf. A., 1935, 1304).—The dielectric consts. of the vapours of EtSH, Et<sub>2</sub>S, and thiophen were measured and used to calculate the dipole moments and at. polarisations of the mols. Results are discussed in relation to available data for dil. solutions.

N. B.

**Dielectric constant of helium.** F. J. WIŚNIEWSKI (Acta phys. polon., 1934, 2, 383—391; Chem. Zentr., 1935, ii, 1666).—The val. calc. from the Bohr atom model agrees with the experimental val.

J. S. A.

**Dipole moments of alkali halides.** W. H. RODEBUSH, L. A. MURRAY, jun., and M. E. BIXLER (J. Chem. Physics, 1936, 4, 372—376).—The following dipole moments have been determined by the mol. beam method (A., 1933, 1105): KCl 9.5, KBr 10.9,

KI 11.1, CsI 12.1  $\times 10^{-18}$ . The actual moment of the mols. is uncertain owing to the possibility of association.

F. L. U.

**Dielectric polarisation of alums.** T. PIECH (Bull. Acad. Polonaise, 1936, A, 108—122; cf. A., 1933, 1000).—The dielectric consts. ( $\epsilon$ ) and densities of KAl(SO<sub>4</sub>)<sub>2</sub>·12H<sub>2</sub>O, FeNH<sub>4</sub>(SO<sub>4</sub>)<sub>2</sub>·12H<sub>2</sub>O, and KCr(SO<sub>4</sub>)<sub>2</sub>·12H<sub>2</sub>O (I) have been measured at 10—60° and the polarisability of the mols. calc. They all show dispersion of  $\epsilon$  at room temp., explained by the rotation of these mols., which contain loosely bound H<sub>2</sub>O. For (I) the  $\epsilon$ -*T* curve shows a max. at about 45°.

J. W. S.

**Influence of magnetic fields on the dielectric constant of liquids.** S. D. CHATTERJEE (Indian J. Physics, 1936, 10, 233—236).—In a field of the order 26 k.-gauss PhNO<sub>2</sub> showed an increase in dielectric const. for both parallel and perpendicular fields. No change was observed with C<sub>6</sub>H<sub>6</sub>, CCl<sub>4</sub>, and Pr<sup>n</sup>OH at 2 k.-gauss.

N. M. B.

**Dipole moments of certain polynitro-compounds.** H. O. JENKINS (J.C.S., 1936, 862—867).—Dielectric consts. and densities have been found for dil. solutions of C<sub>6</sub>H<sub>5</sub> in CHCl<sub>3</sub>, 1 : 3 : 5-C<sub>6</sub>H<sub>3</sub>(NO<sub>2</sub>)<sub>3</sub> (I) in CHCl<sub>3</sub>, trinitromesitylene in C<sub>6</sub>H<sub>6</sub>, and 2 : 4 : 6 : 1 : 3 : 5-C<sub>6</sub>Et<sub>3</sub>(NO<sub>2</sub>)<sub>3</sub> in C<sub>6</sub>H<sub>6</sub> and CCl<sub>4</sub>. C<sub>6</sub>H<sub>5</sub> in CHCl<sub>3</sub> gives a total polarisation of 27.5  $\pm$  0.5, in agreement with Smyth *et al.* (A., 1933, 339). (I) has no moment in CHCl<sub>3</sub>. The pyramidal structure for the :C:NO<sub>2</sub> group suggested by Le Fevre *et al.* (A., 1935, 1056) is untenable, since it involves single linkings between N and O, whereas the N—O distance in the above group is 1.22 Å., which is essentially a double linking distance. The structure is a resonating one, requiring a coplanar arrangement. The moment shown by some symmetrical, and therefore “non-polar,” substances in solution, and the invariance of the polarisation of such mols. with temp., are explained by assuming a fluctuation of link moments about a most probable val., that changes in the moment of any one mol. are slow relative to its time of relaxation in the medium, and that each group moment is independent. The moment of *p*-C<sub>6</sub>H<sub>4</sub>(NO<sub>2</sub>)<sub>2</sub> in solution can be related to the most probable val. for that of PhNO<sub>2</sub> in the same solvent. It is suggested that at. polarisations determined by the dil. solution method are too high.

A. J. M.

**Raman effect and dipole moment in relation to free rotation. IV. Molecular structure of acetylene tetrachloride.** S. MIZUSHIMA, Y. MORINO, and K. KOZIMA (Sci. Papers Inst. Phys. Chem. Res. Tokyo, 1936, 29, 111—121; cf. this vol., 776).—Measurements of the dipole moment of C<sub>2</sub>H<sub>2</sub>Cl<sub>4</sub> in hexane, C<sub>6</sub>H<sub>6</sub>, and Et<sub>2</sub>O in the temp. range 50° to —25° show that the moment changes considerably with the solvent, but, contrary to the case of C<sub>2</sub>H<sub>4</sub>Cl<sub>2</sub>, is almost const. over the temp. range. The Raman spectra of C<sub>2</sub>H<sub>2</sub>Cl<sub>4</sub> were investigated in the solid and liquid state and in dil. hexane and Et<sub>2</sub>O solutions. Results are discussed in relation to mol. structure.

N. M. B.

**Refraction and dispersion of deuterium. T.** LARSEN (Z. Physik, 1936, 100, 543—546).—Refraction and dispersion data are given between 2300 and

5790 Å.; refraction values are  $<$  for  $H_2$ , and the dispersion curve is flatter. Inequality of zero point energies accounts for these differences. A. B. D. C.

**Rotatory dispersion and circular dichroism of 2:2-dinitrocamphane in the ultra-violet.** S. MITCHELL and R. R. GORDON (J.C.S., 1936, 853—856).—The rotation of 2:2-dinitrocamphane in EtOH falls to a negative max. at approx. 3020 Å., and passes through zero at 2762 Å. The solution absorbs strongly beyond 2666 Å., thus preventing the determination of the rotation at lower  $\lambda$ . The graph of mol. ellipticity against  $\lambda$  is symmetrical, with a negative max. at 2770 Å. The dissymmetry factor is approx. const. down to 2778 Å., after which it decreases. The contribution of the  $NO_2$  groups accounts for essentially the whole of the observed rotation. A. J. M.

**Magneto-optical rotation and natural dispersion in gases.** R. T. LAGEMAN and F. G. SLACK (Physical Rev., 1936, [ii], 49, 807—809).—Formulae are tested by the use of experimental data for  $C_2H_2$ ,  $C_2H_4$ , and  $CO_2$ . Agreement is found for dispersion and Verdet const. formulae. N. M. B.

**Debye effect and lag of the Kerr effect in pure nitrobenzene.** I. RANZI (Nuovo Cim., 1935, [ii], 12, 285—289; Chem. Zentr., 1935, ii, 2337).— $PhNO_2$  shows a high dispersion at long  $\lambda$ ,  $n$  being 3.6 and 2.7, respectively, for 7.2- and 3.8-cm. waves. The time of relaxation of the mol. is calc. as  $2 \times 10^{-10}$  sec. J. S. A.

**Electronic configuration and bond energy.** R. K. ASUNDI and R. SAMUEL (Proc. Indian Acad. Sci., 1936, 3, A, 466—481).—Theoretical. A survey has been made of the spectroscopic data for diat. mols. Results are stated to support the electronic pair-linking theory of valency and to contradict the identification of promoted and non-promoted with non- or anti-linking and linking electrons, respectively. R. S. B.

**Intensity of valency and the structure of molecules.** V. RASUMOVSKI (Compt. rend. Acad. Sci. U.R.S.S., 1936, 2, 101—105).—A discussion. H. J. E.

**Latent and active polarity of molecules.** V. RASUMOVSKI (Compt. rend. Acad. Sci. U.R.S.S., 1936, 2, 63—66).—A discussion of the relation between electronic mobility, polarity, and valency electrons. H. J. E.

**Stereochemistry of quadricovalent atoms: copper and silver.** E. G. COX, W. WARDLAW, and K. C. WEBSTER (J.C.S., 1936, 775—781).—The high birefringence of Ag picolinate shows that it has a planar configuration, confirmed by its isomorphism with the corresponding Cu compound, demonstrated by X-ray powder photographs. X-Ray analysis of Cu picolinate dihydrate gives a planar configuration. The complex in the anhyd. salt has the same structure as in the hydrate. Quadricovalent  $Ag^I$  and  $Cu^I$  derivatives have a tetrahedral structure, revealed by X-ray examination of  $K_3[Cu(CN)_4]$ , tetrakis-thioacetamide-cuprous chloride, and tetrakis-thioacetamide-argentous chloride. The structure of the thioacetamide derivatives is given in detail. The prep. of all

the above compounds, and the picolates of Ni, Pt, and Pd are described. The effect of the principal valency of a metal atom in determining the configuration of its quadricovalent derivatives is emphasised. A. J. M.

**Potential curves of the hydrogen molecule ion.** G. STEENSHOLT (Z. Physik, 1936, 100, 547—548).—Curves for various levels are obtained by calculation. A. B. D. C.

**Polarisability of molecular hydrogen  $H_2$ .** C. E. EASTHOPE (Proc. Camb. Phil. Soc., 1936, 32, 260—264).—Theoretical. T. G. P.

**Quantum-mechanical treatment of helium hydride molecule-ion  $HeH$ .** J. Y. BEACH (J. Chem. Physics, 1936, 4, 353—357).—The equilibrium nuclear distance, force const., and fundamental vibration frequency are calc. The doubly charged mol.-ion is unstable. F. L. U.

**Metallic binding. II.** P. GOMBAS (Z. Physik, 1936, 100, 599—614; cf. this vol., 781).—Previous calculations are extended to include heat of sublimation, and the crystal consts. are given for K, Rb, and Co. A. B. D. C.

**General theory of molecular co-ordination.** G. URBAIN (Rev. univ. Mines, 1935, [viii], 11, 124—133; Chem. Zentr., 1935, ii, 2486).—The constitution of compounds of  $CH(NO_2)_3$  and  $CHCl_3$  involving  $C^{III}$  is discussed. J. S. A.

**Diffraction and selective adsorption of atoms at crystal surfaces.** J. E. LENNARD-JONES and A. F. DEVONSHIRE (Nature, 1936, 137, 1069—1070).—An explanation of the observed (A. 1933, 994) anomalous reflexion and diffraction of He atoms by LiF is suggested. Under certain conditions, atoms incident on a solid surface may be diffracted along and not away from it. The atom is captured by the surface field of the solid, by "selective adsorption." Energy levels for an adsorbed He atom on LiF are deduced. L. S. T.

**Quantum theory of temperature variation of the magnetisation curve.** N. AKULOV (Z. Physik, 1936, 100, 197—202). A. B. D. C.

**Application of "eks" to determining crystal lattice energy.** A. E. FERSMAN (Bull. Acad. Sci. U.R.S.S., 1935, 1425—1430).—Application of the conception of eks (energy coeffs. of ions in a lattice) permits the approx. evaluation of the energy of crystal lattices of complex compounds. R. T.

**Determination of the efficiency of X-ray fluorescence by means of the counter tube.** W. NIENS (Ann. Physik, 1936, [v], 26, 513—532).—The counter-tube provides a sensitive method of determining the efficiency ( $u$ ) of X-ray fluorescence (ratio of no. of emitting atoms to the no. of excited atoms). The vals. for K-fluorescence,  $u_K$ , are V 0.21, Cr 0.25, Fe 0.30, in satisfactory agreement with results of other methods.

**Determinations with the complete reflexion system of a crystal lattice.** W. KOSSEL (Ann. Physik, 1936, [v], 26, 533—553).—The multi-periodic structure of a crystal lattice, providing, as it does, a series of diffracting systems in mutually opposite

positions, may be employed in the precision determination of crystal structure, or  $\lambda$  of X-rays, by a compensation process. The method involves the determination of a small angle, and  $\lambda\lambda$  can be determined by observations made directly on the plate, and not involving the distance from the plate to the lattice. The lattice const. of Cu is found to be  $a=3.6075\pm0.0005$  A. A. J. M.

Graphical method of studying crystal structure by means of the Weissenberg X-ray goniometer. Application to specimens of aluminium foil. J. GARCIA DE LA CUEVA and J. PALACIOS (Anal. Fis. Quím., 1936, 34, 165—172).—The method previously described (A., 1935, 433) is amplified.

F. R. G.

Interpretation of Weissenberg diagrams. J. GARRIDO (Anal. Fis. Quím., 1936, 34, 399—401).—A graphical method for the interpretation of the diagrams is described (cf. preceding abstract).

F. R. G.

New spectrographic measurements for the quality and homogeneity of X-rays. I. Technique. H. TELLEZ PLASENCIA (Anal. Fis. Quím., 1936, 34, 402—413).—Employing the data of Glocker (A., 1927, 999) the photographic blackening obtained in a Cu X-ray diagram is translated into terms of ionisation and energy, which are plotted against  $\lambda$ .

F. R. G.

Principles of crystal chemistry, and physico-chemical analysis. A. F. KAPUSTINSKI (Ann. Sect. Anal. Phys.-Chim., 1936, 8, 103—114).—Theoretical.

R. T.

Non-ambiguous system of crystallography. B. N. DELONE (Ann. Sect. Anal. Phys.-Chim., 1936, 8, 91—101).—Mathematical.

R. T.

Crystal structure of Spanish graphite. A. LASTOWIECKI (Acta. phys. polon., 1934, 3, 33—38; Chem. Zentr., 1935, ii, 1858).—Lattice dimensions and intensities of reflexion agree with those of graphite from other sources.

J. S. A.

Crystal structure and composition of intermediary phases in non-tungsten and non-molybdenum alloys. H. ARNFELT and A. WESTGREN (Jernkont. Ann., 1935, 119, 185—196; Chem. Zentr., 1935, ii, 1944).—The hexagonal phase in  $\text{Fe}_2\text{W}$  has  $a$  4.727,  $c$  7.704 A., with 8 Fe and 4 W per unit cell; space-group  $D_{6h}$ . The phases saturated with Fe, usually designated  $\text{Fe}_3\text{W}_2$  and  $\text{Fe}_3\text{Mo}_2$ , are rhombohedral, the elementary rhombohedra having the edge 9.02 A., angle  $30^\circ 30' 5''$  and edge 8.97 A. angle  $30^\circ 38' 6''$ , respectively. Both have 13 atoms per unit cell and must be actually  $\text{Fe}_7\text{W}_6$  and  $\text{Fe}_7\text{Mo}_6$ , belonging to space-group  $D_{3d}^5$ . Technical Fe-W with 85% W consists only of Fe<sub>7</sub>W and W, indicating that  $\text{Fe}_7\text{W}_6$  is unstable at low temp. No intermediary phases other than  $\text{Fe}_7\text{Mo}_6$  could be detected in Fe-Mo after prolonged heating at 500—700°. J. S. A.

Crystal structure of  $\text{MgNi}$ , and its relations to the types of  $\text{MgCu}$ , and  $\text{MgZn}_2$ . F. LAVES and H. WITTE (Metallwirts., 1935, 14, 645—649; Chem. Zentr., 1935, ii, 2023).— $\text{MgNi}_2$  is hexagonal,  $a$  4.805,  $c$  15.77 A., with 8 mols. per unit cell; space-group  $D_{6h}$ . Compared with  $\text{MgZn}_2$  the  $c$  axis is

doubled in length: the structure is similar in type to, and intermediate in the disposition of the atoms between, those of  $\text{MgCu}$ , and  $\text{MgZn}_2$ . J. S. A.

Model of polymerised molecule of silicic acid in a melt. G. G. LAEMMLEIN (Compt. rend. Acad. Sci. U.R.S.S., 1936, 2, 139—142).—A discussion. The tetrahedral configuration of  $\text{SiO}_2$  breaks down on melting, chain-like  $\text{SiO}_2$  mols. being formed.

H. J. E.

Transitions of solid hydrogen sulphide. E. JUSTI and H. NITKA (Physikal. Z., 1936, 37, 435—438).—The cryst. structure of solid  $\text{H}_2\text{S}$  has been investigated by the Debye-Scherrer method. All its three phases have a face-centred cubic lattice, the lattice const. ( $5.77\pm0.03$  A.) being almost unaltered by change of temp. between  $20^\circ$  and  $150^\circ$  abs. For 4 mols. in the unit cell,  $d=1.17$  g. per c.c. The  $\alpha$ - $\beta$  and  $\beta$ - $\gamma$  transitions are transitions of the third order (rotational transitions). It is shown that such transitions can occur with integral energies  $> RT$  g.-cal. per g.-mol.

A. J. M.

Orientation of crystals of potassium borofluoride by mica and barytes, and of sodium sulphite crystals by mica. L. ROYER (Compt. rend., 1936, 202, 1687—1689).—If conc. aq.  $\text{KBF}_4$  is allowed to crystallise on a fresh mica cleavage face most of the crystals are oriented by the mica so that planes become coincident. A similar phenomenon may be observed with aq.  $\text{KBF}_4$  on barytes or aq.  $\text{Na}_2\text{SO}_3$  on mica.

M. S. B.

Application of the three-dimensional Patterson method and crystal structures of proustite,  $\text{Ag}_3\text{AsS}_3$ , and pyrrargyrite,  $\text{Ag}_3\text{SbS}_3$ . D. HARKER (J. Chem. Physics, 1936, 4, 381—390).—Patterson's method (A., 1935, 1193) is simplified and applied to determine the positions of the atoms in proustite and pyrrargyrite, the structures of which are described.

F. L. U.

Interstitial chemical compounds. Structure of antimony pentoxide hydrate and of some antimonates. G. NATTA and M. BACCAREDDA (Gazzetta, 1936, 66, 308—316; cf. A., 1933, 692).— $\text{Sb}_2\text{O}_5\cdot\text{H}_2\text{O}$  has a cubic structure, with unit cell containing 8 mols.,  $a$  10.21—10.25 A., space-group  $O_h^1$ ,  $d_{\text{calc}}$  4.15,  $d_{\text{obs}}$  3.5—4. The structure belongs to the same space-group as those of the antimonates of Ca, Pb, and  $\text{Sb}_2\text{O}_4$ . The ageing of  $\text{Sb}_2\text{O}_5\cdot\text{H}_2\text{O}$  is described.

O. J. W.

Crystals of lead chromate produced in various inorganic and organic substances. N. MATSUMOTO (J. Soc. Chem. Ind. Japan, 1936, 39, 180B).— $\text{PbCrO}_4$ , pptd. in the presence of proteins and starches, is tetragonal, having axes  $a=b=6.74$ ,  $c=13.97$  A. The unit cell contains 8 mols.

C. R. H.

Isomorphism and its dependence on the spatial structure of organic compounds. J. FIRSCH (Ber., 1936, 69, [B], 1323—1330).—Examination of many org. compounds shows that the similar mode of space fulfilment of the mol. and not structural similarity is the decisive factor for the occurrence of isomorphism. With mols. of approx. spherical space utilisation, in contrast with other spatial types, this factor is so important that addition of Me groups or

rings does not inhibit isomorphism if the mol. form remains almost unchanged. Therefore, at least for mols. with equally pronounced space extension, the form rather than the magnitude of the space demand is decisive for the formation of solid solutions.

H. W.

**Crystallography and structure of hexamethylenetetramine salicylate.** A. LASZKIEWICZ (Arch. Chem. Farm., 1935, 2, 219—233; Chem. Zentr., 1935, ii, 2353—2354).—Full crystallographic data are given.

H. N. R.

**Crystal structure of acetylnaphthazarin.** L. RIVOIR and R. SALVIA (Anal. Fís. Quím., 1935, 33, 314—318).—The triclinic crystals of 1:4-diacetoxynaphthoquinone have  $a_0=b_0=8.02$ ,  $c_0=10.94$  Å.;  $\alpha=\beta=112^\circ 2'$ ,  $\gamma=86^\circ 13'$ ; 2 mols. in unit cell; space-group  $C_i^1$  or  $C_i^2$ .

F. R. G.

**X-Ray study of the structure of some dibenzyl derivatives.** M. MILONE (Z. Krist., 1936, 93, 113—115).—Space-groups and cell data are given for  $\alpha$ -diphenylglyoxime, diphenylfurazan, and diphenylglyoxime peroxide.

B. W. R.

**Stereochemistry of fluorene.** J. W. COOK and J. IBALL (Chem. and Ind., 1936, 467—468).—X-Ray crystallographic examination of pure fluorene shows that the crystals are orthorhombic (unit cell  $a$  8.47,  $b$  5.70,  $c$  18.87 Å.). It is concluded that the mol. is not planar, the planes of the six-membered rings being inclined at an angle of  $20^\circ$  to the plane of the five-membered ring and at about  $40^\circ$  to each other.

S. C.

**Spatial configuration of fluorene and its derivatives.** E. D. HUGHES, C. G. LE FEVRE, and R. J. W. LE FEVRE (Chem. and Ind., 1936, 545—546, 581; cf. preceding abstract).—Dipole moments of fluorenone, 2-nitro- and 2:7-dinitro-fluorenones (3.35, 6.04, and 4.80, respectively) suggest that fluorene and fluorenone derivatives exist in solution as flat mols. mesomeric between the unreal structures (I) and (II).

(I.)

F. N. W.

**Crystallographic study of  $\gamma$ -oximino- $\beta$ -keto- $\alpha$ -phenylbutane.** E. SANERO (Period. Min., 1935, 6, 31—41; Chem. Zentr., 1935, ii, 2353).—The crystals are monoclinic-prismatic ( $a$  10.95,  $b$  15.83,  $c$  5.67 Å.; 4 mols. in unit cell). Goniometric measurements are given.

H. J. E.

**X-Ray crystallographic measurements on phrenosinic (cerebronic) acid and its oxidation product.** (Miss) D. M. CROWFOOT (J.C.S., 1936, 716—718).—Phrenosinic acid (I), its oxidation product (II), the synthetic acids  $C_{21}H_{48}O_2$  (III) and  $C_{23}H_{46}O_2$  (IV), and the K salts of (II), (III), and (IV) were examined. The  $d_{001}$  vals. for (II) are near those of pure tricosanoic acid (V); (II) is probably (V) contaminated with acids of longer chain length. The  $c$  spacing of (I) suggested that it is more nearly  $C_{24}H_{48}O_3$ .

W. R. A.

**Crystalline structure of the sugars. III. Ascorbic acid and related compounds.** E. G.

COX and T. H. GOODWIN (J.C.S., 1936, 769—775; cf. A., 1935, 1484).—A crystallographic examination of ascorbic acid (I) and several related compounds has been made. (I) crystallises in the monoclinic system, the elementary cell consisting of two asymmetric units each of two mols., which are probably connected by a pseudo-glide plane of symmetry. The mol. possesses a plane of symmetry perpendicular to the ring. X-Ray evidence suggests a mol. in which most of the atoms lie in one plane. The positions of the four mols. in the unit cell and of the 12 atoms in each mol. have been ascertained by comparison of the vals. of the structure factors obtained from X-ray reflexion intensity results and those calc. by assuming all the possible vals. for the parameters, which were reduced to three by the assumption of various interat. distances etc. Both  $d$ - and  $l$ -synthetic (I) have been examined and are identical in cryst. structure with the natural  $l$ -compound. X-Ray data are also recorded for  $d$ -galactoscorbic acid monohydrate,  $d$ -imino-galactoscorbic acid, and dimethyl- $d$ -glucoscorbic acid.

F. R.

**Long spacings in macromolecular solids.** R. B. COREY and R. W. G. WYCKOFF (J. Biol. Chem., 1936, 114, 407—414).—Using a set-up capable of showing mol. spacings as long as 150 Å. in the X-ray diffraction spectrum it is shown that all the well-cryst. proteins examined, except silk fibroin (I), have numerous sharply-defined large spacings with large mol. units. (I) gave a typical polysaccharide pattern with a continuous band of scattering reaching to the shortest measurable angles.

H. D.

**Fibrous structure of native cellulose in Japanese Kozo and Ganpi (*Broussonetia* sp. and *Wikstroemia* sp.).** T. FUJIWARA and Y. IMAKAWA (J. Sci. Hiroshima Univ., 1936, A, 6, 237—238).—X-Ray patterns are reproduced and discussed.

W. R. A.

**Images of foils with the immersion objective.** R. BEHNE (Ann. Physik, 1936, [v], 26, 385—397).—The examination of foils by the electron microscope using the immersion objective (cf. this vol., 814) is described.

A. J. M.

**Determination of molecular structure by electron diffraction.** P. G. AOKERMANN and J. E. MAYER (J. Chem. Physics, 1936, 4, 377—381).—Apparatus using 6.4-kv. electrons for studying mol. structure is described. Interat. distances and configurations of  $(CH_2)_2O$ ,  $S_2Cl_2$ ,  $MeCHO$ , and paraldehyde have been determined.

F. L. U.

**Electron interference of aluminium oxide.** E. BELWE (Z. Physik, 1936, 100, 192—196).—Electrolytic oxide layers are fine cryst.  $\gamma$ - $Al_2O_3$ , whilst those obtained in a flame are coarse crystals of the same  $\gamma$ -oxide containing small Al single crystals.

A. B. D. C.

**Inverse piezo-electric properties of Rochelle salt at audio frequencies.** O. NORGORDEN (Phys. Rev., 1936, [ii], 49, 820—828).—Results of measurements of the variation of the inverse piezo-electric dilation with the temp. and with the frequency and intensity of the applied field, for temp. above and below the Curie point, are given and discussed.

N. M. B.

**Piezo-electricity of quartz in liquid air.** H. DOBBERSTEIN (Naturwiss., 1936, 24, 414).—Experiments are described which show, contrary to Osterberg (this vol., 672), that quartz will oscillate piezo-electrically at temp.  $< -190.5^\circ$ . A. J. M.

**Temperature variation of crystal plasticity.** W. BOAS and E. SCHMID (Z. Physik, 1936, 100, 463—470).—Flow experiments recorded for Zn, Cd, Bi, and Sn at temp. down to  $90^\circ$  abs. do not agree with the Becker-Orowan theory (cf. this vol., 145).

A. B. D. C.

**Effect of titanium on polymorphic transformations in iron.** V. N. ŠVERŠCHNIKOV and V. N. GRIDNEV (Domez, 1935, No. 2, 41—43).—Pure Fe containing 0.17, 0.36, and 0.59% Ti was heated at the rate of  $6-7^\circ$  per min. and studied dilatometrically and micrographically. The  $\gamma$ -field is closed at approx. 0.6% Ti.

CH. ABS. (e)

**Polymorphism of potassium pentaborate,  $K_2O_5B_2O_3$ .** A. P. ROLLET (Compt. rend., 1936, 202, 1863—1865; cf. A., 1935, 824).— $K_2O_5B_2O_3$  exists in three forms. The transition points are  $\alpha \rightarrow \beta$   $720^\circ$  and  $\alpha \rightarrow \gamma$  (metastable)  $690^\circ$ .  $\alpha$ , at the m.p. ( $780^\circ$ ), decomposes  $\alpha \rightarrow \text{liq.} + K_2O_4B_2O_3$  and  $\beta$ , m.p.  $760^\circ$  (metastable), behaves similarly.

J. G. A. G.

**Lattice constitution and growth of polymorphic substances, especially potassium nitrate, in the transition range.** J. LEONHARDT and W. BORCHERT (Naturwiss., 1936, 24, 412—413).—A single crystal of the rhombic ( $\beta$ )  $KNO_3$  heated above  $128^\circ$  becomes a mass of small crystals of the high-temp. trigonal form ( $\alpha$ ). At  $< 195^\circ$  there is the possibility of re-forming a distorted single crystal of the  $\beta$ -form on cooling. At  $> 195^\circ$  there is recrystallisation on cooling. If a single crystal of the  $\alpha$ -form is cooled to  $123-113^\circ$  the distorted trigonal form is retained. Cooling below  $113^\circ$  gives the  $\beta$ -form. The existence of a third (monotropic) modification (cf. Cohen *et al.*, A., 1929, 498) could not be demonstrated. A. J. M.

**Two coexistent electronic lattices in iron and alloys of the  $\beta$ -brass type.** M.-p. law. R. FORRER (Ann. Physique, 1936, [xi], 5, 719—756; cf. A., 1935, 1305).—An investigation of the m.-p. law and electronic lattice theory as applied to  $\alpha$ -Fe,  $\beta$ -brass, alloys of analogous constitution, and to Heusler's alloy shows that these substances possess two independent electronic lattices, the supplementary lattice, stable up to the anomalous ferromagnetic point ( $465^\circ$ ) in  $\beta$ -brass, and to the Curie point in Fe, and the principal lattice, stable up to the  $\beta$ - $\gamma$  transition point in Fe, and to the m.p. in alloys. The above points correspond with the rupture of the respective lattices. The principal electron valency of  $\alpha$ -Fe and  $\beta$ -brass is 4; the supplementary vals. are 3 and  $3/2$ , respectively. The latter vals. agree with the Hume-Rothery law in the case of the cubic-centred lattice.

N. M. B.

**Inversion of polymorphism in the series of normal saturated diacids.** F. D. LA TOUR (Compt. rend., 1936, 202, 1935—1937; cf. A., 1935, 1351).—For the acids with 7 and 9 C rise of temp. tends to convert the  $\alpha$ - into the  $\beta$ -form. For higher acids the

reverse is true. The transition temp. is nearer to the m.p. for higher members of the series. H. J. E.

**Determination of thermo-electrical force of metals in a vacuum by a photographically recording double galvanometer.** E. ROSENBOHM and F. M. JAEGER (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 469—477; cf. this vol., 672).—The apparatus and method are described. Measurements for Fe-Cu ( $200-950^\circ$ ) and for Ni-Cu ( $300-400^\circ$ ) are recorded.

H. J. E.

**Hypothesis of spontaneous magneto-galvanic and thermo-electric forces.** A. PERRIER and L. MEYLAN (Helv. phys. Acta, 1935, 8, 320—322; Chem. Zentr., 1935, ii, 2500).—Former results are confirmed.

J. S. A.

**Peltier heat for the element copper-cuprous oxide-copper.** G. MÖNCH (Z. Physik, 1936, 100, 321—325).—The thermo-electric potential due to the Peltier effect  $\propto$  abs. temp. (cf. this vol., 148).

A. B. D. C.

**Crystal structure and diamagnetic susceptibility.** R. N. MATHUR and M. B. NEVGI (Z. Physik, 1936, 100, 615—620).—Diamagnetic susceptibility has been measured for allotropic forms of S, Hg oxides, Pb, Sb, and As; it varies with crystal structure.

A. B. D. C.

**Diamagnetic susceptibility of heavy water.** V. C. G. TREW and J. F. SPENCER (Nature, 1936, 137, 998).—The mean val. for two samples of 99.95%  $D_2O$  is  $0.638 \times 10^{-6}$  in agreement with the previous val. (this vol., 786).

L. S. T.

**Diamagnetic susceptibilities of tin in the bi- and quadri-valent states.** S. S. BHATNAGAR, M. B. NEVGI, and R. L. SHARMA (J. Indian Chem. Soc., 1936, 13, 273—280).—The  $\chi$  of Sn salts in solution and in the solid state have been measured and the vals. of  $\chi$  for Sn<sup>++</sup> and Sn<sup>++++</sup> calc. Whilst for the solid state  $\chi$  increases with rise of temp., for solutions the reverse is the case, and is attributed to the breakdown of complexes at high temp.

C. R. H.

**Diamagnetism of thiocyanates and of the cuprous ion.** C. COURTNY (Compt. rend., 1936, 202, 1929—1931).—Vals. for the susceptibility agree with those calc. for the formulæ  $S:C:N \cdot Ag$  and  $S:C:N \cdot Cu$ .

H. J. E.

**Magnetic susceptibilities of some organic compounds in different physical states.** K. C. SUBRAMANIAM (Proc. Indian Acad. Sci., 1936, 3, A, 420—427).—The following diamagnetic susceptibilities have been observed in the solid, dissolved (MeOH), and liquid states, respectively;  $COPh_2$ , 0.600, 0.616, 0.629;  $p\text{-C}_6\text{H}_4\text{Me} \cdot NO_2$ , 0.518, 0.483, 0.492. Supercooling was observed with  $COPh_2$ . The changes on melting and dissolution are attributed to the breakdown of polymerides.

R. S. C.

**Magnetic studies of sulphur and some sulphur compounds.** P. S. VARADACHARI and K. C. SUBRAMANIAM (Proc. Indian Acad. Sci., 1936, 3, A, 428—434).—The magnetic susceptibility ( $\chi$ ) of solutions of S in  $CS_2$  shows small departures from additivity owing to the breakdown of  $S_{16}$  mols. In  $S_2Cl_2$  solutions of S vals. of  $\chi$  suggest that no  $S_2$  mols. are formed even on heating to  $120^\circ$ . Vals. of  $\chi$  determined are:

$\text{CS}_2$  —0.556,  $\text{S}_2\text{Cl}_2$  —0.461,  $\text{SCl}_2$  —0.467,  $\text{SOCl}_2$  —0.372,  $\text{SO}_2\text{Cl}_2$  —0.365. For the halides vals. agree with those calc. for the structures  $\text{S}:\text{SCl}_2$ ,  $\text{O}:\text{SCl}_2$  and  $(\text{O})_2\text{SCl}_2$ . The val. for the "iodide" (—0.329) shows that no compound is formed. R. S. B.

Magnetic properties and structure of hæmoglobin, oxyhæmoglobin, and carboxyhæmoglobin.—See this vol., 867.

Paramagnetism of the octahydrated sulphates of the rare earths. I. Terbium, dysprosium, holmium, and erbium. S. VELAYOS (Anal. Fis. Quím., 1935, 33, 297—313).— $\chi$  for  $\text{M}_2(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$  has been measured over the range 80—300° abs. whence the magneton nos. of Tb, Dy, Ho, and Er are 48.3<sub>6</sub>, 52.0<sub>5</sub>, 51.7<sub>8</sub>, and 46.9<sub>4</sub>. F. R. G.

Paramagnetic relaxation. C. J. GORTER (Physica, 1936, 3, 503—514; cf. this vol., 417).—The heat liberated ( $H$ ) under the action of an alternating magnetic field at high frequency and low temp. has been studied for Ti, V, Cr, Fe, and Al alums, mixed crystals of ferro-magnetic alums with Al alum, and for  $\text{Gd}_2(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$ . In each case  $H \propto A/T$  ( $A$  = amplitude of magnetic field;  $T$  = abs. temp.). In some cases  $H$  diminishes when a continuous field is superimposed, either parallel or perpendicular to the alternating field.  $H$  increases more rapidly with frequency for strongly magnetic alums than for weakly magnetic compounds. J. W. S.

Magnetic and electrical properties of the binary systems  $\text{MO}-\text{Fe}_2\text{O}_3$ . J. L. SNOEK (Physica, 1936, 3, 463—483; cf. A., 1935, 1451; this vol., 421, 810).—The magnetisation curves and electrical conductivities have been measured for the binary systems of  $\text{Fe}_2\text{O}_3$  with FeO, MnO, CuO, NiO, and MgO, and for some ternary systems of those oxides with  $\text{Fe}_2\text{O}_3$ . The data are in accord with  $X$ -ray measurements. J. W. S.

Alteration of conductivity of thin metal sheets. M. PIERUCCI (Nuovo Cim., 1935, [ii], 12, 73—75; Chem. Zentr., 1935, ii, 1670).—Observations on W foil confirm the results of Deubner (A., 1934, 1061). J. S. A.

Variation of resistance and structure of cobalt with temperature and a discussion of its photo-electric emission. L. MARICK (Physical Rev., 1936, [ii], 49, 831—837).— $X$ -Ray diffraction patterns for Co, obtained in a camera designed for high-temp. work, showed no crystallographic change in the region of the reported temp. of change of photo-electric emission (cf. Cardwell, A., 1933, 105). The  $\alpha$ - $\beta$  transformation temp. at 492° is unchanged by heating at 875° for 55 hr. The variation of electrical resistance with temp., extended to 1200°, shows a change of slope at the Curie point at 1100°. An expansion of approx. in the lattice edge is observed as Co is heated through the Curie temp. There is no evidence of reversion to the hexagonal form at 1015°. The temp. coeff. of expansion is  $0.143 \times 10^{-4}$  per degree, agreeing with the macroscopic coeff. N. M. B.

Electrical resistance of gold and silver at low temperatures. W. J. DE HAAS and G. J. VAN DEN BERG (Physica, 1936, 3, 440—449; cf. A., 1935, 154).—It is confirmed that Au wires containing  $<10^{-3}\%$

impurity, of different origins and annealed to different extents, all show a min. in their resistance-temp. curves. The temp. of the min. is the lower the lower is the residual resistance. For the region above the min., the "ideal" resistance, calc. from Matthiessen's rule,  $\propto T^{4.2}$ . One Ag wire tested also showed a min. The ideal resistance of Ag  $\propto T^{4.1}$ . J. W. S.

Electrical resistance of gold at low temperatures in a transverse magnetic field. II. E. JUSTI and H. SCHEFFERS (Physikal. Z., 1936, 37, 475—481).—There is strong anisotropy with respect to the electrical resistance of Au crystals at 14° abs. in a transverse magnetic field, when the field is variously oriented in relation to the crystal. Al, Cu, and Ag (not specially pure) also show this anisotropy, but to a much smaller extent. A. J. M.

Electrodynamics of macroscopic fields in superconductors. F. LONDON (Nature, 1936, 137, 991—992).—Theoretical. L. S. T.

Transition of a tin sphere from the non-superconductive state to the superconducting state. W. J. DE HAAS and O. A. GUINAU (Physica, 1936, 3, 534—542; cf. this vol., 556).—The changes of magnetic field strength measured by Bi wires through a central canal and around the equator of a Sn sphere during transition from non-superconducting to superconducting state ( $a$ ) at const. temp. and ( $b$ ) at const. magnetic field are analogous to those occurring during the reverse change. The phenomenon is not completely reversible, however. Lippmann's rule is not valid at the centre of the sphere. J. W. S.

Magnetic fields in superconductors. F. LONDON (Physica, 1936, 3, 450—462).—Mathematical. A theory of the intermediate stage of superconductivity has been developed. J. W. S.

Ultrasonic velocities in organic liquids. III. Esters and ethers. S. PARTHASARATHY (Proc. Indian Acad. Sci., 1936, 3, A, 482—486; cf. this vol., 787).—Ultrasonic velocities ( $v$ ) have been determined for a frequency of  $7.382 \times 10^6$  kc. at 25.5—28°. For the substituent groups of ethers  $v$  is in the order Me and OMe > Et and OEt, aromatic > aliphatic. For esters  $v$  decreases with increasing mol. wt., but increases on introduction of Cl as in  $\text{CH}_3\text{Cl}-\text{CO}_2\text{Et}$ . R. S. B.

Regulated behaviour of the magnitude of mol. depression of the m.p. of mixtures of solvents from isomorphous organic compounds. J. PIRSCH (Ber., 1936, 69, [B], 1330—1332).—Examination of mixtures of  $\alpha$ -dicyclopentadiene, dihydro- and tetrahydro- $\alpha$ -dicyclopentadiene shows that the law of additivity of mol. depression of the m.p. holds also for ternary solvent mixtures. H. W.

M.p. of vanadium oxytrichloride and vanadium tetrachloride. Thermal analysis of the system chlorine-vanadium tetrachloride. A. MORETTE (Compt. rend., 1936, 202, 1846—1847).—The m.p. are:  $\text{VOCl}_3$  —77 $\pm$ 2°,  $\text{VCl}_4$  —28 $\pm$ 2°. There are no discontinuities in the f.-p. and m.-p. curves of the system  $\text{Cl}_2$ - $\text{VCl}_4$  over the entire range of composition. J. G. A. G.

Exact measurement of the specific heats of metals at high temperatures. XXIII. Calori-

metrical, electrical, and thermo-electrical behaviour of ductile titanium. I—III. F. M. JAEGER, E. ROSENBOHM, and R. FONTEYNE (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 442—452, 453—461, 462—469; cf. this vol., 672).—The sp. heat of Ti, plotted as a function of temp., shows minor discontinuities at 297—300°, 298—400°, approx. 554°, 640°, and 817°. There is no change in the X-ray diagram at these points.  $\beta$ -Ti is formed above 950°. Its at. heat is 7.525 g.-cal., and is independent of temp. The minor discontinuities are connected with the presence of O or oxides. They may be at the transition points of the modifications of  $\text{TiO}_2$ . Measurements of the electrical resistance (15—1000°) are recorded. The hysteresis effects are discussed. Vals. for the c.m.f. of a Ti—Au thermocouple (15—1000°) are recorded.

H. J. E.

Transition of hexagonal  $\alpha$ -titanium into regular  $\beta$ -titanium at a high temperature. J. H. DE BOER, W. G. BURGERS, and J. D. FAST (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 515—519).—The transition temp. of  $\alpha$   $\beta$ -Ti (from measurements of electrical resistance) is  $882 \pm 20^\circ$ .  $\beta$ -Ti is cubic body-centred ( $a$  at  $900^\circ = 3.32 \text{ \AA}$ ). When Ti has taken up N or O it shows a transition range instead of a transition temp.

H. J. E.

Temperature variation of properties used to measure temperature. V. JACYNA (Z. Physik, 1936, 100, 205—211).—Theoretical. A. B. D. C.

Determination of vapour pressure. D. RADULESCU and S. TILENSCHI (Bul. Soc. Chim. Romania, 1935, 17, 323—327).—Pure electrolytic  $\text{H}_2$  is passed over the substance and the amount entrained determined by adsorption on active charcoal. The v.p. of  $\text{CH}_2\text{PhCl}$  at  $170^\circ$  is 0.523 mm.

R. S. B.

Vapour-pressure curve of thallium at very low densities. F. MÜLLER (Helv. phys. Acta, 1935, 8, 152—164; Chem. Zentr., 1935, ii, 1840; cf. A., 1935, 438).—The v.p. of Tl between  $350^\circ$  and  $500^\circ$  is calc. from abs. measurements of the max. absorption of the 3776  $\text{\AA}$ . resonance line, the abs. intensity of which is calc. Vals. found ( $1.2 \times 10^{-6}$  to  $7.4 \times 10^{-4}$  mm.) accord well with the high-temp. measurements of Gibson and von Wartenberg.

J. S. A.

Vapour pressure measurements on indium halides. C. ROBERT and M. WEHRLI (Helv. phys. Acta, 1935, 8, 322—324; Chem. Zentr., 1935, ii, 2501).—The v.p. of  $\text{InCl}$ ,  $\text{InBr}$ ,  $\text{InI}$ ,  $\text{InCl}_2$ , and  $\text{InBr}_2$  between  $300^\circ$  and  $600^\circ$  are recorded. Between  $500^\circ$  and  $700^\circ$ ,  $\text{InCl}_2$  and  $\text{InBr}_2$  form undissociated simple mols.

J. S. A.

Vapour pressure of certain substances. V. A. KIREEV and V. A. NIKIFOROVA (J. Gen. Chem. Russ., 1936, 6, 75—77).—V.p. data are recorded for  $\text{CH}_2\text{Cl}\cdot\text{CHMeCl}$  ( $16$ — $95^\circ$ ),  $\text{CH}_2\text{Cl}\cdot\text{CH}_2\cdot\text{OH}$  ( $17.5$ — $127.5^\circ$ ), and  $\text{CH}_2\text{Cl}\cdot\text{CHMe}\cdot\text{OH}$  ( $43.8$ — $126^\circ$ ). Empirical formulæ connecting v.p. with temp. are given.

R. T.

Determination of the thermodynamical temperature scale below  $1^\circ$  abs. W. J. DE HAAS and E. C. WIERSMA (Physica, 1936, 3, 491—494; cf. A., 1935, 815).—When  $\text{Cs}_2\text{SO}_4\cdot\text{Ti}_2(\text{SO}_4)_3\cdot 24\text{H}_2\text{O}$  is magnetised in a field of 24,075 gauss at  $1.20^\circ$  abs. and

demagnetised down to  $104.6$  gauss, its magnetisation remains const. It is shown that for such salts the thermodynamic temp. scale can be determined for a large interval below  $1^\circ$  abs. by magnetic measurements only.

J. W. S.

Relation between critical data and atomicity. M. PEDRERO (Anal. Fís. Quím., 1936, 34, 173—178).—The relation  $T/p + 0.1p = 1 + i + (3i - 2)T/31i^2$  where  $T$  is the abs. crit. temp.,  $p$  the crit. pressure, and  $i$  the no. of atoms in the mol. is calc. for 79 substances. Other relations containing variable atomicity factors are considered and summarised as  $f(p, T, i) = 0$ .

F. R. G.

General equation of state. G. WOOLSEY (J. Amer. Chem. Soc., 1936, 58, 984—987).—The formula  $PV + (4.555V + 7.427)/(T^{1/2}V^2 + 0.9382T^{2/3}V + 2.140/[T^{3/2}]) = 3.25T + 0.2837P + 1.343 \log(P + 1)$  is put forward.

E. S. H.

Verification of the laws of Knudsen and of Reynolds by means of radon. W. MUND and A. LUYCKX (Ann. Soc. Sci. Bruxelles, 1936, B, 56, 196—219).—Knudsen's cosine law for the directional distribution of mols. leaving a vessel wall and Reynolds' law for the flow of gas mols. through an orifice are discussed. Data for the flow of Rn through an orifice are applied to the verification of these laws.

C. R. H.

Critical relation and molecular association. R. LAUTIFÉ (Bull. Soc. chim., 1936, [v], 3, 1136—1139).—The expression  $xP_c V_c/T_c = 25.2 + 4.0617 \times 10^{-4} T_c^2 / (1 + 1.925 \times 10^{-5} T_c^2)$  is derived.  $x$ , the degree mol. association, can thus be calc. from crit. data.

E. S. H.

Nernst theorem. R. BRUNNER (Z. Physik, 1936, 100, 584—593).—The entropy of a substance is obtained from pressure characteristics.

A. B. D. C.

Phaseequilibria in hydrocarbons. XIV. Joule-Thomson coefficients of *n*-butane and *n*-pentane. E. R. KENNEDY, B. H. SAGE, and W. N. LACEY (Ind. Eng. Chem., 1936, 28, 718—720; cf. this vol., 788).—Joule-Thomson coeffs. were determined for *n*- $\text{C}_4\text{H}_{10}$  and *n*- $\text{C}_5\text{H}_{12}$  at temp.  $70$ — $220^\circ \text{F}$ . and pressures from 1 atm. to nearly saturation pressure and compared with vals. for  $\text{C}_3\text{H}_8$ . The vals. of  $C_p$  and isothermal changes of heat content with change of pressure were also calc.

D. M. M.

Joule-Thomson coefficient of carbon monoxide. T. C. HUANG, F. LIN, and C. Y. FU (Z. Physik, 1936, 100, 594—598).—This coeff. is calc. from the Beattie-Bridgman equation of state.

A. B. D. C.

Bismuth crystals. I. Thermal and electrical conductivity in transverse magnetic fields. E. GRUNEISEN and J. GIELESSEN (Ann. Physik, 1936, [v], 26, 449—464).—The effect of a magnetic field, in various directions, on the thermal and electrical conductivity of single Bi crystals at  $-183^\circ$  and  $-195^\circ$  has been examined. The thermal conductivity decreases slowly with increasing field strength, irrespective of the direction. A similar, but more rapid, decrease of the electrical conductivity was found. Both thermal and electrical conductivity vary with the direction of the field. Except at high field strengths, there is an

approx. linear relationship between the two conductivities. The electronic conductivity derived from this relationship is somewhat < that obtained from the Wiedemann-Franz-Lorenz equation. A. J. M.

Effect of a magnetic field on thermal conductivity and viscosity of paramagnetic gases. II. M. VON LAUE (Ann. Physik, 1936, [v], 26, 474—480).—Corrections in the method of an earlier paper (A., 1935, 923) are made, but the results are unaffected. A. J. M.

Viscosity and diffusion coefficients of atomic hydrogen and atomic deuterium. I. AMDUR (J. Chem. Physics, 1936, 4, 339—343; cf. A., 1935, 827).—The viscosity of at. H, recalcd. from Harteck's experimental data, is  $\eta = 4.746 \times 10^{-6} \sqrt{T/(1+30.6/T)}$  between 0° and 100°. Expressions for the diffusion coeffs. of H and D in binary mixtures of H, D, H<sub>2</sub>, and D<sub>2</sub> are given. F. L. U.

Viscosity of air. W. N. BOND (Nature, 1936, 137, 1031).—The val. obtained,  $\eta_{23} = (1834.7 \pm 0.8) \times 10^{-7}$ , agrees with that found by Kellstrom (A., 1935, 1455), and gives  $e = (4.800 - 4.816 \pm 0.005) \times 10^{-10}$  e.s.u. L. S. T.

Penetration of copper and gold ions into transparent crystals of NaCl and KCl. S. A. ARZIBISCHEV, M. N. BOGOMOLOVA, N. V. BORISOV, and I. C. REPSE (Compt. rend. Acad. Sci. U.R.S.S., 1936, 2, 95—96).—Mobility data are recorded. The diffusion of the Cu ion in NaCl was less during electrolysis than in absence of the field. The Au colloids were pptd. by cooling the crystal to 300—350°. H. J. E.

Correlations between curves of inverse properties in binary systems. V. J. ANOSOV (Ann. Sect. Anal. Phys.-Chim., 1936, 8, 69—75).—Theoretical. R. T.

Shape of curves representing properties in binary systems in the case of formation of an undissociated chemical compound, when the property in question is represented in an ideal system by a straight line. II. V. J. ANOSOV (Ann. Sect. Anal. Phys.-Chim., 1936, 8, 77—89).—Theoretical. R. T.

Refractivity and magnetic birefringence of liquid mixtures. M. RAMANADHAM (Proc. Indian Acad. Sci., 1936, 3, A, 384—397).—The deviations of observed vals. (cf. Chinchalkar, A., 1933, 889) from those calc. by the Langevin theory are quantitatively explained by the new idea of a varying set of anisotropic polarisation field coeffs. The actual variations of the coeffs. with changing concn. have been determined from observed refractivities of mixtures of the requisite composition in the case of CCl<sub>4</sub>-C<sub>6</sub>H<sub>6</sub>, -PhMe, -PhNO<sub>2</sub>, -CS<sub>2</sub>; C<sub>6</sub>H<sub>6</sub>-CS<sub>2</sub>, CS<sub>2</sub>-PhCl, and CS<sub>2</sub>-PhBr. N. M. B.

Diamagnetism of some organic binary mixtures at different temperatures. S. SEELY (Physical Rev., 1936, [ii], 49, 812—819; cf. Pal, A., 1930, 1245).—Results obtained by use of the improved Wills-Boeker manometric balance (cf. A., 1933, 212) are recorded for binary mixtures of CCl<sub>4</sub>, C<sub>6</sub>H<sub>6</sub>, and PhNO<sub>2</sub> over the temp. range 10—50°. For C<sub>6</sub>H<sub>6</sub>-PhNO<sub>2</sub> mixtures, each constituent of which shows no variation of mass susceptibility with temp., additive

relations are shown, but systematic deviations, depending on concn. and temp., are found for C<sub>6</sub>H<sub>6</sub>-CCl<sub>4</sub> or PhNO<sub>2</sub>-CCl<sub>4</sub> mixtures. N. M. B.

Variation of vapour pressure of the isotopic mixture of hydrogen with time at 20.38° abs. A. FARKAS, L. FARKAS, and P. HARTECK (Physikal. Z., 1936, 37, 447—448).—The explanation of this phenomenon given by Steiner (A., 1935, 1456) is not the same as that suggested for the variation of thermal conductivity of the isotopic mixture at low temp. by Farkas *et al.* (A., 1934, 608). A. J. M.

Vapour pressure of the binary mixtures (A) PbCl<sub>2</sub> + CuCl<sub>2</sub> and ZnCl<sub>2</sub> + CuCl<sub>2</sub>, (B) ZnCl<sub>2</sub> + PbCl<sub>2</sub>, in an atmosphere of chlorine. D. N. TARASENKOV and A. V. BABAeva (J. Gen. Chem. Russ., 1936, 6, 305—310, 311—314).—(A) The v.p. of PbCl<sub>2</sub> at 500—700° in a Cl<sub>2</sub> atm. is > in N<sub>2</sub>. Dissociation of CuCl<sub>2</sub> in Cl<sub>2</sub> at 760 mm. becomes evident at 520°. The partial pressure of CuCl<sub>2</sub> in the systems CuCl<sub>2</sub>-PbCl<sub>2</sub> and -ZnCl<sub>2</sub> is at a max. for 1 : 1 mixtures.

(B) V.-p. data are recorded for ZnCl<sub>2</sub> and for the system ZnCl<sub>2</sub>-PbCl<sub>2</sub> in a stream of Cl<sub>2</sub>, at 398°, 516°, and 604°. R. T.

Orthobaric azeotropes. M. LECAT (Ann. Soc. Sci. Bruxelles, 1936, B, 56, 221—234).—A further list is given of 452 orthobaric or normal azeotropic mixtures together with their b.p. and compositions (cf. this vol., 675). C. R. H.

Binary systems of organic compounds. Thermal analyses and specific refractivities. W. R. BURNHAM and W. M. MADGIN (J.C.S., 1936, 789—793).—F.-p. and *n* data show that the binary mixtures *p*-C<sub>6</sub>H<sub>4</sub>Cl<sub>2</sub>-*p*-C<sub>6</sub>H<sub>4</sub>Cl-OH, C<sub>5</sub>H<sub>5</sub>N-PhCl, and AcOH-PhCl are of the simple eutectic type, and that *p*-C<sub>6</sub>H<sub>4</sub>Me-NH<sub>2</sub>-*o*-C<sub>6</sub>H<sub>4</sub>Cl-OH, *p*-C<sub>6</sub>H<sub>4</sub>Me-NH<sub>2</sub>-*p*-C<sub>6</sub>H<sub>4</sub>Cl-OH, and *p*-C<sub>6</sub>H<sub>4</sub>Cl-OH-C<sub>5</sub>H<sub>5</sub>N form stable 1 : 1 compounds. Deviations from a straight line in the *n*-composition curve for AcOH-PhCl are attributed to the presence of dimeric AcOH and, possibly, of higher polymerides. C. R. H.

*p*-Toluidine in binary systems with certain phenols. K. HRYNAKOWSKI and M. SZMYTÓWNA (Rocz. Chem., 1936, 16, 113—118).—Fusion diagrams for PhOH,  $\alpha$ - and  $\beta$ -C<sub>10</sub>H<sub>7</sub>-OH, and *m*-, *o*-, and *p*-NH<sub>2</sub>-C<sub>6</sub>H<sub>4</sub>-OH indicate the existence of 1 : 1 compounds in all but the last two systems. R. T.

Systems : sulphur dioxide and mono-olefines. I. Caprylene and sulphur dioxide. W. F. SEYER and L. HODNETT (J. Amer. Chem. Soc., 1936, 58, 996—998).—Miscibility relations and f.-p. data for octene-SO<sub>2</sub> mixtures have been determined. Octene absorbs O<sub>2</sub> from the air, apparently forming a peroxide. E. S. H.

Formation of molecular swarms in binary liquid mixtures. V. S. VRKLJAN and M. KATALINČ (Physikal. Z., 1936, 37, 482—487).—Theoretical. Gans' theory (this vol., 144) is applied to the Krishnan effect of anomalous depolarisation in binary liquid mixtures at the crit. solution temp. (or slightly above). A. J. M.

Electrical resistance of dilute solid solutions. N. F. MOTT (Proc. Camb. Phil. Soc., 1936, 32, 281—290).—Theoretical. T. G. P.

**Dependence of hardness of Ag-Zn alloys on their composition.** G. I. PETRENKO and E. E. TSCHERKASCHIN (Z. anorg. Chem., 1936, 227, 415—416).—The hardness-composition curve for Ag-Zn alloys exhibits max. corresponding with the compounds  $\text{AgZn}$ ,  $\text{Ag}_2\text{Zn}_3$ , and  $\text{Ag}_5\text{Zn}_8$ . F. L. U.

**Incubation of alloys.** K. HONDA and K. TAMARU (Bull. Inst. Phys. Chem. Res. Japan, 1936, 15, 315—319).—Measurements of hardness, electrical resistance, and  $d$  for Cu-Be alloys and duralumin lead to an explanation of incubation in terms of differential hardening and lattice distortion. N. M. B.

**Crystallisation of ternary eutectics.** A. A. BOTSCHVAR and K. V. GOREV (Ann. Sect. Anal. Phys.-Chim., 1936, 8, 283—290).—The components of the ternary eutectics of the systems Cd-Pb-Bi, Cd-Pb-Sn, and Cd-Sn-Bi crystallise out successively, with the result that the concn. of each constituent in the liquid eutectic varies during the process of solidification. Simultaneous crystallisation takes place only when centres of crystallisation for each component co-exist. R. T.

**Density and refractive index of the ternary systems water-methyl alcohol-*n*-propyl alcohol and water-*n*-propyl alcohol-isobutyl alcohol.** R. RIGAMONTI (Annali Chim. Appl., 1936, 26, 143—151).—The composition of ternary  $\text{H}_2\text{O}$ -MeOH-PrOH mixtures may be derived from measurements of  $d$  and  $n$ , but this is not possible in the case of ternary  $\text{H}_2\text{O}$ -PrOH-BuOH mixtures. Miscibility relations in the latter system have been studied at 15—120°. L. A. O'N.

**Homogenising properties of binary liquid mixtures.** I. Water-aniline-pyridine-piperidine. II. Water-aniline-pyridine-acetic acid. III. Water-aniline-piperidine-acetic acid. IV. Water-dimethylaniline-piperidine-allylthiocarbimide. V. F. UST-KATSCHKINTZEV and R. V. MERTZLIN (J. Gen. Chem. Russ., 1936, 6, 15—21, 22—26, 27—31, 32—36).—Phase diagrams have been constructed for the systems at 0—50°. Homogenising power is an additive property for the systems in I and IV. R. T.

**"Antagonism" and "synergism" of ions in heterogeneous equilibrium in liquid systems of three components. Two co-existing phases.** X. A. K. VLCEK (Chem. Obzor, 1935, 10, 88—90; Chem. Zentr., 1935, ii, 1822).—Equilibrium relations for the systems  $\text{H}_2\text{O}$ -Et<sub>2</sub>O-COMe<sub>2</sub>,  $\text{H}_2\text{O}$ -Et<sub>2</sub>O-EtOH,  $\text{H}_2\text{O}$ -Et<sub>2</sub>O-AcOH, and  $\text{H}_2\text{O}$ -C<sub>6</sub>H<sub>6</sub>-COMe<sub>2</sub>, in presence of pairs of salts, have been determined and compared with the relations which are exhibited when a single salt is present. J. S. A.

**Equilibria in liquid mixtures and solutions. Solubility in different solvents, at less than atmospheric pressure.** IX. Acetylene and vinyl chloride, at 0°. X. Hydrogen and methane at -20° to 40°. V. A. KIREEV and M. A. ROMANTSCHUK (J. Gen. Chem. Russ., 1936, 6, 78—80, 81—84).—IX. Data are recorded for C<sub>2</sub>H<sub>2</sub> and CH<sub>2</sub>:CHCl (I) in kerosene at -20° to 20° (100—760 mm.) and in heavy solvent oil, "solar oil," EtOH, and C<sub>2</sub>H<sub>4</sub>Cl<sub>2</sub> at 0° (100—760 mm.). Small deviations from Henry's

law are found in all cases, the greatest differences being shown by (I) at low temp. The best solvent for (I) is C<sub>2</sub>H<sub>4</sub>Cl<sub>2</sub>.

X. Data are given for H<sub>2</sub> and CH<sub>4</sub> in xylene, kerosene, and "cracking benzine" at -20° to 40° (50—760 mm.) and in C<sub>2</sub>H<sub>4</sub>Cl<sub>2</sub> and heavy solvent oil at 0° (500—760 mm.). Henry's law is followed in all cases. The solubility of H<sub>2</sub> in xylene rises with temp. over the range -20° to 40°. R. T.

**Solubility of mono-, di-, and tri-olein in some organic solvents.** C. ARTOM and L. REALE (Boll. Soc. ital. Biol. sperim., 1935, 10, 880—882).—Solubility and partition data (with H<sub>2</sub>O as the second medium) are given at 20—25° for CHCl<sub>3</sub>, light petroleum, Et<sub>2</sub>O, CS<sub>2</sub>, C<sub>6</sub>H<sub>6</sub>, EtOAc, EtOH (also at 50°, 80°, and 90°), and COMe<sub>2</sub> (also at 50° and 80°). The hydrophilic character of mono-olein is noteworthy. F. O. H.

**Solubility of silver nitrate in ethyl and isopropyl alcohols.** C. L. M. BROWN (Pharm. J., 1936, 136, 618).—The solubility of AgNO<sub>3</sub> in 90% aq. EtOH is 10.73 g. per 100 at 15.5° and 5.67 g. at 20°. The corresponding vals. for PrOH are 31.17 and 30.91 g., respectively. A. L.

**Solubility of calcium oxide in water and in aqueous sucrose.** K. SMOLEŃSKI and W. ŻERO (Rocz. Chem., 1936, 16, 24—36, and Bull. Acad. Polonaise, 1935, A, 586—601).—The solubility of CaO in H<sub>2</sub>O and 1.5—36% sucrose (I), at 0—80°, rises with (I) concn. and falls with rising temp. The final  $p_H$  is the same in presence or absence of (I). R. T.

**Solubility measurement. Solubilities in the system SrCl<sub>2</sub>-H<sub>2</sub>O from 20° to 200°.** A. W. C. MENZIES (J. Amer. Chem. Soc., 1936, 58, 934—937).—Apparatus and procedure requiring the use of only 1 c.c. of solvent are described. Solubilities of SrCl<sub>2</sub> in H<sub>2</sub>O are recorded for the range 20—200°. Transition temp. at 61.4° and 134.4° are reported. E. S. H.

**Heteropoly-compounds. V. Solubility of certain heteropoly-compounds.** A. V. RAKOVSKI and E. A. NIKITINA (J. Gen. Chem. Russ., 1936, 6, 50—54).—The solubility of phosphomolybdic (P<sub>2</sub>O<sub>5</sub>.24MoO<sub>3</sub>) and phosphotungstic (P<sub>2</sub>O<sub>5</sub>.24WO<sub>3</sub>) acids, and of their Na<sub>2</sub> and Na<sub>3</sub> salts, has been determined at 0—98°. The existence of definite crystal hydrates is not indicated. The solubility of Na phosphotungstate is greatly depressed in presence of NaCl. R. T.

**Adsorption of zinc sulphide by copper sulphide.** A. DEL CAMPO and A. HOYOS DE CASTRO (Anal. Fis. Quím., 1935, 33, 754—764).—In the pptn. of CuS from aq. HCl by H<sub>2</sub>S in presence of Zn<sup>2+</sup>, ZnS is partitioned between the CuS gel and the aq. layer, unless the pptn. is accompanied by mechanical stirring. CuS pptd. in presence of Pb<sup>2+</sup> cannot be entirely freed from PbS by stirring. F. R. G.

**Adsorption of electrolytes on crystal surfaces.** L. DE BROUCKÈRE (Chem. Weekblad, 1936, 33, 420—423).—A reply to Kolthoff (this vol., 792). D. R. D.

**Influence of indole on the adsorption of indican by various adsorbents.** J. GARCÍA-BLANCO and F. ALDAYA (Anal. Fis. Quím., 1935, 33, 463—465).—

The adsorption of indican (I) by blood charcoal is decreased in amount by the presence of indole (II), but the smaller adsorption of (I) by sheep-blood corpuscles, bone charcoal, talc, and kaolin is increased in presence of (II). F. R. G.

**Measurement of the adsorption of oils by metallic surfaces.** J. J. TRILLAT and R. VAILLÉ (Compt. rend., 1936, 202, 2134—2136).—The adsorption of acids, *e.g.*, oleic acid, from mineral oil by a metallic surface has been followed by measuring the interfacial tension between the oil and  $H_2O$  before and after contact with the metal. C. R. H.

**Adsorption of binary mixtures of acetic acid and alcohols in aqueous solution [by animal charcoal].** R. AMIOT (Compt. rend., 1936, 202, 1852—1854).—The order of the adsorption of the single substances is  $MeOH < EtOH < AcOH < Pr^iOH < Pr^oOH < Bu^iOH < Bu^oOH < isoamyl$  alcohol. With the binary mixtures, each solute depresses the adsorption of the other. The order of the adsorbability of the alcohols is independent of  $[AcOH]$  but the adsorption decreases with rise of  $[AcOH]$  and the adsorption of  $AcOH$  decreases as the adsorbability of the alcohol rises. J. G. A. G.

**Adsorption of glucose by albumin.** E. GOU-BAREV and G. MOISEENKO (Bull. Soc. Chim. biol., 1936, 18, 769—779).—The adsorption of glucose by solutions of albumin increases with increase of  $p_H$ , and for any  $p_H$  val. is represented by the ordinary adsorption formula. A. L.

**Adsorption of alkali and alkaline-earth cations by a colloidal clay medium.** A. DELFORGE (Chim. et Ind., 1936, 35, 1276—1279).—Approx. equimol. quantities are adsorbed as a result of neutralisation, but in the case of the alkaline earths there is an additional adsorption. Reasons for this are discussed. The adsorption effects are reversible and equilibrium is attained more rapidly with excess of alkaline earth. With small amounts of  $CaO$ , corresponding with the usual conditions for the liming of soil, equilibrium may take several months. C. R. H.

**Adsorption of lime on silica gels.** A. MAFFEI (Gazzetta, 1936, 66, 197—204).—The chemisorption of  $CaO$  on  $SiO_2$  gel has been studied. The initial process is one of true adsorption, but  $Ca$  silicate is gradually formed. J. W.

**Validity of Mecklenburg's formula. New viewpoint on the dynamics of adsorption.** D. RADULESCU and S. TILENSCHI (Bul. Soc. Chim. Romania, 1935, 17, 313—321).—Mecklenburg's formula (cf. A., 1931, 298) is criticised. Observations on the adsorption of  $H_2$ ,  $N_2$ , and  $O_2$  by charcoal suggest that for primary adsorption the v.p. is approx. 0, and that this is followed by capillary condensation and the appearance of concave surfaces in the liquid. R. S. B.

**Simultaneous adsorption of two adsorbates which react together.** E. ANGELESCU and D. CISMARU (Bul. Soc. Chim. Romania, 1935, 17, 229—247).—The adsorption by charcoal of acids ( $AcOH$ ,  $EtCO_2H$ ,  $Pr^iCO_2H$ ) and bases ( $NH_2Ph$ , *o*-, *m*-, and *p*- $C_6H_4MeNH_2$ ) from aq. solutions has been examined. The observations are discussed in relation to the constitution of the aq. solutions. R. S. B.

**Formation of unimolecular films on thin foils of metals and of cellulose.** H. MARK and H. MORZ (Chem. Eng. Cong. World Power Conf., 1936, M/1, 13 pp.).—The formation of films of org. substances on metals and on cellulose has been studied by photographing an electron beam reflected from the surface. The org. substance is placed on a support connected with the metal or cellulose film by a wire or band along the surface of which the org. substance diffused. The rate of formation of a cryst. film depends on the rates of diffusion, nucleus formation, and crystal growth. These in turn depend on the nature of the substance, temp., etc. In some cases diffusion consists of a series of jumps between active spots which require a definite activation energy. Diffusion is most rapid for neutral substances and slowest for highly polar substances, but the latter form nuclei more readily; crystal growth is generally relatively rapid. Diffusion is slower on metals than on glass, cellulose, etc. A. G.

**Electrical changes in interfacial films.** T. TEORELL (Nature, 1936, 137, 994—995).—The d.c. conductance of films of  $CCl_4$ , olive oil, etc. changes abruptly as the film becomes thinner from a barely detectable to a measurable val. which increases in definite steps until the bubble bursts. The a.c. conductance also varies but in a more continuous manner. Other liquids, *e.g.*,  $PhNO_2$ , develop an "asymmetry potential" which changes in a characteristic manner as the interfacial non-aq. film becomes thinner. L. S. T.

**Surface ionisation of caesium on tungsten.** M. J. COPLEY and J. GLASSER (J. Amer. Chem. Soc., 1936, 58, 1057—1058).—Below  $2000^\circ$  abs. the % ionisation agrees with theory, but above  $2000^\circ$  abs. the experimental vals. are lower. E. S. H.

**Influence of hydrogen ions on the dielectric potential and surface tension of some alkaloids and other organic substances in aqueous solutions.** B. KAMIENSKI and W. GOSLAWSKI (Bull. Acad. Polonaise, 1935, A, 515—530).—The influence of  $[H^+]$  on the surface tension and on the dielectric potential at the air-solution interface of aq. solutions of veratrine, cevadine, amarine, quinine, quinidine, citronellol, and citral is described. A parallelism between the two effects is observed. O. D. S.

**Dielectric potential and surface tension of  $\beta$ -eucaine, procaine, and orthocaine solutions at different hydrogen-ion concentrations.** B. KAMIENSKI and B. ZAPIÓR (Bull. Acad. Polonaise, 1936, A, 133—144; cf. A., 1935, 931).—The influence of  $p_H$  on the dielectric potential ( $V$ ) and surface tension ( $\sigma$ ) of solutions of  $\beta$ -eucaine, procaine, and orthocaine salts has been investigated. The change of  $V$  and  $\sigma$  at the interface depends on the size of mol. adsorbed and the dissociation const. The mono-bases  $\beta$ -eucaine and procaine show only one break in the  $V$ - $p_H$  curve, instead of two for bivalent bases (quinine and quinidine); both  $V$  and  $\sigma$  begin to rise rapidly at  $p_H$  8 and reach a max. rate of increase above  $p_H$  10. J. W. S.

**Measurement of transient resistance as a method of physico-chemical analysis.** P. P.

PORFIROV (Ann. Sect. Anal. Phys.-Chim., 1936, 8, 135—140).—The importance of transient resistance measurements for the study of surface films is emphasised.  
R. T.

Significance of electrical surface phenomena for the stability of hydrophobic dispersions. H. EILERS and J. KORFF (Chem. Weekblad, 1936, 33, 358—362).—From a mathematical consideration of Donnan's hypothesis, it is shown that the protective action of the double layer in hindering collision between the particles is represented by  $A = c\zeta^2/K$ , where  $\zeta$  is the crit. potential and  $K$  the mean diameter of the ionic sphere (Debye-Hückel) and is not a simple function of  $\zeta$  as is usually supposed. The formula is in good agreement with the more important data in the literature.  
S. C.

Determination of the thickness of the albumin membrane formed between water and benzene and properties of this membrane. H. DEVAUX (Compt. rend., 1936, 202, 1957—1960).—The thickness of albumin membranes formed at a  $H_2O-C_6H_6$  interface is determined by reducing the area until the membrane becomes turbid, due to a process of folding. Membranes formed in contact with air are much more elastic and form more slowly than those between two liquid phases.  
H. J. E.

Liesegang periodicity and concentration of the reagent in the drop. (MLLE.) S. VEIL (Compt. rend., 1936, 202, 2078—2079).—A linear relationship was observed in the distribution const. of the rings formed by adding drops of  $AgNO_3$  to  $Cr_2O_7^{2-}$  in gelatin, and the  $[AgNO_3]$ .  
H. J. E.

[Use of] pyrosulphuric acid as a solvent. C. R. DE ROBLES and E. MOLES (Anal. Fis. Quím., 1935, 33, 643—654).—For solutions of sulphonal, veronal, trional, and  $PhNO_2$  in  $H_2S_2O_7$  the mol. f.-p. depression is 111.5, in agreement with the calc. val. of Auerbach (A., 1926, 791). The addition of  $H_2SO_4$ ,  $H_2O$ , or  $SO_3$  produces an anomalous depression of the m.p. (cf. this vol., 798).  
F. R. G.

Cryoscopic determination of the hydration of hydrochloric acid ions. F. BOURION and O. HUN (Compt. rend., 1936, 202, 2149—2152).—Cryoscopic data for solutions of resorcinol in 0.5*N*-HCl indicate a degree of hydration corresponding with  $HCl \cdot 14.5H_2O$ .  
C. R. H.

Determination of osmotic pressure.—See this vol., 969, 972.

Membrane method and method of isothermal distillation with highly polymerised compounds.—See this vol., 972.

Dialysis and diffusion coefficients of alkali chlorides. W. NOWATKE (Rocz. Chem., 1936, 16, 49—56).  
R. T.

Determination of dielectric constants of aqueous solutions of electrolytes by the Fürth ellipsoid method. T. LIN (Ann. Physik, 1936, [v], 26, 495—512).—The dielectric consts. of aq. solutions of NaCl, LiCl, NaI, HCl,  $Mg(NO_3)_2$ ,  $LaCl_3$ , and  $MgSO_4$  have been determined by the Fürth method with a frequency of  $2.5 \times 10^5$ .  
A. J. M.

Suspended matter in gases. A. WINKEL (Angew. Chem., 1936, 49, 404—410).—A review of recent work on the formation, sedimentation, particle size, optical properties, electrical discharge, and structure of aerosols.  
J. S. A.

Viscosity of suspensions of asbestos and yeast. R. F. GARCIA (Anal. Fis. Quím., 1936, 34, 414—418).—The val. of the const. in Einstein's formula is found to increase with the vol. of the suspended particles.  
F. R. G.

Colloidal solutions. A. LANGIEN and M. PIVO-TEAU (Bull. Sci. pharmacol., 1934, 41, 660—666; Chem. Zentr., 1935, ii, 2502).—The mean particle size of Rh sols has been calc. (a) from the extent of the deviation from Lambert's absorption law, (b) from the  $\lambda$  of scattered light, and (c) from the degree of polarisation of scattered light.  
J. S. A.

Electric double layer of colloids, particularly silver iodide, metals, and carbon. E. J. W. VERWEY (Chem. Weekblad, 1936, 33, 414—420).—The double layer theory is discussed and illustrated by a consideration of the properties of sols of AgI, noble metals, and C.  
D. R. D.

[Properties of] a colloidal solution prepared from resorcinol-formaldehyde resins. M. ENGELDER (Compt. rend., 1936, 202, 1854—1856).—In aq. suspension, the particles are negatively charged. Quantities of LiCl insufficient to cause flocculation retard flocculation by subsequent additions of LiCl.  
J. C. A. G.

Effect of adsorbed layers on the dielectric constant of a disperse system. D. I. SHURAVLEV (J. Phys. Chem. U.S.S.R., 1934, 5, 784—789).—A formula is derived for the dielectric const. as a function of particle size. The calc. thickness of the adsorbed layer on particles of the emulsified  $H_2O-EtOH$  mixture in paraffin oil is approx.  $3.5 \times 10^{-5}$  cm.  
CH. ABS. (e).

Relation between low-temperature research and colloid chemistry. F. F. NORD (Chem. Eng. Cong. World Power Conf., 1936, M5, 24 pp.).—The effect of freezing on the state of aggregation of lyophilic biocolloids has been examined by determining the rate of diffusion of frozen and unfrozen solutions of Na oleate, ovalbumin, polyacrylic acid (I), and myosin. The effect of freezing on electrical conductivity and cataphoresis was also determined. In solutions of concn. <1% there is a disaggregation on freezing, and in solutions more conc. than 1.5% there is an aggregation, which increases with concn. and may become a coagulation. Freshly prepared (I) does not show the effect. These observations may explain the transient increase in activity of frozen solutions of zymases, peroxidases, and tyrosinase in connexion with the carrier theory of enzymic activity, and also the increase in soil activity after freezing.  
A. J. M.

Influence of non-electrolytes on the velocity of coagulation of ferric hydroxide. K. JABECZYNSKI and J. HELWICH (Rocz. Chem., 1936, 16, 141—145).—Coagulation of  $Fe(OH)_3$  sols is accelerated by MeOH, EtOH, PrOH, and  $CO_2Me$ , and retarded by glycol, glycerol, mannitol, and  $CH_2O$ ; MeCHO is without effect.  
R. T.

**Thermo-ageing of colloids. I. Variation of refractivity.** S. S. JOSHI and P. V. J. RAO (J. Indian Chem. Soc., 1936, 13, 217—223).—After heating at about 100° for 2.5 hr. the val. of  $n$  for 19 colloids was found to increase. Diminution of particle size is suggested as the simplest explanation. C. R. H.

**Action of clay stabilisers.** A. FOLDVARI (Kolloid-Beih., 1936, 44, 125—170).—Clay stabilisers act (1) by charging the particles with OH' (alkalis), (2) by reacting with the pptg. electrolytes normally present in the clay, especially Ca<sup>++</sup> (Na<sub>2</sub>C<sub>2</sub>O<sub>4</sub>), or (3) by forming a protective sheath around the clay particles (Na<sub>2</sub>SiO<sub>3</sub>). The degree of effectiveness of a given stabiliser depends on the composition of the suspension. In general, Na<sub>2</sub>C<sub>2</sub>O<sub>4</sub> gives the finest dispersions, but when the clay contains CaCO<sub>3</sub>, CaSO<sub>4</sub>, or considerable amounts of electrolytes, Na<sub>2</sub>SiO<sub>3</sub> is the best stabiliser. E. S. H.

**Silica gels and other dehydrating agents.** J. CAILLAUD and J. BEAUFILS (Chim. et Ind., 1936, 35, 1280—1292).—The theory of desiccation is discussed and applied to the action of SiO<sub>2</sub> gels. C. R. H.

**Action of ultra-violet irradiation on surface tension and viscosity of gelatin solutions.** W. DUCE (Boll. Soc. ital. Biol. sperim., 1935, 10, 978—979).—Irradiation slightly lowers  $\gamma$  and  $\eta$  for equiv.  $p_H$  vals. F. O. H.

**Method of observation of gelation.** T. FUJWARA and T. HUDITA (J. Sci. Hiroshima Univ., 1936, A, 6, 239—243).—The influence of stirring during a sol-gel transformation on the "hardness" of the resulting gel is discussed. W. R. A.

**Syneresis. II.** G. ROSSI and A. MARESCOTTI (Gazzetta, 1936, 66, 223—227; cf. A., 1933, 568).—In the liquid resulting from the syneresis of agar-agar gels containing both NaCl and NaI the molar concn. of both salts is < that for the original gel. The [NaCl]/[NaI] ratio is also smaller and approaches a const. val. as the concn. of the two salts in the original gel decreases. O. J. W.

**Stability of lyophilic bio-colloids.** H. P. TEUNISSEN (Chem. Weekblad, 1936, 33, 362—363).—Differences in stability of lyophilic bio-colloids depend on the nature and the no. of ionogenic groups present in the mol. Such colloids can be divided into three groups according to the types of grouping they contain. S. C.

**Influence of vitamin-D and certain carcinogenic hydrocarbons on the hydrophilic coefficient of lipins.** A. KLING and G. LECORDIER (Compt. rend., 1936, 202, 1535—1538).—The hydrophilic activity of ergosterol (I) in vaseline is > that of cholesterol and the product obtained by irradiation is more active than pure vitamin-D. Carcinogenic hydrocarbons diminish the activity of (I) etc. whilst non-carcinogenic hydrocarbons do not. The carcinogenic hydrocarbons have no hydrophilic activity towards pure vaseline. R. S.

**Interchange equilibrium between acetylene and heavy water.** K. HIROTA and G. OKAMOTO (Bull. Chem. Soc. Japan, 1936, 11, 349—351).—Equilibrium consts. are calc. from spectroscopic data. T. G. P.

**Ionic equilibrium in solutions. I. I. SASLAVSKI** (Z. Physik, 1936, 100, 345—359).—Methods of determining the degree of ionisation are critically reviewed. A. B. D. C.

**Hydration of ions.** H. BRINTZINGER (Z. anorg. Chem., 1936, 227, 341—346; cf. A., 1935, 579, 824).—Reply to criticisms by Schmitz-Dumont (this vol., 289).

[Hydration of ions.] O. SCHMITZ-DUMONT (Z. anorg. Chem., 1936, 227, 347—350).—Reply to Brintzinger.

[Hydration of ions.] H. BRINTZINGER (Z. anorg. Chem., 1936, 227, 351—352).—Reply to Schmitz-Dumont. F. L. U.

**Hydration and change in water equilibrium in electrolytic solutions.** C. S. RAO (Current Sci., 1936, 4, 650; cf. A., 1935, 295).—The intensity curves of the Raman band for H<sub>2</sub>O in the pure solvent and in solutions of NaNO<sub>3</sub>, H<sub>2</sub>SO<sub>4</sub>, and HCl have been determined. The influence of the dissolved electrolytes on the 1-, 2-, 3-H<sub>2</sub>O equilibrium is discussed. N. M. B.

**Electrolytic dissociation processes. I. Dipole moment of iodine monochloride in solution.** F. FAIRBROTHER (J.C.S., 1936, 847—853).—The increase in the dipole moment of ICl in CCl<sub>4</sub> and cyclohexane to approx. double the val. for gaseous ICl is ascribed to an increase in the ionic character of the valency linking of the ICl. In solvents of less non-polar character, e.g., PhCl, CH<sub>2</sub>Cl<sub>2</sub>, this increase in ionic character is sufficient for the ICl to behave as an extremely weak electrolyte. The data are also discussed in relation to the energy of solvation of the ions. C. R. H.

**Ionisation constant of glycollic acid from 0° to 50°.** L. F. NIMS (J. Amer. Chem. Soc., 1936, 58, 987—989).—The ionisation const. and the free energy, heat content, and entropy change have been obtained. E. S. H.

**Formation of polyiodides in dark solutions.** G. HERRERO ORTIZ (Anal. Fis. Quim., 1936, 34, 48—65). F. R. G.

**Polyhalides. I. Solubility of iodine in hydrobromic acid.** F. H. LEE and K. H. LEE (J. Chinese Chem. Soc., 1936, 4, 126—130).—The const. for the equilibrium HBr—I<sub>2</sub> ⇌ HBrI<sub>2</sub> has been determined between 15° and 45°.  $\Delta H = -1602$  g.-cal. R. S.

**Raman effect and dissociation of KHSO<sub>4</sub>.** W. M. SHAFFER and D. M. CAMERON (J. Chem. Physics, 1936, 4, 392—393).—Raman spectra of aq. solutions of KHSO<sub>4</sub> show that progressive dissociation of HSO<sub>4</sub>' with dilution occurs between 34 and 13% concn. No lines attributable to undissociated KHSO<sub>4</sub> are present even at the highest concn. F. L. U.

**Complex fluorides. I. Hydrolysis of the silicofluoride ion.** J. G. RYSS and N. P. BARINA (Compt. rend. Acad. Sci. U.R.S.S., 1936, 2, 21—25).—According to  $p_H$  measurements of Na<sub>2</sub>SiF<sub>6</sub> solutions the hydrolysis const. of SiF<sub>6</sub>' is  $1.2 \times 10^{-2}$  at 20°. T. G. P.

**Complex fluorides. II. Hydrolysis of borofluoride ions.** J. G. RYSS and N. P. BARINA (Compt. rend. Acad. Sci. U.R.S.S., 1936, 2, 107—110).—The

val. of  $K$  for the equilibrium  $\text{BF}_4' + 3\text{H}_2\text{O} \rightleftharpoons \text{H}_3\text{BO}_3 + 4\text{F}' + 3\text{H}'$  ( $18^\circ$ ) is  $2.51 \times 10^{-19}$  according to  $p_H$  data for aq. solutions of KF saturated with  $\text{KBF}_4$  and  $\text{H}_3\text{BO}_3$ . Titration of  $\text{HBF}_4$  in dil. solution does not give satisfactory results. H. J. E.

**Hydrolysis of solutions of quinquivalent vanadium sulphate.** G. GIRE and F. RIVENQ (Compt. rend., 1936, 202, 2081—2083).—The degree of hydrolysis of aq.  $\text{V}_2\text{O}_5(\text{SO}_3)_2$  has been measured at  $0$ – $75^\circ$  in presence of varying amounts of  $\text{H}_2\text{SO}_4$ . H. J. E.

**Equilibrium between isopropyl alcohol and acetone in presence of alcohol-dehydrogenase.** R. WURMSER and (MME.) S. FILITTI-WURMSER (Compt. rend., 1936, 202, 1848—1849; cf. A., 1935, 658).—The normal potential of the system at  $p_H$  7 is  $-0.247$  volt at  $35^\circ$ . The free energy of the reaction is 8300 g.-cal. J. G. A. G.

**B.-p. lowering by non-volatile substances in ternary systems. I. Influence of potassium chloride on the b.p. of aqueous solutions of calcium chloride.** M. CENTNERSZWER and (MISS) M. SWIERCZEWSKA (Bull. Acad. Polonaise, 1935, A, 551—558).—Addition of KCl to aq. solutions of  $\text{CaCl}_2$  causes a lowering of the b.p. at high  $[\text{CaCl}_2]$  and an elevation at low  $[\text{KCl}]$ . At an intermediate concn., the "indifferent solution," the b.p. is unchanged by KCl. Similar effects are observed on addition of glucose and fructose to solutions of  $\text{CaCl}_2$ . The composition of the indifferent solution is sp. for the added substance and independent of its concn. O. D. S.

**Calculation of isoelectric zones and isoelectric points.** D. I. HITCHCOCK (J. Biol. Chem., 1936, 114, 373—379).—A method for calculating the breadth of the isoelectric zone of a simple ampholyte as a function of  $K_1/K_2$  is described and a general equation is given for the isoelectric point of a multivalent ampholyte in terms of the several  $K$  vals. H. D.

**Thermodynamic law of action and reaction.** L. MALIS and V. JACYNA (Bull. Acad. Polonaise, 1935, A, 507—514).—A thermodynamic treatment of irreversible change. O. D. S.

**Thermodynamic properties of nitric oxide [as] an example of an associated liquid.** O. K. RICE (J. Chem. Physics, 1936, 4, 367—372; cf. this vol., 294).—The heat of dissociation of  $(\text{NO})_2$  in the liquid phase, calc. from sp. heat data, is 3.91 kg.-cal. per mol. at the b.p. It is estimated to be about 1 kg.-cal. lower in the gas phase. The sp. heat of the completely associated liquid and the entropy of vaporisation are also calc. F. L. U.

**Free energy of iodine and hydrogen iodide from spectroscopic data.** G. M. MURPHY (J. Chem. Physics, 1936, 4, 344—350).—Thermodynamic quantities relating to the dissociation of I, and of HI are calc. F. L. U.

**Influence of dipole fields between solute molecules. III. Thermodynamic properties of non-electrolytes.** R. M. FUOSS (J. Amer. Chem. Soc., 1936, 58, 982—984; cf. A., 1934, 728).—Theoretical. For solute mols. which may be represented as spheres containing a point dipole, there is a linear relation at

limiting low concns. between (a) the osmotic deviation function  $j$  of Lewis and Randall and the concn., and (b) the partial mol. heat capacity and concn. E. S. H.

**Thermodynamics of hydrobromic acid in aqueous solution from electromotive force measurements.** H. S. HARNED, A. S. KESTON, and J. G. DONELSON (J. Amer. Chem. Soc., 1936, 58, 989—994).—E.m.f. of the cells  $\text{H}_2|\text{HBr}(m)|\text{AgBr}-\text{Ag}$  at  $0$ – $60^\circ$  and  $0.001$ – $1M$  have been determined. The standard potential is given by  $E_0 = 0.06846 - 0.0005185(t-30) - 2.973 \times 10^{-6}(t-30)^2$ . The activity coeff., relative partial mol. heat content, and sp. heat of HBr have been calc. E. S. H.

**Thermodynamic study of zinc bromide.** F. ISHIKAWA, Y. FERUI, and T. TAKAI (Bull. Inst. Phys. Chem. Res. Japan, 1936, 15, 339—346).—From e.m.f. data for the cell  $\text{Zn}-\text{Hg}(10\%)|\text{ZnBr}_2, \text{HgBr}|\text{Hg}$  and v.p. of  $\text{ZnBr}_2$  solutions, differential and integral free energies have been calc. N. M. B.

**Activity coefficients of bivalent metal sulphates in aqueous solution from vapour-pressure measurements.** R. A. ROBINSON and R. S. JONES (J. Amer. Chem. Soc., 1936, 58, 959—961).—Osmotic and activity coeffs. for  $\text{CuSO}_4$ ,  $\text{MgSO}_4$ ,  $\text{ZnSO}_4$ ,  $\text{CdSO}_4$ ,  $\text{MnSO}_4$ , and  $\text{NiSO}_4$  in aq. solution at  $25^\circ$  have been determined. With  $\text{CdSO}_4$  the activity coeff. does not agree with that derived from e.m.f. measurements. E. S. H.

**Quantum mechanics and the third law of thermodynamics.** L. PAULING and E. D. EASTMAN (J. Chem. Physics, 1936, 4, 393—394).—A discussion of a paper by Rodebush (A., 1934, 1306). F. L. U.

**Topological properties of phase diagrams.** A. B. MŁODZIEJEWSKI (Ann. Sect. Anal. Phys.-Chim., 1936, 8, 57—68).—Theoretical. R. T.

**Topology of diagrams of chemical equilibria.** N. S. KURNAKOV (Ann. Sect. Anal. Phys.-Chim., 1936, 8, 15—55).—Theoretical. R. T.

**Micro-structures of some calcium aluminate melts.** D. S. BELJANKIN and N. A. TOROPOV (Zentr. Min., 1935, A, 174—182; Chem. Zentr., 1935, ii, 2034).—Micrographic and equilibrium data for the  $\text{CaO}-\text{Al}_2\text{O}_3$  system are recorded, and the results applied to magmatic rocks. J. S. A.

**Existence of the complex  $\text{MnSO}_4 \cdot x\text{SO}_2$ .** L. I. KASCHTANOV and G. A. GULJANSKAJA (J. Gen. Chem. Russ., 1936, 6, 227—231).— $\text{SO}_2$  is adsorbed by  $\text{MnSO}_4 \cdot \text{H}_2\text{O}$ , to yield a product of the composition  $\text{MnSO}_4 \cdot \text{SO}_2$ , but not by  $\text{MnSO}_4 \cdot 4$  or  $7\text{H}_2\text{O}$ . R. T.

**Physico-chemical analysis of the system iron-oxygen. Revision of earlier studies, applying semi-permeable diaphragms.** E. V. BRITZKE, A. F. KAPUSTINKSI, and T. I. SCHASCHKINA (Ann. Sect. Anal. Phys.-Chim., 1936, 8, 141—149).—The partial  $\text{H}_2\text{O}$  and  $\text{H}_2$  pressures over a mixture of Fe and FeO at  $800$ – $1200^\circ$  have been measured separately by use of a Pd diaphragm. The dissociation pressure of FeO is given by  $\log p = -29078/T + 3.5 \log T - 0.00165(T-600) - 1.68$ . R. T.

**Thermal analysis of mixtures containing ammonium, sodium, potassium, and calcium**

nitrate. T. URBANSKI and S. KOŁODZIEJCZYK (Rocz. Chem., 1936, 18, 119—125).—The system  $\text{NH}_4\text{NO}_3\text{--Ca}(\text{NO}_3)_2$  (eutectic, 71% of  $\text{NH}_4\text{NO}_3$ , 111°) belongs to Rooseboom's type V. Thermal diagrams for the systems  $\text{NH}_4\text{NO}_3\text{--NaNO}_3\text{--KNO}_3$  and  $\text{NH}_4\text{NO}_3\text{--NaNO}_3\text{--Ca}(\text{NO}_3)_2$  have been determined.

R. T.

**System: aluminium sulphate-potassium sulphate-water.** L. TS'AI and W. YEN (J. Chinese Chem. Soc., 1936, 4, 178—182).—Equilibrium data for the system at 0° are recorded.

R. S.

**Partial solubility isotherm of the system  $\text{NH}_3\text{--MoO}_3\text{--H}_2\text{O}$  at 25°.** H. W. FOOTE and W. M. BRADLEY (J. Amer. Chem. Soc., 1936, 58, 930—931).—The conditions for the existence of

$3(\text{NH}_4)_2\text{MoO}_4, 4\text{MoO}_3, 4\text{H}_2\text{O}$  and  $3(\text{NH}_4)_2\text{MoO}_4, 5\text{MoO}_3, 4\text{H}_2\text{O}$  have been determined.

E. S. H.

**Fusion diagram of the ternary system  $\text{Na}_2\text{SiO}_3\text{--PbSiO}_3\text{--PbO}$ .** K. A. KRAKAU (Ann. Sect. Anal. Phys.-Chim., 1936, 8, 331—350).—The cryst. phases are  $\text{Na}_2\text{O}, \text{SiO}_2$ ,  $\text{PbO}$ ,  $3\text{PbO}, \text{SiO}_2$ ,  $2\text{PbO}, \text{SiO}_2$ , and  $\text{PbO}, \text{SiO}_2$ .

R. T.

**Acid salts of monobasic organic acids. II. *r*-Mandelic acid.** J. D. M. ROSS and T. J. MORRISON (J.C.S., 1936, 867—872).—Previous work (A., 1933, 1013) on the system *r*-mandelic acid-metal mandelate- $\text{H}_2\text{O}$  has been extended to Cs, Rb, Tl,  $\text{NH}_4$ , and Mg mandelates. The following acid salts have been isolated:  $\text{RbM}, \text{HM}$ ;  $\text{RbM}, 3\text{HM}$ ;  $\text{CsM}, \text{HM}$ ;  $\text{NH}_4\text{M}, \text{HM}$ ;  $\text{NH}_4\text{M}, 3\text{HM}$ ;  $\text{TlM}, \text{HM}$ ;  $2\text{MgM}_2, \text{HM}, 2\text{H}_2\text{O}$  ( $\text{M}=\text{OH}\cdot\text{CHPh}\cdot\text{CO}_2$ ).

C. R. H.

**Systems zirconium oxalate-alkali oxalates-water.** J. BOULANGER (Compt. rend., 1936, 202, 2156—2159).—The following solid phases were obtained:  $2\text{MCs}_2, \text{MZrO}, \text{MH}_2, 4\text{H}_2\text{O}$ ;  $2\text{MRb}_2, \text{MZrO}, \text{MH}_2, 2\text{H}_2\text{O}$ ;  $2\text{MK}_2, \text{MZrO}, \text{MH}_2, 4\text{H}_2\text{O}$ ;  $\text{MK}_2, \text{MZrO}, \text{MH}_2, \text{H}_2\text{O}$ ;  $\text{MRb}_2, \text{MZrO}, \text{MH}_2, 3\text{H}_2\text{O}$  ( $\text{M}=\text{C}_2\text{O}_4$ ).

C. R. H.

**Quaternary system  $\text{CaO--MgO--2CaO}, \text{SiO}_2\text{--5CaO}, 3\text{Al}_2\text{O}_3$ .** H. F. MCMURDIE and H. INSLEY (J. Res. Nat. Bur. Stand., 1936, 16, 467—474).—Vol. measurements afford no evidence of ternary or quaternary compounds, and there is no detectable solid solution formation. The amount of  $\text{MgO}$  required to be added to the system  $\text{CaO--2CaO}, \text{SiO}_2\text{--5CaO}, 3\text{Al}_2\text{O}_3$  to render it the primary phase varies from 5 to 33%.

J. W. S.

**Entropy of organic compounds from calorimetric data. Lack of equilibrium in crystalline tetramethylmethane.** J. G. ASTON and G. H. MESSERLY (J. Chem. Physics, 1936, 4, 391—392).—Comparison of calorimetric and spectroscopic data indicates zero-point entropy of about 8 e.u. in ordinary crystals of  $\text{CMe}_4$  at 0° abs., due to randomness caused by lack of equilibrium.

F. L. U.

**Heat capacity of lead sulphate.** E. G. HAAS [with G. STEGEMAN] (J. Amer. Chem. Soc., 1936, 58, 879—880).—A low-temp. calorimeter is described. Data are recorded for  $\text{PbSO}_4$  between 83° and 298° abs.

E. S. H.

**Heat capacity and entropy of  $\beta$ -lactose.** E. F. FURTSCH [with G. STEGEMAN] (J. Amer. Chem. Soc.,

1936, 58, 881—882).—Heat capacities between 83° and 298° abs. are recorded. The entropy and free energy of formation have been calc.

E. S. H.

**Heat of reaction of binding substances.** P. P. BUDNIKOV and L. GULINOVA (Ann. Sect. Anal. Phys.-Chim., 1936, 8, 357—372).—The heat evolved when  $\text{H}_2\text{O}$  is added to fired gypsum rises to a max. at 200° with rise in temp. of firing and falls to a min. at 750°, thereafter rising uninterruptedly to 1200°; this corresponds with the production of anhydrite (200°), of inactive  $\text{CaSO}_4$  (750°), and with the dissociation to  $\text{CaO}$  and  $\text{SO}_3$ . The inactive form may be activated by addition of aq.  $\text{NaHSO}_4$ .

R. T.

**Influence of molecular size on activity.** C. G. BOISSONNAS (Arch. Sci. phys. nat., 1936, [v], 18, Suppl., 40—42).—The heats of dilution of solutions of related substances in the same solvent are said to depend only on the wt. composition of the solution.

J. W. S.

**Thermochemistry of aqueous solutions of electrolytes. I. Heat of dissolution, and specific heat of aqueous potassium sulphate.** K. P. MISCHTSCHENKO and M. Z. PRONINA (J. Gen. Chem. Russ., 1936, 6, 85—101).—Heats of dissolution of  $\text{K}_2\text{SO}_4$  and sp. heats, have been determined at 25° for solutions over a wide range extending to saturation, and the integral heats of dilution are calc. Different types of integral heat of dissolution-concn. curves are discussed.

R. T.

**Integral free energy of dissolution of (A) sodium bromide. F. ISHIKAWA and T. TAKAI. (B) Potassium chloride. F. ISHIKAWA and K. MORIWAKI** (Bull. Inst. Phys. Chem. Res. Japan, 1936, 15, 333—335, 336—338).—(A) The integral free energy change has been calc. from differential free energy data for dissolution and dilution.

(B) The free energy change for  $\text{KCl}$  has been derived similarly from heats of dissolution and v.-p. data.

N. M. B.

**Heats of combustion of organic compounds of selenium.** H. MERTEN and H. SCHLÜTER (Ber., 1936, 69, [B], 1364—1366).—The following vals. at const. vol. and pressure, respectively, have been determined:  $\text{CSe}_2$ ,  $240.6 \pm 1.0$  and  $241.8 \pm 1.0$ ;  $\text{Et}_2\text{Se}$ ,  $747.7 \pm 0.7$  and  $749.7 \pm 0.7$ ;  $(\text{CH}_2\text{Ph})_2\text{Se}$ ,  $1846.9 \pm 5.7$  and  $1849.5 \pm 5.7$  kg.-cal. per mol.; polymeride A,  $124.2$  and  $124.8$  kg.-cal. per Se atom.

H. W.

**Conductivity of solutions in iodine. II.** V. A. PLOTNIKOV, J. A. FIALKOV, and V. P. TSCHALI (J. Gen. Chem. Russ., 1936, 6, 273—278).—The conductivity of solutions of  $\text{HgI}_2$ ,  $\text{SnI}_4$ ,  $\text{SbI}_5$ ,  $\text{AlI}_3$ , and  $\text{PI}_3$  in I has been determined, at 130° and 140°. Conductivity is due to dissociation of associated mols. as represented by  $(\text{MI})_n \rightleftharpoons \text{MI}_n - m + m\text{I}$ ; the formation of polyiodides is not indicated.

R. T.

**Mobility of bromine and iodine ions.** M. HLASKO and A. SIEMIASZKO (Rocz. Chem., 1936, 16, 92—100).—The transport nos., calc. from conductivity data, are  $\text{Br}^-$  78.4, and  $\text{I}^-$  78.9.

R. T.

**Metaphosphoric acids. I. Changes in electrical conductivity during transformation of the acids in aqueous solution.** S. GLIXELLI, R.

CHYZANOWSKA, and K. BORATYNSKI (*Z. anorg. Chem.*, 1936, 227, 402—412).—The mol. conductivity ( $\lambda$ ) of aq.  $\text{HPO}_3$  is  $>$  that of  $\text{H}_3\text{PO}_4$  (when referred to equal  $[\text{P}_2\text{O}_5]$ ) at all concns., the difference decreasing with increasing dilution. It is also  $>$  that of  $\text{H}_4\text{P}_2\text{O}_7$  above  $[\text{P}_2\text{O}_5]=0.015M$ , below which the difference is reversed. The alteration of  $\text{HPO}_3$  solutions with time consists of two processes, viz., (1) hydration to  $\text{H}_3\text{PO}_4$ , favoured by high concn., and (2) depolymerisation of  $(\text{HPO}_3)_n$  to simpler mols., favoured by rise of temp. These changes are respectively indicated by decrease and increase of  $\lambda$ . F. L. U.

**Electrochemistry of aqueous glycerol and aqueous glycol solutions.** I. I. I. SHUKOV and I. F. KARPOVA (*J. Gen. Chem. Russ.*, 1936, 6, 161—166).—The  $p_H$  of 0.01—0.1N-HCl or  $\text{H}_2\text{SO}_4$  is unaffected by dilution with glycerol, glycol, or erythritol. R. T.

**Oxidation potential of thalious and thallic salts.** M. S. SHERRILL and A. J. HAAS, jun. (*J. Amer. Chem. Soc.*, 1936, 58, 952—959).—In mixtures of  $\text{TiClO}_4$ ,  $\text{Ti}(\text{ClO}_4)_3$ , and  $\text{HClO}_4$  the oxidation potential is determined by the ionic strength  $\mu$  of the solution and by the concn. ratio  $(\Sigma\text{Ti}^{III})/(\Sigma\text{Ti}^{IV})$ , as given by  $E=E_0+0.02957 \log (\Sigma\text{Ti}^{III})/(\Sigma\text{Ti}^{IV})$  and  $E_0=1.2466+0.0076\mu+0.00482\mu^2$ , in which  $E_0$  is the formal oxidation potential of the reaction  $\text{Ti}^{III}+2e=\text{Ti}^{IV}$ . In  $\text{Ti}_2\text{SO}_4\text{—Ti}_2(\text{SO}_4)_3\text{—H}_2\text{SO}_4$  mixtures the formal electrode potential calc. as above varies appreciably at the lower concn. ratios, but is nearly const. when  $(\Sigma\text{Ti}^{III})/(\Sigma\text{Ti}^{IV})=1$ . The solubility of moist  $\text{Ti}(\text{OH})_3$  in aq.  $\text{HClO}_4$  and  $\text{H}_2\text{SO}_4$  at  $25^\circ$  has been determined. The solubility product of  $\text{Ti}(\text{OH})_3$  is  $1.5 \times 10^{-44}$ . E. S. H.

**Double electrode potential and oxidation-reduction potential.** T. T. CHEN (*J. Chinese Chem. Soc.*, 1936, 4, 117—125).—The double electrode potentials for pairs of benzoquinone-quinol mixtures are approx. equal to the oxidation-reduction potentials which would be obtained if the two pairs were combined to produce a single solution. In the case of pure, unstirred benzoquinone and quinol solutions, more or less stable mixtures are at once formed around the electrodes; if these are dispersed by stirring, a steady potential is not obtained. R. S.

**Luciferin-oxy luciferin system.** I. M. KORR (*J. Amer. Chem. Soc.*, 1936, 58, 1060—1061).—The oxidation-reduction potential of the system (which is partly reversible, is active at an electrode, and is unusually  $+$  for a biological compound) lies near that for quinihydrone. H. B.

**Mechanism of the Becquerel effect of organic molecules.** C. STORA (*Compt. rend.*, 1936, 202, 2152—2154).—From data for coloured org. compounds it is concluded that the Becquerel effect at any instant is the resultant of the positive and negative effects due to the oxidisability of the reduced form and the reducibility of the oxidised form, respectively. C. R. H.

**Potentials at liquid-liquid phase boundaries.** I, II. K. KARCZEWSKI (*Rocz. Chem.*, 1936, 16, 69—75, 126—129).—I. The potentials ( $-$ ) between  $\text{EtOAc}$  (I) and 0—0.1N-KCNS, (I) saturated with

$\text{H}_2\text{O}$  and KCNS in aq. (I), and the same system at equilibrium, have been measured, at  $17^\circ$ . In the last case, a min.  $\pi$  is found for 0.005N-KCNS, at which concn. the most stable emulsions are obtained. No correlation is found between  $-$  and surface tension.

II. The vals. of  $\pi$  have been determined for the systems  $\text{Bu}^\circ\text{OH}$ —0.0001—0.1N-KCNS, in presence of different concns. of KCl (0—1N) equal to those in the electrolyte of the standard (AgCl) electrodes.

R. T.

**Thermo-electric potentials in salt crystals with colour centres.** O. STASIŃ (Nachr. Ges. Wiss. Göttingen, 1935, [ii], 1, 199—202; *Chem. Zentr.*, 1935, ii, 1837).—The thermo-electric potential between clear KCl and coloured KCl crystals, with the "hot junction" at  $700^\circ$ , has been measured. From its variation with temp. the mobility of the positive ions is calc. J. S. A.

**Decomposition potentials of Grignard reagents in ether solution.** F. H. LEE and C. H. LI (Nanking J., 1934, 4, 1—3; cf. A., 1934, 517).—Relative vals. recorded for different groups are: Ph 2.17, Me 1.94,  $\text{Pr}^\circ$  1.42,  $\text{Bu}^\circ$  1.32, Et 1.28,  $\text{Bu}^\beta$  1.24,  $\text{Pr}^\beta$  1.07,  $\text{Bu}^\gamma$  0.97, allyl 0.86. CH. ABS. (r)

**Acoustic electrochemical phenomena.** II. L. V. NIKITIN (*Compt. rend. Acad. Sci. U.R.S.S.*, 1936, 2, 67—69; cf. A., 1935, 306).—Certain cells with Pt electrodes are said to be sensitive to sound waves. H. J. E.

**Passivity of iron and steel in nitric acid solution.** Y. YAMAMOTO (*Bull. Inst. Phys. Chem. Res. Japan*, 1936, 15, 350—383).—The p.d. between active Fe in dil.  $\text{HNO}_3$  and passive Fe in conc.  $\text{HNO}_3$  is about 0.33—0.39 volt, corresponding with the difference between the electrode potentials  $\text{Fe}/\text{Fe}^{II}$  (−0.43 volt) and  $\text{Fe}/\text{Fe}^{III}$  (−0.04 volt). When Fe in  $\text{HNO}_3$  becomes passive, the p.d. between Fe and Pt is lowered, and the difference between the max. (p.d. between active Fe and Pt) and the min. (p.d. between passive Fe and Pt) is about 0.75—0.78 volt, corresponding with the standard potential for  $\text{Fe}^{III}+e\rightleftharpoons\text{Fe}^{II}$  (+0.748 volt). Results indicate that the surface of passive Fe is in the ferric, and that of active Fe in the ferrous, condition. N. M. B.

**Structure and properties of the insulating layers formed on aluminium electrodes during anodic polarisation.** I. ZŁOTOWSKI (*Bull. Acad. Polonaise*, 1936, A, 164—194).—A method is developed for measuring the changes in resistance ( $R$ ), capacity ( $C$ ), and dielectric losses during anodic formation of Al at const. c.d. The influence of c.d., temp., and concn. for aq.  $\text{H}_2\text{C}_2\text{O}_4$  suggests that the insulating layer comprises a very thin and almost non-porous film of solid dielectric next to the Al, and an outer, relatively thick, porous layer impregnated with electrolyte. The thin film determines  $R$  and  $C$ . Assuming the dielectric const. of this film to be 7.45, the thickness of the films formed at 1—25 volts is  $10^{-7}$ — $10^{-6}$  cm., and  $R$  is  $10^{10}$ — $10^{11}$  ohms per  $\text{cm}^2$ .  $R$  increases exponentially with increasing temp. of polarisation. The results are in accord with X-ray measurements. J. W. S.

**Free energy and rate of chemical reactions. Relation between rate and oxidation-reduction potentials.** H. GERSHINOWITZ (J. Chem. Physics, 1936, 4, 363—366; cf. A., 1935, 1205).—A theoretical explanation of the connexion between rates of oxidation-reduction reactions and the potentials of the reagents is given. F. L. U.

**Rate of reaction of deuterium with iodine.** K. H. GEIB and A. LENDLE (Z. physikal. Chem., 1936, B, 32, 463—470; cf. this vol., 567).—At 710—780° abs. the velocity coeff. for the reaction of  $H_2$  with I is on the average 2.2 times that of the reaction of 95%  $D_2$  with I. If this difference is due not only to difference in collision no. but also to a difference in the heats of activation the latter amounts to ~0.75 kg.-cal. R. C.

**Thermal decomposition of acetone.** A. O. ALLEN (J. Amer. Chem. Soc., 1936, 58, 1052—1053).—Thermal decomp. of  $COMe_2$  to  $CH_2=CO$  and  $CH_4$  is investigated by the usual static method; the results indicate a chain mechanism (cf. Rice and Herzfeld, A., 1934, 369; Winkler and Hinshelwood, A., 1935, 827). H. B.

**Kinetics of cyclopentadiene.** G. B. KISTIAKOWSKY and W. H. MEARS (J. Amer. Chem. Soc., 1936, 58, 1060).—Polymerisation of cyclopentadiene (I) and depolymerisation of dicyclopentadiene in the gas phase are second- and first-order reactions, respectively; the consts. differ somewhat from those found by Khambata and Wasserman (this vol., 684) but the abs. rates are nearly the same. Dimerisation of liquid (I) is a reaction of nearly first order; no chains are involved. H. B.

**Application of the theory of chain reactions to the slow combustion of benzene.** A. AMIEL (Compt. rend., 1936, 202, 1509—1511; cf. A., 1933, 1249).—The slow combustion of  $C_6H_6$  exhibits a region of const. velocity and belongs therefore to the  $C_2H_2$ -aldehyde class of oxidation reactions (Semenov, "Chain Reactions and Chemical Kinetics," 1935, p. 338). The theory of interacting branched chains accounts qualitatively for the results. Certain products inhibit the reaction and diminish the period of const. velocity. R. S.

**Detection of reaction chains by small amounts of nitric oxide. Thermal decomposition of acetaldehyde and of propaldehyde.** L. A. K. STAVELEY and C. N. HINSHELWOOD (J.C.S., 1936, 812—818; cf. this vol., 803).—The decomp. of  $MeCHO$  is approx. independent of  $[NO]$  up to 1.0 mm., whilst further additions accelerate the rate. It is inferred that the reaction is of the non-chain type. In the case of  $EtCHO$ , the rate of decomp. is reduced by addition of  $NO$ , the min. velocity occurring when  $[NO]=2$  mm., but the position of the end-point is unaffected. The energy of activation of the inhibited reaction is approx. 5000 g.-cal. < that of the uninhibited, the inhibition occurring chiefly in the initial region of rapid decomp., whilst the rate of the subsequent decomp. is equal to that of the inhibited reaction. It is suggested that short chains may arise only from a certain type of activated  $EtCHO$  mol. which is formed in the early stages. R. S.

**Kinetics of thermal polymerisation of indene.** H. DOSTAL and R. RAFF (Z. physikal. Chem., 1936, B, 32, 417—429).—The rate of polymerisation of the liquid in a high vac. and under  $CO_2$  and of the  $PhMe$  solution has been determined at 120—200°, and the results have been worked out in relation to the theory previously advanced (this vol., 164). The velocity of the nucleus-forming reaction is  $0.92 \times 10^{-4}$  and the steric factor  $5 \times 10^{-10}$ . Owing to the exceptionally high velocity of the process of isomeric change which terminates the growing chains only a low degree of polymerisation is achieved. R. C.

**Kinetics and mechanism of decomposition of hydrocarbons. III. Relation between velocity and extent of decomposition of *n*-hexane and *n*-octane.** A. I. DINTZES and A. V. SHERKO (J. Gen. Chem. Russ., 1936, 6, 68—74).—The velocity of thermal decomp. of  $n-C_6H_{14}$  or  $-C_8H_{18}$  does not conform to that of a reaction of the first order, or to any other simple scheme. The velocity coeff. is given, for 50—70% decomp., by  $k t - \log 1/(1+x)$ —where  $\delta$  is a const. for a given hydrocarbon and temp., and  $x$  is extent of decomp. at time  $t$ . R. T.

**Kinetics of thermal *cis-trans* isomerisations.** R. W. HARKNESS (J. Amer. Chem. Soc., 1936, 58, 1058—1059).—The results of Kistiakowsky and Smith (this vol., 802) are consistent with the hypothesis of a bimol. mechanism. E. S. H.

**Velocity of the reaction between organic peracids and cyclohexene.** S. MEDVEDEV and O. BLOCH (J. Phys. Chem. U.S.S.R., 1933, 4, 721—730).—The reactions of perbenzoic, *p*-methoxyperbenzoic (I), *p*- (II) and *m*-nitroperbenzoic,  $\alpha$ - and  $\beta$ -pernapththoic, peracetic, and phenylperacetic acids with cyclohexene at 25° follow the bimol. law. The velocity coeff.  $k$  depends on the initial peroxide concn. but not on that of cyclohexene. The ratio of  $k$  in  $C_6H_6$  to  $k$  in xylene was 1.76. The reactivity of the acyl radicals was of the same order as in the corresponding acyl halides. The activation energy was approx. 14,000 g.-cal. in each case. The Arrhenius coeff.  $\beta$  varied from  $2 \times 10^8$  for (I) to  $4 \times 10^{11}$  for (II).

CH. ABS. (c)

**Oxidising action of ferric chloride. I. Statics and dynamics of the reaction.** C. N. IONESCU and A. BARDEANU (Bul. Soc. Chim. Romania, 1935, 17, 297—307; cf. A., 1934, 521).—The reaction between  $\beta-C_{10}H_7 \cdot OH$  and  $FeCl_3$  has been studied in aq. solution, when  $2C_{10}H_7 \cdot OH + 2FeCl_3 = (C_{10}H_6 \cdot OH)_2 + FeCl_2 + 2HCl$ . Owing to hydrolysis of  $FeCl_3$  the reaction is not quant., but becomes so in presence of 0.1N-HCl;  $Fe(OH)_3$  has no influence on  $C_{10}H_7 \cdot OH$ . The reaction is unimol. with respect to both reactants, indicating the existence of intermediate reactions. R. S. B.

**Elucidation of the course of reactions and of rates of reaction by modern conductometric methods.** G. JANDER and H. IMMOG (Ber., 1936, 69, [B], 1282—1292).—A conductometric method for measuring rates of reaction is described. The great sensitivity of measurement of conductivity allows the rate of ester hydrolysis ( $OH \cdot CHPh \cdot CO_2Me$  and  $Pr^aCO_2Me$ ) to be determined in buffered solutions. The dependence of the coeff. on temp. and  $p_H$  is

confirmed and the marked catalytic influence of liver esterase on the hydrolysis of  $\text{Pr}^{\text{CO}_2}\text{Me}$  is established. In buffered solutions, the unimol. course of hydrolysis is transformed by the catalyst into a reaction of zero order. The method is also applied to the fission of  $\text{CCl}_3\text{-CO}_2\text{H}$ , which is greatly accelerated by sulphates.

H. W.

**Kinetics of the reaction between iodoacetic acid and glycine.** R. BRDIČKA (J. Gen. Physiol., 1936, 19, 843—866).—The reaction, being of the ionic type and showing a positive salt catalysis, proceeds in two steps in which H of the  $\text{NH}_2$  are replaced by Ac, the velocity coeff. being in the ratio 2 : 1. Since only the anionic form of glycine reacts there is evidence for the existence of an unbonded pair of electrons on the N in the  $\text{NH}_2$ .

H. G. R.

**Hydrolysis of acetyl and chloroacetyl chlorides.** J. RODRÍGUEZ VELASCO and J. R. DE LA BORBOLLA (Anal. Fis. Quím., 1936, 34, 179—197).—The velocity coeffs. of hydrolysis, in  $\text{PhMe}$ , of the chlorides at  $25^\circ$  are inversely  $\propto$  the square root of the dissociation consts. of the corresponding acids.

F. R. G.

**Kinetics of racemisation of 2:2'-diamino-6:6'-dimethyldiphenyl.** G. B. KISTIAKOWSKY and W. R. SMITH (J. Amer. Chem. Soc., 1936, 58, 1043—1045).—The reaction in  $\text{Ph}_2\text{O}$  solution or in the gaseous phase is homogeneous and unimol., and has an activation energy of 45,100 g.-cal. The rate coeffs. have been determined.

E. S. H.

**Ease of formation of cyclic imines. III. Kinetics of the formation of polymembered rings.** G. SALOMON (Helv. Chim. Acta, 1936, 19, 743—793; cf. A., 1934, 902).—Formation of  $[\text{CH}_2]_n\text{NH}$  from  $\text{NH}_2\text{[CH}_2\text{]}_x\text{Br}$  differs from the accompanying polymerisation and hydrolysis in being unimol. The rate of liberation of  $\text{Br}'$  under various conditions thus allows detection of the conditions under which unimol. ring-formation is the chief reaction and is determined in aq.  $\text{PrOH}$ . Ease of formation of 17-, 15-, and 14-membered rings is in the ratio, 2 : 1 : 1; that of the 12-membered ring is very much less, as hydrolysis is in this case the main reaction under comparable conditions. The kinetic measurements show that this hydrolysis is partly a bimol. reaction with  $\text{OH}'$  and partly reaction with the solvent. The data of Stoll *et al.* (A., 1934, 1201) show that formation of poly-esters occurs by various routes, so that his figures give relative accessibility and not relative ease of formation.

R. S. C.

**Thermal decomposition of silver oxalate. I. Experimental. II. Theoretical.** J. Y. MACDONALD (J.C.S., 1936, 832—838, 839—947; cf. A., 1926, 134).—I. The period of attainment of the max. rate of decomp. of  $\text{Ag}_2\text{C}_2\text{O}_4$  in vac. increases with increasing  $[\text{NO}_3']$  or  $[\text{SO}_4'']$  in the pptg. solutions, and in some cases the fraction decomposed at the max. diminishes. Dispersion of the  $\text{Ag}_2\text{C}_2\text{O}_4$  in gelatin has little effect, but in presence of air the rate = that in vac. up to 3% of decomp., after which it decreases. When the salt is suspended in paraffin, the behaviour resembles that in air with the addition of a second and greater max. Exposure to ultra-violet light produces two rate max., viz., (a) corresponding with the first

paraffin max. and (b) corresponding with the max. in vac. The reaction is catalysed by Hg. Microscopical examination has shown that decomp. proceeds uniformly throughout and not from crystal to crystal. Three mechanisms are suggested. Process I concerns only the initial 3% of decomp. and is associated with the first paraffin max. Process II is a surface reaction which appears in vac. but is absent in presence of air or paraffin, whilst process III is responsible for the second paraffin max. Experiments with large crystals are in agreement with these views.

II. The ways in which a single crystallite may decompose have been studied in relation to the experimental results and the following conclusions have been reached. Process I is due to decomp. starting from a fixed no. of initial centres and propagating in two dimensions in thin plates across the crystal planes, whence  $dx/dt \propto kt$ . The energy of activation is 32,700 g.-cal. Process II depends on the formation of fresh planes of decomp. by branching at the crystal surface, and  $dx/dt \propto \frac{1}{2}\pi K^2 n(e^{p'} - 1)/p$ , where  $p$  is the rate of branching. In the case of vac. decomp.,  $p \propto -\log [\text{NO}_3']$ , i.e., the rate of branching depends on the concn. of ions on the surface. Finally a plane may branch at any point along its edge. This process (III), which is much slower than II, becomes important when the no. of active planes is only a small fraction of the total no. of planes. Here  $dx/dt \propto bwne^{bt}$  where  $b$  is the no. of new planes generated per sec. by each decomp. plane.

R. S.

**Velocity of dissolution of magnesium in acids.** J. V. DURDIN and A. M. MARKEVITSCH (J. Gen. Chem. Russ., 1936, 6, 236—249).—The velocity of dissolution,  $V$ , of Mg in aq.  $\text{HCl} \propto [\text{H}']$ , whilst in aq.  $\text{AcOH-NaOAc}$  buffers it is independent of the  $[\text{H}']$ , but  $\propto [\text{AcOH}]$ ; it is unaffected by the presence of  $\text{MgCl}_2$  or  $\text{Mg}(\text{OAc})_2$ . At const. temp.  $V$  rises rapidly with increasing rate of stirring; the temp. coeff. falls with rise in temp., in contrast to the behaviour of Cr. In the case of  $\text{HCl}$ , the val. of  $V$ , with const. rate of stirring, varies with temp. parallel with variation in the  $\eta$  of the medium ( $V \propto k/\eta$ ), whilst in  $\text{AcOH}$   $V \propto T/\eta$ . The process is concluded to be exclusively one of diffusion in the case of  $\text{HCl}$ , and dominantly so in the case of  $\text{AcOH}$ .

R. T.

**Corrosion of magnesium.**—See B., 1936, 600.

**Theories of corrosion. III.** W. J. MULLER (Korros. u. Metallschutz, 1935, 11, 35—34; Chem. Zentr., 1935, ii, 2118; cf. B., 1934, 324).—Intercryst. corrosion and the relation of corrosion to the electrode potential of a metal are considered in terms of a porous oxide skin theory of passivity.

J. S. A.

**Kinetics of hydration of some cobalt complexes.** J. BRULL (Compt. rend., 1936, 202, 1584—1586).—Conductometric determinations of velocity have been made for the reaction of  $[\text{Co en}_2\text{Cl}_2]\text{Cl}$  (I),  $[\text{Co en}_2\text{Cl}(\text{H}_2\text{O})]\text{Cl}$  (II), and  $[\text{Co en}_2\text{ClO}(\text{H})]\text{Cl}$  with  $\text{H}_2\text{O}$ . Differences in rate were observed with the isomeric forms of (I) and (II).

H. J. E.

**Adsorption of gases by glass walls. XIII. Sulphur dioxide on Jena glass. Kinetics of the adsorption.** M. CRESPI and V. ALEXANDRE (Anal. Fis. Quím., 1935, 33, 350—359).—The adsorption

of  $\text{SO}_2$  by Jena glass is between 0.33 and 0.5 of that by ordinary glass. The vol. adsorption by 1 sq. cm. of Jena glass wall is given by  $1.3 \times 10^{-5} p^{0.35}$ , where  $p$  is the pressure in mm. for vals. of  $p$  between 50 and 710. The velocity ( $v$ ) at const. pressure is given by  $dy/dt = Kp(y_e - y)/y$ , where  $y_e$  is the equilibrium velocity,  $y$  is the velocity at time  $t$ , and  $K$  varies but slightly from 0.0076 for vals. of  $p$  from 50 to 710. Corrections are given for the wt. of a given vol. of  $\text{SO}_2$  at  $16^\circ$  and pressures between 100 and 710 mm. when contained in Jena glass. F. R. G.

**Quantum theory of catalysis.** A. A. SCHUCHOVITZKI (Acta Physicochim. U.R.S.S., 1934, 1, 901—912).—The calc. activation energy for the ortho-para- $\text{H}_2$  conversion was 7 kg.-cal. < the val. of Eyring and Polanyi. CH. ABS. (e)

**Influence of hydrogen on unimolecular reactions involving short chains.** C. N. HINSHELWOOD and L. A. K. STAVELEY (J.C.S., 1936, 818—820; cf. A., 1927, 630, 1036).—The addition of  $\text{H}_2$  to  $\text{EtCHO}$  or  $\text{Et}_2\text{O}$  (35 mm.), containing  $\text{NO}$ , increases the rate of decomp. to that prevailing at high initial pressures as in the absence of  $\text{NO}$ . It is inferred that only the primary activation process is affected by  $\text{H}_2$ . R. S.

**Catalytic action of salts on the velocity of ionic reactions.** II. E. BEKIER (Rocz. Chem., 1936, 16, 64—68).—The catalytic action of different ions in the reaction  $\text{CH}_3\text{Cl} \cdot \text{CO}_2' + \text{S}_2\text{O}_3'' \rightarrow \text{S}_2\text{O}_3 \cdot \text{CH}_3 \cdot \text{CO}_2'' + \text{Cl}'$  varies in the series  $\text{K}' > \text{Na}' > \text{Li}'$ ;  $\text{Ba}'' > \text{Sr}'' > \text{Ca}'' > \text{Mg}''$ ;  $\text{Br}' > \text{Cl}' > \text{NO}_3' > \text{OAc}'$ . The same order holds for the mobility of the ions, and the inverse order for their hydration. The heat of activation of the reaction is 18,500 g.-cal. R. T.

**Influence of alkyl groups on reaction velocities in solution. I. Acid-catalysed prototropy of phenyl alkyl ketones.** D. P. EVANS (J.C.S., 1936, 785—789; cf. A., 1935, 828, 1206; this vol., 35).—The acid-catalysed prototropy of a series of ketones  $\text{CH}_3\text{R} \cdot \text{COPh}$  has been studied. The velocity coeffs. decrease in the order  $\text{R} = \text{H}, \text{Me}, \text{Et}, \text{Pr}^a, \text{Bu}^a$ , tending towards a const. val. There is an increase in the energy of activation of 2000 g.-cal. and a tenfold increase in the  $P$  factor in passing from  $\text{R} = \text{H}$  to  $\text{R} = \text{Me}$ , after which  $E$  and  $P$  decrease. Since  $E$  is about the same in the case of  $\text{COPhPr}^a$  and  $\text{COPhEt}$ , it is inferred that the increase is due to the co-ordination of a  $\beta\text{-H}$  with  $\text{O}$ , whilst the increase in  $P$  is attributed to the greater inductive effect due to co-ordination. R. S.

**Formation of intermediate compounds in the oxidation of sulphur dioxide by oxygen in presence of catalysts and anti-catalysts.** L. I. KASCHTANOV and V. P. RISHOV (J. Gen. Chem. Russ., 1936, 6, 549—554).—The yield of  $\text{H}_2\text{S}_2\text{O}_6$  falls, and that of  $\text{H}_2\text{SO}_4$  rises, with increasing  $[\text{H}']$  when air containing small amounts of  $\text{SO}_2$  is bubbled through  $\text{H}_2\text{O}$  at  $0\text{--}20^\circ$ , whilst at  $40\text{--}60^\circ$  the opposite effects are observed. In presence of  $\text{MnSO}_4$  increasing  $[\text{H}']$  favours  $\text{H}_2\text{SO}_4$  formation at  $0\text{--}60^\circ$ , whilst  $\text{PhOH}$ , alone or in presence of  $\text{MnSO}_4$ , favours  $\text{H}_2\text{S}_2\text{O}_6$  production. Flue gases are best desulphurised by passing the gas mixture through aq.  $\text{MnSO}_4$  at  $0\text{--}20^\circ$ .

**Olefine-benzene condensation with sulphuric acid catalyst.**—See this vol., 975.

**Destructive alkylation with a hydrogenating catalyst.**—See this vol., 975.

**Phosphoric acid as catalyst for destructive alkylation of hydrocarbons.**—See this vol., 976.

**Dehydrogenating enzyme system of *Acetobacter peroxydans*.**—See this vol., 893.

**Significance of surface of glass and of salts in certain homogeneous gas reactions.** M. PRETTE (Document. sci., 1935, 4, 33—41; Chem. Zentr., 1935, ii, 2174).—The ignition temp. of  $\text{H}_2\text{--CO}$ -air mixtures on a Pyrex glass vessel was not appreciably raised by coating the glass with  $\text{KCl}$ . The combustion of  $\text{H}_2$  proceeded much more slowly at a  $\text{KCl}$  surface. In the latter case the wall is considered to initiate reaction chains. J. S. A.

**Heterogeneous catalysis of gas reactions.** M. POURBAIX (Rev. univ. Mines, 1935, [viii], 11, 367—370; Chem. Zentr., 1935, ii, 2488).—A theory of heterogeneous catalysis is outlined, whereby the catalyst consists (e.g., for oxidation reactions) of two materials in oxidation-reduction equilibrium. Any oxide pair may thus function catalytically for which the equilibrium pressure of  $\text{O}_2$ , as calc. from the Nernst formula, =  $\text{O}_2$  pressure of the gas mixture. J. S. A.

**Ageing of thin-layered palladium catalysts.** D. P. DOBUTSCHIN and A. V. FROST (J. Phys. Chem. U.S.S.R., 1934, 5, 1031—1038, and Acta Physicochim. U.R.S.S., 1934, 1, 503—510).—During ageing of a  $\text{Pd}$  catalyst, obtained by sublimation, the crystal nuclei increase in size from  $<40$  to  $250\text{--}1000$  Å. The total adsorption of  $\text{H}$  is unchanged, but the rate of adsorption and desorption is reduced. Ageing was effected by heating in vac. at  $0\text{--}100^\circ$  for  $0\text{--}20$  hr. Its rate was reduced by the presence of  $\text{H}_2$ ,  $\text{C}_2\text{H}_4$ ,  $\text{C}_2\text{H}_6$ , or air. No ageing occurred in vac. at  $-185^\circ$ . Desorption from the fresh layer occurred very rapidly. Sintering took place only after desorption (cf. Bastow, A., 1931, 1120; Muller and Schwab, A., 1933, 36).

CH. ABS. (e)

**Catalytic decomposition of  $\text{N}_2\text{O}$ .** J. SANCHO (Anal. Fis. Quím., 1935, 33, 854—860).—The reaction coeff. for the decomp. of  $\text{N}_2\text{O}$  by bauxite having  $1.5 \times 10^{19}$  active centres per g. at temp. from  $180^\circ$  to  $300^\circ$  and 10 to 15 mm. has a zero temp. coeff. between  $214^\circ$  and  $280^\circ$ . The vol. remains const., and it is concluded that the reaction is unimol.,  $\text{O}_2$  being adsorbed by the catalyst, which it poisons. A mixture of  $\text{N}_2\text{O}$  with  $\text{O}$ , is not decomposed.

F. R. G.

**Platinised silver gauze, and silver-platinum alloys, in the oxidation of ammonia.** I. E. ADADUROV, J. M. DEITSCH, and N. A. PROZOROVSKI (J. Appl. Chem. Russ., 1936, 9, 807—812).—Platinised  $\text{Ag}$  gauze gives satisfactory results, without corrosion, at temp.  $<750^\circ$ ; at higher temp. the gauze fuses.  $\text{Pt--Ag}$  alloys are less fusible, but are comparatively inactive, even with a  $\text{Pt}$  content of 90%. 96% conversion is given by 8 : 1 : 1  $\text{Pt--Ag--Rh}$  alloy at  $935^\circ$ . R. T.

**Catalysis by alloys. I. Decomposition of formic acid vapour on copper-gold and silver-**

gold alloys. G. RIENACKER (Z. anorg. Chem., 1936, 227, 353—375; cf. A., 1934, 974).—Energies of activation ( $E$ ) of the reaction  $\text{HCO}_2\text{H} \rightarrow \text{H}_2 + \text{CO}_2$  have been determined, using as catalysts Au, Ag, Cu, and Ag-Au and Cu-Au alloys. With Ag-Au at 180°  $E$  is approx. the same as with the pure components. With Cu-Au  $E$  retains the val. (about 24 kg.-cal.) observed with pure Cu up to Au 75 at.-%, but shows a marked decrease (21.3 kg.-cal.) when the crystals of composition  $\text{Cu}_3\text{Au}$  have an ordered structure (non-statistical distribution of atoms). F. L. U.

Reactions in concentrated sulphuric acid. I. Carbon disulphide. J. MILBAUER and J. DOŠKAR (Chem. Obzor, 1935, 10, 65—69; Chem. Zentr., 1935, ii, 2045).— $\text{CS}_2$  reacts with  $\text{H}_2\text{SO}_4$  ( $\text{N}_2$  atm.) at temp.  $> 190^\circ$  with formation of  $\text{CO}$ ,  $\text{CO}_2$ ,  $\text{SO}_2$ , and S. The effect of catalysts is described; Pd-black reduces the min. reaction temp. to  $105^\circ$ , with production of COS. The primary reaction is  $\text{CS}_2 + \text{H}_2\text{O} = \text{COS} + \text{H}_2\text{S}$ , followed by oxidation. H. N. R.

Pumice as a support for copper-chromium oxide catalysts in dehydrogenations. R. E. DUNBAR, D. COOPER, and R. COOPER (J. Amer. Chem. Soc., 1936, 58, 1053—1054).—The prep. of supported catalysts, which give a high yield of aldehyde from alcohols at  $330\text{--}350^\circ$ , is described. E. S. H.

Enhancement of thermostability of chromium catalysts.—See B., 1936, 640.

Preparation of catalyst for ammonia synthesis from Ural magnetite.—See B., 1936, 639.

Nickel catalysts. I. Effect of temperature of preparation on the crystal size and composition of nickel oxide. M. C. BOSWELL and R. K. ILER (J. Amer. Chem. Soc., 1936, 58, 924—928).—NiO, prepared at fairly low temp. from  $\text{Ni}(\text{OH})_2$ , is microcryst. When treated with aq.  $\text{NaOCl}$  the surface takes up active O, which can be determined iodometrically; assuming a unimol. layer, the particle size of NiO can be calc. X-Ray determination of particle size tends to show that there is 1 atom of active O to each atom of surface Ni. The diameter of the crystals,  $D$ , increases with rising temp. of prep.,  $T$ , according to  $\log D = kT + C$ , where  $k$  and  $C$  are consts. The presence of  $\text{Al}_2\text{O}_3$  retards the sintering of NiO at high temp. S. H.

Electrolytic production of alkali metals from non-aqueous solutions. N. P. FEDOTEEV and R. N. KINKULSKAJA (Coll. Trans. I U.S.S.R. Conf. Non-aq. Solutions, Kiev, 1935, 114—141).—Na is obtained in 60% yield on the current (2.5—3 volts)

from NaBr in  $(\text{CH}_3\text{NH}_2)_2$  at  $150^\circ$  (Ni electrodes). Preliminary experiments indicate the possibility of similarly producing K from KI. R. T.

Mechanism of electrolysis of manganese salts. M. GELOSO (Compt. rend., 1936, 202, 1573—1575; cf. this vol., 807).—A discussion. The composition of the pseudo- $\text{MnO}$ , deposited varies continuously with the conditions. The reactions are  $\text{Mn}^{++} \rightarrow \text{Mn}^{IV+} + 2e$ , and  $\text{Mn}^{IV+} + 2\text{H}_2\text{O} \rightarrow \text{MnO}_2 + 4\text{H}^+$ . H. J. E.

Water vapour discharge and hydrogen peroxide formation. K. H. GEIB (J. Chem. Physics, 1936, 4, 391; cf. A., 1934, 157).— $\text{H}_2\text{O}_2$  is formed from the products of discharge in  $\text{H}_2\text{O}$  vapour only below  $-100^\circ$ . The following mechanism is suggested ( $s$ =surface of glass,  $\text{H}_2\text{O}$ , or  $\text{H}_2\text{O}_2$ ):  $s + \text{H} = s\text{H}$ ;  $s\text{H} + \text{O}_2 \rightarrow s\text{HO}_2$ ;  $s\text{HO}_2 + \text{H} \rightarrow s + \text{H}_2\text{O}_2$ . F. L. U.

Action of colloids on the KG of cathode deposits. A. GLAZUNOV and E. DRESCHER (Chem. Listy, 1936, 30, 145—149).—The linear velocity of crystallisation of Ag at the cathode rises with increasing concn. of gelatin in the electrolyte to a max., thereafter falling. The significance of the phenomenon is discussed. R. T.

Cathodic reduction of oxides on iron surfaces as a method of estimating corrosion.—See B., 1936, 599.

Electrodeposition of (A) tungsten, (B) tungsten-nickel and tungsten-nickel-copper alloys, from aqueous solutions.—See B., 1936, 645.

Electrochemical reduction of europium. W. KAPFENBERGER (Z. anal. Chem., 1936, 105, 199—205).—Eu is separated as insol.  $\text{EuSO}_4$  by electrochemical reduction of rare earth chloride solutions (containing 60—100 g. of  $\text{H}_2\text{O}_2$  per litre) +  $\text{H}_2\text{SO}_4$  at a Hg cathode. A divided cell is employed, with  $N\text{-H}_2\text{SO}_4$  as anolyte. Some  $\text{SmSO}_4$  may be pptd. at high c.d. The  $\text{EuSO}_4$  is separated and oxidised with conc.  $\text{HNO}_3$ . Hg is pptd with  $\text{H}_2\text{S}$ , and Eu is converted into  $\text{Eu}_2(\text{C}_2\text{O}_4)_3$  and thence into  $\text{Eu}_2\text{O}_3$ . This is converted into  $\text{EuCl}_3$ , and re-electrolysed. From material containing 3% of Eu, 99.7% of Eu is recovered as  $\text{EuSO}_4$  from each reduction. Three reductions give a product containing 98% Eu + a little Sm; 99.9% Eu is obtainable with  $> 6$  reductions. J. S. A.

Electrolytic oxidation. VII. Electrolysis of acetates in non-aqueous solutions. S. GLASSTONE and A. HICKLING (J.C.S., 1936, 820—827; cf. A., 1934, 176).—The electrolysis of  $N\text{-KOAc} + N\text{-AcOH}$  in glycol has been studied. The efficiency of  $\text{C}_2\text{H}_6$  formation is a max. at  $50^\circ$  and decreases with decreasing c.d., total  $[\text{OAc}']$ , and  $[\text{AcOH}]$ , whilst the duration of the electrolysis and the nature of the anode material have little effect. In the case of an Au anode, the efficiency decreases linearly with increasing  $[\text{H}_2\text{O}]$ , becoming const. at 4.7% of  $\text{H}_2\text{O}$ . It is unaffected by the addition of  $\text{Mn}^{++}$ ,  $\text{Pb}$ ,  $\text{Co}$ ,  $\text{Cu}^{++}$ , and  $\text{Fe}^{++}$ , but is diminished by small  $[\text{OH}']$ . When the anode is coated with  $\text{PbO}_2$ , the efficiency is greatly reduced, but  $\text{MnO}_2$  is without effect. Various anode materials give approx. the same e.m.f., except  $\text{PbO}_2$ , with which it is less. It is suggested that the reactions  $2\text{OAc}' \rightarrow 2\text{OAc} \rightarrow (\text{OAc})_2$  occur and that

(OAc)<sub>2</sub> yields C<sub>2</sub>H<sub>6</sub>+CO<sub>2</sub> or reacts with the solvent to give CHO·CH<sub>2</sub>·OH. The latter has been shown to be a product of the anodic oxidation of (CH<sub>2</sub>·OH)<sub>2</sub>. The PbO<sub>2</sub> electrode is reduced to PbO by (CH<sub>2</sub>·OH)<sub>2</sub>, which then decomposes the (OAc)<sub>2</sub>, thus inhibiting the reaction. *Glyoxal-2:4-dinitrophenylhydrazone*, reddish-orange needles, m.p. 330°, has been prepared.

R. S.

**Electrolytic reduction and oxidation of aminoacetic acid and alanine.** E. BAUR (Z. Elektrochem., 1936, 42, 285—287).—The "redox" decomp. which NH<sub>2</sub>-acids undergo in contact with bone C (A., 1935, 1356) is separable into a reduction and an oxidation which can be realised electrolytically. Thus in N-H<sub>2</sub>SO<sub>4</sub> solution NH<sub>2</sub>·CH<sub>2</sub>·CO<sub>2</sub>H gives NH<sub>2</sub>Me and HCO<sub>2</sub>H at the cathode and CH<sub>2</sub>O at the anode. With NH<sub>2</sub>·CHMe·CO<sub>2</sub>H the products are EtOH, NH<sub>3</sub>, and HCO<sub>2</sub>H at the cathode and MeCHO at the anode.

F. L. U.

**Electrolytic reduction of pyrrole.** B. SAKURAI (Bull. Chem. Soc. Japan, 1936, 11, 374—376).—Electrolytic reduction of pyrrole in presence of Ni or Pt affords pyrrolidine in 15.6% yield.

J. T. A.

**Dissociation of carbon dioxide in the electrodeless discharge.** W. C. SCHUMB and F. A. BICKFORD (J. Amer. Chem. Soc., 1936, 58, 1038—1043).—The influence of variation in frequency, current, and voltage on the % decomp. has been determined by the pressure change and by analysis of the gaseous products. The decomp. products under the experimental conditions are CO and O<sub>2</sub>, avoiding the formation of C<sub>3</sub>O<sub>2</sub>. A mechanism of decomp. is proposed.

E. S. H.

**Relationship between the critical pressure and the energy absorbed in the photochemical ignition of mixtures of hydrogen and chlorine.** F. A. LAVROV and A. V. SAGULIN (Acta Physicochim. U.R.S.S., 1934, 1, 979—984).—Stoichiometric H<sub>2</sub>-Cl<sub>2</sub> mixtures at various pressures were exploded by various intensities of light from a C arc. The same energy-crit. ignition pressure law holds for photochemical and for spark discharge ignition.

CH. ABS. (c)

**Photochemical reaction of mercury vapour with oxygen.** I. M. FRANK (J. Phys. Chem. U.S.S.R., 1934, 5, 1013—1030, and Acta Physicochim. U.R.S.S., 1934, 1, 833—854).—The oxidation of Hg under the action of the resonance line 2537 Å., and pressures of a few tenths mm. to several cm., was studied. Formation of O<sub>3</sub> was observed. The mechanism proposed is Hg\*+O<sub>2</sub>→Hg+O<sub>2</sub>\*; O<sub>2</sub>\*+O<sub>2</sub>→O<sub>3</sub>+O; Hg+O<sub>2</sub>→HgO+O<sub>2</sub>. Dickinson and Sherill's results are explained (cf. A., 1926, 485). The mechanism Hg\*+O<sub>2</sub>→HgO+O; Hg\*+O<sub>2</sub>→Hg'+O<sub>2</sub>, where Hg' is a metastable atom, is also possible.

CH. ABS. (c)

**Photochemical decomposition of azomethane.** G. GOLDFINGER (Compt. rend., 1936, 202, 1502—1504).—The relative velocity of the photo-decomp. of Me<sub>2</sub>N<sub>2</sub> in the full light of the Hg arc diminishes with increasing [Me<sub>2</sub>N<sub>2</sub>]. Addition of 5 mm. of A, N<sub>2</sub>, or CH<sub>4</sub> accelerates the rate but 100 mm. of A, N<sub>2</sub>, or CH<sub>4</sub> decreases it.

R. S.

**Electro-chemical theory of photographic development.** J. E. DE LANGHE (Physica, 1936, 3, 398—406).—On the basis of the supersaturation theory of photographic development a relationship is developed between the p.d. ΔE (ΔE=E<sub>Ag</sub>−E<sub>red.</sub>, where E<sub>Ag</sub> is the potential of the Ag electrode and E<sub>red.</sub> is the oxidation-reduction potential of the developer) and velocity of development. For univalent developer ions the relation is in accord with experiment.

J. W. S.

**Mechanism of photographic sensitisation and hypersensitisation for the red and infra-red.** G. SEMERANO (Gazzetta, 1936, 66, 154—162; cf. A., 1934, 975).—Infra-red sensitisers of the cyanine class reduce Ag<sup>+</sup> to Ag. With Ag halides the reduction is slow, but is greatly accelerated by the radiation absorbed by the dye. In neutral solution 1 mol. of sensitiser reduces 1 Ag; in alkaline solution 1 mol. reduces 4 Ag immediately and then more Ag slowly. The formation of Ag nuclei in the light absorption process and the mechanism of the sensitisation are discussed.

O. J. W.

**General photographic density law.** A. VAN KREVELD and L. S. ORNSTEIN (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 477—484).—Several expressions are obtained for mixed and for monochromatic colours.

H. J. E.

**Quantum theory and photography.** H. KEILICH (Z. wiss. Phot., 1936, 35, 134—152).—A detailed review and discussion of photographic processes in the light of the quantum theory.

J. L.

**General form of the relation between exposure and photographic density by exposure to Röntgen rays.** E. HOFER (Z. wiss. Phot., 1936, 35, 132—134).—Mathematical. The author's modification (A., 1935, 177) of the formula of Arens *et al.* (A., 1931, 579) is reconsidered in relation to the case of spaces occurring between grains. De Langhe's formula (B., 1935, 783) corresponds with a special case of the above formula.

J. L.

**Action of ordinary metals on the photographic plate and the electrometer.** J. REBOUL (Compt. rend., 1936, 202, 1920—1922).—Russell's explanation of the action of metals as due to formation of H<sub>2</sub>O<sub>2</sub> (cf. A., 1898, ii, 287) is questioned. The action on plates and the ionisation effects are attributed to the emission of soft X-rays by the metal.

H. J. E.

**Theories of the latent photographic image.** H. ARENS and F. LUFT (Veröff. wiss. Zentr.-Lab. phot. Abt. Agfa, 1935, 4, 1—14; Chem. Zentr., 1935, ii, 2005).—A review.

J. S. A.

**Photographic behaviour of colloid-free silver bromide layers.**—See B., 1936, 620.

**Colour indicator for ultra-violet light in the wave-length range 2650—3341 Å.** O. BAUDISCH and F. BENFORD (Naturwiss., 1936, 24, 361).—An ice-cold aq. solution of 2:7-diaminofluorene hydrochloride (I) is colourless in absence of air, but gives a blue colour in the presence of O<sub>2</sub> on exposure to light. If KNO<sub>3</sub> is added to (I), and the latter is then exposed to ultra-violet light (2650—3341 Å.), the at. O produced by the photochemical decomp. of the

$\text{KNO}_3$  ( $\text{KNO}_3 \rightarrow \text{KNO}_2 + \text{O}$ ) oxidises (I) giving a blue colour. A. J. M.

Oxidation of alcohols by molecular oxygen in ultra-violet light.—See this vol., 963.

Photochemical studies. XXII. Effect of radiation of wave-length 1980—1860 Å. on *cis*- and *trans*-dichloroethylene. H. E. MAHNCKE and W. A. NOYES, jun. (J. Amer. Chem. Soc., 1936, 58, 932—933; cf. A., 1935, 561).—The primary action of the radiation is to produce Cl atoms. A small amount of polymerisation product is also formed. E. S. H.

Photochemical chlorination of *tert*-butyl chloride etc.—See this vol., 962.

Production of hydrogen peroxide from hydrogen and oxygen. M. V. POLJAKOV and P. M. STADNIK (Trans. VI Mendeleev Congr. Theor. Appl. Chem., 1932, 1935, 2, Pt. 1, 202—206).— $\text{H}_2\text{O}_2$  may be formed in a homogeneous reaction.

CH. ABS. (e)  
Direct preparation of HD by a chemical method. H. BEUTLER, G. BRAUER, and H. O. JÜNGER (Naturwiss., 1936, 24, 347).—The reaction  $\text{LiH} + \text{D}_2\text{O} \rightarrow \text{HD} + \text{LiOD}$  may be used. The ultra-violet absorption spectrum of the product shows new bands due to HD, the intensity of which was about four times that of the sum of the intensities of lines due to  $\text{H}_2$  and  $\text{D}_2$ . The reaction is probably ionic. A. J. M.

Attempted enrichment of heavier water isotopes in ordinary water by fractional crystallisation. E. H. RIESENFELD and T. L. CHANG (Ber., 1936, 69, [B], 1302—1305).—To obviate, if possible, exchange reactions between solid and liquid phase an apparatus has been devised in which the  $\text{H}_2\text{O}$ , impoverished of HDO and  $\text{H}_2\text{O}^{18}$ , is very rapidly removed from the ice and replaced by fresh, normal  $\text{H}_2\text{O}$ . Enrichment of the cryst. phase in the heavy isotopes is not, however, observed. H. W.

Exchange reactions between heavy water and amino-acids and carbohydrates.—See this vol., 973.

Crystal hydrates of lithium ferrocyanide. V. I. NIKOLAEV and Z. E. BUROVAJA (Ann. Sect. Anal. Phys.-Chim., 1936, 8, 351—356).—Tensimetric and analytical data suggest the hydrates  $\text{Li}_4\text{Fe}(\text{CN})_6$ , 8, 6, and  $3\text{H}_2\text{O}$ . R. T.

Preparation of sodium hydrogen carbonate. E. TOPORESCU (Compt. rend., 1936, 202, 1591; cf. A., 1922, ii, 642).—A reply to criticism by Neumann and Domke (A., 1928, 480). H. J. E.

Rubidium fluorides and silicofluorides. J. MEYER and W. TAUBE (Z. anorg. Chem., 1936, 227, 337—340).—The sparingly sol. salt obtained by treating  $\text{Rb}_2\text{CO}_3$  with excess of 40% HF is  $\text{Rb}_2\text{SiF}_6$ .  $\text{RbHF}_2$  and  $\text{RbH}_2\text{F}_3$  have been prepared from aq. HF free from  $\text{H}_2\text{SiF}_6$ . F. L. U.

Purification of solutions of copper sulphate. L. A. ROTINJANTZ and V. TARAJAN (J. Appl. Chem. Russ., 1936, 9, 813—818).— $\text{CaOCl}_2$  is added to the hot solution, when  $\text{FeSO}_4$  is pptd. as  $\text{Fe}(\text{OH})_3$ . Ca, Mg, and part of the Al and Zn present in the filtrate

are pptd. by HF, and the filtrate is evaporated, when practically pure  $\text{CuSO}_4$  crystallises out. R. T.

Different types of complex salts of 2:2'-dipyridyl with Cu, Zn, Cd, Fe, Ni, Co, and Rh. F. M. JAEGER and J. A. VAN DIJK (Z. anorg. Chem., 1936, 227, 273—327).—In addition to data for compounds previously prepared (cf. A., 1934, 1317; 1935, 167, 312, 714; this vol., 175), the prep. and crystallographic details are given for the following complex salts of 2:2'-dipyridyl (R):

and probably several more or less hydrolysed R derivatives of  $\text{RhCl}_3$ .  $[\text{NiR}_3]\text{Cl}_2 \cdot 7\text{H}_2\text{O}$  has been split up into its two stereoisomerides. These salts vary very much in their stability towards  $\text{H}_2\text{O}$ ; aquo-salts may be formed or it may be impossible to separate the salts at all in presence of  $\text{H}_2\text{O}$ , as in the case of  $\text{R}_1$  and  $\text{R}_2$  salts of  $\text{FeSO}_4$  and  $\text{FeCl}_2$ . M. S. B.

Cupric salts of aminosulphonic acids. J. MEYER and W. TAUBE (Z. anorg. Chem., 1936, 227, 425—428).—The prep. of the compound  $(\text{NH}_2 \cdot \text{CH}_2 \cdot \text{SO}_3)_2\text{Cu}$  is described. It is dark blue, insol. in but hydrolysed by  $\text{H}_2\text{O}$ , and is regarded as a complex salt analogous to  $(\text{NH}_2 \cdot \text{CH}_2 \cdot \text{CO}_2)_2\text{Cu}$ .  $\text{NH}_2 \cdot \text{CH}(\text{SO}_3\text{H})_2$  yields only a normal Cu salt. F. L. U.

Silver salts of aminosulphonic acid. (MLLE.) L. CHAUMETON (Compt. rend., 1936, 202, 1783—1786).—When  $\text{NH}_2 \cdot \text{SO}_3\text{H}$  ( $>1.75$  mol.), dissolved in aq. NaOH equiv. to this acid and the  $\text{AgNO}_3$  added, is treated with solid  $\text{AgNO}_3$  (1 mol.), complete dissolution occurs but a white deposit of the compound  $\text{AgNH} \cdot \text{SO}_3\text{Na} \cdot \text{H}_2\text{O}$  (I) slowly forms. When 1—1.75 mol. of  $\text{NH}_2 \cdot \text{SO}_3\text{H}$  is used the compound  $\text{AgNH} \cdot \text{SO}_3\text{Na} \cdot \text{Ag}_2\text{N} \cdot \text{SO}_3\text{Na} \cdot 4\text{H}_2\text{O}$  (II) is produced. Addition of  $\text{NH}_2 \cdot \text{SO}_3\text{H}$  to very conc.  $\text{AgNO}_3$  yields only  $\text{NH}_2 \cdot \text{SO}_3\text{Ag}$ . (I) and (II) dissolve in aq.  $\text{NH}_3$  but deposit birefringent crystals of the compound  $[\text{NH}_3\text{Ag}]_2\text{NSO}_3[\text{AgNH}_3] \cdot 2\text{H}_2\text{O}$ . J. W. S.

Basic magnesium sulphates. (MME.) L. WALTER-LÉVY (Compt. rend., 1936, 202, 1857—1859).—By prolonged boiling of conc. aq.  $\text{MgSO}_4$  with small quantities of  $\text{K}_2\text{CO}_3$ , the ppt.,  $4\text{MgO} \cdot 2\text{CO}_2 \cdot \text{SO}_3 \cdot 7\text{H}_2\text{O}$ , first formed is gradually converted into  $7\text{MgO} \cdot \text{SO}_3 \cdot 9\text{H}_2\text{O}$ . J. G. A. G.

Formation and dissociation of peroxides of the alkaline-earth metals. M. CENTNERSZWER and M. BLUMENTHAL (Bull. Acad. Polonaise, 1935, A, 540—550).—The dissociation pressures of pure  $\text{MgO}_2$ ,  $\text{CaO}_2$ ,  $\text{SrO}_2$ , and  $\text{BaO}_2$  are measured. Their heats of dissociation are calc. to be, respectively, 12, 12.6, 13.5, and 26.93 kg.-cal. Hydrates are formed at room temp., the dissociation pressures of which are those of the dry compounds.  $\text{BeO}_2$  cannot be obtained free from hydrate. The dissociation of

MgO<sub>2</sub> and BeO<sub>2</sub> is irreversible. CaO<sub>2</sub> and SrO<sub>2</sub> each exist in two modifications. O. D. S.

**Calcium metaphosphates and pyrophosphates.** A. BOULLÉ (Compt. rend., 1936, 202, 1788—1790).—Addition of (NaPO<sub>3</sub>)<sub>6</sub> (I) to a neutral solution of CaCl<sub>2</sub> deposits a viscous amorphous mass retaining 20% H<sub>2</sub>O after drying cold in a vac. and dehydrated only on prolonged heating at 300°. It crystallises at 400° yielding α-Ca(PO<sub>3</sub>)<sub>2</sub> which at > 765° is irreversibly converted into Ca metaphosphate-β, identical with the product of dehydration of CaH<sub>4</sub>(PO<sub>4</sub>)<sub>2</sub> at > 400°. The ppt. obtained on adding (I) to N/25 aq. Ca(OH)<sub>2</sub> has a P<sub>2</sub>O<sub>5</sub>/CaO ratio 1.85, but with N/3—N/60 aq. Ba(OH)<sub>2</sub> (II), the P<sub>2</sub>O<sub>5</sub>/BaO ratio is 1. A neutral solution of (NaPO<sub>3</sub>)<sub>3</sub> gives no ppt. with neutral Ca(NO<sub>3</sub>)<sub>2</sub>, Ba(NO<sub>3</sub>)<sub>2</sub>, or Sr(NO<sub>3</sub>)<sub>2</sub>. Amorphous ppts. with P<sub>2</sub>O<sub>5</sub>/MO ratio=2 (M=Ca, Ba, Sr, or Pb) are obtained on adding (II) to solutions of CaCl<sub>2</sub>, Ca(OAc)<sub>2</sub>, or Pb(OAc)<sub>2</sub> slightly alkaline to Me-orange, or to aq. Ca(OH)<sub>2</sub>, Ba(OH)<sub>2</sub>, or Sr(OH)<sub>2</sub>. The Ca compounds all lose H<sub>2</sub>O at 300° and after keeping at 700° yield the same cryst. variety of Ca pyrophosphate identical with that obtained on heating the ppt. produced in a mixture of theoretical proportions of Na<sub>4</sub>P<sub>2</sub>O<sub>7</sub> and Ca(OH)<sub>2</sub>, or Ca(NO<sub>3</sub>)<sub>2</sub>. J. W. S.

**Ammoniates of simple salts. III. Ammoniates of cadmium salts.** G. SPACU and P. VOICCHESCU (Z. anorg. Chem., 1936, 227, 385—401; cf. this vol., 573).—The existence of ammoniates of Cd salts of the following acids has been established by tensimetric methods (figures indicate no. of mols. of NH<sub>3</sub> per mol. of anhyd. salt): HCNS 8, 6, 5, 4, 2; HCO<sub>2</sub>H 6, 4, 2; AcOH 8, 6, 4, 2, 1; OH·CH<sub>2</sub>·CO<sub>2</sub>H 4, 3, 1; NH<sub>2</sub>·CH<sub>2</sub>·CO<sub>2</sub>H 5, 4, 2, 1; (·CH<sub>2</sub>·CO<sub>2</sub>H)<sub>2</sub> 4, 3, 1; [·CH(OH)·CO<sub>2</sub>H]<sub>2</sub> 2, 1; BzOH 8, 6, 4, 2, 1; o-aminobenzoic 10, 6, 5, 2, 1; 5-sulphosalicylic 10, 6, 5, 4, 2, 1. The same general relations are found as with Zn salts. F. L. U.

**Double salts of mercuric cyanide with the azides of the alkali and alkaline-earth metals.** F. PIRRONE and P. ROSSONI (Gazzetta, 1936, 66, 235—244; cf. A., 1929, 1406).—The prep. and crystallographic properties of the following double salts are described: Hg(CN)<sub>2</sub>·LiN<sub>3</sub>·2H<sub>2</sub>O; Hg(CN)<sub>2</sub>·NH<sub>4</sub>N<sub>3</sub>·2H<sub>2</sub>O; Hg(CN)<sub>2</sub>·KN<sub>3</sub>; Hg(CN)<sub>2</sub>·MN<sub>3</sub>·3H<sub>2</sub>O (M=Ca, Sr, Ba). O. J. W.

**Boron hydrides. XXII. Conversion of diborane, B<sub>2</sub>H<sub>6</sub>, into other volatile boron hydrides. XXIII. Transformation of diborane, B<sub>2</sub>H<sub>6</sub>, into solid boron hydride (BH)<sub>x</sub>.** A. STOCK and W. MATHING (Ber., 1936, 69, [B], 1456—1469, 1469—1475).—XXII. A flow apparatus is described for the decomp. of the now readily accessible B<sub>2</sub>H<sub>6</sub> which can be guided along different paths by suitable choice of conditions. At 180°/0.2 atm. practical yields of B<sub>5</sub>H<sub>11</sub> with some B<sub>4</sub>H<sub>10</sub> are obtained, whilst at 250°/120 mm. with Hg as catalyst B<sub>5</sub>H<sub>9</sub> is produced. B<sub>5</sub>H<sub>11</sub> is obtained by warming B<sub>4</sub>H<sub>10</sub> with H<sub>2</sub>. Only for the prep. of B<sub>6</sub>H<sub>10</sub> in appreciable amounts is it necessary to use Mg<sub>3</sub>B<sub>2</sub> and acid.

XXIII. Exposure of B<sub>2</sub>H<sub>6</sub> under 11 mm. pressure to the silent electric discharge causes formation of (BH)<sub>x</sub> with B<sub>5</sub>H<sub>9</sub> and B<sub>5</sub>H<sub>11</sub>. In presence of excess

of H<sub>2</sub> the transformation is incomplete but no volatile hydrides are produced. In presence of A, B<sub>2</sub>H<sub>6</sub> is slowly but quantitatively converted into (BH)<sub>x</sub>, which forms a chrome-yellow, non-cryst. powder. It occasionally explodes on exposure to air. It cannot be volatilised or dissolved without decomp. H<sub>2</sub>O causes evolution of H<sub>2</sub> with odour of boranes, but hydrolysis does not continue to the formation of H<sub>3</sub>BO<sub>3</sub>. MeOH and EtOH decompose (BH)<sub>x</sub> with evolution of H<sub>2</sub>. With 2N-HNO<sub>3</sub>, (BH)<sub>x</sub> gives a persistent brownish-red colour and the solution when evaporated leaves a mixture of H<sub>3</sub>BO<sub>3</sub> and a (?) NO<sub>2</sub>-compound which explodes when gently heated or rubbed with a glass rod. H. W.

**Etherates of aluminium chloride.** N. KOZLOV, R. BOGDANOVSKAJA, and I. SOLOGUB (J. Gen. Chem. Russ., 1936, 6, 315—317).—Et<sub>2</sub>O and AcCl or Ac<sub>2</sub>O in presence of AlCl<sub>3</sub> or TiCl<sub>3</sub> react as follows: MCl<sub>3</sub>·Et<sub>2</sub>O (I) + AcCl EtOAc + EtCl + MCl<sub>3</sub>·(I) + Ac<sub>2</sub>O → 2EtOAc + MCl<sub>3</sub>. R. T.

**Aluminium iodide.** A. VIAN and E. MOLES (Anal. Fis. Quim., 1936, 34, 81—90).—AlI<sub>3</sub> is synthesised by the action of I in H<sub>2</sub> on Al at 420°. AlI<sub>3</sub> with H<sub>2</sub>O vapour gives dry HI. AlI<sub>3</sub> has m.p. 179.5°. Heat of vaporisation and v.p. from 310° to 370° are recorded and b.p. and crit. temp. are calc. F. R. G.

(A) Variations in m.p., and denaturation of cryolite when fused in contact with air. (B) Molecular state of oxides dissolved in cryolite. V. P. MASCHOVETZ (J. Appl. Chem. Russ., 1936, 9, 789—801, 802—806).—(A) The f.p. and f content of cryolite fall with increasing time of heating in contact with O<sub>2</sub> and H<sub>2</sub>O. The process is associated with a fall in NaF content, and a corresponding rise in Al<sub>2</sub>O<sub>3</sub> content.

(B) Reactions of the type 4CaO + 2Na<sub>2</sub>AlF<sub>6</sub> → 3CaF<sub>2</sub> + Ca(AlO<sub>2</sub>)<sub>2</sub> + 6NaF; 2Al<sub>2</sub>O<sub>3</sub> + Na<sub>2</sub>AlF<sub>6</sub> 3NaAlO<sub>2</sub> + 2AlF<sub>3</sub>; NaAlO<sub>2</sub> Na<sup>+</sup> + AlO<sub>2</sub><sup>-</sup> are shown to take place in molten cryolite in presence of CaO and Na<sub>2</sub>O. R. T.

**Polarimetric study of aluminium malate.** J. L. DELSAL (Compt. rend., 1936, 202, 1589—1591; cf. Quadrat and Korecky, A., 1930, 743).—The compound AlH<sub>5</sub>C<sub>4</sub>O<sub>6</sub> was prepared by dissolution of Al(OH)<sub>3</sub> in malic acid and drying the product at 100°. It yields Na and Na<sub>2</sub> derivatives. Polarimetric and electrometric measurements confirm the existence of these compounds. H. J. E.

**Double salts of indium and organic bases.** J. B. EKELEY and H. A. POTRATZ (J. Amer. Chem. Soc., 1936, 58, 907—909).—The prep. of InCl<sub>3</sub>·4NH<sub>3</sub>MeCl, m.p. > 300°, InCl<sub>3</sub>·4NH<sub>2</sub>Me<sub>2</sub>Cl, m.p. 215—217°, InCl<sub>3</sub>·3NH<sub>2</sub>Me<sub>2</sub>Cl, m.p. 196—198°, InCl<sub>3</sub>·2NMe<sub>4</sub>Cl, m.p. > 300°, InBr<sub>3</sub>·2NMe<sub>4</sub>Br, m.p. 236—238°, InCl<sub>3</sub>·2NEt<sub>4</sub>Cl, m.p. 275—277°, and InBr<sub>3</sub>·NEt<sub>4</sub>Br, m.p. 289—291°, is described. The double salts In<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>·(NH<sub>3</sub>Me)<sub>2</sub>SO<sub>4</sub>·4H<sub>2</sub>O, 2In<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>·2(NH<sub>3</sub>Et)<sub>2</sub>SO<sub>4</sub>·7H<sub>2</sub>O, 2In<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>·2(NH<sub>2</sub>Et)<sub>2</sub>SO<sub>4</sub>·7H<sub>2</sub>O, 2In<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>·2(NH<sub>2</sub>Et)<sub>2</sub>SO<sub>4</sub>·5H<sub>2</sub>O, In<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>·3(n-C<sub>5</sub>H<sub>11</sub>·NH<sub>2</sub>)<sub>2</sub>SO<sub>4</sub>·2H<sub>2</sub>O, and In<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub>·(NH<sub>3</sub>·CH<sub>2</sub>Ph)<sub>2</sub>SO<sub>4</sub>·6H<sub>2</sub>O have been prepared; all have m.p. > 300°. The optical properties

of most of these compounds have been determined. The prep. of  $2\text{InCl}_3 \cdot 4\text{SMe}_3\text{Cl} \cdot 3\text{H}_2\text{O}$ , m.p. 203–204° (decomp.),  $\text{InI}_3 \cdot \text{SMe}_3\text{I}$ , m.p. 149–150°, and  $\text{InI}_3 \cdot \text{SEt}_3\text{I}$ , m.p. 145–147°, is described. E. S. H.

**Preparation and properties of carbon selenide.** H. G. GRIMM and H. METZGER (Ber., 1936, 69, [B], 1356–1364).—Carbon diselenide cannot be prepared from  $\text{Al}_2\text{Se}_3$  and  $\text{CCl}_4$  but is obtained in 50% yield when a mixture of  $\text{H}_2\text{Se}$  and  $\text{CCl}_4$  is passed through a Jena glass tube at 500°. It is a golden-yellow liquid, b.p. 69.5°/130 mm., 124°/760 mm., m.p. –45.5°, which burns with difficulty in air or  $\text{O}_2$  and decomposes slowly in the dark, rapidly in daylight. It does not react with Zn or Ag, slowly blackens Cu, and immediately forms  $\text{HgSe}$  with Hg. With KOH in EtOH– $\text{CCl}_4$  it affords K selenoxanthate. When treated with  $\text{NH}_3$ –EtOH it yields polymeride A (I),  $\text{CHSe}$ , or  $\text{C}_4\text{H}_4\text{Se}_9$ , decomp. 190° after darkening at 170°, which is not affected by  $\text{SeO}_2$  or I in EtOH and is disintegrated by more powerful oxidants. When preserved in 96% EtOH it affords polymeride B, closely similar to (I). With  $\text{NH}_3$  in  $\text{CCl}_4$   $\text{CSe}_2$  yields a compound  $\text{C}_4\text{H}_4\text{Se}_8\text{N}$ . Gradual addition of  $\text{CSe}_2$  to  $\text{NH}_2\text{Ph}$  yields  $\text{H}_2\text{Se}$  and small amounts of diphenylselenocarbamide, also obtained with a yellow polymeride when  $\text{NH}_2\text{Ph}$  is added to  $\text{CSe}_2$ .  $\text{PhOH}$ ,  $\text{NHPh}_2$ ,  $\text{CH}_2(\text{CO}_2\text{Et})_2$ , and  $\text{MeCHO}$  do not react with  $\text{CSe}_2$  at room temp. whereas  $\text{NET}_3$  and  $\text{NPhMe}$ , give dark ppts.  $\text{CCl}_4$  and  $\text{TeH}_4$  give Te,  $\text{TeCl}_2$ , HCl, and  $\text{C}_2\text{Cl}_6$ .  $\text{Ag}_2\text{Te}$  and  $\text{CBr}$ , or  $\text{Cl}$ , in  $\text{CCl}_4$  at room temp. give  $\text{AgBr}$  or  $\text{AgI}$  and Te halides. Te and C do not react at 1000°. H. W.

**Synthesis of cyanic acid by the action of carbonyl chloride on ammonia.** R. FOSSE, P. DE GRAEVE, and P. E. THOMAS (Compt. rend., 1936, 202, 1544–1547).— $\text{HCNO}$  is formed by adding a PhMe solution of  $\text{COCl}_2$  to conc. aq.  $\text{NH}_3$  at 0° (A). It was identified by the formation of blue  $\text{K}_2\text{Co}(\text{CON})_1$  and by the isolation and analysis of  $\text{AgCNO}$ . No  $\text{CO}(\text{NH}_2)_2$  was formed under these conditions. It is formed on heating the solution (A) at 90° for 30 min. H. J. E.

**Silicon fluorobromides.** W. C. SCHUMB and H. H. ANDERSON (J. Amer. Chem. Soc., 1936, 58, 994–996).—The prep. of  $\text{SiFBr}_3$ , m.p. –82.5±0.5°, b.p. 83.8±0.2°,  $\text{SiF}_2\text{Br}_2$ , m.p. –66.9±1°, b.p. 13.7±0.2°, and  $\text{SiF}_3\text{Br}$ , m.p. –70.5±0.5°, b.p. –41.7±0.2°, is described. V.p. have been determined. E. S. H.

**Preparation of disilicon hexachloride.** T. TORAL (Anal. Fis. Quím., 1935, 33, 225–228).—By the use of lower temp. and diffused light, the yield of  $\text{Si}_2\text{Cl}_6$  by chlorination of Ca–Mn–Si (cf. Schumb *et al.*, A. 1932, 482) is increased to 58%. The f.p. is –1°. F. R. G.

**Lead oxides.** E. RENCKER (Bull. Soc. chim., 1936, [v], 3, 981–988).—The thermal decomp. of  $\text{PbO}_2$  in the air yields  $\text{Pb}_2\text{O}_3$  and red lead, accompanied by a brown oxide, also of composition  $\text{Pb}_2\text{O}_4$ . The brown oxide can be obtained by heating  $\text{PbO}$ , in a vac. The two forms of  $\text{PbO}$  cannot be distinguished by colour; the  $\alpha$  form may vary from yellow to red. Dry methods of prep. yield the  $\alpha$  form below 530°; at higher temp. it is converted into the  $\beta$  form, but the

reverse transformation has not been observed. Both forms may be obtained by wet methods of prep. E. S. H.

**Formation of  $\text{N}_2\text{O}_3$  by reduction of nitric acid with aluminium.** W. GELLER (Z. anorg. Chem., 1936, 227, 413–414).— $\text{HNO}_3$  (sp. gr. 1.210), left undisturbed in contact with pure Al for 30 days at room temp., assumes an intense blue colour, and is shown by titration with  $\text{KMnO}_4$  to contain about 0.7% of  $\text{N}_2\text{O}_3$ . Stirring prevents the formation of the blue colour and destroys it when formed, with evolution of  $\text{NO}$ . F. L. U.

**Volume-chemical evidence as to existence of orthonitric acid.** W. BILTZ [with O. HULSMANN and W. EICKHOLZ] (Nachr. Ges. Wiss. Göttingen, 1935, [ii], 1, 95–102; Chem. Zentr., 1935, ii, 1846–1847).—From measurements of the vol. increments and thermal expansions in the  $\text{HNO}_3$ – $\text{H}_2\text{O}$  system,  $\text{HNO}_3 \cdot \text{H}_2\text{O}$  is regarded as actually  $\text{H}_3\text{NO}_4$ , and  $\text{HNO}_3 \cdot 3\text{H}_2\text{O}$  as its dihydrate  $\text{H}_3\text{NO}_4 \cdot 2\text{H}_2\text{O}$ . J. S. A.

**Dynamics of preparation of red phosphorus.** I. A. J. ZVORIKIN (J. Appl. Chem. Russ., 1936, 9, 779–788).—Complete conversion of white into red P is attained in 15–30 min. at 400–500°. Red P,  $\text{Fe}_2\text{O}_3$ ,  $\text{CaO}$ ,  $\text{SiO}_2$ ,  $\text{U}_3\text{O}_8$ , and Se are without catalytic action. R. T.

**Mutual reactions of phosphates and soils. III. Monocalcium hydrogen phosphate and calcium carbonate, alone or in presence of variable quantities of lime.** J. CLARENS and H. MARGULIS (Bull. Soc. chim., 1936, [v], 3, 1053–1060; cf. this vol., 39).—When  $\text{Ca}(\text{H}_2\text{PO}_4)_2$  is pptd. by  $\text{Ca}(\text{OH})_2$  in presence of small amounts of  $\text{CO}_2$ , a certain amount of  $\text{Ca}_2(\text{HPO}_4)_2$  is found in the ppt. Dil. solutions of  $\text{Ca}(\text{H}_2\text{PO}_4)_2$  do not attack pptd.  $\text{CaCO}_3$ . The pptn. of aq.  $\text{Ca}(\text{H}_2\text{PO}_4)_2$ , containing suspended  $\text{CaCO}_3$ , by progressively increasing amounts of  $\text{Ca}(\text{OH})_2$  has been studied. E. S. H.

**Alteration of properties of vanadium pentoxide brought about by cold-working.** C. KROGER (Z. anorg. Chem., 1936, 227, 376–384).—Cold-working of  $\text{V}_2\text{O}_5$ , by compression or by grinding in a mortar, effects a change of colour from yellow to green. At the same time  $d$  is reduced from 3.32 to 2.83, and the adsorptive capacity for  $\text{SO}_2$  and reactivity with CO are increased. X-Ray examination shows slight broadening of the lines, but no essential change in cryst. structure. The effects are attributed to disturbance of the atoms in the outer lattice planes. Similar behaviour is shown by  $\text{CuVO}_3$ . F. L. U.

**Bismuth bromide,  $\text{BiBr}_2$ .** E. MONTIGNIE (Bull. Soc. chim., 1936, [v], 3, 1082–1084).—Properties and reactions of  $\text{BiBr}_2$ , prepared by the action of Br on pptd. Bi, are described. E. S. H.

**Sulphide, selenide, and thioselenide of thiocyanogen.** A. BARONI (Atti R. Accad. Lincei, 1936, [vi], 23, 139–142).—The compounds  $\text{Se}_2(\text{SCN})_2$  and  $\text{SeS}(\text{SCN})_2$  have been prepared by the action of  $\text{Hg}(\text{SCN})_2$  on  $\text{Se}_2\text{Cl}_4$  and  $\text{SeSCL}_2$ , respectively.  $\text{S}(\text{SCN})_2$  can be obtained in an analogous way from  $\text{SCl}_2$ . All three substances polymerise readily at room temp. giving non-fusible and insol. products.

**Potassium tellurates.** Analogy with the sulphates and selenates. M. PATRY (Compt. rend., 1936, 202, 1516—1519; cf. A., 1935, 1090).— $K_2TeO_4 \cdot 2H_2O$  is not isomorphous with  $K_2H_4OsO_6$  (Retgers, A., 1893, ii, 161). Of the compounds  $KHTeO_4 \cdot 1.5H_2O$ ,  $KHTeO_7 \cdot 1.5H_2O$ , and  $K_2Te_3O_{10} \cdot 5H_2O$  reported in the literature, only the amorphous  $KHTeO_4 \cdot 1.5H_2O$  could be prepared.  $K_2TeO_4$ ,  $K_2SeO_4$ , and  $K_2SO_4$  have been shown by X-rays to be isomorphous. R. S.

**Chromic picrate.** H. J. S. KING (J.C.S., 1936, 861—862).—Excess of  $Ag_2O$  with picric acid affords Ag picrate +  $1H_2O$  (I) (cf. J.C.S., 1908, 93, 486), which loses  $1H_2O$  at  $85^\circ$ . Hexa-aquochromic chloride (II) (cf. A., 1904, ii, 565) with (I) at  $0^\circ$  gives chromic picrate +  $8H_2O$  (III) (the aq. solution is probably an equilibrium mixture as shown by conductivity measurements; boiling  $H_2O$  affords a basic picrate), converted at  $85^\circ$  into the anhyd. salt, sinters with decomp. at  $94^\circ$ , which with cold  $H_2O$  gives picric acid and basic chromic picrate, and with liquid  $NH_3$  affords a mixture of chromiammine picrates in which 1 Cr is associated with 3.5  $NH_3$ . (III) (1 mol.) with hexamminochromic nitrate (1.5 mols.) in cold  $H_2O$  gives immediately hexa-amminochromic dipicrate (cf. A., 1924, i, 1060). Dichlorotetra-aquochromic chloride with (I) gives mainly (III), and (II) with  $AgNO_3$  evolves N oxides and affords no  $Cr(NO_2)_3$ . J. L. D.

**Behaviour of tri(hydroxyethyl)amine towards tungstic acid.** F. GARELLI and A. TETTAMANZI (Atti. R. Accad. Sci. Torino, 1935, 70, I, 588—594; Chem. Zentr., 1935, ii, 2035).—The following compounds are described  $[Tr=N(CH_2 \cdot CH_2 \cdot OH)_3]$ :

J. S. A.

**Preparation of hydrobromic acid in the laboratory.** C. N. IONESCU and V. RADULESCO (Bul. Soc. Chim. Romania, 1935, 17, 309—312).—Pure HBr is prepared by slowly dropping Br on to lighting petroleum in presence of  $AlBr_3$  at room temp. at first and at a higher temp. towards the end. The yields with and without  $AlBr_3$  are 80—90 and 45%.

R. S. B.

**Dissociation of excited iodine molecules.** E. RABINOWITCH and W. C. WOOD (J. Chem. Physics, 1936, 4, 358—362; cf. this vol., 437).—Using  $I_2$  vapour diluted with He, A,  $N_2$ , or  $H_2$ , it is shown that all excited  $I_2$  mols. dissociate by collision with foreign mols. With He  $\leq 10$  collisions are required, whilst with the other gases the first collision is effective.

F. L. U.

**Preparation of iodic acid.** A. PÉREZ-VITORIA (Anal. Fis. Quím., 1935, 33, 795—803).—Further details (cf. A., 1932, 352) are given. The action of samples of fuming  $HNO_3$  containing from 84.7 to 98.3%  $HNO_3$  ( $d$  1.476 to 1.511) on I is described; a minimum concn. of 89%  $HNO_3$  is essential. A solution of  $HIO_3$  in  $HNO_3$  yields crystals of  $HIO_3$  or  $3I_2O_5 \cdot H_2O$  (cf. Moles *et al.*, A., 1934, 617) according as the  $HNO_3$  is dil. and cold, or conc. and hot.

F. R. G.

**Metallic iodochlorides. II.** M. G. DE CELIS (Anal. Fis. Quím., 1935, 33, 203—224).— $MCl_4I$  ( $M=NH_4$ , Rb, Cs), and  $M(Cl_4I)_2 \cdot 8H_2O$  ( $M=Be$ , Mn, Co, Ni, Zn) have been prepared by the author's method (A., 1932, 1215). The  $d$  of these salts and their m.p. together with the m.p. of the salts previously prepared (*loc. cit.*) are recorded. The mol. vol. of the anion is influenced by the nature of the cation.

F. R. G.

**Internal complex salts of bivalent manganese and univalent copper.**—See this vol., 968.

**Amorphous and crystalline oxide hydrates and oxides. XXVI.** Structure and catalytic properties of crystalline ferric hydroxides which give amorphous X-ray patterns. A. KRAUSE and S. KRZYŻANSKI (Z. anorg. Chem., 1936, 227, 417—422; cf. this vol., 686, 691).—The prep. of two microcryst. varieties of hydrated  $Fe_2O_3$  by means of conc. KOH is described (cf. A., 1935, 314). Both belong to the ortho-hydroxide type and give amorphous X-ray diagrams. When heated with  $H_2O$  or aq. KOH in an autoclave they yield  $\alpha$ - $Fe_2O_3$ .

F. L. U.

**Barium ferric fluorides.** A. H. NIELSEN (Z. anorg. Chem., 1936, 227, 423—424; cf. this vol., 441).—The prep. and properties of the compound  $Ba_3Fe_2F_{13} \cdot H_2O$  are described. Attempts to prepare the anhyd. salt were unsuccessful.

F. L. U.

**Reaction of ferric salts with pyrimidone in the presence of complex cyanides of iron.** J. V. DUBSKY, E. KRAMETZ, and J. TRTÍLEK (Publ. Fac. Sci. Univ. Masaryk, 1936, 223, 7—10).—Reduction of  $Fe^{III}$  salts by pyrimidone (I) in aq. solution accounts for the different constitution,  $[Fe^{III}(CN)_5NO]Fe^{II}6aq.$  of the ppt. obtained with Na nitroprusside in the presence of  $Fe^{III}$  salts, to that obtained with antipyrine. Only with KCNS and  $Fe^{III}$  salts in aq. solution (I) gives purple-red ppts.,  $2Fe(SCN)_3 \cdot 3pyram.$ , analogous to those obtained with antipyrine, whilst in alcoholic solution in which antipyrine gives  $Fe(SCN)_3 \cdot 0.3antip.$ , no satisfactory result was obtained.  $Fe^{III}$  salts and (I) with  $[Fe^{III}(CN)_5NO]Na_3$  and  $[Fe^{III}(CN)_5NH_2]Na_2$  give respectively blue ppts. of  $[Fe^{III}(CN)_5NO]_2Fe^{II}$  and  $[Fe^{III}(CN)_5NH_2]Fe^{II}$ ; with  $[Fe^{II}(CN)_5NH_3]Na_3$  and  $[Fe^{II}(CN)_5NO]Na_4$  they give respectively blue ppts. of  $[Fe^{II}(CN)_5NH_3]Fe^{III}$  and  $[Fe^{II}(CN)_5NO]_3Fe^{II}_4$ .

F. R.

**Temperature of the iron thermite reaction.** H. VON WARTENBERG and G. WEHNER (Z. Elektrochem., 1936, 42, 293—298; cf. A., 1932, 913).—The temp. of a Fe-thermite mass, determined spectrographically, is  $2400 \pm 50^\circ$ .

F. L. U.

**Complexes of sodium nitroprusside.** V. L. MASALSKI and A. T. TSCHERNI (J. Gen. Chem. Russ., 1936, 6, 37—41).— $Na_2[Fe(CN)_5NO]$  yields complexes of the probable structures  $Na_3[Fe(CN)_4NO_2NO]$  (I),  $Na[Fe(CN)_2NO_2 \cdot 3NO]$  (II), and  $[Fe(CN)_4NO][NO_2]$  (III), when treated with NaOH. Titration with  $KMnO_4$  in acid solution at room temp. converts (I) into  $Na_2[Fe^{III}(CN)_4NO_2NO]$ , (II) into  $Na_2[Fe^{III}(CN)_2NO_2 \cdot 3NO \cdot SO_4]$ , and (III) into  $[Fe^{III}(CN)_4NO_2NO_2][H]$ . At  $75^\circ$   $Fe^{II}$  is oxidised to  $Fe^{III}$ , and then  $NO_2^-$  to  $NO_3^-$ .

R. T.

**Insoluble nitroprussides of metals.** J. V. DUBSKY and E. KRAMETZ (Publ. Fac. Sci. Univ. Masaryk, 1936, 223, 1—8).—Na nitroprusside precipitates  $\text{Fe}^{\text{II}}\text{X}_2 \cdot 6\text{H}_2\text{O}$  (chocolate),  $\text{CdX}_2 \cdot 2\text{H}_2\text{O}$  (flesh-pink),  $\text{ZnX}_2 \cdot 3\text{H}_2\text{O}$  (flesh),  $\text{CoX}_2 \cdot 4 \cdot 5\text{H}_2\text{O}$  (pink),  $\text{Hg}^{\text{I}}\text{X}_2 \cdot 0 \cdot 5\text{H}_2\text{O}$  (white),  $\text{Hg}^{\text{II}}\text{X}_2 \cdot 2\text{H}_2\text{O}$  (white), and  $\text{Ag}_2\text{X}$  (white), from solutions of salts of these metals [ $\text{X} = \text{Fe}^{\text{III}}(\text{CN})_5\text{NO}$ ]. Antipyrine when present in the pptns. forms a complex only with  $\text{Fe}^{\text{II}}$  nitroprusside. F. R.

**Gmelin's reaction (sulphides and nitroprussides).** F. E. RAURICH-SAS (Anal. Fis. Quím., 1936, 34, 419—494).—Solutions of  $\text{Na}_3[\text{Fe}(\text{CN})_5(\text{NO})]$  (I) with  $\text{M}_2\text{S}$  ( $\text{M} = \text{alkali metal or NiI}_2$ ) give a deep red compound,  $\text{Na}_3\text{M}_2[\text{Fe}(\text{CN})_4(\text{HS})_2]$  (II), which, in presence of the  $\text{NO}_2^-$  formed, yields an indigo compound,  $\text{Na}_2\text{M}_2[\text{Fe}(\text{CN})_4(\text{S} \cdot \text{S}(\text{S})_2)]$  (III); this is the sole product of the reaction of (I) with tetrasulphides (IV), which are formulated  $\text{S}' \cdot \text{S}(\text{S}) \cdot \text{S}'$ . The variation of colour obtained in the reaction is due to formation of (II) and (III) in differing proportions together with  $\text{Na}_4[\text{Fe}(\text{CN})_5(\text{NO})_2]$  and  $\text{Na}_4[\text{Fe}(\text{CN})_6]$ . The following analogues of (IV) give a colour reaction:  $\cdot\text{O} \cdot \text{SO} \cdot \text{O} \cdot$ ,  $\cdot\text{O} \cdot \text{CS} \cdot \text{O} \cdot$ ,  $\cdot\text{S} \cdot \text{CS} \cdot \text{S} \cdot$ ,  $\cdot\text{O} \cdot \text{CO} \cdot \text{O} \cdot$ ,  $\text{CO}(\text{NH}_2)_2$ ,  $\text{CS}(\text{NH}_2)_2$ . The blue ppt. given by  $\text{Na}_2\text{S}_2\text{O}_4$  with (I) (cf. Comanducci, A., 1918, ii, 248) is regarded as  $\text{Na}_3\text{Fe}^{\text{III}}[\text{Fe}^{\text{II}}(\text{CN})_6]_3$ . Evidence is adduced for the formulæ  $\cdot\text{O} \cdot \text{SO} \cdot \text{O} \cdot \text{S} \cdot \text{O} \cdot$  and  $\cdot\text{O} \cdot \text{SO} \cdot \text{O} \cdot \text{S}'$  for the hypsulphite and thiosulphate ions. F. R. G.

**Nitrites. III. Ammines of cobaltous nitrite.** L. LE BOUCHER (Anal. Fis. Quím., 1936, 34, 66—71).— $\text{Co}(\text{NO})_2 \cdot 2 \cdot 3\text{C}_5\text{H}_5\text{N}$  (A., 1929, 781), after alternate treatment with  $\text{NH}_3$  and evacuation over  $\text{H}_2\text{SO}_4$ , yields the *hexammoniate*, which at  $50^\circ$  12 mm. loses  $\text{NH}_3$  to give the *tetrammoniate* which again loses  $\text{NH}_3$  at lower pressures.  $d_{40}^{25}$  are recorded. F. R. G.

**Complex cobalti-oxalates. II.** G. SPACU and M. VANCEA (Bul. Soc. Stiințe Cluj, 8, 228—236; Chem. Zentr., 1935, ii, 2795—2796; cf. A., 1934, 1321).—The following salts are described:  $\text{A}[\text{Co}(\text{NH}_3)_5\text{X}]\cdot\text{H}_2\text{O}$  ( $\text{A} = [(\text{C}_2\text{O}_4)_2, \text{Co}(\text{OH})(\text{H}_2\text{O})]$ ,  $\text{X} = \text{Cl, Br, CNS, NO}_2, + 2\text{H}_2\text{O, NO}_3 + 2\text{H}_2\text{O}$ );  $\text{A}[\text{Co en}_2\text{Cl}_2] \cdot 2\text{H}_2\text{O}$ ;  $\text{A}[\text{Co}(\text{NH}_3)_6] \cdot 9\text{H}_2\text{O}$ ;  $\text{A}[\text{Co}(\text{NH}_3)_5\text{Co}_2] \cdot 2\text{H}_2\text{O}$ ;  $\text{A}_3[\text{Co}(\text{NH}_3)_3(\text{H}_2\text{O})_2] \cdot 8\text{H}_2\text{O}$ ;  $\text{A}[\text{Co en}_2(\text{OH})(\text{H}_2\text{O})]$ . J. S. A.

**Substitution of water for chlorine in the dichloro-trans-ethylenediaminecobaltic ion.** O. BINDER and P. SPACU (Compt. rend., 1936, 202, 1586—1588).—The X-ray spectra of *cis*- and *trans*-dichloro-, *cis*-monoquo- and *cis*-diaquo-diethylenediaminecobaltic chlorides are distinct. Interaction of *trans*- $[\text{Co en}_2\text{Cl}_2]\text{Cl}$  with  $\text{H}_2\text{O}$  yields only *cis*- $[\text{Co en}_2(\text{H}_2\text{O})\text{Cl}]\text{Cl}_2$ . H. J. E.

**Action of malonic acid on dichloro-trans-diethylenediaminecobaltic chloride.** O. BINDER and P. SPACU (Compt. rend., 1936, 202, 1786—1787).—X-Ray spectra indicate that *trans*- $[\text{Co en}_2\text{Cl}_2]\text{Cl}$  treated with malonic acid yields the violeo-compound and not the monoquo-salt (A., 1929, 780). J. W. S.

**Thiocyanate co-ordination compounds.** R. J. McILROY, A. C. ESPINER, and A. D. MONRO (J. New Zealand Inst. Chem., 1936, 1, 10—14).—The following compounds prepared by the action of the amine+

$\text{NH}_4\text{CNS}$  on the metal salts are described:  $\text{Co}[p\text{-C}_6\text{H}_4(\text{NH}_2)_2]_2(\text{CNS})_2$ ;  $\text{NiX}_2(\text{CNS})_2$  [ $\text{X} = o\text{-, } m\text{-, and } p\text{-C}_6\text{H}_4(\text{NH}_2)_2$ ;  $o\text{-, } m\text{-, and } p\text{-C}_6\text{H}_4\text{Me} \cdot \text{NH}_2$ ;  $\text{NH}_2\text{Ph}$ ; and benzidine]. Cu salts yield  $2\text{CuCNS}$ ,  $o\text{-}$  or  $m\text{-C}_6\text{H}_4(\text{NH}_2)_2$ .  $\text{NH}_3$  displaces the amines from the Ni compounds at room temp., yielding  $[\text{Ni}(\text{NH}_3)_6](\text{CNS})_2$ . From their greater solubility in associated solvents, it is considered that the Ni compounds are electrolytes, e.g.,  $[\text{Ni}(\text{C}_6\text{H}_4\text{Me} \cdot \text{NH}_2)_2](\text{CNS})_2$ . J. S. A.

**Iodates. I. Copper and nickel.** J. MARTINEZ-CROS and L. LE BOUCHER. II. Cobalt and zinc. J. MARTINEZ-CROS (Anal. Fis. Quím., 1935, 33, 229—240; 1936, 34, 72—80).—I. A green form of  $\text{Ni}(\text{IO}_3)_2$  has been isolated, as well as the yellow form, by dehydration of  $\text{Ni}(\text{IO}_3)_2 \cdot 2\text{H}_2\text{O}$ .  $\text{Ni}(\text{IO}_3)_2$  with  $\text{NH}_3$  under pressure gives  $\text{Ni}(\text{IO}_3)_2 \cdot 6\text{NH}_3$ , which, when left at reduced pressure over  $\text{H}_2\text{SO}_4$ , yields  $\text{Ni}(\text{IO}_3)_2 \cdot 2\text{NH}_3$  and this, when heated at  $120^\circ$ , gives  $\text{Ni}(\text{IO}_3)_2 \cdot \text{NH}_3$ .  $\text{Cu}(\text{IO}_3)_2$  has been obtained in a colourless form by dehydration of  $\text{Cu}(\text{IO}_3)_2 \cdot \text{H}_2\text{O}$ , which with  $\text{NH}_3$  gives  $\text{Cu}(\text{IO}_3)_2 \cdot 5\text{NH}_3$  whence  $\text{Cu}(\text{IO}_3)_2 \cdot 2\text{NH}_3$  and  $\text{Cu}(\text{IO}_3)_2 \cdot \text{NH}_3$  are obtained as above.  $d_{40}^{25}$  have been determined.

II. The observations of Meusser (A., 1901, ii, 555) on the hydrates of  $\text{Co}(\text{IO}_3)_2$  are confirmed.  $\text{Co}(\text{IO}_3)_2$  with  $\text{NH}_3$  under pressure gives the *hexammoniate* which, when left in vac. over  $\text{H}_2\text{SO}_4$ , yields the *diammoniate*.  $\text{Zn}(\text{IO}_3)_2 \cdot 4\text{NH}_3$  (cf. Ephraim *et al.*, A., 1915, ii, 166), when heated at  $125^\circ$ , yields the *di-ammoniate*.  $d_{40}^{25}$  and mol. vol. are recorded for  $\text{Co}(\text{IO}_3)_2$ ,  $\text{Zn}(\text{IO}_3)_2$ , their hydrates and ammoniates. F. R. G.

**Oxidising agents for nickel solutions.** W. A. WESLEY (Metal Ind., N.Y., 1935, 33, 290).—A discussion (cf. A., 1935, 45, 1467). L. S. T.

**Luteo- and purpureo-salts of ruthenium. Ruthenammines. I.** K. GLEU and K. REHM (Z. anorg. Chem., 1936, 227, 237—248).—The following stable complex *ammines* of  $\text{Ru}^{\text{III}}$ , with co-ordination no. 6, have been obtained: luteo-salts (I)  $[\text{Ru}(\text{NH}_3)_6]_2(\text{SO}_4)_3 \cdot 5\text{H}_2\text{O}$  and  $[\text{Ru}(\text{NH}_3)_6]_2(\text{H}_2\text{SO}_4)_2$ ; purpureo-salts (II)  $[\text{Ru}(\text{NH}_3)_5\text{Cl}]\text{Cl}_2$  and  $[\text{Ru}(\text{NH}_3)_5\text{Br}]\text{Br}_2$ . The compounds are analogous with the corresponding Co and Cr compounds, but (I) are colourless like Rh hexammines. (I) are stable to dil. mineral acids, but not to conc. alkalis, which give a yellow colour with liberation of  $\text{NH}_3$ . By treating this yellow product with conc.  $\text{HCl}$  a blue compound is obtained which is an oxidation-reduction indicator, being colourless in the oxidised stage. With dil. alkali both (I) and (II) give a deep red colour. (I) are not readily oxidised in acid solution in the cold, but are completely decomposed on heating, giving  $\text{RuO}_4$ . They form insol. ppts. with a no. of anions, e.g.,  $\text{I}^-$ ,  $\text{C}_2\text{O}_4^{2-}$ ,  $\text{P}_2\text{O}_7^{4-}$ ,  $\text{CrO}_4^{2-}$ ,  $\text{Cr}_2\text{O}_7^{2-}$ ,  $\text{Fe}(\text{CN})_6^{4-}$ ,  $\text{Fe}(\text{CN})_6^{3-}$ , and  $\text{ClO}_4^-$ . (II) are obtained by boiling (I) with conc.  $\text{HCl}$  or  $\text{HBr}$  giving, respectively, yellow and orange-red ppts. They are dissolved by gentle warming with excess of aq.  $\text{NH}_3$  giving the ion  $[\text{Ru}(\text{NH}_3)_5\text{OH}]^+$  in solution from which a white cryst. roseo-salt,  $[\text{Ru}(\text{NH}_3)_5\text{H}_2\text{O}]\text{X}_3$ , is probably pptd. by carefully acidifying. All the compounds are paramagnetic, in accordance with

theory, and have a moment of 2 Bohr magnetons at 20°.  
M. S. B.

Interaction of pyridine with the chloride and bromide of Blomstrand salt.—See this vol., 998.

Artificial preparation of radioactive elements. (MME.) I. JOLIO-CURIE and F. JOLIO (Angew. Chem., 1936, 49, 367—369).—Nobel lecture. J. W. S.

Microchemical methods. T. A. THOMSON (J. New Zealand Inst. Chem., 1936, 1, 21—26).—A review. J. S. A.

Raman effect in analytical chemistry. J. GOUBEAU (Z. anal. Chem., 1936, 105, 161—182).—The application of the Raman effect to the detection and determination of org. compounds is discussed, with special reference to the analysis of hydrocarbon fuel mixtures. The intensity  $I$  of the Raman lines is measured by their persistence through a series of standardised exposures decreasing in geometrical progression, and is compared with  $I$  for the pure substance: quant. results are inaccurate for lines of small  $I$ .  $H_2O$  and fluorescent impurities are first removed by shaking with  $CaSO_4$  and active C.

Importance of the absorption of light in chemistry. H. FROMHERZ (Chem.-Ztg., 1936, 60, 445—448).—Applications of absorption spectra methods to the determination of the presence and concn. of substances possessing absorption bands, and to the elucidation of problems of constitution, are illustrated by examples drawn from the lit.

Electrometric analysis. Attempt at a general classification. J. GUZMÁN (Anal. Fis. Quím., 1935, 33, 109—113).—A survey of the methods in use.

Magneto-optic method of chemical analysis. I. History and present status of the method. II. Construction, adjustments and operation of the apparatus; physical measurements; unknowns. S. S. COOPER [with T. R. BALL] (J. Chem. Educ., 1936, 13, 210—215, 278—283).—I. From a review of evidence for and against the method, it is concluded that min. exist and are characteristic of the substance or substances under examination.

Crystallo-chemical analysis. G. B. BOXI (Ann. Sect. Anal. Phys.-Chim., 1936, 8, 115—124).—Descriptive.

Methods of physico-chemical analysis. V. A. KISTIakovSKI (Ann. Sect. Anal. Phys.-Chim., 1936, 8, 5—13).—Descriptive.

Systematic qualitative analysis of anions. E. W. FLOSDORF and C. HENRY (J. Chem. Educ., 1936, 13, 274—277).—Details are given for the separation of 19 of the commoner anions into 4 groups. Sensitivities of the tests are recorded.

Hydrogen carbonate method of qualitative chemical analysis for cations. A. B. LEVIN (Z. anal. Chem., 1936, 105, 328—331).—A scheme for the group separation of the common cations, avoiding the use of  $H_2S$ , is outlined.

New oxidation-reduction indicators. I. Phenylanthranilic acid (diphenylamine-*o*-carboxylic acid). W. S. SYROKOMSKY and V. V. STIEPIN (J. Amer. Chem. Soc., 1936, 58, 928—929).—Phenylanthranilic acid gives sharp, reversible colour changes with the usual oxidising solutions used in volumetric analysis, and is more stable in presence of excess of oxidant than  $NHPh_2$  and its derivatives. The normal oxidation potential, referred to the  $H_2$  electrode, is +1.08 volt. The indicator error, determined potentiometrically, is negligible.

Micro-method for accurate determination of  $D_2O$  in water. K. FENGER-ERIKSEN, A. KROGH, and H. USSING (Biochem. J., 1936, 30, 1264—1269).—The precautions for the removal and purification of  $H_2O$ - $D_2O$  mixtures from tissues, and a pipette for producing drops of the same vol. in the  $d$  determinations, are described.

Measurement of  $p_H$  values. L. G. GROVES (J. Sci. Instr., 1936, 13, 209—214).—A discussion of the methods available, especially of the glass electrode.

Accuracy of  $p_H$  measurements. F. LIENEWEG (Arch. tech. Mess., 1935, 4, 774—775, 4 pp.; Chem. Zentr., 1935, ii, 2248—2249).—The accuracy of the customary colorimetric and electrometric methods is reviewed.

Determination of hydrogen-ion concentration. T. T. COCKING (Ind. Chem., 1936, 12, 299—301).—An apparatus for the prep. and storage of  $H_2O$  for use in  $p_H$  determinations, and an accurate method of determining  $p_H$  so as to avoid the error due to the buffering action of the indicator, are described.

Borax as an acidimetric standard. F. H. HURLEY, jun. (Ind. Eng. Chem. [Anal.], 1936, 8, 220—221).—The drying of  $Na_2B_4O_7 \cdot 10H_2O$  with  $EtOH$  and  $Et_2O$  is described. The rate of loss of  $H_2O$  of crystallisation by exposure to air has been determined. The stability is such that borax may be used satisfactorily.

Action of 4-nitropyrocatechol as a titration indicator. S. R. COOPER and V. J. TULANE (Ind. Eng. Chem. [Anal.], 1936, 8, 210—211).—4-Nitropyrocatechol is useful for titrations of strong acids with strong bases, or strong acids with weak bases, but not for weak acids.

Oximinothiocamphor as an indicator.—See this vol., 856.

Titration of weak acids and bases in water-alcohol mixtures. H. BAGGESGAARD-RASMUSSEN (Z. anal. Chem., 1936, 105, 269—282).—The theories of Bjerrum and Bronsted are applied to the titration of weak acids and bases in  $H_2O$ - $EtOH$  mixtures. The  $p_A$  of weak acids, as also of most indicators except Me-orange, is elevated with increasing  $[EtOH]$ , the  $p_A$  of weak bases being similarly progressively lowered. Weak acids may therefore be titrated accurately in aq.  $EtOH$ , using phenolphthalein, but no advantage is obtained other than increased solubility of org. acids. The titration of weak bases is less practicable than in  $H_2O$ , but the salts of weak bases

(e.g., alkaloid hydrochlorides) may be titrated with much enhanced accuracy in conc. aq. EtOH.

J. S. A.

**Universal indicator for the range  $p_H$  1.2—12.7, and its use in volumetric analysis.** F. ČUTA and K. KÁMEN (Chem. Listy, 1936, 30, 22—24, 129—133).— $s\text{-C}_6\text{H}_3(\text{NO}_2)_3$  1.125, phenolphthalein 0.0355,  $o$ -cresolphthalein 0.03, bromothymol-blue 0.1, Me-red 0.022, Me-orange 0.0085, and 2':4':2'':4'':2'''-penta-methoxytriphenylcarbinol 0.5 g. are dissolved in a litre of MeOH, and the solution is made exactly neutral with aq. NaOH. The indicator is unstable when made up in EtOH instead of MeOH. Examples of its application to volumetric analysis are given, and a colour scale is appended, enabling  $p_H$  vals. from 1.2 to 12.7 to be read with an error of  $\pm 0.2$ . R. T.

**Determination of free acid in dark coloured liquids.** M. DE MINGO and H. THALER (Anal. Fis. Quim., 1935, 33, 376—380).—Electrometric titration is preferred to the use of outside indicators.

F. R. G.

**Titration of hydrogen peroxide in presence of oxalic acid (alkali oxalates).** A. SIMON and T. REETZ (Z. anal. Chem., 1936, 105, 321—323).— $\text{H}_2\text{O}_2 + \text{H}_2\text{C}_2\text{O}_4$  is titrated with  $\text{KMnO}_4$ .  $\text{H}_2\text{O}_2$  in a second portion is destroyed by boiling with NaOH or  $\text{NH}_3$  in presence of  $\text{FeCl}_3$ , and  $\text{H}_2\text{C}_2\text{O}_4$  is then titrated alone.

J. S. A.

**Determination of active chlorine in bleach liquors.**—See B., 1936, 589.

**[Use of] benzidine acetate in the determination of bromides by silver.** F. BURRIEL (Anal. Fis. Quim., 1935, 33, 692—695).—The method previously described (A., 1932, 825) for the determination of  $\text{I}'$  is suitable for determination of  $\text{Br}'$  between  $N$  and  $0.02N$  with an error  $< 0.5\%$ , but is unsuitable for determination of  $\text{Cl}'$ .

F. R. G.

**Ultra-violet light as an aid in the fluorescence test for bromine.** J. GRANT (Analyst, 1936, 61, 400—401).—The sensitiveness of the Baubigny test for Br (cf. B., 1936, 254) is increased by examination of the stains in ultra-violet light.

E. H. S.

**Micro-determination of iodine.** F. GONZALEZ NUNEZ and P. P. REGIDOR (Anal. Fis. Quim., 1935, 33, 445—456).—The solution (10 c.c.) containing about  $5 \times 10^{-6}$  g. I with an equal amount of 28%  $\text{K}_2\text{CO}_3$  is evaporated and calcined and the residue lixiviated; the solution is evaporated, this residue extracted with 95% EtOH, which is boiled with a few drops of 20%  $\text{H}_2\text{SO}_4$  and 1 c.c. of  $\text{Br-H}_2\text{O}$ , with subsequent addition of a little KI and starch, and titrated with 0.002*N*- $\text{Na}_2\text{S}_2\text{O}_3$ . The method is used for the determination of I in blood with an error of about 5%.

F. R. G.

**Volumetric determination of iodides by ceric sulphate.** Application of the indicator  $o$ -phenanthroline ferrous ion. D. LEWIS (Ind. Eng. Chem. [Anal.], 1936, 8, 199—200).—A satisfactory visual end-point is obtained in presence of  $\text{CoMe}$ , and  $\text{H}_2\text{SO}_4$ . Moderate amounts of neutral chloride do not interfere. If  $\text{Br}'$  is present, more  $\text{Ce}(\text{SO}_4)_2$  is required.

E. S. H.

**Quantitative distillation of fluorine.** D. DAHLE and H. J. WICHMANN (J. Assoc. Off. Agric.

Chem., 1936, 19, 313—320).—The effect of varying the amount of non-volatile acid used, the distillation temp., the vol. of distillate collected, and the size of flask used in the Willard and Winter method is investigated. The retarding effect of Al salts and gelatinous  $\text{SiO}_2$  on the distillation is confirmed.

E. C. S.

**Determination of fluorine in presence of a large excess of aluminium ions.** D. DAHLE and H. J. WICHMANN (J. Assoc. Off. Agric. Chem., 1936, 19, 320—327; cf. preceding abstract).—The Willard and Winter method is modified (a) by raising the distillation temp. to  $162^\circ$ , (b) by increasing the vol. of distillate collected to 300—350 c.c., and (c) by evaporating and redistilling the distillate. 2 p.p.m. of F can be detected in  $\text{Al}_2(\text{SO}_4)_3$  and alum.

E. C. S.

**Determination of fluorine.** S. SHINKAI (J. Soc. Chem. Ind. Japan, 1936, 39, 162B).—Fluorides are decomposed by conc.  $\text{H}_2\text{SO}_4$  and Si, the liberated  $\text{SiF}_4$  being absorbed in powdered NaF.

C. R. H.

**Conductometric determination of fluorine down to minimal quantities.** J. HARMS and G. JANDER (Z. Elektrochem., 1936, 42, 315—319; cf. A., 1935, 1092).—Conductometric titration of NaF in dil. AcOH with  $\text{AlCl}_3$  gives good results for quantities of F from 20 mg. to  $12 \times 10^{-6}$  g. No disturbance is caused by  $\text{Cl}'$ ,  $\text{NO}_3'$ ,  $\text{SO}_4''$ , or  $\text{SiO}_3''$ .

F. L. U.

**Determination of fluorine in artificial cryolite.**—See B., 1936, 640.

**Determination of fluorine in presence of beryllium.** A. A. VASILIEV (J. Appl. Chem. Russ., 1936, 9, 943—945).—The sample is fused with 2:1  $\text{Na}_2\text{CO}_3\text{-K}_2\text{CO}_3$ , and F' is determined as  $\text{PbFCl}$  in the aq. extract of the melt.

R. T.

**Analysis of sulphide-hydrosulphide lyes.**—See B., 1936, 639.

**Volumetric determination of sulphate using sodium rhodizonate.** R. STREBINGER and L. VON ZOMBORY [with L. POLLAK] (Z. anal. Chem., 1936, 105, 346—350; cf. A., 1930, 53).—In acid solutions,  $\text{SO}_4''$  is pptd. with an excess of standard  $\text{BaCl}_2$ . Na rhodizonate is added as indicator, and the excess of Ba is then titrated with aq.  $\text{K}_2\text{SO}_4$ . The addition of  $\text{NH}_4\text{Cl}$  is advantageous.

J. S. A.

**Colorimetric determination of inorganic sulphate.**—See this vol., 914.

**Standardisation of sodium thiosulphate iodometrically against copper.** L. O. HILL (Ind. Eng. Chem. [Anal.], 1936, 8, 200).—After dissolving the Cu in  $\text{HNO}_3$ ,  $\text{HNO}_3$  is removed by boiling with  $\text{CO}(\text{NH}_2)_2$ . The usual procedure is then followed.

E. S. H.

**Micro-determination of nitrogen by Kjeldahl.** Z. ZAKRZEWSKI and H. J. FUCHS (Biochem. Z., 1936, 285, 390—406).—The technique of this determination is investigated critically in all its stages—burning, liberation and distillation of  $\text{NH}_3$ , and iodometric titration—and apparatus and modifications are introduced which lead to improved accuracy.

P. W. C.

**Colorimetric determination of nitrates in water in presence of chlorides.**—See B., 1936, 622.

**Reaction for hydroxylamine.**—See this vol., 1036.

**Removal of phosphate ion [in qualitative analysis].** L. J. CURTMAN and T. B. GREENSLADE (J. Chem. Educ., 1936, 13, 238—239).—The Sn, FeCl<sub>3</sub>, and ZrOCl<sub>2</sub> methods have been compared. All are efficient for removal of PO<sub>4</sub>''', but in the first two loss of cations is serious. The ZrOCl<sub>2</sub> method is the most rapid, efficient, and convenient. L. S. T.

**"Purity-testing" for arsenic by the method of the Swiss Pharmacopoeia V.** H. T. LIEM (Pharm. Tijds. Nederl.-Indie, 1935, 12, 81—85, 145—152; Chem. Zentr., 1935, ii, 2244).—The method is described and the results are discussed.

H. N. R.

**Determination of arsenic in steel, pig iron, and iron ores.**—See B., 1936, 598.

**[Determination of] carbon monoxide content of laboratory air.**—See B., 1936, 669.

**Systematic separation of anions.** E. UMBLIA (Keem. Teated, 1935, 2, 79—87; Chem. Zentr., 1935, ii, 2408).—A group separation is described. (1) acids detected in the original solution; CO<sub>3</sub>'', OAc', CrO<sub>4</sub>'', MnO<sub>4</sub>', NO<sub>2</sub>', S'', Fe(CN)<sub>6</sub>''', and Fe(CN)<sub>6</sub>'''. (2a) Anions with Ba salts insol. in mineral acids; SO<sub>4</sub>' and SiF<sub>6</sub>'; (2b) Ba salts insol. in AcOH; IO<sub>3</sub>', C<sub>2</sub>O<sub>4</sub>'', SO<sub>3</sub>'', F', S<sub>2</sub>O<sub>3</sub>'', and BrO<sub>3</sub>'; (2c) Ba salts insol. in H<sub>2</sub>O; PO<sub>4</sub>''', AsO<sub>3</sub>'', AsO<sub>4</sub>'', SiO<sub>3</sub>'', C<sub>4</sub>H<sub>4</sub>O<sub>6</sub>'', BO<sub>2</sub>'. (3) Anions giving Zn salts insol. in AcOH; S'', Fe(CN)<sub>6</sub>''', Fe(CN)<sub>6</sub>'''. (4) Anions the Ag salts of which are insol. in HNO<sub>3</sub>; I', Br', Cl', CN', CNS', IO<sub>3</sub>', BrO<sub>3</sub>'. (5) ClO<sub>4</sub>', NO<sub>3</sub>', ClO<sub>3</sub>'. J. S. A.

**Use of direct and alternating current in effusion method of measuring radioactivity of air.** G. ALIVERTI and G. ROSA (Nuovo Cim., 1935, [ii], 12, 26—36; Chem. Zentr., 1935, ii, 2847—2848).—The apparent nos. of atoms of Rn found, using a.c. and d.c., are as 1 : 0.925. J. S. A.

**Determination of small amounts of potassium by means of silver cobaltinitrite.** R. J. ROBINSON and G. L. PUTNAM (Ind. Eng. Chem. [Anal.], 1936, 8, 211—213).—A modification of Breh and Gaebler's procedure (A., 1930, 944) permits the determination of 0.002 mg. of K. E. S. H.

**Reagent for potassium.** I. Qualitative. A. W. CLARK and C. O. WILLITS (Ind. Eng. Chem. [Anal.], 1936, 8, 209—210).—The use of 2% naphthol-yellow S is described. 1 part of K in 2500 parts of solution can be detected. Na and NH<sub>4</sub> do not interfere. E. S. H.

**Rapid detection of sodium and potassium in presence of ammonium and magnesium.** C. CANDEA and L. I. SAUCIUC (Bull. sci. École polytech. Timişoara, 1934, 5, 111—113; Chem. Zentr., 1935, ii, 2555).—Na and K, present as chlorides after volatilisation of NH<sub>4</sub> salts, are detected with H<sub>3</sub>Sb<sub>2</sub>O<sub>7</sub>+KOH, and NaOAc+tartaric acid respectively. J. S. A.

**Spectrographic detection of metal traces in experimentally produced current contact marks.** T. SCHMIDT (Deut. Z. ges. gerichtl. Med., 1935, 25, 164—166; Chem. Zentr., 1935, ii, 2848—2849).—

The spectrographic detection of traces of metals is applied in forensic examinations to the detection of the direction of passage of current. J. S. A.

**Microchemical detection of metal ions with picric acid.** C. FRANGOPOLO (Bul. Chim. Soc. rom. Stiinte, 1934, 37, 259—261; Chem. Zentr., 1935, ii, 2250).—Crystal forms given by NH<sub>4</sub>, Al, Ag, Ba, Ca, Fe, Mg, Mn, and Pb with picric acid are described.

J. S. A.

**Titration of silver with potassium iodide. Ceric ammonium sulphate and starch as indicators.** A. BLOOM and W. M. McNABB (Ind. Eng. Chem. [Anal.], 1936, 8, 167).—The procedure gives good results in presence of Cu'' or Fe'''. E. S. H.

**Identification of silver in opaque minerals by the method of imprints.** T. HILLER (Arch. Sci., phys. nat., 1936, [v], 18, Suppl., 54—57; cf. A., 1935, 1478).—A Cu-containing mineral is attacked electrolytically in contact with 50% HNO<sub>3</sub> imbibed on filter-paper above which is a layer of gelatinized paper. The filter-paper is then washed for 1 min. in 1% KBr and then in HNO<sub>3</sub> and distilled H<sub>2</sub>O. It is developed in a physical developer, when the intensity of darkening produced  $\propto$  the [Ag] in the mineral. In absence of Cu the filter-paper is soaked in a reagent comprising 5% aq. KCN (2 parts) and a saturated solution of *p*-dimethylaminobenzylidenerhodanine in COMe<sub>2</sub> (3 parts) and is applied to a polished surface of the mineral for 3—5 min. It is then immersed in dil. HNO<sub>3</sub> or H<sub>2</sub>SO<sub>4</sub>, when a violet-red colour indicates Ag. Presence of Cu is indicated by a violet-blue colour.

J. W. S.

**Micro-determination of zinc by means of 8-hydroxyquinoline.** C. CHERMAN, D. FRANK, and P. WENGER (Arch. Sci. phys. nat., 1936, [v], 18, Suppl., 57—59).—The neutral solution containing 1—3 mg. Zn'' is treated with 1 drop of Merck's Universal Indicator, 2 drops of 10% AcOH, and 6—7 drops of 40% NaOAc to yield a *p*<sub>H</sub> of 5—6. It is heated to the b.p., and excess (0.1—1 c.c.) of freshly prepared EtOH solution of 8-hydroxyquinoline added. It is stirred and boiled for 1—2 min. and filtered through porcelain. The ppt. is washed 8 times with H<sub>2</sub>O (1—2 c.c.) and dried at 155—158°.

J. W. S.

**Anthranilic acid and its use in the determination of zinc, cadmium, cobalt, nickel, and copper.** R. J. SHENNAN, J. H. F. SMITH, and A. M. WARD (Analyst, 1936, 61, 395—400).—The conditions specified by Funk and Ditt (A., 1933, 924), i.e., pptn. of the anthranilate from neutral, unbuffered solution, are satisfactory and are not improved by the addition to the solution of NH<sub>4</sub>OAc, NaOAc, or Na tartrate. These increase the solubility of the ppt. For the volumetric determination of anthranilic acid, Day and Taggart's procedure (A., 1928, 660) is preferred. E. H. S.

**Indicator transformations of fuchsin.** V. N. SKVORTZOV and E. S. SCHEPELEVA (J. Gen. Chem. Russ., 1936, 6, 55—62).—The transition point of fuchsin (I) shifts in the direction of rising *p*<sub>H</sub> with increasing concn. of (I) and with rising temp.; the salt error is relatively small. (I) is a suitable indi-

cator for the titration of  $\text{ZnSO}_4$  with  $\text{NaOH}$  (at  $100^\circ$ , end-point at  $p_{\text{H}}$  11.5). R. T.

**Sodium diethyldithiocarbamate as a reagent for certain micro-crystal reactions.** J. GRANT and F. A. MEGGY (*Analyst*, 1936, 61, 401—402).—Characteristic micro-crystals of  $\text{Cd}$  (sensitiveness 1:20,000),  $\text{Hg}^{\text{II}}$  (1:2000), and  $\text{Mn}^{\text{II}}$  (1:20,000) diethyldithiocarbamate are formed and  $\text{Co}$  may easily be detected in the presence of  $\text{Ni}$ . The  $\text{Sb}$  and  $\text{Bi}$  salts form oily drops and the  $\text{Pb}$ ,  $\text{Zn}$ , and  $\text{Sr}$  salts have little practical significance. E. H. S.

**Separation of sulpho-bases from sulpho-acids and detection of individual elements of second analytical group. Detection and separation of elements of second group;  $\text{Pb}$ ,  $\text{Hg}$ ,  $\text{Bi}$ ,  $\text{Cd}$ , and  $\text{Cu}$ . Detection and separation of elements of third group.** C. CÂNDEA and L. I. SAUCIU (*Bull. sci. École polytech. Timişoara*, 1934, 5, 104—105, 106—107, 108—110; *Chem. Zentr.*, 1935, ii, 2554).—Modifications of the usual procedure are described. J. S. A.

**Photographic ripening accelerator ("thiocarbin") and sensitive analytical reagent.**—See B., 1936, 621.

**Spectrographic determination of small quantities of copper, lead, arsenic, and antimony in nickel and nickel sulphate solutions.**—See B., 1936, 599.

**Copper catalysis of the oxidation of thiol acids as a basis for the micro-determination of copper.** J. BJERRUM (*J. Biol. Chem.*, 1936, 114, 357—359).—Thiol acids, *e.g.*, thioglycollic acid (I), are oxidised by air in the presence of small quantities of  $\text{Cu}$ . The rate of reaction  $\propto [\text{Cu}]$  below a crit. concn.; hence quantities of  $\text{Cu}$  of the order of  $10^{-7}$  g. may be determined by observing the rate of oxidation of (I) in their presence. H. D.

**Quantitative spectral analysis of traces [of metallic impurities].** W. SMITH and A. KEIL (*Z. Elektrochem.*, 1936, 42, 299—302).—In the determination of minimal quantities of an impurity by spectrophotometric comparison with a reference substance, the relative intensities of the observed lines may be affected by the presence of the main substance; *e.g.*, excess of  $\text{Mg}$  thus affects the relative intensities of  $\text{Cu}$  3247 and  $\text{Zn}$  3282. Experiments are recorded to show that a quant. analysis is possible if due account is taken of the absorption of the lines concerned. F. L. U.

**Photo-electric micro-determination of copper.**—See this vol., 1038.

**Mercurimetry. Action of ammonia on mercuric chlorides and their determination.** M. SCHTSCHIGOL (*Ann. Chim. Analyt.*, 1936, [iii], 18, 149—151).—For the determination of  $\text{Hg}_2\text{Cl}_2$ , 0.3—0.4 g. is heated for 5—10 min. with 25—40 c.c. of 3*N*-aq.  $\text{NH}_3$  and the mixture is filtered and washed. The filtrate is acidified with  $\text{HNO}_3$  and the  $\text{NH}_4\text{Cl}$  is titrated according to the method previously described (this vol., 577). The same method, slightly modified, is used for  $\text{HgCl}_2$ . The reactions of the two compounds with aq.  $\text{NH}_3$  are:  $2\text{Hg}_2\text{Cl}_2 + 4\text{NH}_3\text{OH} =$

$[\text{Hg} + \text{Hg}_2\text{O} + \text{HgNH}_2\text{Cl}] + 3\text{H}_2\text{O} + 3\text{NH}_4\text{Cl}$ ,  $\text{Hg}_2\text{O} \rightarrow \text{Hg} + \text{HgO}$ ;  $\text{HgCl}_2 + 2\text{NH}_3 = \text{NH}_4\text{Cl} + \text{HgNH}_2\text{Cl}$ .

E. H. S.

**Anomalous valencies of the rare earths.** D. W. PEARCE and P. W. SELWOOD (*J. Chem. Educ.*, 1936, 13, 224—230).—The quadri- and bi-valency of certain rare earths metals are discussed, together with the application to methods of analysis and separation. L. S. T.

**Detection of lanthanum, yttrium, and ytterbium from spark in flame spectra.** O. S. PLANTINGA and C. J. RODDEN (*Ind. Eng. Chem. [Anal.]*, 1936, 8, 232).—The limit of detection is in each case about 0.0001*M*, but is influenced by the presence of other rare earths or of large amounts of  $\text{Na}$ . E. S. H.

**Colorimetric determination of aluminium with alizarin S.** A. P. MUSSAKIN (*Z. anal. Chem.*, 1936, 105, 351—361).—The method of Atack (*A.*, 1915, ii, 842) is critically reviewed. The optimum acidity of the solutions is  $p_{\text{H}}$  3.6. The coloration does not follow Beer's law;  $\text{Fe}$ , if present, is best removed as  $\text{Fe}(\text{CNS})_3$  by extraction with  $\text{C}_5\text{H}_{11}\text{OH}$ . J. S. A.

**Separation and determination of gallium.** V. Separation of gallium from beryllium, titanium, zirconium, and thorium, and the determination of the gallium thus separated. S. ARO (*Sci. Papers Inst. Phys. Chem. Res. Tokyo*, 1936, 29, 71—77; *cf. A.*, 1934, 1192).—A solution of the chlorides in 5.6*N*- $\text{HCl}$  is extracted with  $\text{Et}_2\text{O}$ , the extract is washed with 5.6*N*- $\text{HCl}$ , the washings are evaporated, and the aq. solution is treated with 2*N*- $\text{NH}_4\text{OAc} + 6\text{N}$ - $\text{NH}_3$  and filtered. The filtrate is combined with the washed  $\text{Et}_2\text{O}$  extract and the  $\text{Ga}$  pptd. with  $\text{Na}$  camphorate. Each stage has been quantitatively investigated. R. S.

**Solution of manganese problem in analysis of silicate rocks.** O. HACKL (*Z. anal. Chem.*, 1936, 105, 182—199).—Factors governing the choice and accuracy of the method previously described (this vol., 813) are exhaustively discussed. For the oxidation of  $\text{Mn}$ ,  $[\text{H}_2\text{SO}_4]$  should be  $> 2\%$  to prevent pptn. of  $\text{Ti}$ , and  $< 10\%$  to prevent oxidation of  $\text{Ti}$ . J. S. A.

**Last lines of rhenium in presence of large amounts of molybdenum.** S. A. BOROVIK and N. M. GUDRIS (*J. Appl. Chem. Russ.*, 1936, 9, 937—942).—The intensity of the lines at 3451.88, 3460.7, and 3464.72 Å. is unaffected by presence of 16—30% of  $\text{Mo}$ . The lines serve for the detection of  $\leq 0.002\%$  of  $\text{Re}$  in calcite or molybdenite.  $\text{Mn}$  interferes with the spectrometric detection of  $\text{Re}$ . R. T.

**Quantitative separation of iron from copper and nickel.** P. SPACU (*Bull. Soc. chim.*, 1936, [v], 3, 1061—1063).—The solution is treated with excess of  $\text{C}_5\text{H}_5\text{N}$ .  $\text{Fe}^{\text{III}}$  is pptd. as  $\text{Fe}(\text{OH})_3$ , ignited, and weighed as  $\text{Fe}_2\text{O}_3$ . The filtrate is treated with solid  $\text{KCNS}$ , which ppts.  $\text{Ni}(\text{C}_5\text{H}_5\text{N})_4(\text{SCN})_2$  or  $\text{Cu}(\text{C}_5\text{H}_5\text{N})(\text{SCN})_2$ , which are weighed as such. E. S. H.

**Application of 5:7-dibromo-8-hydroxyquinoline to determination of small amounts of iron, titanium, and aluminium in mixtures.** A. M.

ZANKO and A. J. BURSUK (J. Appl. Chem. Russ., 1936, 9, 895—898).—1 g. of tartaric acid and 3 ml. of  $\text{COMe}_2$  (I) are added to 100 ml. of solution, which is then made neutral with aq.  $\text{NH}_3$ , and 10 ml. of  $\text{AcOH}$  and 2% 8-hydroxyquinoline (II) in  $\text{AcOH}$  [0.6 mg. of (II) per mg. of Fe present] are added. The ppt. of Fe salt is collected, washed with  $\text{H}_2\text{O}$ , dried at  $110^\circ$ , and weighed. 2 ml. of 2*N*- $\text{HCl}$ , 2 g. of  $\text{NH}_4\text{NO}_3$ , and 15 ml. of (I) are added per 100 ml. of filtrate + washings, and 9 ml. of 0.2*N*- $\text{KBrO}_3$ - $\text{KBr}$  are added to the solution at  $50^\circ$ , thereby converting excess of (II) present into the 5:7- $\text{Br}_2$ -derivative (III), which then forms a ppt. with Ti. This is collected, washed successively with 200 ml. of 0.04*N*- $\text{HCl}$  containing 10% of (I), and with  $\text{H}_2\text{O}$ , and dried at  $185^\circ$ . 3 g. of  $\text{NH}_4\text{NO}_3$  and (I) to 15% are added to the filtrate (containing 6—8 mg. of Al), the solution is made feebly alkaline with aq.  $\text{NH}_3$ , and 5—20 ml. of a 1% solution of (III) in (I) are added, at  $100^\circ$ . The ppt. of Al salt is washed successively with 10% aq. (I) containing 1.5% of  $\text{NaOAc}$ , and with  $\text{H}_2\text{O}$ , and dried at  $190^\circ$ . R. T.

**Determination of ferrous oxide in ores containing manganese peroxides.**—See B., 1936, 640.

**Determination of very small amounts of iron in silicic acid, with special reference to quantitative spectral analysis.** H. SCHLEGEL (Angew. Chem., 1936, 49, 411—412).— $\text{SiO}_2$  is removed by evaporation with  $\text{HF} + \text{H}_2\text{SO}_4$ . The residue is dissolved in 0.2 c.c. of  $\text{HCl}$  and 0.2 c.c. of a standard solution of  $\text{CrSO}_4 + \text{NiSO}_4$  is added to provide spectral lines of standard intensity for comparison with the Fe lines. 0.02 c.c. of the solution, which should contain 0.00025—0.001 mg. of Fe, is transferred to a C electrode, and the spectrum excited by a condensed spark discharge. J. S. A.

**Colorimetric determination of cobalt.** G. SPACU and C. G. MACAROVICI (Bul. Soc. Ştiinţe Cluj, 8, 245—256; Chem. Zentr., 1935, ii, 2707—2708).—The method of Chiarottino (Ind. Chim., 1933, 8, 32) is modified by use of tolidine (Tld) in place of benzidine (Bzd). The solution is mixed with 5 c.c. of 1% dimethylglyoxine ( $\text{DH}_2$ ) + 2 c.c. of 1% tolidine, and colorimetric after 15 min. 0.0002 mg. of Co per c.c. may be determined. As possible sources of the reddish-brown colour, the following compounds have been obtained by the action of  $\text{DH}$  on Co-Bzd and Co-Tld salts:  $\text{Co}(\text{DH})(\text{NO}_3)(\text{DH}_2)(\text{Bzd})_2 \cdot 2\text{H}_2\text{O}$ ;  $[(\text{DH}_2)(\text{Bzd})\text{Cl} \cdot \text{Co} \cdot \text{D} \cdot \text{CoCl}(\text{Bzd})(\text{DH}_2)]_2 \cdot 6\text{H}_2\text{O}$ ;  $[(\text{DH}_2)(\text{Tld})(\text{H}_2\text{O})\text{ClCo} \cdot \text{D} \cdot \text{CoCl}(\text{H}_2\text{O}) \cdot \text{Tld} \cdot \text{DH}_2]$ . J. S. A.

**Method of preventing formation of colloidal nickel sulphide in qualitative analysis.** Z. H. PAN and C. C. TANG (Nanking J., 1934, 4, 33—39).—The test solution is neutralised with  $\text{HNO}_3$  and then made just alkaline with aq.  $\text{NH}_3$  before passing  $\text{H}_2\text{S}$  to ppt.  $\text{NiS}$ . CH. ABS. (e)

**Volumetric determination of nickel.** G. SPACU and V. ARMEANU (Bul. Soc. Ştiinţe Cluj, 8, 206—210; Chem. Zentr., 1935, ii, 2708).—A solution containing 2% of  $\text{KCN}$  + 1% of  $\text{C}_5\text{H}_5\text{N}$  is titrated with the Ni solution [as  $\text{Ni}(\text{NO}_3)_2$ , preferably in the absence of  $> 5\%$  of  $\text{NH}_4$  salts] until a permanent turbidity

forms.  $[\text{Ni}(\text{CN})_2(\text{H}_2\text{O})(\text{C}_5\text{H}_5\text{N})]$  is initially formed, and redissolves in excess of  $\text{KCN}$  forming  $\text{K}_2[\text{Ni}(\text{CN})_4]$ . J. S. A.

**Preparation and storage of standard chromous sulphate solutions.** H. W. STONE and C. BEESON (Ind. Eng. Chem. [Anal.], 1936, 8, 188—190).— $\text{CrSO}_4$  is prepared by reduction of violet chrome alum solutions in preference to  $\text{K}_2\text{Cr}_2\text{O}_7$ . Modified procedure for preventing oxidation by air is recommended. E. S. H.

**Determination of tungsten with hydroxyquinoline.** E. OTERO and R. MONTEQUI (Anal. Fis. Quím., 1935, 33, 132—139).—The method of Halberstad (A., 1933, 366) is performed in slightly acid solution and the ppt. dried by washing with  $\text{EtOH}$  and  $\text{Et}_2\text{O}$ .  $(\text{NH}_4)_6\text{W}_7\text{O}_{24} \cdot 6\text{H}_2\text{O}$  can be determined by this method. With insufficient  $\text{C}_6\text{H}_5\text{N} \cdot \text{OH}$  a blood-red compound,  $\text{C}_6\text{H}_5\text{N} \cdot \text{OH} \cdot \text{WO}_3$ , is formed. F. R. G.

**Conductometric titration of tungstate with silver nitrate.** C. CANDEA and I. G. MURGULESCU (Bul. Soc. Chim. Romania, 1935, 17, 223—227).—Solutions of  $\text{Na}_2\text{WO}_4$  may be titrated conductometrically with  $\text{AgNO}_3$  in presence of  $\text{EtOH}$  (30% for 0.05*N*- and 50% for 0.05*N*- $\text{Na}_2\text{WO}_4$ ):  $\text{WO}_4^{2-} + 2\text{Ag}^+ = \text{Ag}_2\text{WO}_4$ . After the addition of  $\text{EtOH}$  the solution is kept for 0.75 hr. before titration. Results are accurate down to 0.005*N*- $\text{Na}_2\text{WO}_4$ . R. S. B.

**Volumetric determination of orthotungstates with fluorescent indicators.** A. DEL CAMPO and F. SIERRA (Anal. Fis. Quím., 1935, 33, 364—373).—The solution containing  $\text{WO}_4^{2-}$  is titrated with  $\text{Pb}(\text{NO}_3)_2$  using umbelliferone or quinine to give fluorescence with Wood light. F. R. G.

**Substituted benzene-*o*-dithiols as specific reagents for tin.**—See this vol., 840.

**Application of gravimetric methods of determination of thorium to its isolation and determination in small amounts.** L. E. KAUFMAN (J. Appl. Chem. Russ., 1936, 9, 918—924).—An equal vol. of a solution of 15 g. of  $\text{KIO}_3$  in 150 ml. of 33%  $\text{HNO}_3$  is added to 10—40 ml. of the solution, containing Th, Ce, and group III cations and 25% of its vol. of  $\text{HNO}_3$ , the mixture is heated at  $60$ — $80^\circ$  for 15 min., and 2 vols. of 0.8%  $\text{KIO}_3$  in 20%  $\text{HNO}_3$  are added. The ppt. of Th iodate is washed with the last-named solution, heated with 3—5 g. of  $\text{H}_2\text{C}_2\text{O}_4$  in 50 ml. of  $\text{H}_2\text{O}$ , to elimination of I, the solution is made acid with 0.3*N*- $\text{HCl}$ , and the ppt. is washed, calcined, and weighed as  $\text{ThO}_2$ . R. T.

**Micro-determination of bismuth compounds.** M. M. KIRILLOV (J. Appl. Chem. Russ., 1936, 9, 932—936).—The solution, containing 0.01—0.04 mg. of Bi per ml., is brought to  $p_H$  0.7 by means of  $\text{HNO}_3$  and 0.2 ml. of 20%  $\text{KIO}_3$  is added, the ppt. is washed 6—10 times on the centrifuge with  $\text{H}_2\text{O}$  (0.2 ml.), 1 ml. of 5%  $\text{KI}$  and 0.3 ml. of 5%  $\text{H}_2\text{SO}_4$  are added, and the I liberated is titrated with 0.01*N*- $\text{Na}_2\text{S}_2\text{O}_3$ . R. T.

**Titration of bivalent platinum and tervalent iridium at different temperatures.** A. A. GRUNBERG and B. V. PRIZYN (Compt. rend. Acad. Sci. U.R.S.S., 1936, 2, 17—19).— $[\text{PtCl}_4]^{2-}$ , in presence of  $[\text{IrCl}_6]^{3-}$ , may be titrated potentiometrically with

$\text{KMnO}_4$  (+ $\text{H}_2\text{SO}_4$ ) at 80–90°; or  $\text{KMnO}_4$  may be added until the Ir begins to oxidise, and the solution visually back titrated with aq. Mohr's salt until the reddish-brown colour just vanishes. The titrations are less satisfactory with  $\text{NaBrO}_3$  (+ $\text{HCl}$ ).

T. G. P.

Comparison of platinum resistance thermometers with the helium thermometer from –190° to –258°. W. H. KEESOM and A. BIJL (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 574–575, and Physica, 1936, 3, 418–423).—Determinations for 4 thermometers are described. H. J. E.

Production of temperatures below 1° abs. Heat capacities of water, gadolinium nitrobenzenesulphonate heptahydrate, and gadolinium anthraquinonesulphonate. D. P. MACDOUGALL and W. F. GIAUQUE (J. Amer. Chem. Soc., 1936, 58, 1032–1037).—The production of very low temp. by adiabatic demagnetisation is described. Heat capacity calculations show that increased dilution of the magnetic atoms results in a closer approach to the ideal magnetic situation than would result if the Gd atoms were controlled only by the external magnetic field. The heat capacity of  $\text{H}_2\text{O}$  between 0.2° and 4° abs. is zero within about 0.01 g.-cal. per degree per mol. The reversibility of the magnetic phenomena of the above Gd compounds is illustrated. E. S. H.

Lowest temperatures. E. WOLTHUIS (J. Chem. Educ., 1936, 13, 172–174).—A summary of the magnetic method. L. S. T.

Inorganic liquid mixture for temperature baths in the range 100–250°. B. E. CHRISTENSEN and A. E. KING (Ind. Eng. Chem. [Anal.], 1936, 8, 194).—Mixtures of  $\text{H}_3\text{PO}_4$  and  $\text{HPO}_3$  are recommended. E. S. H.

Simple thermostat for temperatures between 100° and 150°. H. C. S. SNETHLAGE (Chem. Weekblad, 1936, 33, 368–369).— $\text{CaCl}_2$  solutions of definite b.p. are boiled in an Al pan and evaporation is corr. by adding  $\text{H}_2\text{O}$  at a const. rate. S. C.

Ebulliometric investigation of the impurity contents of succinic acid, proposed as a secondary standard for calorimetric measurements. W. SWIENTOSLAWSKI, M. WOJCIECHOWSKI, and E. SAPIRO (Bull. Acad. Polonaise, 1935, A, 531–539).—The impurity content of specially purified samples is 0.002–0.02%. O. D. S.

Twin calorimeter for small heat effects. H. GAWLICK (Z. Ver. deut. Ing., 1935, 79, 1089; Chem. Zentr., 1935, ii, 2703).—A double calorimeter, enabling small effects to be measured by a null method, is described. J. S. A.

Determination of insulating power of Dewar vessels. J. GUERON (Document. sci., 1935, 4, 114–118; Chem. Zentr., 1935, ii, 2846).—The rate of evaporation of solid  $\text{CO}_2$  from a vessel, plugged with cotton wool, is determined gravimetrically. J. S. A.

Thermal balance-analyser with photographic recording. P. DUBOIS (Bull. Soc. chim., 1936, [v], 3, 1178–1181).—Apparatus and technique are described. E. S. H.

Apparatus for photometric and colorimetric measurements using the photometric law of distances. F. ANSELM and F. WÜRSTLIN (Z. tech. Phys., 1935, 16, 157–161; Chem. Zentr., 1935, ii, 1753–1754).—A photometer is described. J. S. A.

Precision photo-electric colorimeter. R. B. WITHROW, C. L. SHREWSBURY, and H. R. KRAYBILL (Ind. Eng. Chem. [Anal.], 1936, 8, 214–219).—The principles of design are discussed and apparatus based on these principles is described. E. S. H.

Photo-electric colorimeter. T. W. SCHMIDT (Z. Instrument., 1935, 55, 336–346, 357–367; Chem. Zentr., 1935, ii, 2552).—Apparatus is described. J. S. A.

Photo-electric colorimetry. VIII. Starch-iodine system. R. H. MÜLLER and M. H. MCKENNA (J. Amer. Chem. Soc., 1936, 58, 1017–1020; cf. A., 1935, 1097).—Photo-electric titrations with approx. monochromatic light show that Beer's law is obeyed beyond a preliminary dissociation stage. The system does not require the use of purely empirical correction. E. S. H.

Colorimeter for a series of determinations. HORMISDAS (Compt. rend., 1936, 202, 1925–1927).—The tube holding the solution under examination is mounted so that it can be moved horizontally, and compared in turn with a series of comparison tubes. H. J. E.

Recent developments in fluoroscopic screens. F. E. SWINDELLS (X-Ray Technician, 1935, 6, 162–164, 184).—A form of  $\text{ZnS}$  which is free from afterglow, and fluoresces more brightly than Cd tungstate, is described. CH. ABS. (e)

Light source for absorption spectroscopic investigations in the ultra-violet. H. KLUMB and R. ODENWALD (Z. tech. Phys., 1935, 16, 200–202; Chem. Zentr., 1935, ii, 1753).—A W-filament lamp running in  $\text{H}_2$  and giving a continuous spectrum down to 2200 Å. is described. J. S. A.

Colorimeter pipette cell. S. T. BOWDEN (J.S.C.I., 1936, 55, 180r).—A glass pipette cell which facilitates the examination of coloured solutions by tintometric or photo-electric methods is described. It may be readily adapted for measurements on reactive or hydrolysable solutions, and is also suitable for the observation of colour changes in a reaction system.

Determination of the refractive power of liquids.—See B., 1936, 623.

Individual determination of principal elastic stresses by X-rays. R. GLOCKER and E. OSSWALD (Z. tech. Phys., 1935, 16, 237–242; Chem. Zentr., 1935, ii, 2573–2574).—The X-ray method of determining total superficial stress from its effect on the X-ray reflexion lines is applied to the determination of the magnitude and direction of stresses. J. S. A.

Apparatus for making spectral flames of the alkali and alkaline-earth metals. J. F. BIRMINGHAM, jun., and W. H. WOOD (J. Chem. Educ., 1936, 13, 240–241). L. S. T.

Glass filters for isolating lines of mercury arc in photography of Raman spectra. L. AMY (Document. sci., 1935, 4, 97–103; Chem. Zentr.,

1935, ii, 2848).—For isolation of the 4358 Å. line, 0.27 mm. of Corning glass 38 is recommended, and for the 4047 Å. line, 3 mm. of Corning glass 597.

J. S. A.

**Photometric method suitable for spectrum analysis.** D. H. FOLLETT (J. Sci. Instr., 1936, 13, 221—228).—A stepped wedge of Pt deposited on fused  $\text{SiO}_2$  is used. Microphotometric readings are taken of the density of two consecutive steps on one line of a pair of two neighbouring lines, and a similar reading on a step of intermediate density on the other. The relative intensities of the two lines can then be calc. The probable error of a single determination is about 1.5%.

C. W. G.

**Production of silver mirrors by cathodic sputtering.** E. G. JONES and E. W. FOSTER (J. Sci. Instr., 1936, 13, 216—219).—An apparatus is described. Special attention must be paid to the cleanliness of the specimen to be silvered, the containing vessel, and the discharge atm.

C. W. G.

**Deposits of colloidal graphite.** B. H. PORTER (Nature, 1936, 137, 1034).—Homogeneous films of colloidal graphite can be used in the construction of  $\alpha$ -particle counters, the formation of guard rings for evacuated apparatus, coating of plate glass for electrostatic condensers, and electrodes in ionisation chambers, etc.

L. S. T.

**Photo-electric apparatus for delineating the size frequency curve of clays or dusts.** E. G. RICHARDSON (J. Sci. Instr., 1936, 13, 229—233).—While sedimentation is taking place in accordance with Stoke's law, the concns. at various heights are compared by means of a beam of light and a photo-electric cell.

C. W. G.

**Vacuum-tube voltmeter.** G. F. KINNEY and R. L. GARMAN (J. Chem. Educ., 1936, 13, 190—192).—A voltmeter suitable for electrometric titrations is described.

L. S. T.

**Tellurium electrode.** G. A. BRAVO (Annali Chim. Appl., 1936, 26, 162—166).—The Te electrode is not sufficiently accurate for ordinary  $p_{\text{H}}$  determinations, but may be used for potentiometric titrations if the solution is kept agitated by a current of air free from dust and  $\text{CO}_2$ .

L. A. O'N.

**Potentiometry of autoinversion.** J. GUZMAN and A. ARA (Anal. Fis. Quím., 1935, 33, 729—751).—In an apparatus for electrometric titration the comparison electrode Pt or  $\text{Pd|N-KCl}$  or  $\text{K}_2\text{SO}_4$  in a porous porcelain container is immersed in the solution being titrated. The application of the method to several types of titration is described.

F. R. G.

**Energy distribution in back-diffusing cathode rays.** J. O. BRAND (Ann. Physik, 1936, [v], 26, 609—624; cf. A., 1930, 269).—The velocity distribution of the back-diffusing electrons produced when a target is bombarded with cathode rays of 16, 24, and 32 kv. has been studied photographically in a special magnetic refraction apparatus. In the case of Al, Cu, Ag, and Pt anodes, the quality of the surface is without effect but the position of the velocity max. alters with the angle  $\varphi$  between the incident and emitted electron beams. Increase of  $\varphi$  broadens the

max. and displaces it towards greater energy loss in the case of Al and Cu, but less so with Ag and Pt.

R. S.

**Electron microscopic photographs (electron micrograms) of chitin objects.** E. DRIEST and H. MULLER (Z. wiss. Mikroskop., 1935, 52, 53—57; Chem. Zentr., 1935, ii, 2702).—An electron microscope technique permitting total linear exposures up to 25,000 diameters is described, revealing detail not perceptible with the optical ultramicroscope.

J. S. A.

**Apparatus for measuring ionic spectrum [of the atmosphere].** H. GRIEGER (Z. Instrument., 1935, 55, 116—122; Chem. Zentr., 1935, ii, 2847).—Apparatus is described.

J. S. A.

**Micro-electrode for determining  $p_{\text{H}}$ .**—See this vol., 1038.

**Apparatus for the measurement of magnetic susceptibility by Faraday's method.** B. CARRERA and J. M. TORROJA (Anal. Fis. Quím., 1936, 34, 5—25).—A new apparatus for the measurement of vals. of between  $-50^\circ$  and  $150^\circ$  employs a permanent Co-steel magnet tempered at  $950^\circ$ .

F. R. G.

**Pipette for titrating dark-coloured liquids in two phases.** M. M. HICKS-BRUN and L. W. CLAFFEY (Ind. Eng. Chem. [Anal.], 1936, 8, 229).

E. S. H.

**Gas analytical apparatus.** F. BUCHLER (Glückauf, 1935, 71, 641—643; Chem. Zentr., 1935, ii, 2407).—A gas burette of increased accuracy, and modified Orsat absorption vessels, are described.

J. S. A.

**Biburette.** J. GUZMAN (Anal. Fis. Quím., 1935, 33, 470—473).—Several modified forms of micro-burette, designed to increase the amount of liquid which can be measured accurately, are described.

F. R. G.

**Macro-micro-burette.** J. GUZMAN (Anal. Fis. Quím., 1935, 33, 241—243).—A combination of a graduated micro-pipette and micro-burette is described.

F. R. G.

**Gravimetric methods in use during the sixteenth century.** J. GUZMAN (Anal. Fis. Quím., 1936, 34, 495—500).—A description of the balance and aliquot wts. used by Alonso Barba.

F. R. G.

**Errors in micro-weighing due to the use of lead shot in tares.** R. J. WILLIAMS (Ind. Eng. Chem. [Anal.], 1936, 8, 229—230).—The use of Pb shot introduces considerable errors due to variations of temp., atm. pressure, and R.H.

E. S. H.

**Modification of Pregl's apparatus, permitting the carrying out of a series of micro-determinations of nitrogen.** P. BLANC (Bull. Soc. chim., 1936, [v], 3, 1019—1021).—Apparatus and procedure are described.

E. S. H.

**One-piece glass micro-Kjeldahl distillation apparatus.** P. L. KIRK (Ind. Eng. Chem. Anal., 1936, 8, 223—224).

E. C. S.

**Micro-determination of bromide.**—See this vol., 1009.

**Apparatus for measurement of surface tension.** L. D. MAHAJAN (J. Sci. Instr., 1936, 13, 189—191).—

A modification of Sutton's method (A., 1933, 250) is described. J. S. A.

**Hill method for solubility determinations.** T. W. EVANS (Ind. Eng. Chem. [Anal.], 1936, 8, 206—208).—The theoretical basis of the method is investigated and suitable apparatus described. E. S. H.

**Manipulator for glass blowing.** V. COLLIER, jun. (Ind. Eng. Chem. [Anal.], 1936, 8, 208). E. S. H.

**Apparatus for analytical laboratories.** Crucible support for desiccators, graduated cylinder, and flask cover. F. E. TUTTLE (Ind. Eng. Chem. [Anal.], 1936, 8, 230—231). E. S. H.

**Laboratory shaking machine.** S. H. HIGBERGER (Ind. Eng. Chem. [Anal.], 1936, 8, 227). E. C. S.

**Combination of continuous extractor and extract washer.** H. B. WYLIE and M. J. SCHMULOVITZ (Science, 1936, 83, 398). L. S. T.

**Electrical pressure dilatometer.** E. COHEN and A. K. W. A. VAN LIESHOUT (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 596—603).—The expansion or contraction is measured by the change in resistance of a thin Pt wire dipping into Hg. The Hg meniscus is connected by a closed system with the substance under examination and records its vol. change. Measurements with Sn up to 200 atm. are described. H. J. E.

**Glass pump for circulation of gases against moderate pressures.** J. C. BALSBAUGH, R. G. LARSEN, and D. A. LYON (Ind. Eng. Chem., 1936, 28, 682—683).—An all-glass magnetically operated pump, which completely eliminates gas leakage between piston and cylinder wall, and can force air against a pressure of 210 mm. Hg, is described. C. R. H.

**Differential measurement of density by means of twin pycnometers.** E. R. SMITH and M. WOJCIECHOWSKI (Rocz. Chem., 1936, 16, 104—112).—A differential method, involving an error of  $\pm 1$  p.p.m., is described. R. T.

**Apparatus for catalytic micro-hydrogenation in liquid medium.** B. FORESTI (Annali Chim. Appl., 1936, 26, 207—217).—The apparatus for catalytic micro-hydrogenation which is described measures the velocity of hydrogenation to an accuracy of 10<sup>-4</sup> g.-mol. H<sub>2</sub>, determines at the same time the  $p_H$  of the medium, and enables the to be varied by addition of acid or alkali, or by anodic or cathodic polarisation, without interrupting the experiment. L. A. O'N.

**Light metal rotors for the molecular ultracentrifuge.** J. BISCOE, E. G. PICKELS, and R. W. G. WYCKOFF (Rev. Sci. Instr., 1936, [ii], 7, 246—250).—Tests of the range of usefulness of light metal rotors proved the superiority of duralumin 14ST; a shape of 7 in. diameter rotor can be used at speeds up to 900 r.p.s. (field at centre of cell=215,000 times gravity). For more intense fields, special steels or smaller diameter must be used. N. M. B.

**Measurement of viscosity at high temperatures, as a method of physicochemical analysis.** M. P. VOLAROVITSCH (Ann. Sect. Anal. Phys.-Chim., 1936, 8, 125—134).—A review. R. T.

**Bimetal high-vacuum manometer.** H. SEEMANN (Physikal. Z., 1936, 37, 446—447).—An instrument similar to that devised by Klumb *et al.* (this vol., 183) was patented in 1925. A. J. M.

**Preparation and measurement of adsorbing surfaces.** F. DURAU and G. TSCHOEPE (Z. Physik, 1936, 100, 145—165).—Reproducible surfaces were obtained for Pb, Sn, Zn, Bi, Cd, Wood's metal, NaNO<sub>3</sub>, KNO<sub>3</sub>, CdCl<sub>2</sub>, and PbCl<sub>2</sub> by passing the vapour through N, at several atm., and condensing. The effective adsorbing surface is roughly the geometrical surface. A. B. D. C.

**Separation of gas mixtures by diffusion in streaming mercury vapour.** H. BARWICH (Z. Physik, 1936, 100, 166—191).—Hertz's separation pump (cf. A., 1935, 59) is investigated, and a formula deduced for the separation factor. A. B. D. C.

**Spiral bubbler.** P. H. PEARCE and E. C. ROBERSON (Chem. and Ind., 1936, 543).—A spiral bubbler, giving a long contact time between gas and washing liquid, and suitable for use in Vandaveer trains for CO determination, is described. H. J. E.

**Precision manometer.** J. PREVOT (Document. sci., 1935, 4, 177—181; Chem. Zentr., 1935, ii, 2845—2846). J. S. A.

**Vapour-pressure hygrometer.** J. J. DOWLING (J. Sci. Instr., 1936, 13, 214—216).—An air sample of fixed vol. is exposed to a chemical drying agent and the consequent reduction in pressure observed. C. W. G.

**Use of the dilatometric method in chemistry.** E. RENCKER (Bull. Soc. chim., 1936, [v], 3, 978—981).—The application of the dilatometer to the study of chemical reactions involving vol. change is discussed. E. S. H.

**Apparatus with plane glass joints for fractional distillation in a vacuum.** L. PALFRAY (Bull. Soc. chim., 1936, [v], 3, 1175—1178).—An all-glass apparatus is described. E. S. H.

**Condenser system for fractional distillation.** E. A. MEANS and E. L. NEWMAN (Ind. Eng. Chem. [Anal.], 1936, 8, 231). E. S. H.

**Bubble-cap columns of glass.** J. H. BRUUN (Ind. Eng. Chem. [Anal.], 1936, 8, 224—226).—Two laboratory all-glass columns, suitable for vapour velocities up to 31.3 and 65.5 cm. per sec., respectively, are described. E. S. H.

**Micro-distillation apparatus.** L. C. CRAIG (Ind. Eng. Chem. [Anal.], 1936, 8, 219—220). E. S. H.

**Micro-determination of mol. wt. in exaltone.** F. GIRAL (Anal. Fis. Quim., 1935, 33, 438—444).—*cyclopentadecanone* (I) is a suitable solvent for determination of mol. wt. of substances which decompose at the m.p. of camphor, as it is readily procurable and a good solvent for many substances including carotenoids and sterols. The mol. wt. of alkannin (C<sub>16</sub>H<sub>16</sub>O<sub>5</sub>) and calciferol (C<sub>28</sub>H<sub>44</sub>O) has been determined. The mol. m.p. depression and mol. latent heat of fusion of (I) are shown to differ from those

of  $\text{CO}(\text{C}_2\text{H}_{15})_2$  in accordance with the views of Pirsch (A., 1934, 79, 951). F. R. G.

**Nomographs for determining mol. wts. by the f.-p. and b.-p. methods.** W. S. GILFOIL (Ind. Eng. Chem. [Anal.], 1936, 8, 228). E. S. H.

**Isopiestic method for the determination of mol. wts.** C. M. MASON and H. M. GARDNER (J. Chem. Educ., 1936, 13, 188—190).—An apparatus for measuring the relative v.p. of aq. solutions is described. L. S. T.

**Accuracy of measurement of null method of dosage of radium.** P. KIPFER (Helv. phys. Acta, 1935, 8, 267—271; Chem. Zentr., 1935, ii, 2847).—The accuracy of  $\gamma$ -ray measurements over a given time is discussed. J. S. A.

**Leo Africanus on Alchemy.** F. B. DAINS (J. Chem. Educ., 1936, 13, 272). L. S. T.

**Ko Hung on the yellow and the white.** T. L. DAVIS and LU-CH'ANG WU (J. Chem. Educ., 1936, 13, 215—218).—Alchemical. L. S. T.

## Geochemistry.

**Ozone content of the lower layers of the atmosphere during winter at Abisko (Swedish Lapland).** D. BARBIER, D. CHALONGE, and E. VASSY (Compt. rend., 1936, 202, 1525—1527; cf. A., 1934, 626).—There is no direct connexion between the  $\text{O}_3$  content and meteorological or seasonal variations, whilst the mean thickness of the  $\text{O}_3$  layer is similar to that obtaining elsewhere. R. S.

**Neon content of natural gases.** N. P. PÉNTCHEFF (Compt. rend., 1936, 202, 1604—1606).—The gas from a spring at Kovanlik (Bulgaria) contained 0.003 vol.-% of Ne (based on  $d$  measurements). H. J. E.

**Distribution of the heavy water isotopes on the earth.** E. H. RIESENFELD and T. L. CHANG (Ber., 1936, 69, [B], 1308—1310).—The distribution is explained by the differing v.p. of the water isotopes. H. W.

**Content of  $\text{HDO}$  and  $\text{H}_2\text{O}^{18}$  in rain and snow.** E. H. RIESENFELD and T. L. CHANG (Ber., 1936, 69, [B], 1305—1307).— $\text{H}_2\text{O}$  obtained by melting snow collected at Potsdam and Uppsala is, as an average,  $2.7 \times 10^{-6}$  lighter than Berlin water and  $4.2 \times 10^{-6}$  lighter than that of the ocean. H. W.

**Hydrochemical study of River Tzna water.** N. E. KUSCHLIANSKI (J. Appl. Chem. Russ., 1936, 9, 899—912).—Hydrochemical data are recorded. R. T.

**Physico-chemical properties of Ui and Uvelka river water.** K. B. SHAGGARS (J. Appl. Chem. Russ., 1936, 9, 913—917).—Analytical data are recorded. R. T.

**Presence of gold in sea-water.** G. CLAUDE (Compt. rend., 1936, 202, 1885—1887).—Treatment of 168 cu.m. of sea- $\text{H}_2\text{O}$  (off the Californian coast) with pyrites gave no detectable pptn. of Au. The Au content of the  $\text{H}_2\text{O}$  was  $< 0.1$  mg. per cu.m. H. J. E.

**Spectrographic analyses of some Spanish medicinal waters.** III. S. PIÑA DE RUBIES and M. A. BARGUÉS (Anal. Fís. Quím., 1935, 33, 765—766).—Four samples have been analysed and determinations made of the Sr, Be, Pb, Li, Ag, when present, by the authors' method (A., 1934, 48). F. R. G.

**Iodine in Polish waters.** K. JABŁCZYNSKI, A. HARTMAN, and M. SALWIN (Rocz. Chem., 1936, 16, 19—23).—The I content of Vistula  $\text{H}_2\text{O}$  varies from 0.98 to  $27.5 \times 10^{-6}$  g. per litre, at different seasons.

Data are recorded for other Polish rivers ( $1-4 \times 10^{-6}$  g. per litre) and mineral springs ( $2.5-52,500 \times 10^{-6}$  g. per litre). R. T.

**Density of purified Nevada hot spring and surface water.** M. DOLE (Science, 1936, 83, 434).—The Nevada surface  $\text{H}_2\text{O}$  and  $\text{H}_2\text{O}$  from three different hot springs have the same  $d$ , which is  $<$  that of Lake Michigan  $\text{H}_2\text{O}$  by  $2.8 \pm 0.6$  p.p.m. The difference is due primarily to the O and not to the H in the two waters. L. S. T.

**Water of the mud volcanoes of Western Turkmenia.** A. I. KOSIGIN (Bull. Acad. Sci. U.R.S.S., 1935, 1029—1039).—Analysis of the  $\text{H}_2\text{O}$  from a no. of mud volcanoes indicates a high degree of mineralisation. R. T.

**Hyperthermal springs of Colli Euganei.** G. BRAGAGNOLO and E. CARRARO (Annali Chim. Appl., 1936, 26, 185—193).—Chemical and physico-chemical analyses of the hyperthermal waters of Abano, Montegrotto, Monteortone, and Battaglia have been made, and the radioactivity has been measured. The waters contain appreciable quantities of NaCl. History, geology, and pharmacological action are discussed. L. A. O'N.

**Mineral water of the "sulphurous spring" of Alfredena (Aquila).** M. TALENTI and A. RAGNO (Annali Chim. Appl., 1936, 26, 224—233).—The  $\text{H}_2\text{O}$  has an odour of  $\text{H}_2\text{S}$  and contains a notable quantity of  $\text{CaSO}_4$ . Chemical and physico-chemical analyses are given. Radioactivity is not appreciable. L. A. O'N.

**Geochemistry of alkaline magmas.** A. E. FERSMAN (Bull. Acad. Sci. U.R.S.S., 1935, 1419—1424).—Alkalinity is associated with high concn. of Na, K, Ca, Fe, or Mn, in conjunction with a high oxide content. R. T.

**Origin of the gold ore of Belaya Gora, on the southern coast of Ochotsk.** V. N. DANILOVITSCH (Bull. Acad. Sci. U.R.S.S., 1935, 1021—1027).—The ore contains sulphides, whence it is supposed that it represents the oxidised zone of a disseminated porphyritic pyrites deposit. R. T.

**Formula and structural scheme of attapulgitite.** J. DE LAPPARENT (Compt. rend., 1936, 202, 1728—1731; cf. A., 1935, 1346).—From the crystal structure of attapulgitite and its analogy with sepiolites it is concluded that its formula is

(OH)<sub>2</sub>H<sub>2</sub>(Mg<sub>2</sub>Al<sub>4/3</sub>)Si<sub>3</sub>H<sub>4</sub>O<sub>10</sub>, and a lattice structure is proposed. It is suggested that substitution of 2Al for 3Mg in this crystal enables H<sub>2</sub>O of composition to be included within a 10 Å elementary film, whereas in sepiolite it causes expansion to 12 Å. (A., 1935, 1099).

J. W. S.

(A) Instances of incrustations selective upon crystal forms. (B) Mineral incrustations upon the edges and corners of crystals. C. FRONDEL (Amer. Museum Nov., 1935, No. 695, 6 pp.; No. 759, 11 pp.).—(A) Examples of selective incrustations of stilbite on apophyllite and of marcasite on calcite, and of selective filming of hæmatite on calcite, are described.

(B) Various examples of edge and corner incrustations are described. The effect may be due to the greater absorptive power of these parts. CH. ABS. (e)

Oxidation of single crystals of zinc sulphide studied by electron diffraction. G. AMINOFF and B. BROOMÉ (Nature, 1936, 137, 995).—When a crystal of sphalerite is heated in air it is covered by a thin film, presumably of ZnO, which, when examined by electron diffraction, shows the properties of a single crystal in a crystallographically defined position relative to the ZnS structure. L. S. T.

Age of ferro-manganese concretions. L. M. KURBATOV (Nature, 1936, 137, 949—950; cf. this vol., 49).—Times of deposition calc. from the variation in Ra content of successive layers are 5300—5500 years for a specimen from the Kara Sea and 2000 years for one from Lake Uksche, Karelia. L. S. T.

Origin of a crystalline schist from Southern Katanga. M. GYSIN (Arch. Sci. phys. nat., 1936, [v], 18, Suppl., 52—54).—Schist from Mokambo (Katanga) contains labradorite (27.1%), epidote (30.1%), chlorite (17.5%), biotite (13.8%), magnetite (6.7%), and sphene (4.8%). Comparison with analysis of other schists suggests that it was produced from metamorphosed gabbroic rock. J. W. S.

Spectrophotometric study of smoky quartz. N. M. MOHLER (Amer. Min., 1936, 21, 258—263).—The absorption curve of smoky quartz (I) has been determined from 700 to 200 mμ and compared with the absorption after decolorisation by heat and exposure to Ra, and with clear cryst. and fused (I) coloured by the same exposure. Fluorescence effects were obtained. All show max. at 16,500, 20,000, 25,000, 33,000, and 38,000 (wave no. per cm.) with increased absorption beyond 42,000. Further irradiation by Ra in general increases absorption, but fused (I) shows a shift in importance of the bands with a superimposed lavender tint. The similarity in the curves confirms the theory of radioactive coloration. The change in energy due to transfer of an electron from an O to a Si ion is calc., and possible subsequent changes due to redistribution of such electrons. These changes correspond with amounts of energy indicated by positions of absorption bands. L. S. T.

Bertrandite and epistilbite from Bedford, New York. F. H. PUGH (Amer. Min., 1936, 21, 264—265).—Occurrences at Baylis Quarry are described. L. S. T.

Uraninite from Hottah Lake. F. H. BRUNER (Amer. Min., 1936, 21, 265—266).—The sample has U<sub>3</sub>O<sub>8</sub> 51.45, Fe<sub>2</sub>O<sub>3</sub> 41.51, Pb 2.31, SiO<sub>2</sub> 2.75, Al<sub>2</sub>O<sub>3</sub> 1.12, CaO 1.01, MgO trace, Mn present, S 0.14, CO<sub>2</sub> 0.42, total 100.71%. Th is absent. The Pb:U ratio 0.0529, gives an approx. age of 387×10<sup>6</sup> years. Weathering appears to be more selective to U than to Pb. L. S. T.

Fluorescence of Japanese hyalite in ultra-violet light. II. E. IWASE (Bull. Chem. Soc. Japan, 1936, 11, 377—379).—The fluorescence of Japanese hyalite has been compared with that of U compounds and several minerals. It may be due to UO<sub>3</sub> phosphate or sulphate. Other radioactive minerals may accompany deposits of fluorescent hyalite. J. T. A.

Nesquehonite from the Cogne mines, Val d'Aosta. M. FENOGLIO (Period. Min., 1935, 16, 1—17; Chem. Zentr., 1935, ii, 2507).—The crystals were rhombic (*a*<sub>0</sub> 7.68, *b*<sub>0</sub> 11.93, *c*<sub>0</sub> 5.39 Å.; 4 mols. MgCO<sub>3</sub>·3H<sub>2</sub>O in unit cell; space-group *V*<sub>h</sub><sup>1</sup>).

H. J. E.

New occurrences in oxidation zone of Rudabánya. G. KERTAI (Foldt. Kozlony, 1935, 65, 21—30; Chem. Zentr., 1935, ii, 2350).—Occurrences of petrological interest are described, including zoned crystals the composition of which grades from Cu through cuprite to malachite. J. S. A.

Copper occurrence in Studene, S. Serbia. T. GEDEON (Fold. Kozlony, 1935, 65, 50—52; Chem. Zentr., 1935, ii, 2192).—The deposits are described. H. J. E.

Vogesite from Ginepro (Island of Elba). M. FENOGLIO (Atti R. Accad. Lincei, 1936, [vi], 23, 77—82).—A vogesite rock of the hornblende type is described. Analysis gave SiO<sub>2</sub> 46.61, TiO<sub>2</sub> 2.26, Al<sub>2</sub>O<sub>3</sub> 12.23, Fe<sub>2</sub>O<sub>3</sub> 2.32, FeO 9.79, MgO 8.59, CaO 12.96, K<sub>2</sub>O 1.65, Na<sub>2</sub>O 2.31, H<sub>2</sub>O—0.12, H<sub>2</sub>O+ 1.41, P<sub>2</sub>O<sub>5</sub> 0.03, S 0.05, total 100.33%; traces of Cr<sub>2</sub>O<sub>3</sub>, MnO, BaO. O. J. W.

Monazite sand in the Arosa estuary (Galicia). I. PARGA-PONDAL (Anal. Fis. Quim., 1935, 33, 466—469).—The sand of a small beach at Palmeira (W. coast of Spain) contains 30% of monazite which consists of rare-earth oxides 67.97%, ThO<sub>2</sub> 3.14%, P<sub>2</sub>O<sub>5</sub> 28.89%. F. R. G.

Phosphate of iron and manganese from Olgiasca pegmatites. E. GRILL (Period. Min., 1935, 16, 19—23; Chem. Zentr., 1935, ii, 2651).—A new mineral, *repossite*, consisting essentially of an Fe<sup>II</sup> Mn<sup>II</sup> phosphate is described. J. S. A.

Iron ore deposits and mineral occurrences on the island of Serifos. C. PRAGER (Fortschr. Min. Krist. Petr., 1935, 19, 53—56; Chem. Zentr., 1935, ii, 2038).—Analytical data are given. J. S. A.

Spherosiderite and siderite from Felsőbánya. A. KOCH and L. VON ZOMBORY (Fold. Kozlony, 1935, 65, 18—20; Chem. Zentr., 1935, ii, 2038).—Analytical data are given. J. S. A.

Mineralogical and chemical composition of syenite-granite from Boekit Batoe near Palembang, Sumatra. W. VAN TONGEREN (Proc. K.

Akad. Wetensch. Amsterdam, 1936, 39, 670—673).—Data are given. H. J. E.

**Cobaltiferous oligon spar.** R. REISSNER (Zentr. Min., 1935, A, 170—173; Chem. Zentr., 1935, ii, 2037).—The mineral contains 14.44% of  $\text{CoCO}_3$ . J. S. A.

**Violet kainite containing hydrogen sulphide.** J. LEONHARDT and R. KÜHN (Zentr. Min., 1935, A, 193—194; Chem. Zentr., 1935, ii, 2037).—The occurrence and petrographical properties of the mineral are described. J. S. A.

**Cronstedite from Kisbánya.** B. GOSSNER (Zentr. Min., 1935, A, 195—201; Chem. Zentr., 1935, ii, 2037).—The mineral is an isomorphous mixture of  $\text{Si}_2\text{Fe}_2\text{O}_{10}\cdot\text{Fe}^{\text{III}}_2\text{Fe}^{\text{II}}_4(\text{OH})_8$  with  $\text{Si}_2\text{O}_{10}\text{Fe}^{\text{II}}_6(\text{OH})_8$  with an excess of  $\text{Fe}(\text{OH})_2$ , with  $a$  5.48,  $b$  9.45,  $c$  7.08 Å.;  $\beta = 90^\circ$ . J. S. A.

**Silicified aragonite twins from Uruguay related to Molina-Bastennes type.** K. WALTHER (Zentr. Min., 1935, A, 201—209; Chem. Zentr., 1935, ii, 2036).—Comparative geological and petrographical data are recorded. J. S. A.

**Photographs of axial figures of opaque minerals in infra-red.** D. MALMQUIST (Zentr. Min., 1935, A, 209—213; Chem. Zentr., 1935, ii, 2035).—Semi-conductors such as sulphide ores are transparent to infra-red light. The optic axial figures of Sb and Fe glance and arsenical pyrites have been so investigated with negative results. J. S. A.

**Wollastonite-urtite, and manner of formation of alkali rocks.** O. H. ERDMANNSDÖRFFER (Sitzungsber. Heidelberg. Akad. Wiss., 1935, No. 2, 19 pp.; Chem. Zentr., 1935, ii, 2798).—Mineralogical data are given for rocks from Lake Natron (Magadi), in the E. African rift valley region. J. S. A.

**Basalts of Guiliana and Contessa Entellina and their alteration; petrographic investigation.** A. SCHERILLO (Period. Min., 1935, 16, 61—84; Chem. Zentr., 1935, ii, 2797—2798).—Celadonite and lepto-chlorite are identified as products of basaltic alteration. J. S. A.

**Method of delineating a curve representing the manner of variation of chemical composition in a zoned plagioclase.** F. HOMMA (Proc. Imp. Acad. Tokyo, 1936, 12, 132—134).—The method of constructing a composition curve from an extinction curve for the various zones of a plagioclase is given. The formation of the rock is discussed. A. J. M.

**Age and origin of the Oberharz lead-zinc dykes.** E. BECKSMANN (Z. ges. Naturwiss., 1935, 1, 121—122; Chem. Zentr., 1935, ii, 2192—2193).—An upper carboniferous or lower Permian sandstone age is inferred. J. S. A.

**Structural and morphological relations between epidote and zoisite, and between epidote and ardennite.** H. STRUNZ (Z. Krist., 1936, 92,

402—407).—By a suitable choice of axes, close relationship is evident between these compounds. B. W. R.

**Electrical conductivity of the zeolites.** B. GROSS (Z. Krist., 1936, 92, 284—292).—The abnormal electrical behaviour of the zeolites is confirmed; Ohm's law is obeyed only for brief currents, and for long durations at a potential gradient exceeding 3000 volts per cm. the current increases and hysteresis effects appear. These are discussed on the basis of a heating effect. B. W. R.

**"Blue copper pyrites."** W. KURZ (Z. Krist., 1936, 92, 408—434).—This is a mixed crystal of  $\text{Cu}_2\text{S}$  with  $\text{CuS}$  in which the  $\text{CuS}$  content has delayed the transition  $\alpha \rightarrow \beta$ . B. W. R.

**Natural and synthetic emerald.** E. SCHIEBOLD (Z. Krist., 1936, 92, 435—473).—A detailed comparison by X-ray and microscopic methods. Whilst in general the natural and the synthetic products are identical, there are definite slight differences, e.g., in chemical purity, shape, and arrangement of layers and inclusions, lattice const. along the  $a$  axis, mosaic structure,  $d$ , cleavage,  $n$ , colour, dichroism, fluorescence, and resistance to etching. B. W. R.

**Synthetic emerald.** H. ESPIC (Z. Krist., 1936, 92, 387—391).—The synthetic is compared with the natural stone. B. W. R.

**Petrofabric analysis of gypsum.** H. W. FAIRBAIRN (Z. Krist., 1936, 92, 321—343).—General orientation and cleavage of the constituent grains in samples of gypsiferous schist are described.

**Bentonitic magnesian clay mineral from California.** W. F. FOSHAG and A. O. WOODFORD (Amer. Min., 1936, 21, 238—244).—A bentonitic clay from the Mojave Desert, near Hector, San Bernardino Co., California, is a hydrated Mg silicate (analysis given). X-Ray powder photographs show that it closely resembles saponite. The high  $\text{Na}_2\text{O}$  (3.00%) and  $\text{Li}_2\text{O}$  (1.12%) contents are unusual. When placed in  $\text{H}_2\text{O}$  the white clay swells immediately, and finally sets to a firm jelly 5 or 6 times the vol. of the original dry clay. Similar Mg clays are widespread in this desert region of California and Nevada. L. S. T.

**Constitution of Normandy flintstone clay.** B. BRAJNIKOV (Compt. rend., 1936, 202, 1595—1597).—Optical and analytical data are given. The essential minerals belong to the beidellite-nontronite series. H. J. E.

**Occurrence of beryllium in fossil coals.** A. SILBERMINZ and A. K. RUSANOV (Compt. rend. Acad. Sci. U.R.S.S., 1936, 2, 27—31).—Of 604 Russian coals only 38 had  $\text{Be} > 0.001\%$ , and none  $> 0.1\%$ . T. G. P.

**Brown and red carbonated crust soils in Tunis.** V. AGAFONOV (Compt. rend., 1936, 202, 159, 1599).—A discussion.

## Organic Chemistry.

**Electronic structure of organic compounds.** E. OLIVIERI-MANDALA (Gazzetta, 1936, 66, 253—258).—A crit. review. E. W. W.

**Theory of organic reactions.** H. F. TSEOU (J. Chinese Chem. Soc., 1936, 4, 235—277).—Theoretical. A theory applicable to all org. reactions is put forward: the position of an element in the periodic table is determined by its electrical condition in the outermost sphere, the position being capable of displacement according to the affinity for electrons of the atoms joined to it, and the periodic table is represented not by isolated elements, but by a continuous function of the electrical forces of the different elements.

F. R. S.

**Empirical method for predicting configuration of optically active carbon compounds.** R. E. MARKER (J. Amer. Chem. Soc., 1936, 58, 976—978).—23 groups are tabulated in decreasing and 6 (more polar) in increasing order of levorotation. The resulting table is used to predict the configurative relationships of various compounds. H. B.

**Reactions of paraffins and naphthenes with olefines. Alkylation.** V. N. IPATIEV and A. V. GROSSE (J. Gen. Chem. Russ., 1936, 6, 423—432).—*n*-Paraffins in presence of  $\text{AlCl}_3$ , or *iso*-paraffins in presence of  $\text{AlCl}_3$  or  $\text{BF}_3$ , at 30—70°/1—15 atm., afford a mixture of higher paraffins; thus *n*- $\text{C}_6\text{H}_{14}$  and  $\text{C}_2\text{H}_4$  afford chiefly  $\text{C}_8\text{H}_{18}$  and  $\text{C}_{10}\text{H}_{22}$ , *iso*- $\text{C}_4\text{H}_{10}$  and  $\text{C}_2\text{H}_4$  yield chiefly  $\text{C}_6\text{H}_{12}$  and  $\text{C}_8\text{H}_{18}$ , *iso*- $\text{C}_4\text{H}_{10}$  and *iso*-butylene give  $\text{C}_8\text{H}_{18}$  and  $\text{C}_{12}\text{H}_{26}$ , and *iso*- $\text{C}_5\text{H}_{12}$  and  $\text{C}_2\text{H}_4$  afford  $\text{C}_7\text{H}_{16}$  and  $\text{C}_8\text{H}_{18}$ . R. T.

**Isomerism of hydrocarbons. III. Thermal isomerisation of *n*-hexane and *n*-octane.** B. L. MOLDAVSKI, M. V. KOBILSKAJA, and S. E. LIVSCHITZ (J. Gen. Chem. Russ., 1936, 6, 616—620).—*n*- $\text{C}_6\text{H}_{14}$  does not yield *iso*-paraffins when heated in presence of Fe,  $\text{SiO}_2$ , or  $\text{MoS}_3$  at temp. not involving cracking (370—609°). Analogous results are obtained with *n*- $\text{C}_8\text{H}_{18}$ ; under conditions involving production and condensation of unsaturated hydrocarbons (475°/70 atm., in a steel autoclave) the liquid products contain 40% of *iso*-paraffins. R. T.

**Structure of ceresin hydrocarbons.** S. S. NAMETKIN and S. S. NIFONTOVA (J. Appl. Chem. Russ., 1936, 9, 834—840).—Surachani ceresin consists chiefly of *n*- and *iso*-paraffins of mean mol. wt. corresponding with  $\text{C}_{43}\text{H}_{92}$ , with an admixture of hydrocarbons of low mol. wt. ( $\text{C}_{22}\text{H}_{46}$ ). R. T.

**Alkylation of paraffins with olefines in presence of aluminium chloride.** V. N. IPATIEV, A. V. GROSSE, H. PINES, and V. I. KOMAREVSKI (J. Amer. Chem. Soc., 1936, 58, 913—915; cf. A., 1935, 1348).—A mixture, b.p. 20—350° (mostly 45—235°), of paraffins is formed when  $\text{C}_2\text{H}_4$  is passed into *n*- $\text{C}_6\text{H}_{14}$  +  $\text{AlCl}_3$  at 30—40° and atm. pressure; after absorption of  $\text{C}_2\text{H}_4$  slows down, a little dry HCl and fresh  $\text{AlCl}_3$  are added. Reaction proceeds much faster with  $\text{AlBr}_3$ . *n*- $\text{C}_6\text{H}_{14}$  (1 mol.) and  $\text{C}_2\text{H}_4$  (2—2.5 mols.) with  $\text{AlCl}_3$  at 25° and 15 atm. give paraffins, b.p. 25—400° (mostly 50—330°);  $\text{CHMe}_3$  (1 mol.) and  $\text{C}_2\text{H}_4$  (3 mols.) similarly afford paraffins, b.p. 25—200°.

Side reactions are: (i) polymerisation of  $\text{C}_2\text{H}_4$ ; (ii) compound formation with  $\text{AlCl}_3$ ; (iii) "auto-destructive alkylation" of paraffins, i.e., fission to a lower paraffin and olefine (which then alkylates the original mol. to a higher paraffin). H. B.

**System octene-sulphur dioxide.**—See this vol., 931.

**Selective catalytic hydrogenation by cold nickel. I. Ethylenic linking. II. Acetylenic linking.** G. DUPONT (Bull. Soc. chim., 1936, [v], 3, 1021—1030, 1030—1035).—I. Hydrogenation of terminal  $\text{CH}:\text{CH}_2$  in presence of Raney Ni in EtOH at room temp. proceeds very rapidly and at an approx. const. rate until completion (examples cited:  $\Delta^a$ -heptene,  $\text{CHPh}:\text{CH}_2$ ,  $\text{CH}_2\text{Ph}:\text{CH}:\text{CH}_2$ , safrole, eugenol,  $\text{CH}_2:\text{CH}:\text{CH}(\text{CH}_2)_8\text{CO}_2\text{H}$ ).  $\text{CH}_2:\text{CH}_2:\text{CH}_2\text{OH}$  and  $\text{CH}_2:\text{CH}:\text{CHO}$  are rapidly reduced initially, but reaction soon stops, apparently due to temporary poisoning of the catalyst. Hydrogenation of  $\text{CH}:\text{CH}$  generally proceeds less rapidly than that of  $\text{CH}:\text{CH}_2$ , and the rate diminishes as the reaction proceeds (examples,  $\Delta^b$ -octene, maleic acid,  $\text{CHPh}:\text{CH}:\text{CH}_2\text{OH}$ , isosafrole, isoeugenol, cyclohexene). Double linkings in the aromatic nucleus or in furfuraldehyde are not appreciably affected, whilst Me oleate and elaidic acid are not reduced. The linking  $\text{CR}:\text{R}'\text{CH}_2$  or  $\text{CR}:\text{R}'\text{CHR}'$  is not usually hydrogenated (examples: dimethyloctene, methylcyclohexene, camphene, nopinene, pinene, carvomenthene,  $\Delta^b$ -menthene,  $\alpha$ -dihydro-linalol, citronellal, terpineol, methylheptenone, dihydroionone). Two or more double linkings reciprocally increase the ease of hydrogenation. If one is *tert.*, it usually remains unattacked; if two are *tert.*, one of them is reduced. If the linkings are conjugated, addition occurs partly in the  $\alpha\delta$  position (examples: alloocimene, geraniol, linalol, limonene,  $\alpha$ -terpinene,  $\alpha$ - and  $\beta$ -pyronene). CO or CHO conjugated to a primary or *sec.* double linking appears to reduce the rate of hydrogenation of the latter; otherwise they participate in the reaction, which does not cease after the absorption of 2 H (examples:  $\text{CHPh}:\text{CH}:\text{CHO}$ ,  $\text{COMe}:\text{CH}:\text{CHPh}$ ,  $\alpha$ - and  $\beta$ -ionone, citral, mesityl oxide).

II. Hydrogenation of heptinene proceeds at an approx. const. rate throughout its entire course, but interruption of the reaction after absorption of 2 H shows the process to be selective.  $\text{CPh}:\text{CH}$  is similarly hydrogenated. With disubstituted acetylenes the selectivity is satisfactory.  $\Delta^b$ -Octinene and  $\alpha$ -methoxy- $\Delta^b$ -octinene are rapidly reduced until 2 H have been absorbed, after which there is a sudden fall in the velocity of the change. Me heptinenyl carbonate behaves similarly.  $\text{C}_2\text{H}_2$  and  $\text{H}_2$  in equal vols. give  $\text{C}_2\text{H}_4$ , much  $\text{C}_2\text{H}_6$ , unchanged  $\text{C}_2\text{H}_2$ , and complex products;  $\text{C}_6\text{H}_2 + 2\text{H}_2$  yield  $\text{C}_6\text{H}_6$  quantitatively.

H. W.

**Polymerisation of ethylene with aluminium chloride.** V. N. IPATIEV and A. V. GROSSE (J. Amer. Chem. Soc., 1936, 58, 915—917).— $\text{C}_2\text{H}_4$  does not react with pure  $\text{AlCl}_3$  at 10—50° and 50 atm. except in presence of traces of  $\text{H}_2\text{O}$  or HCl. When reaction does occur, paraffins, b.p.  $-10^\circ$  to  $372^\circ$ , and

unsaturated cyclic hydrocarbons, b.p. 175—392° (which combine with  $\text{AlCl}_3$ ), are formed. The process is termed "conjunct polymerisation." H. B.

**Physical constants of polymerisation products of unsaturated hydrocarbons.** H. I. WATERMAN, J. J. LEENDERTSE, and J. P. MAKINK (J. Inst. Petroleum Tech., 1936, 22, 333—340; cf. A., 1935, 469).—The  $\eta$  and  $\eta$ -temp. curves of a series of polymeride fractions obtained from a mixture of branched pentenes ( $\text{CMeEtCH}_2$  and  $\text{CMe}_2\text{CHMe}$ ) have been compared graphically over the range 20—80° with unbranched  $\Delta^2$ -*n*-pentene polymerides. The latter are slightly more cyclic than the former. The properties of the polymerised fractions are independent of the chemical structure of the original pentenes, branching having no influence when polymerisation is carried out under similar conditions.

C. C.

**Alkylacetylenes and their additive products.**

## XII. Addition of methanol to alkenylacetylenes.

D. B. KILLIAN, G. F. HENNION, and J. A. NIEUWLAND (J. Amer. Chem. Soc., 1936, 58, 892—894; cf. A., 1934, 1089).— $\text{CH}_2\text{:CH}\cdot\text{C}\equiv\text{CEt}$  and MeOH in presence of  $\text{BF}_3$ ,  $\text{Et}_2\text{O}$ ,  $\text{HgO}$ , and  $\text{CCl}_3\cdot\text{CO}_2\text{H}$  give (probably)  $\alpha\gamma$ -trimethoxyhexane, b.p. 80—82°/19 mm.;  $\text{CH}_2\text{:CH}\cdot\text{COMe}$  similarly affords  $\text{OMe}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{COMe}$ , b.p. 137—138°/745 mm., whilst divinylacetylene is polymerised. Butyl-, amyl-, and phenyl-alkylacetylenes similarly add MeOH at the C:C only to give the *Me*<sub>2</sub> acetals, b.p. 91—93°/18 mm., 104—106°/16 mm., and 117—118°/16 mm., respectively, of Bu, b.p. 75—77°/19 mm., amyl, b.p. 86—88°/16 mm., and Ph, b.p. 127—129°/21 mm.,  $\Delta^2$ -butenyl ketone, respectively. The conjugated system C:C-C appears to be necessary for addition of MeOH to the C:C of an alkenylacetylene. Physical data for the acetals are given.

H. B.

**Vinylacetylene as a primary product of polymerisation of acetylene under different conditions.** L. G. TZIURICH, E. M. EFREMOVA, V. A. BARTASHEV, and J. G. JAPPU (J. Gen. Chem. Russ., 1936, 6, 197—202).— $\text{CH}_2\text{:CH}\cdot\text{CH}\cdot\text{CH}_2$  is identified amongst the gaseous products obtained when  $\text{C}_2\text{H}_2$  is passed over  $\text{CuCl}$ -pumice at 200—250° or  $\text{ZnCl}_2$ -pumice at 350°.

R. T.

**Formation of *s*-dibromoethylene from *s*-tetrabromoethane.** A. PONGRATZ (Ber., 1936, 69, [B], 1267—1269).—The ratio of *cis*- to *trans*-( $\text{CHBr}$ )<sub>2</sub> produced by treatment of ( $\text{CHBr}_2$ )<sub>2</sub> with Zn dust in abs. EtOH is conveniently deduced from the Raman spectrum.

H. W.

**Mercuric fluoride, a new fluorinating agent.** A. L. HENNE and T. MIDGLEY, jun. (J. Amer. Chem. Soc., 1936, 58, 884—887).—Anhyd.  $\text{HgF}_2$  is obtained in about 75% yield when F is passed into finely divided  $\text{HgCl}_2$  in a revolving Cu vessel at room temp.  $\text{HgF}_2$  is used for the replacement of Hal in aliphatic mono- and poly-halides by F; reaction is effected usually in Cu in absence or presence of solvents ( $\text{CHCl}_3$ ,  $\text{CH}_2\text{Cl}_2$ ,  $\text{C}_6\text{H}_6$ ; not alcohols, ethers, or esters) at 0—160°. The following are prepared: EtF from EtBr; AcF from AcCl;  $\text{CH}_2\text{Br}\cdot\text{CHBrF}$  and  $\text{CH}_2\text{Br}\cdot\text{CHF}_2$  from *s*- $\text{C}_2\text{H}_4\text{Br}_2$ ;  $\text{CHBr}_2\cdot\text{CHBrF}$  or

$\text{CHBr}_2\cdot\text{CHF}_2$  from *s*- $\text{C}_2\text{H}_4\text{Br}_4$ . EtOH gives about 2% of EtF and some  $\text{C}_2\text{H}_4$ . The fluorides from cyclohexyl bromide, 1:2-dibromocyclohexane, dichlorodioxan, and  $(\text{CH}_2\text{Cl}\cdot\text{CH}_2)_2\text{O}$  eliminate HF to give almost quant. yields of the ethylenic compounds. PhHal,  $\text{C}_6\text{H}_6\text{Cl}_6$ , and  $\text{C}_6\text{Cl}_6$  do not react. Very little reaction occurs with acids or anhydrides.

H. B.

**Reactivity and influence of fluorine in aliphatic compounds.** A. L. HENNE and T. MIDGLEY, jun. (J. Amer. Chem. Soc., 1936, 58, 882—884).—Aliphatic compounds containing 1 F atom are unstable and show a marked tendency to liberate HF; those containing  $\text{CHalF}$  are more stable. The presence of  $\cdot\text{CRF}_2$  causes (i) a marked increase in the strength of the C-F linkings, (ii) strengthening of the C-R linking when R is Hal, and (iii) marked increase in the stability of any Hal atoms attached to adjacent C atoms.

H. B.

**Fluoro-derivatives of ethane and ethylene.**

IV, V. A. L. HENNE and M. W. RENOLL (J. Amer. Chem. Soc., 1936, 58, 887—889, 889—890).—IV. *s*- $\text{C}_2\text{H}_2\text{Cl}_2\text{Br}_2$  and  $\text{SbF}_3$  give  $\alpha\beta$ -dichloro- $\alpha$ -bromo- $\beta$ -fluoroethane, b.p. 124.7—125.1°/736 mm.,  $\alpha$ -chloro- $\alpha$ -bromo- $\beta\beta$ -difluoroethane, b.p. 82.3—82.5°/743 mm., and small amounts of  $\text{CHCl}_2\cdot\text{CHClF}$ ,  $\text{CHCl}_2\cdot\text{CHF}_2$  (I),  $\text{CHCl}_2\cdot\text{CCl}_2\text{F}$ , and  $\text{CHCl}_2\cdot\text{CCl}_2\text{F}$  (I) and  $\text{SbF}_3$  under varying conditions afford some  $\alpha$ -chloro- $\beta\beta\beta$ -trifluoroethane, b.p. 6.1°;  $\text{CH}_2\text{Br}_2\cdot\text{CHF}_2$  (II) similarly gives some  $\text{CH}_2\text{Br}\cdot\text{CF}_3$  (?), v.p. 23—25°, and (III) (below). *s*- $\text{C}_2\text{H}_2\text{Br}_2$  and  $\text{HgF}_2$  at 150—160° afford a quant. yield of (II); this and  $\text{HgF}_2$  at 180—190° give  $\alpha$ -bromo- $\alpha\beta\beta$ -trifluoroethane (III), b.p. 40—41°/735 mm., and *s*-tetrafluoroethane, b.p. —23°.

V.  $\text{CMeCl}_3$  and  $\text{SbF}_3$ - $\text{SbF}_3\text{Cl}_2$  (9:1) at 0°—room temp. give  $\alpha\alpha$ -dichloro- $\alpha$ -fluoro-, b.p. 31.7—31.8° (this and following b.p. are at 760 mm.),  $\alpha$ -chloro- $\alpha\alpha$ -difluoro-, b.p. —9.6°, and  $\alpha\alpha\alpha$ -trifluoro-, b.p. —46.7°, -ethane according to amounts of reagents used.  $\text{CHMeCl}$  similarly affords  $\alpha$ -chloro- $\alpha$ -fluoro-, b.p. 16.1—16.2°, and  $\alpha\alpha$ -difluoro-, b.p. —24.7°, -ethane; the latter is better obtained from  $\text{CHMeBr}_2$  and  $\text{HgF}_2$ . *s*- $\text{C}_2\text{H}_4\text{Br}_2$  and  $\text{HgF}_2$  give  $\alpha$ -bromo- $\beta$ -fluoro-, b.p. 71.5—71.8° (50%),  $\alpha\beta$ -difluoro-ethane, b.p. 10—11° (10%), BuF (25—30%), and a mixture (10—15%) of butadiene and  $\text{C}_4\text{H}_8$ ; *s*- $\text{C}_2\text{H}_4\text{I}_2$  behaves similarly but  $\alpha$ -iodo- $\beta$ -fluoroethane, b.p. 98—102°, can be isolated in small amount as an intermediate.  $\text{CH}_2\text{Cl}\cdot\text{CHCl}_2$  and  $\text{HgF}_2$  at 140° afford  $\alpha\beta$ -dichloro- $\alpha$ -fluoro-, b.p. 73.7—73.9° (50%), and  $\beta$ -chloro- $\alpha\alpha$ -difluoro-ethane, b.p. 35.1° (8—10%); use of  $\text{SbF}_3$  with various catalysts is less satisfactory.  $\text{CH}_2\text{Br}\cdot\text{CHBr}_2$  and  $\text{HgF}_2$  give  $\text{CH}_2\text{Br}\cdot\text{CHBrF}$  and then  $\text{CH}_2\text{Br}\cdot\text{CHF}_2$  (which does not react further; successive treatment with EtOH- $\text{CaI}_2$  and  $\text{HgF}_2$  affords  $\alpha\alpha\beta$ -trifluoroethane, b.p. 5°).  $\alpha$ -Chloro- $\beta$ -bromo- $\alpha$ -fluoroethane, b.p. 96.6°, is obtained in almost quant. yield from  $\text{CH}_2\text{Br}\cdot\text{CHClBr}$  and  $\text{HgF}_2$ . The at. refraction of F calc. from  $\text{CMeCl}_2\text{F}$  is abnormal.

H. B.

**Action of sulphuric acid in the gas phase on alkyl chlorides and bromides.** J. B. SENDRENS and J. ABOULENC (Compt. rend., 1936, 202, 1548—1550; cf. A., 1935, 604).— $\text{Pr}^n\text{Cl}$ ,  $\text{Pr}^n\text{Br}$ ,  $\text{Bu}^n\text{Cl}$ ,  $\text{Bu}^n\text{Br}$ , and *s*- $\text{C}_2\text{H}_4\text{Cl}_2$  are decomposed by conc.  $\text{H}_2\text{SO}_4$  at 200—210°, 210—215°, 205—210°, 160°, and 225—230°, respectively, with the formation of CO and  $\text{CO}_2$

(from deposited C) in different proportions.  $\text{CHCl}_3$  and  $\text{CHBr}_3$  give gases rich in CO and there is but a slight deposit of C.  $\text{CCl}_4$  gives no CO. J. L. D.

**Liquid-phase photochemical chlorination of tert.-butyl chloride and related compounds.** A. O. ROGERS and R. E. NELSON (J. Amer. Chem. Soc., 1936, 58, 1027—1029).—Chlorination of  $\text{Bu}^t\text{Cl}$  in light from incandescence lamps gives  $\alpha\beta$ -dichloro- $\beta$ -methyl- (I),  $\alpha\alpha\beta$ -trichloro- $\beta$ -methyl- (II), b.p. 144.5—145.4°, m.p.  $-6.5^\circ$  to  $-6^\circ$ ,  $\alpha\beta\gamma$ -trichloro- $\beta$ -methyl- (III), b.p. 162—163.1° (major product),  $\alpha\alpha\alpha\beta$ -tetrachloro- $\beta$ -methyl- (IV), b.p. 192°/1175 mm., m.p. 178.6—179.6° (trace),  $\alpha\alpha\beta\gamma$ -tetrachloro- $\beta$ -methyl- (V), b.p. 190.6—191.3°, m.p.  $-46^\circ$ , and  $\alpha\beta\gamma$ -trichloro- $\beta$ -chloromethyl-propane, b.p. 206—210°. All b.p. are corr. Similarly, (II) gives (IV); (I) affords (II) and (III);  $\text{CHMe}(\text{CH}_2\text{Cl})_n$  yields (III) and (V). Cl attached to C promotes further substitution on the same C. H. B.

**Effect of radiation of wave-length 1980—1860 Å. on cis- and trans-dichloroethylene.**—See this vol., 944.

**Study of the structure of polymerides of chloroprene by ozonolysis and oxidation by nitric acid.** I. A. L. KLEBANSKI and V. G. VASILIEVA (J. Gen. Chem. Russ., 1936, 6, 359—369).—The ozonide of  $\alpha$ -polychloroprene gives succinic acid (I) in 82.3% yield when treated with 30%  $\text{H}_2\text{O}_2$  at 100°; substitution of  $\text{H}_2\text{O}$ , an aq. suspension of  $\text{CaCO}_3$ , or 3% HCl in MeOH for  $\text{H}_2\text{O}_2$  leads to formation of tarry products. The ozonides of the  $\mu$ - and  $\omega$ -polymerides yield (I) in 87—90% yield when heated with  $\text{H}_2\text{O}$  at 100°. R. T.

**Mechanism of the allyl change.** A. KIRRMANN and P. RENN (Compt. rend., 1936, 202, 1934—1935).— $\alpha\alpha$ -Dibromo- $\Delta^2$ -propene (I), b.p. 29—31°/14 mm., is stable in a sealed tube, but in presence of dry HBr is converted into  $\text{CH}_2(\text{CH}_2\text{Br})_2$ , which supports the view that addition followed by removal of HBr is responsible for the change. (I) with HBr (liquid) at  $-80^\circ$  in a sealed tube affords mainly  $\text{CHBr}(\text{CH}_2\text{Br})_2$ , which loses HBr to give  $\alpha\beta$ -dibromo- $\Delta^2$ -propene. Acetaldehyde with HBr, followed by  $\text{PCl}_3\text{Br}_2$ , affords  $\alpha\gamma$ -tribromopropene (II), b.p. 84—85°/14 mm. which does not lose HBr with quinoline but gives (I) with anhyd. KOH at 200°, indicating that (II) is not an intermediate product of the change. J. L. D.

**$\alpha\delta$ -Dibromobutane from divinyl.** L. G. TZIURICH and I. A. ROTENBERG (J. Gen. Chem. Russ., 1936, 6, 203—205).—Divinyl and Br afford  $\text{CH}_2\text{Br}\cdot\text{CH}:\text{CH}\cdot\text{CH}_2\text{Br}$ , converted by NaOEt in EtOH into  $(\text{CH}\cdot\text{CH}_2\cdot\text{OEt})_2$ , which is hydrogenated (Pd-Ni) to  $\text{OEt}\cdot[\text{CH}_2]_4\cdot\text{OEt}$ , and this yields  $\alpha\delta$ -dibromobutane when heated with HBr (130°; 3 hr.). R. T.

**Reactions and derivatives of  $\alpha\beta\gamma$ -trichloro- $\beta$ -methylpropane.** A. O. ROGERS and R. E. NELSON (J. Amer. Chem. Soc., 1936, 58, 1029—1032).—Alkaline hydrolysis of  $\alpha\beta\gamma$ -trichloro- $\beta$ -methylpropane (I) gives a good yield of  $\gamma$ -chloro- $\beta$ -methylallyl alcohol (II), two (*cis* and *trans*) forms, b.p. 160—162° (corr.) (3:5-dinitrobenzoate, m.p. 94.4—95.8°), and

160—168° (corr.) (3:5-dinitrobenzoate, m.p. 63.8—64.5°), which is readily oxidised (dil.  $\text{KMnO}_4$ ), adds Br very slowly, and could not be reduced (Na-Hg). Thermal decomp. of (I) at 450—550° affords a mixture (A) of  $\text{CH}_2\cdot\text{C}(\text{CH}_2\text{Cl})_2$  and *cis*- and *trans*- $\text{CH}_2\text{Cl}\cdot\text{CMe}\cdot\text{CHCl}$ . (II) is obtained by alkaline or neutral hydrolysis of (A); acid conditions lead to an aldehyde as one of the main products. (A) and  $\text{Cl}_2$  at 0° in the dark give  $\alpha\alpha\beta\gamma$ -tetrachloro- $\beta$ -methyl- and  $\alpha\beta\gamma$ -trichloro- $\beta$ -chloromethyl-propane and some  $\text{Cl}_5$ -derivatives.  $\alpha$ -Chloro- $\gamma$ -phenyl- $\beta$ -methyl- $\Delta^2$ -propene, b.p. 125°/36 mm., is obtained from (A) and  $\text{MgPhBr}$ ; *Mg n*- and *iso*-amyl bromides similarly afford complex mixtures. H. B.

**Rearrangement of polyinenes. IX. Dimerides of tritert.-butylethynylmethyl halides.** W. J. SPARKS and C. S. MARVEL (J. Amer. Chem. Soc., 1936, 58, 865—870).—The chloride, new m.p. 176° (A., 1926, 43), and bromide, m.p. 177—178° (A., 1928, 988), previously obtained from  $(\text{CBu}^t)_2\text{C}\cdot\text{OH}$  (I) are dimerides,  $\text{C}_{38}\text{H}_{54}\text{Cl}_2$  (II) and  $\text{C}_{38}\text{H}_{54}\text{Br}_2$  (III), respectively, containing 1 reactive halogen. The compound (A., 1932, 496) from (I) and  $\text{TiCl}_3$  is also (II). (II) and (III) with Ag in  $\text{C}_6\text{H}_6$  give compounds,  $\text{C}_{76}\text{H}_{108}\text{Cl}_2$ , m.p. 241°, and  $\text{C}_{76}\text{H}_{108}\text{Br}_2$ , m.p. 244—246°, respectively; (III) and  $\text{AgOAc}$  in AcOH afford a compound,  $\text{C}_{38}\text{H}_{54}\text{Br}\cdot\text{OAc}$ , m.p. 108—110°. Tritert.-butylethynylmethyl chloride (IV), m.p. 73° [from (I) and  $\text{PCl}_3$  in light petroleum at room temp. or from (I) and aq. EtOH-HCl at 0°], is oxidised ( $\text{CrO}_3$ , warm AcOH) to  $\text{Bu}^t\text{CO}_2\text{H}$  and  $(\text{CBu}^t)_2\text{C}\cdot\text{CO}$  (V), m.p. 62—63°, indicating a preliminary rearrangement of (IV) into  $(\text{CBu}^t)_2\text{C}\cdot\text{C}:\text{C}:\text{CBu}^t\text{Cl}$  (VI). Similar oxidation of (II) gives a compound,  $\text{C}_{38}\text{H}_{54}\text{O}_{10}$  (VII), amorphous, m.p. about 65°; whilst  $(\text{CBu}^t)_2\text{C}\cdot\text{CH}\cdot\text{COBu}^t$  (A., 1928, 988) affords (V). (II) and  $\text{NaNH}_2$  in boiling xylene afford resinous products [the hydrocarbon, previously reported (A., 1932, 496) could not be isolated], whilst (II) and Mg in Et<sub>2</sub>O give a compound,  $\text{C}_{38}\text{H}_{56}\text{O}_2$ , m.p. 178°. (II) heated to 170° (in small amounts only) rearranges to an isomeride, m.p. 257°, which does not react with Ag, is oxidised ( $\text{KMnO}_4$ ,  $\text{COMe}_2$ ) to a compound,  $\text{C}_{38}\text{H}_{54}\text{O}_3$ , m.p. 260—263° [also obtained from (VIII) (below) and moist Ag<sub>2</sub>O in  $\text{C}_6\text{H}_6$ ], and absorbs  $\text{O}_2$  readily to give an oxide,  $\text{C}_{38}\text{H}_{54}\text{OCl}_2$  (VIII), m.p. 250° (decomp.). The Cl atoms of (VIII) are replaced by OAlk by heating with AlkOH; the (*OMe*)<sub>2</sub>, m.p. 250°, (*OEt*)<sub>2</sub>, m.p. 217°, (*OBu*)<sub>2</sub>, m.p. 132°, and (*O-C*<sub>12</sub>H<sub>25-n</sub>)<sub>2</sub>, m.p. 85°, derivatives are described. These acetals (?) and (VIII) are all hydrolysed (50%  $\text{H}_2\text{SO}_4$ ) to a compound,  $\text{C}_{38}\text{H}_{54}\text{O}_2$ , m.p. 169—170°, which is oxidised (conc.  $\text{HNO}_3$ ) to (probably) (VII). (II) is considered to be a cyclobutane derivative (structure suggested) formed by dimerisation of (VI). (VIII) is probably a furan. H. B.

**Catalysts promoting dehydrogenation and dehydration of alcohols.** N. N. MOVOILOVA (Sintet. Kautschuk, 1935, 4, No. 1, 44—49; No. 2, 25—40; No. 3, 24—38).—A review. CH. ABS. (r)

**Reaction between magnesium and alcohols in presence of certain alkyl halides.** M. N. VISCHN-JAKOV (J. Gen. Chem. Russ., 1936, 6, 107—128).—The reactivity of Mg with alcohols in presence of alkyl

halides rises in the order  $\text{MeOH} < \text{Pr}^n\text{OH} < \text{EtOH}$ ; the activating action of the halides increases in the series  $\text{RX} < \text{RX}_2 < \text{RX}_3$ ;  $\text{RCl} < \text{RBr} < \text{RI}$ ;  $\text{Pr}^n\text{X} < \text{EtX} < \text{MeX}$ . A limiting concn. exists for each activator, below which the reaction does not proceed, or commences after a prolonged induction period; in presence of high concns. of halides two max. are found on the velocity of reaction curve. The gaseous products consist of  $\text{H}_2$  and saturated hydrocarbons in presence of mono- and unsaturated hydrocarbons in presence of di-halides. The results are explained on the assumption that the first reaction is  $\text{ROH} + \text{Mg} + \text{R}'\text{X} \rightarrow \text{MgX} \cdot \text{OR} + \text{H}$ , and that the  $\text{MgX} \cdot \text{OR}$  catalyses the reaction  $2\text{ROH} + \text{Mg} \rightarrow \text{Mg} \cdot \text{OR} + \text{H}_2$ . R. T.

**Photochemical peroxide formation. II. Oxidation of ethyl, propyl, butyl, and amyl alcohol by molecular oxygen in ultra-violet light. Photochemical formation of peralcohols.** R. CANTENI (Ber., 1936, 69, [B], 1386—1394).— $\text{EtOH}$ ,  $\text{Pr}^n\text{OH}$ ,  $\text{Pr}^s\text{OH}$ ,  $\text{Bu}^n\text{OH}$ ,  $\text{Bu}^s\text{OH}$ , and fermentation amyl alcohol yield peroxides in the presence of  $\text{O}_2$  under the influence of ultra-violet light of the quartz-Hg lamp of short or long. Addition of  $\text{H}_2\text{O}$  to  $\text{EtOH}$  or  $\text{PrOH}$  retards peroxide formation. Production of peroxides occurs most rapidly with *iso*-alcohols, rapidly with  $\text{MeOH}$ , more slowly with the remaining *n*-alcohols. In ultra-violet light of long  $\lambda$ , the rate of formation of peroxides increases with increasing no. of C atoms ( $\text{MeOH}$  is an exception). The peroxides formed from the alcohols at a nearly const. rate decompose as their concn. increases until a balance is nearly attained. The production of peroxides from alcohols cannot be attributed to the formation of  $\text{H}_2\text{O}_2$  from  $\text{H}_2\text{O}$  and  $\text{O}_2$  or from photolytically formed  $\text{H}$  and  $\text{O}_2$ , and the production of peralcohols,  $\text{R} \cdot \text{O} \cdot \text{OH}$ , is postulated. H. W.

**Action of calcium hypochlorite on organic compounds with hydroxyl and carbonyl groups. II. Calcium hypochlorite and secondary alcohols and ketones.** J. SUNEVIČ and A. TSCHILINGARJAN (Ber., 1936, 69, [B], 1537—1542).—The following general scheme is given for the action of  $\text{Ca}(\text{OCl})_2$  on ketones  $\text{COR}_2$  or the corresponding carbinols:  $\text{COEt} \rightarrow \text{OH} \cdot \text{CEt} \cdot \text{CHMe} \rightarrow$

$\text{CEt}(\text{OCl}) \cdot \text{CHMe} \rightarrow \text{COEt} \cdot \text{CHMeCl} \rightarrow \text{COEt} \cdot \text{CMeCl}$ , (I)  
 $\text{COMe} \cdot \text{COEt} \xrightarrow{\text{AcOH} + \text{EtCO}_2\text{H}} \text{(I)} \rightarrow$   
 $\text{CO}(\text{CMeCl}_2)_2 \rightarrow \text{COMe} \cdot \text{CO} \cdot \text{CMeCl} \rightarrow \text{AcOH} + \text{CMeCl}_2 \cdot \text{CO}_2\text{H}$  (II); (II)  $\rightarrow \text{AcCO}_2\text{H} \rightarrow \text{AcOH} + \text{CO}_2$ ;  
 (II)  $\rightarrow \text{CCl}_3 \cdot \text{CO} \cdot \text{CO}_2\text{H} \rightarrow \text{CHCl}_3 + \text{H}_2\text{C}_2\text{O}_4$ . The following transitions are illustrative;  $\text{COPr}^n \cdot \text{C}_6\text{H}_4\text{Me}$  to  $\text{CHCl}_3$ ,  $p\text{-C}_6\text{H}_4(\text{CO}_2\text{H})_2$ , and  $\text{AcOH}$ ;  $\text{CHEt}^n \cdot \text{OH}$  to  $\text{CHCl}_3$ ,  $\text{AcOH}$ , and  $\text{EtCO}_2\text{H}$ ;  $\text{COEt}^n$  to  $\text{CHCl}_3$ ,  $\text{AcOH}$ , and  $\text{EtCO}_2\text{H}$ ;  $\text{CHPr}^n \cdot \text{OH}$  to  $\text{CHCl}_3$ ,  $\text{EtCO}_2\text{H}$ , and  $\text{Pr}^n\text{CO}_2\text{H}$ ;  $\text{COPr}^s$  to  $\text{CHCl}_3$  with traces of acid;  $\text{COPr}^s$  to  $\text{CHCl}_3$ ,  $\text{AcOH}$ , and  $\text{Pr}^s\text{CO}_2\text{H}$ ;  $\text{CHPr}^n \cdot \text{OH}$  to  $\text{PrCO}_2\text{H}$ , and  $\text{BuCO}_2\text{H}$ ;  $\text{CHBu}^s \cdot \text{OH}$  to  $\text{EtCO}_2\text{H}$  and  $\text{CHMeEt} \cdot \text{CO}_2\text{H}$ ;  $\text{COMe} \cdot \text{CH}_2\text{Ph}$  to  $\text{BzOH}$ ,  $\text{PhCHO}$ , and  $\text{AcOH}$ .  $\text{Ac}_2$  yields  $\text{AcOH}$  exclusively.  $\text{CH}_3\text{Ac}_2$  gives  $\text{CHCl}_3$  and  $\text{AcOH}$ .  $\text{CH}_3\text{Cl} \cdot \text{CH}_2 \cdot \text{OH}$  affords little  $\text{CHCl}_3$  and very little unidentified acids. Propylene chlorohydrin gives  $\text{CHCl}_3$  and  $\text{AcOH}$ .  $(\text{CH}_2\text{OH})_2$  yields very little acid and no  $\text{CHCl}_3$  or  $\text{H}_2\text{C}_2\text{O}_4$ .  $\text{CHCl}_3$  and (?) aldehyde are obtained from

$\text{OH} \cdot \text{CHMe} \cdot \text{CH}_2 \cdot \text{OH}$  whilst  $\text{CHCl}_3$  and a little  $\text{AcOH}$  are derived from  $(\text{CHMe} \cdot \text{OH})_2$ . H. W.

**$\alpha$ -Chloro-3-methylpropan-3-ol from  $\alpha$ ,5-dichloro-3-methylpropane.** C. E. SPARKS and R. E. NELSON (J. Amer. Chem. Soc., 1936, 58, 1010—1011; cf. Pogorzelsky, A., 1905, i, 165).—Liquid-phase hydrolysis of  $\text{CH}_2\text{Cl} \cdot \text{CMe}_2\text{Cl}$  under neutral, slightly basic, or slightly acidic conditions gives 35—48% of  $\text{CH}_2\text{Cl} \cdot \text{CMe}_2 \cdot \text{OH}$ . H. B.

**Preparation of *cis*- and *trans*-ethylenic alcohols and their derivatives. Comparison of their physical properties.** (MLLE.) B. GREDY (Bull. Soc. chim., 1936, [v], 3, 1093—1101).—Treatment of acetaldehyde with  $\text{Mg}$  and  $n\text{-C}_2\text{H}_{11}\text{Br}$  affords vinylamylcarbinol, b.p.  $74^\circ/15$  mm., converted by excess of  $\text{PBr}_3$  in  $\text{C}_2\text{H}_5\text{N}$  into  $\alpha$ -bromo- $\Delta^8$ -octene (I), b.p.  $74$ — $75^\circ/14$  mm., which with  $\text{NaOAc}$  in  $\text{AcOH}$  gives  $\Delta^8$ -octenyl acetate, b.p.  $95.5$ — $96^\circ/14$  mm., hydrolysed to  $\Delta^8$ -octen- $\alpha$ -ol (II).  $\text{NaNH}_2$  and  $\text{Me}_2\text{SO}_4$  transform (II) into *trans*- $\alpha$ -methoxy- $\Delta^8$ -butene, b.p.  $69.5$ — $70^\circ/15$  mm. The following compounds are derived by semihydrogenation of the requisite acetylenic compounds (colloidal  $\text{Pd}$ ): *cis*- $\alpha$ -methoxy- $\Delta^8$ -butene (III), b.p.  $61^\circ/12$  mm.; *cis*- $\Delta^8$ -octen- $\alpha$ -ol, b.p.  $80$ — $12$  mm., whence *cis*- $\Delta^8$ -octenyl acetate, b.p.  $91.5$ — $92^\circ/10$  mm.; (III) is transformed by  $\text{HBr}$  followed by  $\text{H}_2\text{SO}_4$  mainly into (I). Technical cinnamyl alcohol, shown by the Raman spectrum to be the *trans*-derivative, is converted by boiling  $\text{Ac}_2\text{O}$  into *trans*-cinnamyl acetate, b.p.  $141$ — $142^\circ/14$  mm., by  $\text{NaNH}_2$  and  $\text{Me}_2\text{SO}_4$  into *trans*- $\alpha$ -methoxy- $\gamma$ -phenyl- $\Delta^8$ -propene, b.p.  $111.5$ — $112.5^\circ/15$  mm., and by  $\text{PBr}_3$  in  $\text{C}_5\text{H}_5\text{N}$  into *trans*- $\gamma$ -phenyl- $\Delta^8$ -propenyl bromide, b.p.  $128$ — $129^\circ/10$  mm., m.p.  $29^\circ$ . Partial hydrogenation of  $\gamma$ -phenyl- $\Delta^8$ -propinen- $\alpha$ -ol affords *cis*-cinnamyl alcohol, b.p.  $127$ — $128^\circ/?$  pressure; *cis*- $\alpha$ -methoxy- $\gamma$ -phenyl- $\Delta^8$ -propene, b.p.  $95$ — $96^\circ/9$  mm., and *cis*- $\gamma$ -phenyl- $\Delta^8$ -propenyl acetate, b.p.  $140$ — $15$  mm., are obtained similarly. The physical properties of the aliphatic *trans*- and *cis*-compounds are closely similar to one another, whereas marked differences are observed in the cinnamic series. H. W.

**Isolation from cottonseed oil of an alcohol resembling  $\alpha$ -tocopherol from wheat-germ oil.** O. H. EMERSON, G. A. EMERSON, and H. M. EVANS (Science, 1936, 83, 421; cf. this vol., 531).—The unsaponifiable matter of cottonseed oil yielded four allopphanates, m.p.  $240^\circ$  (I),  $158$ — $160^\circ$  (II),  $134$ — $135^\circ$ , and  $80^\circ$  (III), respectively. The regenerated alcohol from (III) is biologically inactive, that from (I) is inactive as vitamin-E, whilst the remainder are active. The alcohol from (II) appears identical with  $\alpha$ -tocopherol. L. S. T.

**Explosiveness of methylated ether.** P. S. ARUP (Chem. and Ind., 1936, 546—547).—Comments on the conditions under which  $\text{Et}_2\text{O}$  is likely to explode. F. N. W.

**Etherates of aluminium chloride.**—See this vol., 945.

**Carbohydrates and polysaccharides. XLVIII. Ethylene oxide and related compounds: synthesis of polyethylene glycols.** S. Z. PERRY and H. HIBBERT (Canad. J. Res., 1936, 14, B, 77—83).—Fractional distillation of the product obtained by

heating diethylene glycol with I at 190° affords *tri*-, b.p. 115.5—117°/0.1 mm., *tetra*- (I), b.p. 140.0—145.5°/0.1 mm. (*dichloride*, b.p. 107.5—108.5°/1 mm., by the action of  $\text{SOCl}_2$ ), and *penta-ethylene glycol*, b.p. 174.0—176.0°/0.14 mm. (total yield, 25%). Higher polyethylene glycols are best obtained by interaction of the  $\text{Na}_1$  derivative of a glycol (by the action of  $\text{NaOMe-MeOH}$ , or Na at a high temp. on an excess of the glycol) with an  $\omega\omega'$ - $\text{Cl}_2$ -derivative. Thus  $(\text{CH}_2\text{Cl-CH}_2)_2\text{O}$  and  $\text{OH-CH}_2\text{-CH}_2\text{-ONa}$  at 65° give (I), and by similar action with the appropriate Na derivative are obtained *hexa*-, b.p. 166—168°/0.015 mm. (*dichloride*, b.p. 146.5—148°/1 mm.), *octa*-, b.p. 206—209°/0.015—0.018 mm. (*dichloride*, b.p. 199.5—202°/3—4 mm.), and *deca-ethylene glycol*, b.p. 220—223°/0.01 mm. (*dichloride*, b.p. 205—208°/0.015 mm.). J. W. B.

**Preparation of  $\beta$ -ethoxy- $\Delta^{\gamma}$ -butadiene and  $\beta$ -methoxy- $\Delta^{\beta\gamma}$ -butadiene and their polymerisation.** I. A. ROTENBERG and M. A. FAVORSKAJA (J. Gen. Chem. Russ., 1936, 6, 185—189).— $\text{CH}_2\text{:C-CH:CH}_2$  in  $\text{EtOH}$  and  $\text{KOH}$  (140—150°; 10 hr.) afford  $\text{CH}_2\text{:CH-C(OEt):CH}_2$ , b.p. 113—117° (ozonolysis products  $\text{HCO}_2\text{H}$  and  $\text{H}_2\text{C}_2\text{O}_4$ ), oxidised by  $\text{KMnO}_4$  in aq.  $\text{K}_2\text{CO}_3$  at 30—35° to  $\text{H}_2\text{C}_2\text{O}_4$  and  $\text{AcOH}$ . When  $\text{MeOH}$  is substituted for  $\text{EtOH}$  in the above reaction (150°; 18 hr.), the product is  $\text{OMe-CMe:C:CH}_2$ ; in absence of  $\text{KOH}$  styrene is obtained. R. T.

**Polymembered heterocyclic compounds. IX. Polymembered cyclic ethers and keto-ethers.** M. STOLL and W. SCHERRER (Helv. Chim. Acta, 1936, 19, 735—743; cf. A., 1935, 1351).—Active, very fine Na powder (I) is obtained by dissolving Na in  $\text{PhMe}$  (in solid  $\text{CO}_2\text{-Et}_2\text{O}$ ) by  $\text{NH}_3$  and removing the  $\text{NH}_3$  by vigorous stirring. The Na in the resulting suspension is determined by removing all trace of  $\text{NH}_3$  by  $\text{N}_2$ , treating with aq.  $\text{EtOH}$ , and titrating the  $\text{NaOH}$  formed. Very dry reagents are required for the prep. and use of (I).  $\text{OH-[CH}_2\text{]}_{14}\text{-OH}$  and (I) in hot  $\text{PhMe}$  give slowly  $\text{OH-[CH}_2\text{]}_{14}\text{-ONa}$ , which with  $\text{PhSO}_2\text{Cl}$  gives  $\xi$ -hydroxytetradecyl benzenesulphonate, m.p. 47—48°; with (I) in hot  $\text{C}_6\text{H}_6$  this gives 5% of tetradecylene  $\alpha\xi$ -ether (II), m.p. 31.5—33°, with large amounts of highly sulphonated products.  $\text{OH-[CH}_2\text{]}_3\text{-O-[CH}_2\text{]}_{10}\text{-CO}_2\text{H}$  with  $\text{SOCl}_2$  in  $\text{CHCl}_3\text{-MeOH-H}_2\text{O}$  gives *Me  $\kappa$ - $\gamma'$ -chloropropoxyundecate*, b.p. 145—147°/0.2 mm., which with  $\text{CHNa(CO}_2\text{Me)}_2$  gives *Me $_2$   $\gamma$ - $\kappa'$ -carbomethoxydecoxypropylmalonate*, b.p. 172—175°/0.5 mm., and thence  $\delta$ -carboxybutyl  $\kappa$ -carboxydecyl ether, m.p. 94.5—95°, the Ce salt of which affords  $\epsilon$ -keto-n-pentadecylene  $\alpha\text{o}$ -ether (III), b.p. 120—121°/0.05 mm., and a substance,  $\text{CO-[CH}_2\text{]}_{10}\text{-O-[CH}_2\text{]}_4\text{-CO}$  or  $\text{CO-[CH}_2\text{]}_{10}\text{-O-[CH}_2\text{]}_4\text{-CO}$ , b.p. 220—230°/0.02 mm., separated by the semicarbazones, m.p. 171.5—172° (IV) and 182.5—183°, respectively. (IV) and  $\text{KOH-EtOH}$  give pentadecylene  $\alpha\text{o}$ -ether (V), m.p. 26°, b.p. 84—85°/0.02 mm., and the pinacone,  $\left| \text{O-[CH}_2\text{]}_4\text{-C(OH)-[CH}_2\text{]}_4\text{-C(OH)-[CH}_2\text{]}_4\text{-O} \right|$ , b.p. 230—233°/0.3 mm., m.p. 30—31°. The structure of (V) is proved by hydrolysis

to  $\text{Br-[CH}_2\text{]}_{15}\text{-Br}$ . (II), (III), and (V) have weak musk-like odours. R. S. C.

**Alkyl hypochlorites. I. Action on Schiff's bases.** R. FUSCO and C. MUSANTE (Gazzetta, 1936, 66, 258—264).— $\text{CMe}_2\text{Et-OCI}$ , prepared from  $\text{CMe}_2\text{Et-OH}$  (cf. J.C.S., 1923, 123, 3002), is extracted and used in  $\text{CCl}_4$ . It reacts with  $\text{NPh:CHPh}$  and with  $p\text{-C}_6\text{H}_4\text{Me:N:CHPh}$  to give *NN'*-diphenyl- and *NN'*-di-*p*-tolyl-benzamidine, respectively, presumably by addition of  $\text{ROCl}$  to  $\text{CH:N}$  in the direction  $\text{CHCl-N(OR)}$ , followed by reaction of  $\text{Cl}$  with the amine.  $\beta\text{-C}_{10}\text{H}_7\text{:N:CHPh}$ , however, gives exclusively its 2- $\text{Cl}$ -derivative, and  $\alpha\text{-C}_{10}\text{H}_7\text{:N:CHPh}$  its 2- and 4- $\text{Cl}$ -derivatives; here addition in the direction  $\text{C(OR)-NCl}$  is presumed. E. W. W.

**Relative mobility of alkyl radicals in their chlorosulphites and chloroformates.** P. CARRÉ (Bull. Soc. chim., 1936, [v], 3, 1064—1073; cf. A., 1935, 606).—The relative mobilities of the alkyl groups of chlorosulphites and chloroformates is deduced from their temp. of decomp. when heated in  $\text{C}_6\text{H}_5\text{N}$  or quinoline. With *n*-alkyl chlorosulphites the mobility diminishes from  $\text{C}_1$  to a min. at  $\text{C}_7$ ; between  $\text{C}_8$  and  $\text{C}_{15}$  alternation is marked, the groups with an odd no. of C atoms being more mobile than neighbouring groups with an even no. With the chloroformates the mobility decreases from  $\text{C}_1$  to  $\text{C}_4$ ; between  $\text{C}_7$  and  $\text{C}_{15}$  alternation is marked in the inverse order from that recorded for chlorosulphites. For simpler pairs containing the same no. of C atoms the mobilities of the *sec.* are > those of primary radicals; with the higher members the difference becomes less or disappears, and is inverted in the cases of *n*- and *sec.*-octyl chlorosulphite. Introduction of  $\text{Cl}$  or  $\text{Ph}$  into the alkyl of a chlorosulphite diminishes the mobility of the radical, but enhances it in the case of chloroformates. A double linking in the alkyl increases the mobility.  $\gamma$ -Chloropropyl, b.p. 111—112°/21 mm.,  $\beta\gamma$ -dichloropropyl, b.p. 110—111°/3 mm.,  $\beta$ -chloroisopropyl, b.p. 86—88°/20 mm.,  $\beta\beta'$ -dichloroisopropyl, b.p. 120°/20 mm., chlorosulphite and di- $\beta$ -chloroisopropyl sulphite, b.p. 155—158°/37 mm., are described. H. W.

**Attempted explanation of the principal differences in the properties of alkyl chloroformates and chlorosulphites.** P. CARRÉ (Bull. Soc. chim., 1936, [v], 3, 1073—1082; cf. this vol., 453).—An electronic explanation of the differing behaviour of alkyl chlorosulphites and chloroformates is advanced. The differing reactivities of elements directly united may be considered as corresponding with a difference in polarity which is the more pronounced as the electronic distance becomes greater. The latter depends qualitatively on the at. nos. of the directly united elements and their immediate substituents. H. W.

**Action of certain dihalogen derivatives of hydrocarbons on ethyl phosphite and on diethyl phosphites.** A. E. ARBUSOV and N. P. KUSCHKOVA (J. Gen. Chem. Russ., 1936, 6, 283—288).— $\text{P(OEt)}_3$  and  $\text{CH}_2\text{I}_2$  at 150° yield  $\text{CH}_2\text{I-PO(OEt)}_2$  (I), b.p. 133°/6 mm.,  $\text{OK-P(OEt)}_2$  and  $\text{CH}_2\text{I}_2$  in 90%  $\text{EtOH}$  afford  $\text{OH-CH}_2\text{-P(OEt)}_2$ , b.p. 72°/5 mm., from which

$OH\cdot CH_2\cdot P(OH)_2$ , m.p. 84.5—86°, is obtained by hydrolysis with 50% HCl (4 hr. at 150°). R. T.

Raman spectra of molten organic acids and their derivatives.—See this vol., 923.

Influence of structure on saponification. Analytical technique for esters. W. M. D. BRYANT and D. M. SMITH (J. Amer. Chem. Soc., 1936, 58, 1014—1017).—The esters are saponified by an excess of 2*N*-NaOH in 90% MeOH in a closed glass vessel at 60—100°, the temp. and time depending on the structure. The procedure has been applied to 34 esters, chiefly aliphatic, and the effect of steric hindrance is shown. The prep. of  $\beta\delta$ -dimethyl- $\gamma$ -amyl phthalate, b.p. 231°/20 mm., and  $\alpha\alpha$ -dimethylpropionate, b.p. 127.5—128°/95 mm., is described. E. S. H.

Detection of acetic acid by formation of acet-aldehyde. J. VAZQUEZ SANCHEZ (Anal. Fis. Quím., 1936, 34, 198—201).—AcOH is detected by distillation with 0.07 g. of  $Ca(OH)_2$  and a drop of 2%  $(HCO_2)_2Ca$ , the formation of MeCHO being confirmed by the Rimini-Simon reaction (cf. Dœuvre, A., 1934, 630). 15—20  $\times 10^{-6}$  g. of AcOH can be detected. The distillate obtained by heating lactic, butyric, or propionic acid with  $Ca(OH)_2$  also gives a positive reaction. F. R. G.

Electrolysis of acetates in non-aqueous solutions.—See this vol., 942.

Kinetics of the reaction between iodoacetic acid and glycine.—See this vol., 940.

Electrolysis of mixtures of isovalerates and nitrates. F. FICHTER and F. METZ (Helv. Chim. Acta, 1936, 19, 880—889).—Electrolysis of  $Bu^iCO_2Na$  in presence of  $NaNO_3$  gives  $Bu^i_2$ ,  $(CMe_2)_2$  (I), and  $(CHMe)_2$  (II) as primary products. (I) reacts further to yield  $Bu^iOH$  and  $Bu^iOH$  and thence  $Bu^iCO_2Bu^i$ , whilst (II) leads to (a)  $CHMeEt\cdot OH$  and thence  $Bu^iCO_2CHMeEt$ , (b)  $CHMeEt\cdot CHMe\cdot CHMe\cdot OH$ ,  $(CHMe\cdot OH)_2$ ,  $OH\cdot CHMe\cdot CH_2\cdot CH_2\cdot OH$ , and  $OH\cdot CHMe\cdot CH(OH)\cdot CH_2\cdot OH$  (III). All these compounds, except (I) and (II), were isolated and identified, but the structure of (III) (urethane, m.p. 131°) is uncertain. Relatively small amounts of glycol nitrates are formed. R. S. C.

Electrolytic reduction of organic compounds. III.  $\beta$ -Vinylacrylic acid. E. ISAACS and C. L. WILSON (J.C.S., 1936, 810—812).—The electrolytic reduction of  $\beta$ -vinylacrylic acid using a spongy Ni cathode in EtOH-NaCl and 0.5*N*-NaOH gave, respectively, 25.1% and 15.6% of  $\Delta^a$ -*n*-pentenoic acid and 19.5% and 49.5% of  $Bu^aCO_2H$ , the remaining reduction product being  $\Delta^a$ . (I) +  $\Delta^v$ -*n*-pentenoic acids (cf. Muskat and Knapp, A., 1934, 631). A Cu cathode in 0.5*N*-NaOH gave 99.2% of (I), and Hg in  $NaHCO_3$  gave 75% of (I) and considerable quantity of pinacol-like dimeride. The ease of reduction of vinylacrylic acid and the three pentenoic acids is in the order: vinylacrylic  $\gg \Delta^a > \Delta^v > \Delta^v$ -*n*-pentenoic acid, in both acid and alkaline solution. F. R.

Alkylacetylenes and their additive compounds.

XI. Bromination of alkenyl esters. S. J. SLANINA, G. F. HENNION, and J. A. NIEUWLAND (J. Amer. Chem. Soc., 1936, 58, 891—892).— $CH_2\cdot CAlk\cdot CO_2R$  (A., 1934, 1089) and Br in  $CHCl_3$  at

$< 0^\circ$  give unstable dibromides which undergo spontaneous fission to  $RCOBr$  and  $COAlk\cdot CH_2Br$ .  $\alpha$ -Butylvinyl chloroacetate thus affords  $CH_2Cl\cdot COBr$  and  $\alpha$ -bromohexan- $\beta$ -one, b.p. 86—88°/30 mm., whilst  $\alpha$ -amylvinyl acetate yields  $AcBr$  and  $\alpha$ -bromoheptan- $\beta$ -one, b.p. 109—110°/30 mm.  $CH_2\cdot CH\cdot OAc$  similarly gives  $\alpha\beta$ -dibromoethyl acetate, b.p. 94—95°/22 mm., the yield increasing with rise in temp. (30% at 5°; 42% at 70°). H. B.

Use of fractionating column for separation of fatty acids. S. LEPKOVSKY, G. V. FESKOV, and H. M. EVANS (J. Amer. Chem. Soc., 1936, 58, 978—981).—Octoic, deoic, lauric, and myristic acids can be obtained pure by fractional distillation of the mixed acids from coconut oil (I); an improved column (cf. A., 1930, 1153) is described. A better separation is effected through the Me esters; the composition of (I) is thus determined as hexoic 0.5, octoic 9, deoic 6.8, lauric 46.4, myristic 18, palmitic 9, stearic 1, oleic 7.6, and linoleic 1.6%. Erucic acid is obtained in 40% yield from the Me esters from rape-seed oil. H. B.

Comparative hydrogenation of different substances in one solution. H. I. WATERMAN and C. VAN VLODRUP (Rec. trav. chim., 1936, 55, 401—406).—Selective hydrogenation in mixtures of octadecenoic with more unsaturated esters (i.e., in partly hydrogenated linseed oil) is attributed to the active surface of the catalyst being occupied by the more unsaturated groups. The substances taken alone are hydrogenated with similar velocities. Selective hydrogenation is not observed with mixtures of  $C_{10}H_{18}$  and peanut oil, which at 180° with  $H_2$  at atm. pressure in presence of Ni-kieselguhr are hydrogenated simultaneously. E. W. W.

Transformation of oleic acid into elaidic acid and fission of fats with simultaneous increase of the solid fatty acids. G. RANKOFF (Ber., 1936, 69, [B], 1231—1238).—Treatment of oleic acid (I) with  $H_3PO_3$  in presence or absence of  $H_2O$  at 200—220° gives a crude product with solidifying point 26—30°; on further crystallisation the product attains the m.p. 49—51° or 61—62°, according to the ratio of the components, and hence does not contain elaidic acid (II). Under these conditions  $H_3PO_3$  does not give  $H_2$  or  $PH_3$ . (I) and  $H_3PO_2$  give a product of solidifying point 24—27° from which (II) can be isolated;  $H_3PO_2$  is decomposed with production of  $PH_3$ , and hence is possibly not the actual elaidinising agent. (I) and yellow P do not interact at 200—220°. In presence of  $H_2O$  (I) is transformed by yellow or red P into (II) in 60—70% yield;  $PH_3$ ,  $H_3PO_2$ ,  $H_3PO_3$ , and  $H_3PO_4$  are also produced. The yield of (II) is higher with P than with  $H_3PO_2$ . The bulk of the unused yellow P is recovered unchanged, whereas unattacked red P is transformed into bright red P. Treatment of olive oil, palm oil, tallow, or bone fat with S (1%) or P (3%) in  $H_2O$  (50%) at 220° causes almost complete hydrolysis into glycerol and a fatty acid mixture containing much more solid acid than is obtained from the fat by alkaline hydrolysis, owing to the formation of (II). Simultaneously pronounced bleaching is observed particularly when P is used. The acids are suitable for direct conversion into soaps of high detergent power. H. W.

**Diene synthesis with fats. I. Diene value of fats.** H. P. KAUFMANN and J. BALTES (*Fette u. Seifen*, 1936, **43**, 93—97).—Maleic anhydride (I) and  $\Delta^8$ -octadecadienecarboxylic acid give (?) 1-hexyl-4-carboxyheptyl- $\Delta^2$ -cyclohexene-5:6-dicarboxylic anhydride, m.p. 94.5°. With  $\alpha$ -elaeostearic ( $\Delta^8$ -octadecatrienecarboxylic) acid a substance, m.p. (impure) 62°, is formed (Morrell and Samuels, A., 1932, 1019). The "diene val.," suggested as a new const. for conjugated unsaturated fatty acids and fats, is determined by heating 0.1—0.15 g. of the unsaturated material with 10 ml. of a 1.0%  $\text{COMe}_3$  solution of (I) for 20 hr. at 100° in a sealed tube, adding  $\text{H}_2\text{O}$ , and titrating the excess of maleic acid with 0.1N-alkali. Vals. in good agreement with theory have been obtained for tri- $\beta$ -elaeostearin. F. C. B. M.

**Synthesis of normal  $\text{C}_{23}$ ,  $\text{C}_{25}$ ,  $\text{C}_{27}$ , and  $\text{C}_{29}$  saturated fatty acids, alcohols, and alkyl iodides.** S. SHIINA (*J. Soc. Chem. Ind. Japan*, 1936, **39**, 180B).—Et erucate is catalytically hydrogenated to docosoic acid, which is converted by the usual methods [ $\text{R}\cdot\text{CO}_2\text{Et} \rightarrow \text{R}\cdot\text{CH}_2\cdot\text{OH}$   $\text{R}\cdot\text{CH}_2\cdot\text{I} \rightarrow \text{R}\cdot\text{CH}_2\cdot\text{CN}$ , and by the  $\text{CH}_2(\text{CO}_2\text{Et})_2$  synthesis; no prep. details given] into the  $\text{C}_{23}$ ,  $\text{C}_{25}$ , and  $\text{C}_{27}$  fatty acids and their Me and Et esters, and the  $\text{C}_{23}$ ,  $\text{C}_{25}$ , and  $\text{C}_{27}$  saturated alcohols and iodides. M.p. are given. P. G. C.

**X-Ray crystallographic measurements in phrenosinic (cerebronic) acid and its oxidation product.**—See this vol., 927.

**Pyruvyl chloride.** P. CARRE and P. JULLIEN (*Compt. rend.*, 1936, **202**, 1521—1523).— $\text{SOCl}_2$  and  $\text{AcCO}_2\text{H}$  at room temp. give a mixture  $\text{AcCl}$ ,  $\text{Ac}_2\text{O}$ ,  $\text{CHMeCl}$ , etc. When, however, they interact in  $\text{C}_5\text{H}_5\text{N}$ , and the product after pptn. of  $\text{C}_5\text{H}_5\text{N}$  by gaseous  $\text{HCl}$  is distilled, the fraction of b.p. 70—80° contains *pyruvyl chloride*, converted into pyruvanilide (*semicarbazone*, m.p. 268°). E. W. W.

**Ether-like compounds. XVII. Constitutive factors in esterification and hydrolysis.** M. H. PALOMAA and T. A. SIITONEN (*Ber.*, 1936, **69**, [B], 1338—1353).—Acids of the types,  $\text{OR}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{O}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$ ,  $\text{OR}\cdot[\text{CH}_2]_2\cdot\text{O}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$ ,  $\text{OR}\cdot[\text{CH}_2]_2\cdot\text{O}\cdot\text{CHMe}\cdot\text{CO}_2\text{H}$ ,  $\text{OR}\cdot[\text{CH}_2]_2\cdot\text{O}\cdot[\text{CH}_2]_2\cdot\text{O}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$ ,  $\text{OR}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$ ,  $\text{OR}\cdot[\text{CH}_2]_2\cdot\text{CO}_2\text{H}$ , and fatty acids  $n\text{-C}_x\text{H}_{2x+1}\cdot\text{CO}_2\text{H}$  have been investigated. All  $n$ -fatty acid from  $\text{Pr}\cdot\text{CO}_2\text{H}$  onwards have the same or almost the same esterification const., and their esters the same hydrolysis const.  $\text{AcOH}$  and  $\text{EtCO}_2\text{H}$  also  $\text{HCO}_2\text{H}$  form peculiar groups. The influence of the position and nature of the O atoms is discussed in detail. H. W.

**Glycidic acids from chlorohydroxystearic acids.** K. HASHI (*J. Soc. Chem. Ind. Japan*, 1936, **39**, 162—163B).—The chlorohydroxystearic acid prepared from oleic acid is converted by 4N-aq.  $\text{KOH}$  at 100° into *oxido-stearic acid*, m.p. 57.5—58.3°. The *isomeride* from chlorohydroxyelaidic acid has m.p. 54.5—55.3°; mixed m.p. and solubilities are given. P. G. C.

**Complex cobaltioxalates.**—See this vol., 948.

**Condensations by sodium VI. Malonic acids from mercury dialkyls.** A. A. MORTON and I.

HECHENBLEIKNER (*J. Amer. Chem. Soc.*, 1936, **58**, 1024—1026).— $\text{Hg}$  diamyl, b.p. 95—96°/3 mm. (obtained in 25% yield from amyl chloride, 2%  $\text{Na-Hg}$ , and a little  $\text{EtOAc}$  in light petroleum), with  $\text{Na}$  powder in  $\text{C}_5\text{H}_{12}$  followed by  $\text{CO}_2$ , gives hexoic (20—35%) and butylmalonic (40—50%) acids:  $\text{NaHg} + 2\text{C}_5\text{H}_{11}\text{Na} \xrightarrow{\text{Hg}(\text{C}_5\text{H}_{11})_2 + 3\text{Na}} \text{NaHg} + \text{C}_5\text{H}_{12} + \text{C}_5\text{H}_{10}\text{Na}_2$ .  $\text{C}_6\text{H}_6$  as solvent leads to  $\text{BzOH}$  and  $m$ - and  $p$ - $\text{C}_6\text{H}_4(\text{CO}_2\text{H})_2$ ;  $\text{PhMe}$  gives  $\text{CH}_2\text{Ph}\cdot\text{CO}_2\text{H}$  and  $\text{CHPh}(\text{CO}_2\text{H})_2$ .  $\text{CHMe}(\text{CO}_2\text{H})_2$  is similarly formed from  $\text{HgEt}_2$  (obtained in 60—70% yield from  $\text{EtI}$ , 1%  $\text{Na-Hg}$ , and  $\text{EtOAc}$  in light petroleum). H. B.

**Action of malonic acid on dichloro-*trans*-diethylenediaminecobaltic chloride.**—See this vol., 948.

**Application of the indophenol reaction to the detection of certain organic polyacids.** J. VÁZQUEZ SÁNCHEZ (*Anal. Fis. Quím.*, 1935, **33**, 126—131).—Certain acids, which after neutralisation with  $\text{Na}_2\text{CO}_3$  and treatment with  $\text{P}_2\text{S}_5$  yield  $\text{C}_4\text{H}_4\text{S}$  or thiophthen, give a blue colour with isatin solution in Feigl's micro-apparatus. The following quantities of the acids may be detected: succinic (I) and fumaric, 25; maleic and malic, 50; methylsuccinic (II), 100; tartaric and citric,  $250 \times 10^{-6}$  g. (I) and (II) may be detected in presence of the remaining acids by preliminary oxidation of the mixture with a boiling solution of  $\text{KMnO}_4$  in 33%  $\text{H}_2\text{SO}_4$ . F. R. G.

**Formation of enolates from lactonic esters.** A. MICHAEL and N. WEINER (*J. Amer. Chem. Soc.*, 1936, **58**, 999—1004).—The production of  $\alpha$ -carbomethoxy- $\alpha$ -methyl- $\beta$ -isobutyrolactone (Ott, A., 1913, i, 1302) from the Ag salt of  $\alpha$ -carboxy- $\beta$ -isobutyrolactone (I) and  $\text{MeI}$  is considered to indicate that (I) forms an enolate. Attempted esterification [ $\text{Na}$  salt with  $\text{Me}_2\text{SO}_4$  in  $\text{MeOH}$ ;  $\text{EtOH-H}_2\text{SO}_4$  (trace)] of (I) results in retrogressive decomp. to  $\text{COMe}$ , and  $\text{CH}_2(\text{CO}_2\text{R})_2$ .  $\gamma$ -Butyrolactone (II) shows little or no tendency to form an enolate; the Na derivative obtained by Brecht (A., 1882, 34) from  $\gamma$ -isohexolactone is probably dimeric (cf. Fittig and Strom, A., 1892, 813).  $\alpha$ -Carbomethoxy- $\gamma$ -butyrolactone (III) and  $\text{NaOEt}$  give the enolate,  $\text{CH}_2\text{CH}_2 \begin{smallmatrix} \text{O} & \text{CO} \end{smallmatrix} \text{ONa}(\text{OEt})$ , also obtained by Traube and Lehmann's method (A., 1901, i, 501), which with  $\text{MeI}$  in  $\text{C}_6\text{H}_6$  affords  $\alpha$ -carbomethoxy- $\alpha$ -methyl- $\gamma$ -butyrolactone, b.p. 104.5—105°/2 mm., 264—265°/765.5 mm., and with I in  $\text{C}_6\text{H}_6$  gives two (probably) stereoisomeric  $\alpha\alpha'$ -dicarbomethoxy- $\alpha\alpha'$ -di- $\gamma$ -butyrolactones, b.p. 189°/2 mm. and m.p. 145°. These are hydrolysed [aq.  $\text{Ba}(\text{OH})_2$ ] to the same  $\alpha\alpha'$ -dicarboxy- $\alpha\alpha'$ -di- $\gamma$ -butyrolactone, m.p. 154—156° (decomp.), which when heated at 170° gives  $\alpha\alpha'$ -di- $\gamma$ -butyrolactone, m.p. 176°; (III) is similarly converted into (II).  $\delta$ -Chloro- $\alpha$ -carbomethoxy- $\gamma$ -valerolactone (Traube and Lehmann, *loc. cit.*) and  $\text{EtOH-NaOEt}$  give an enolate which when heated gives (by intramol. alkylation) the thermally stable 3-hydroxy-1-carbomethoxycyclobutane-1-carboxylic acid lactone, b.p. 135°/2 mm., which is hydrolysed (conc.  $\text{HCl}$ ) to  $\beta\gamma$ -dihydroxypropylmalonic acid dilactone (Leuchs and Spletstösser, A., 1907, i, 176). The lactone, m.p. 80—81°, of 3-hydroxycyclobutane-1:1-dicarboxylic acid (*Ba* salt) undergoes little decomp. at 200°; the stability of the

rings is not in harmony with Baeyer's strain theory.  $\delta$ -Lactonic esters could not be prepared. Thus,  $\text{CHNa}(\text{CO}_2\text{Et})_2$  (IV) and  $\text{CH}_2\text{Br}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{OH}$  give a product (?  $\alpha$ -carbethoxy- $\delta$ -valerolactone) (V), which on attempted distillation in a high vac. first polymerises to a rubber-like mass and then decomposes. A similar product is obtained from (IV) and  $\text{CH}_2\text{Br}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{OAc}$  in EtOH; in  $\text{C}_6\text{H}_6$  or dioxan *Et*  $\gamma$ -acetoxypromylmalonate, b.p. 143—145°/4 mm. (from which a lactone could not be obtained), results.  $\delta$ -Hydroxy- $\alpha$ -carbethoxy- $\gamma$ -valerolactone [from glycidol and (IV) in EtOH] also polymerises readily.  $\text{CH}_2\text{Cl}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{OH}$  (VI) and  $\text{CO}_2\text{Et}\cdot\text{CH}_2\cdot\text{COCl}$  or (VI),  $\text{CH}_2(\text{CO}_2\text{Et})_2$ , and dry HCl give  $\text{CH}_2(\text{CO}_2\text{Et})_2$ , *Et*  $\gamma$ -chloropropyl malonate (VII), b.p. 118°/3 mm., and  $\gamma$ -chloropropyl malonate, b.p. 164—165°/2 mm. (VII), and  $\text{EtOH}\cdot\text{NaOEt}$  afford (V). *Et*  $\beta$ -chloroethyl malonate (VIII), b.p. 105—106°/3 mm., and  $\text{CH}_2(\text{CO}_2\text{CH}_2\cdot\text{CH}_2\text{Cl})_2$  are similarly formed from  $\text{CH}_2(\text{CO}_2\text{Et})_2$ ,  $\text{CH}_2\text{Cl}\cdot\text{CH}_2\cdot\text{OH}$ , and dry HCl. (VIII) and Na in  $\text{C}_6\text{H}_6$  followed by dil. acid give (II).

H. B.

**Synthesis of cyclic derivatives of tartaric acid.** Y. TSUZUKI (Bull. Chem. Soc. Japan, 1936, 11, 362—366).—The following *Me*<sub>2</sub>-dioxysuccinates are obtained from *Me*<sub>2</sub> tartrate and the appropriate aldehyde or ketone in presence of a dehydrating agent: isopropylidene-, b.p. 139°/16 mm.,  $[\alpha]_D^{20} -53.13^\circ$  (*Et*<sub>2</sub> ester, b.p. 150°/19 mm.,  $[\alpha]_D^{25} -51.19^\circ$ ); ethylidene-, b.p. 142°/18 mm.,  $[\alpha]_D^{20} -82.17^\circ$  (*Et*<sub>2</sub> ester, b.p. 151°/19 mm.,  $[\alpha]_D^{20} -74.67^\circ$ ); methylene-, b.p. 145°/17 mm. (*Et*<sub>2</sub> ester, b.p. 153—154°/19 mm.,  $[\alpha]_D^{20} -78.54^\circ$ ).

J. T. A.

**Mechanism of the condensation of benzylmalonic ester with fumaric ester.** Michael's reaction. R. MALACHOWSKI, E. BILBEL, and M. BILIŃSKI-TABASOWICZ (Ber., 1936, 69, [B], 1295—1302).—Contrary to Duff and Ingold and to Rydon (A., 1935, 977), *Et*<sub>4</sub>  $\alpha$ -benzylpropane- $\alpha\beta\gamma$ -tetracarboxylate (I), b.p. 206—208°/1.5 mm., is the sole product of the condensation of NaOEt,  $\text{CH}_2\text{Ph}\cdot\text{CH}(\text{CO}_2\text{Et})_2$ , and  $\text{CO}_2\text{Et}\cdot\text{CH}_2\cdot\text{CHBr}\cdot\text{CO}_2\text{Et}$  or of NaOEt,  $\text{CH}_2\text{Ph}\cdot\text{CH}(\text{CO}_2\text{Et})_2$ , and *Et*<sub>2</sub> fumarate. Hydrolysis of (I) with boiling 20% HCl or with  $\text{H}_2\text{O}\cdot\text{H}_2\text{SO}_4\cdot\text{HCO}_2\text{H}$  (1 : 3 : 9 vol.) gives a mixture of  $\alpha$ -benzyltricarballic acids, m.p. 177° (anhydride, m.p. 120°) and m.p. 198° (anhydride m.p. 130°), respectively, separable by fractional crystallisation or, preferably, through the anhydrides. The interconversion of the acids is described.

H. W.

**Crystalline structure of sugars.** III.—See this vol., 927.

**Bismuth salts of gluconic acid.** W. M. LAUTER and H. A. BRAUN (J. Amer. Pharm. Assoc., 1936, 25, 497—499).— $\text{Bi}(\text{OH})_3$  with gluconic acid in dil. NaOH followed by pptn. with EtOH yields Na di- (Bi 59.6%) and tri-bismuthylgluconate (Bi 67.6%); the tetra-derivative could not be isolated.

F. O. H.

**Preparation of acetone derivatives of gluconic acid.** F. GARCÍA GONZÁLEZ and T. QUINTERO GUERRA (Anal. Fis. Quím., 1935, 33, 570—573; cf. A., 1932, 144).—K  $\alpha$ -ketodiiisopropylidenegluconate with 1 mol. of  $N\cdot\text{H}_2\text{SO}_4$  gives a compound, m.p. 155—

156°, and with  $N\cdot\text{H}_2\text{SO}_4$  at 100° yields K gluconate, the Ca salt of which with  $\text{COMe}_2$  and conc.  $\text{H}_2\text{SO}_4$  gives a compound,  $\text{C}_{27}\text{H}_{42}\text{O}_{14}\text{K}_2$  regarded as formed from 5 mols. of  $\text{COMe}_2$  with 2 mols. of gluconic acid.

F. R. G.

**Lactones in liquid ammonia.** J. W. E. GLATT-FELD and D. MACMILLAN (J. Amer. Chem. Soc., 1936, 58, 898—901).—*d*-Glucono- $\gamma$ -lactone (cf. A., 1935, 72) and benzylidenephthalide (I) are completely ammonolysed by anhyd. liquid  $\text{NH}_3$ ; (I) gives *o*- $\text{CO}\cdot\text{NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{CO}\cdot\text{CH}_2\text{Ph}$ . Phthalide,  $\alpha$ -phenylphthalide, phthalophenone, coumarin, and the lactone of 2':4'-dihydroxydiphenyl-2-carboxylic acid do not react. Phenolphthalein is temporarily ammonolysed; the resulting product loses all its  $\text{NH}_3$  on prolonged evacuation yielding a pink hygroscopic compound. Me, Et, Pr, and Bu lactates, Et mandelate, and  $\text{CH}_2\text{Ph}\cdot\text{CO}_2\text{Et}$  are partly or completely ammonolysed whilst BuOAc, EtOBz, *o*- $\text{OH}\cdot\text{C}_6\text{H}_4\cdot\text{CO}_2\text{Me}$ , and  $\text{OH}\cdot\text{CH}_2\cdot\text{CH}(\text{OH})\cdot\text{CH}_2\cdot\text{OAc}$  are not.

H. B.

**Keten and acetylketen.** C. D. HURD and J. W. WILLIAMS (J. Amer. Chem. Soc., 1936, 58, 962—968).—*EtSH* and liquid keten (I) at  $-80^\circ$  (3 days) and then at room temp. give 92.6% of crude *EtS*Ac; little or none is obtained with gaseous (I). (I) with ZnMe<sub>2</sub> and ZnEt<sub>2</sub> in PhMe similarly affords about 40% of  $\text{COMe}_2$  and  $\text{COMeEt}$ , respectively; MgEt<sub>2</sub> gives a resin. (I) passed into  $\text{CHPh}\cdot\text{CH}\cdot\text{CHO}$ —anhyd. KOAc affords  $\beta$ -styrylacrylic acetic anhydride; intermediate production of a  $\beta$ -lactone is considered not to occur (cf. A., 1933, 274) since  $\beta$ -*m*-nitrophenyl- $\beta$ -propiolactone does not react with (I). Mixed anhydrides are not obtained from (I) and  $\text{Pr}^n\text{CHO}$ ,  $\text{COPhMe}$ ,  $\text{COMe}_2$ , or  $\text{CPh}_2\cdot\text{CO}$ . The production of styrene and  $\text{CO}_2$  during the Perkin reaction (cf. *loc. cit.*) is probably due to the decomp. of  $\text{CHPh}\cdot\text{CH}\cdot\text{CO}_2\text{H}$ . Benzilic acid and (I) in  $\text{COMe}_2$  give acetylbenzilic acetic anhydride, which is hydrolysed (aq.  $\text{COMe}_2$ ) to  $\text{OAc}\cdot\text{CPh}_2\cdot\text{CO}_2\text{H}$  (II) (*anilide*, m.p. 176°), and converted by  $\text{NH}_4\text{Ph}$  in  $\text{COMe}_2$  into (II) and  $\text{NHAcPh}$ . Mandelic acid and (I) similarly afford acetylmandelic acetic anhydride, which undergoes thermal decomp. to  $\text{Ac}_2\text{O}$  and  $\text{PhCHO}$ , is hydrolysed ( $\text{H}_2\text{O}$ ) to  $\text{OAc}\cdot\text{CHPh}\cdot\text{CO}_2\text{H}$ , and is converted by  $\text{NH}_4\text{Ph}$  into  $\text{NHAcPh}$  and  $\text{OAc}\cdot\text{CHPh}\cdot\text{CO}\cdot\text{NHPh}$ . Acetylsalicylic acetic anhydride is similarly formed from *o*- $\text{OH}\cdot\text{C}_6\text{H}_4\cdot\text{CO}_2\text{H}$ . Contrary to the previous statement (*ibid.*, 259),  $\text{Bu}^n\text{OH}$  is not acetylated by (I). No reaction occurs between (I) and  $\text{CPh}_3$  in  $\text{C}_6\text{H}_6$ . Contrary to Angus *et al.* (this vol., 191), the dimeride (III) of (I) is considered to be  $\text{CHAc}\cdot\text{CO}$  or its resonance isomeride  $\beta$ -crotonolactone. Thus, (III) and  $\text{NH}_4\text{Ph}$  give  $\text{CH}_2\text{Ac}\cdot\text{CO}\cdot\text{NHPh}$ , whilst ozonolysis of (III) affords  $\text{AcCHO}$  [and  $\text{AcOH}$  but no  $\text{CH}_2(\text{CO}_2\text{H})_2$ ]. Pyrolysis of (III) at 550° gives C, dehydroacetic acid, resinous material, and the same gaseous products ( $\text{CO}$ ,  $\text{CH}_4$ ,  $\text{C}_2\text{H}_4$ ) as are formed from (I) (Williamson, A., 1935, 67). Thermal decomp. of (I) probably occurs by way of (III).

H. B.

**Micro-determination of acetone.** A. LINDENBERG (Compt. rend. Soc. Biol., 1936, 122, 317—319).—The  $\text{COMe}_2$  is absorbed in aq.  $\text{NaHSO}_3$  and I added to oxidise both  $\text{NaHSO}_3$  and  $\text{COMe}_2$ , excess of I being

titrated with 0.005*N*-Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>. The error for 0.01—0.05 mg. COMe<sub>2</sub> is  $\pm$  1%. F. O. H.

**Thermal decomposition of acetone.**—See this vol., 939.

**Action of phenylhydrazine on metallic acetylacetonates.** B. EMMERT and O. SCHNEIDER (Ber., 1936, 69, [B], 1316—1319).—Fe<sup>III</sup> acetylacetonate in abs. EtOH or C<sub>6</sub>H<sub>6</sub> is transformed by NHPh·NH<sub>2</sub> into the compound  $\left( \text{CH} \begin{smallmatrix} \text{CMe} \cdot \text{O} \\ \text{CMe} \cdot \text{O} \end{smallmatrix} \right) \text{Fe}(\text{NH}_2\text{NHPh})_2$ , also obtained from Fe<sup>II</sup> acetylacetonate (+2C<sub>6</sub>H<sub>5</sub>N) and NHPh·NH<sub>2</sub> in C<sub>6</sub>H<sub>6</sub>. Similar reduction is observed with Fe<sup>III</sup> benzoylacetonate, which affords the substance, C<sub>20</sub>H<sub>28</sub>O<sub>4</sub>Fe·2C<sub>6</sub>H<sub>5</sub>N<sub>2</sub>, with Mn<sup>III</sup> acetylacetonate, which yields the compound, C<sub>10</sub>H<sub>14</sub>O<sub>4</sub>Mn·2C<sub>6</sub>H<sub>5</sub>N<sub>2</sub>, with Co<sup>III</sup> benzoylacetonate, which gives the substance, C<sub>20</sub>H<sub>18</sub>O<sub>4</sub>Co·2C<sub>6</sub>H<sub>5</sub>N<sub>2</sub>, and with Co<sup>III</sup> acetylacetonate, which yields the product, C<sub>28</sub>H<sub>40</sub>O<sub>5</sub>N<sub>6</sub>Co. Al acetylacetonate does not appear to react with NHPh·NH<sub>2</sub>. H. W.

**Internal complex salts of bivalent manganese and univalent copper.** B. EMMERT, H. GSOTT-SCHNEIDER, and H. STANGER (Ber., 1936, 69, [B], 1319—1321).—MnCl<sub>2</sub> and CH<sub>3</sub>Ac<sub>2</sub> in H<sub>2</sub>O in absence of air and presence of NaOH, NH<sub>3</sub>, NH<sub>2</sub>Me, C<sub>3</sub>H<sub>7</sub>(NH<sub>2</sub>)<sub>2</sub>, or piperidine give the compound, C<sub>10</sub>H<sub>14</sub>O<sub>4</sub>Mn·2H<sub>2</sub>O; if conc. NH<sub>3</sub> is used followed by treatment with NH<sub>3</sub> at 100—120° the product, C<sub>10</sub>H<sub>14</sub>O<sub>4</sub>Mn·2NH<sub>3</sub>, results; this passes when kept over P<sub>2</sub>O<sub>5</sub> in high vac. into C<sub>10</sub>H<sub>14</sub>O<sub>4</sub>Mn. Analogously CH<sub>3</sub>AcBz, CH<sub>3</sub>Ac·CO<sub>2</sub>Et, CO(CH<sub>3</sub>·CO<sub>2</sub>Et)<sub>2</sub>, and o-OH·C<sub>6</sub>H<sub>4</sub>·CHO give the substances, C<sub>20</sub>H<sub>18</sub>O<sub>4</sub>Mn·1.5H<sub>2</sub>O, C<sub>12</sub>H<sub>18</sub>O<sub>6</sub>Mn, C<sub>18</sub>H<sub>26</sub>O<sub>10</sub>Mn·1.5H<sub>2</sub>O, and C<sub>14</sub>H<sub>20</sub>O<sub>4</sub>Mn·1.5H<sub>2</sub>O, respectively. The compound, C<sub>6</sub>H<sub>7</sub>O<sub>4</sub>Cu, results from CH<sub>3</sub>Ac<sub>2</sub> and NH<sub>3</sub>-Cu<sub>2</sub>O. H. W.

**Synthesis of tetrahydroartemisia ketone.** L. RUZICKA, T. REICHSTEIN, and R. PULVER (Helv. Chim. Acta, 1936, 19, 646—649).—CMc<sub>2</sub>Et·COCl, b.p. 23°/12 mm., and ZnBu<sup>II</sup>I give tetrahydroartemisia ketone, b.p. 65—68°/12 mm., the semicarbazone, m.p. 139—140° (corr.), of which is identical (mixed m.p., X-ray diagram, and crystallographic change at about 120°) with that of the H<sub>4</sub>-derivative of the natural product. Artemisia ketone is one of the rare, but increasingly frequent, compounds built up "irregularly" from isoprene units. R. S. C.

**Optical analysis and rotatory power of glycothiodiazolines.** H. WUYTS and R. VERSTRAETEN (Bull. Acad. roy. Belg., 1935, [v], 21, 415—431).—The condensation of β-thiobenzoyl-α-phenylhydrazine (I) with aldoses gives a mixture of isomeric glycothiodiazolines. Condensation products of (I) with arabinose, xylose, rhamnose, and fucose have been formed and vals. of  $[\alpha]_{780}^{20}$  and  $[\alpha]_{5461}^{20}$  are given and compared with previous data on glucose, mannose, and galactose. In each case the condensation product consists of two substances differing in solubility and in  $[\alpha]$ , the more sol. constituent being laevo- and the less sol. dextro-rotatory, except for rhamnose. W. R. A.

**Determination of acetyl in carbohydrate derivatives.** A. FRIEDRICH and H. STERNBERG (Biochem. Z., 1963, 286, 20—27; cf. A., 1932, 1051).—Accuracy

is increased and simplification achieved by half-neutralising with KOH the *p*-C<sub>6</sub>H<sub>4</sub>Me·SO<sub>3</sub>H used for hydrolysis. The average error is —4% and hence a correction is applied. W. McC.

**Formation of hydrocyanic acid by the oxidation of sugars in presence of ammoniacal copper salts.** J. PARROD (Bull. Soc. chim., 1936, [v], 3, 1126—1136).—HCN is formed from sugars and HNO<sub>3</sub> or NH<sub>3</sub> in presence of *Pangium edule*. Oxidation of fructose by NH<sub>3</sub>-CuSO<sub>4</sub> by atm. O<sub>2</sub> at room temp. gives HCN and traces of CO(NH<sub>2</sub>)<sub>2</sub>. HCN is formed in considerable amount when the principal reducing sugars and their closely allied derivatives [glycer-aldehyde, CO(CO<sub>2</sub>H)<sub>2</sub>, tartaric acid (I), (CHO)<sub>2</sub>, CHO·CO<sub>2</sub>H] are oxidised by NH<sub>3</sub>-CuSO<sub>4</sub> at 60—80°; under these conditions, lactose, maltose, sucrose, rhamnose, gluconic acid, tartaric acid, H<sub>2</sub>C<sub>2</sub>O<sub>4</sub>, CH<sub>2</sub>O, and pyrogallol do not yield HCN. If SO<sub>3</sub><sup>2-</sup> is replaced by other anions, CO(CO<sub>2</sub>H)<sub>2</sub> and (I) yield HCN in considerable quantity, whereas fructose gives small and variable yields. H. W.

**Crystalline 6-methylglucose. New synthesis.** D. J. BELL (J.C.S., 1936, 859—861).—*iso*Propylidene-glucose when shaken with freshly distilled PhCHO and P<sub>2</sub>O<sub>5</sub> gives 3 : 5-benzylidene-*isopropylidene*glucose 6-acetate, methylated and deacetylated with Me<sub>2</sub>SO<sub>4</sub>+NaOH to 3 : 5-benzylidene-6-methyl-*isopropylidene*glucose, m.p. 95—96°,  $[\alpha]_{D}^{20} +3.8^\circ$  in CHCl<sub>3</sub>, hydrolysed by EtOH-H<sub>2</sub>SO<sub>4</sub> to 6-methylglucose, m.p. 145°. F. R.

**Use of ceric salts in the micro-determination of glucose.** R. VANOSI and R. FERRAMOLA (Anal. Assoc. Quím. Argentina, 1935, 23, 162—180).—The authors' method (A., 1933, 138) employed for the determination of 0.003—0.3 mg. of glucose (I), particularly in blood, is 3—4 times as accurate as the iodometric method. A solution of glucose is heated under controlled conditions, varying with the amount of (I) present, with K<sub>2</sub>Fe(CN)<sub>6</sub> in Na<sub>2</sub>CO<sub>3</sub> solution and the Fe(CN)<sub>6</sub><sup>4-</sup> titrated in neutralised (H<sub>2</sub>SO<sub>4</sub>) solution with 0.00025*N*- or 0.0005*N*-Ce(SO<sub>4</sub>)<sub>2</sub>, using Me-violet as indicator. The influence of time of heating and concn. of the reagents on the accuracy of the method has been investigated. F. R. G.

**Glucosone. I. Halogenoses and glucosidic derivatives. II. Catalytic hydrogenation of osones.** K. MAURER and R. BOHME (Ber., 1936, 69, [B], 1399—1410).—I. Glucosone 2 : 3 : 4 : 6-tetra-benzoate (I) does not give a hydrate form. The presence of the anhydride ring is supported by the observations that it has 4 Bz groups, does not contain OH (Zerevitinov), and does not show mutarotation; it is converted by C<sub>6</sub>H<sub>5</sub>N into dibenzoylkojic acid (II), since C<sub>11</sub> is not esterified, and gives a *phenylosazone*, m.p. 201°,  $[\alpha]_D^{20} -45.1^\circ$  in C<sub>6</sub>H<sub>5</sub>N. (I) is therefore A. (I) is stable towards Ac<sub>2</sub>O, but reacts with technical AcCl or BzCl owing to presence of HCl. Hence it is converted by these reagents into 1-chloro-Δ<sup>4,5</sup>-glucosone 3 : 6-dibenzoate (III, R=Cl), m.p. 131°,  $[\alpha]_{D}^{20} +78^\circ$  in COMe<sub>3</sub>, and by AcOH-HBr in Et<sub>2</sub>O into the corresponding *Br-sugar*, m.p. 152°,  $[\alpha]_D^{20} +112.8^\circ$  in COMe<sub>3</sub>. The halogeno-sugars slowly reduce Fehling's solution at room temp., are transformed by AcOH and NaOAc into (II), very readily give the corresponding

phenylosazone (IV), m.p. 193°,  $[\alpha]_D^{20} -43.7^\circ$  in  $C_5H_5N$ , immediately react with  $C_5H_5N$ , and are not acetylated

by  $ZnCl_2$  and  $Ac_2O$ ; replacement of halogen by OH could not be effected. (III) and hot EtOH readily afford 1-ethyl- $\Delta^{4:5}$ -glucosonene 3:6-dibenzoate (III;  $R=Et$ ), m.p. 106°,  $[\alpha]_D^{20} -97.7^\circ$  in  $COMe_2$ ; the corresponding benzyl-, m.p. 113°,  $[\alpha]_D^{20} -92.8^\circ$  in  $COMe_2$ , methyl-, m.p. 112°,  $[\alpha]_D^{20} -91.7^\circ$  in  $COMe_2$ , anilino-, m.p. 101°,  $[\alpha]_D^{20} -161.0^\circ$  in  $COMe_2$ , ethylthiol-, m.p. 119°,  $[\alpha]_D^{20} -113^\circ$  in  $COMe_2$ , and acetyl-, m.p. 152°,  $[\alpha]_D^{20} -25^\circ$  in  $COMe_2$ , derivatives are described. The glucosonides reduce boiling Fehling's solution very slowly. They do not contain OH (Zerevitinov). With  $NHPh \cdot NH_2$ , they afford (IV) and with  $NaOAc$  in boiling AcOH they give (II). Br in  $CHCl_3$  or  $CCl_4$  is only very slowly absorbed by them with almost quantitative production of HBr, so that the halogen is used for oxidation. Mutual replacement of the glucosidic residues does not appear possible. The presence of C=O is established by the production of semicarbazones, m.p. 158°,  $[\alpha]_D^{20} -204.1^\circ$  in  $COMe_2$ , and m.p. 138°,  $[\alpha]_D^{20} -210.2^\circ$  in  $COMe$ , from the Et and  $CH_2Ph$  derivatives, respectively. The Et compound is transformed by long contact with cold  $C_5H_5N$  into a substance, m.p. 158°,  $[\alpha]_D^{20} \pm 0^\circ$ , probably

$\text{CO} \begin{array}{c} \text{CH} \cdot \text{C}(\text{OEt}) \\ \text{CH} \cdot \text{C}(\text{CH}_2 \cdot \text{OBz}) \end{array} \text{O}$ ; it is hydrolysed by  $NH_3$ -EtOH,  $NaOMe$ , or  $MeOH-Ba(OH)_2$  to non-cryst. products, but appears stable in acid media. It is not hydrogenated homogeneously, generally giving cryst. products, m.p. 131°,  $[\alpha]_D^{20} -18^\circ$  in  $COMe_2$ . Glucosone hydrate 2:3:4:6-tetra-acetate absorbs 2H (Pd in 50% AcOH), yielding a substance (V), m.p. 158°,  $[\alpha]_D^{20} -32^\circ$  in EtOH (monoacetate, m.p. 116°,  $[\alpha]_D^{20} -25^\circ$  in  $CHCl_3$ ); H does not appear to be absorbed, but to be utilised in the removal of O. (V) is probably B.

H. W.

Determination of osmotic pressure by isothermal distillation using solvents of low boiling point (glucose penta-acetate-acetone). M. ULMANN (Ber., 1936, 69, [B], 1437-1442).—An apparatus is figured and described which permits operations to be effected in the vac. of a  $H_2O$  pump. The mol. wt. of glucose penta-acetate (I) in  $COMe_2$  is normal only if the concn. is  $> 0.025\%$ ; in more conc. solution the observed vals. are markedly greater. The tendency of (I) towards association is greater in  $COMe_2$  than in AcOH. Further, if a 0.1% solution is diluted to 0.07%, after establishment of the corresponding osmotic pressure, a gradual increase of the latter is observed, indicating a slow dissociation of the previously associated mols.

H. W.

Solubility of calcium oxide in water and in aqueous sucrose.—See this vol., 932.

**Biose from methylbioside. Synthesis of 2- $\beta$ -glucosidoglucose.** K. FREUDENBERG and K. SOFF (Ber., 1936, 69, [B], 1245-1251; cf. A., 1933, 149).—In  $Ac_2O-H_2SO_4$  at 20° glucose  $\alpha$ - (I) shows slight downward and the  $\beta$ -penta-acetate (II) marked upward mutarotation; equilibrium [about 88% of (I) and 12% of (II)] is reached in 30 min.  $\beta$ -Glucosan triacetate is converted into (I) and (II) within 20 min. Maltose  $\beta$ -octa-acetate (III) and anhydromaltose hexa-acetate rapidly give an equilibrium mixture of (III) and the  $\alpha$ -octa-acetate (IV), but the degradation to glucose derivatives cannot be followed polarimetrically. The graph of  $\beta$ -methylmaltose hepta-acetate rises steeply owing to loss of Me and then passes through a flat max., pointing to the occurrence of a Walden inversion with production of (IV), and finally of an equilibrium mixture. The process is suitable for the isolation of bioses from methylbiosides. 4:6-Benzylidene- $\alpha$ -methylglucoside and acetobromoglucose give a methylbioside (V) (cf. A., 1930, 1412), converted by catalytic hydrogenation into 2- $\beta$ -glucosido- $\alpha$ -methylglucoside hepta-acetate, m.p. 132°,  $[\alpha]_D^{20} +50.2^\circ$  in  $CHCl_3$ . This is converted by acetolysis and subsequent treatment with  $AcOH-HBr$  into 2- $\beta$ -glucosidoglucose 1-bromohydrin hepta-acetate, m.p. 194° (decomp.),  $[\alpha]_D^{20} +95.6^\circ$  in  $CHCl_3$ , transformed by  $Tl(OAc)_2$  in AcOH, into 2- $\beta$ -glucosido- $\beta$ -glucose octa-acetate, m.p. 192°,  $[\alpha]_D^{20} -32.5^\circ$  in  $CHCl_3$ , which is hydrolysed ( $NaOMe$  in  $CHCl_3-MeOH$ ) to 2- $\beta$ -glucosido- $\alpha$ -glucose (+ $H_2O$ ), (anhyd.)  $[\alpha]_D^{20} +34.5^\circ$  to  $+19.9^\circ$  in  $H_2O$ . With  $NHPh \cdot NH_2$  it immediately yields glucosephenylosazone, establishing thus the union in position 2. It is hydrolysed by emulsin. The reducing power towards Fehling's solution is  $\frac{1}{2}$  that of glucose. A simplified prep. of acetochloroglucose from glucose penta-acetate,  $AcCl$ ,  $PCl_5$ , and  $AlCl_3$  is recorded.

H. W.

**$\beta$ -d-Fructosides of phenols.** B. HELFERICH and R. STREECK (Ber., 1936, 69, [B], 1311-1313).—o-Cresol, p- $C_6H_4Me \cdot SO_3H$ , and  $\beta$ -fructose penta-acetate at 100° afford o-tolyl- $\beta$ -d-fructoside tetra-acetate (I), m.p. 127-129° (corr.),  $[\alpha]_D^{20} -156^\circ$  in  $CHCl_3$ , hydrolysed by  $NaOMe$  in  $MeOH$  to o-tolyl- $\beta$ -d-fructoside, m.p. 167-170° (corr.),  $[\alpha]_D^{20} -223^\circ$  in  $H_2O$ , which slowly reduced boiling Fehling's solution and is not appreciably hydrolysed by sweet almond emulsin. (I) is transformed by the successive actions of  $Me_2SO_4$ ,  $NaOH$ , and  $MeI-Ag_2O$  into tetramethyl-o-tolyl- $\beta$ -d-fructoside, m.p. 57-59° (corr.),  $[\alpha]_D^{20} -163^\circ$  in  $CHCl_3$ , which does not reduce Fehling's solution previously to hydrolysis and is converted by 3%  $HCl$  at 90° into 1:3:4:5-tetramethylfructose.

H. W.

**Emulsin. XXVII. Synthesis of the  $\beta$ -d-cellobiose and  $\beta$ -d-maltoside of vanillin and the action of almond emulsin on these substances.** B. HELFERICH and E. WEBER (Ber., 1936, 69, [B], 1411-1414).—The action of acetobromocellobiose in  $COMe$ , on vanillin in  $KOH-H_2O$  gives vanillin- $\beta$ -d-cellobioside hepta-acetate, m.p. 206°,  $[\alpha]_D^{20} -48^\circ$  in  $CHCl_3$ , hydrolysed (Zemplen) to vanillin- $\beta$ -d-cellobioside (I), m.p. 214-216° (decomp.) after becoming discoloured at 170°,  $[\alpha]_D^{20} -73^\circ$  in  $H_2O$  [p-nitrophenylhydrazone, m.p. 251-252° (decomp.)]. Analogously, acetobromomaltose affords vanillin- $\beta$ -d-

*maltoside hepta-acetate*, m.p. 144—145°,  $[\alpha]^{20}_D +27.7^\circ$  in  $\text{CHCl}_3$ , whence *vanillin- $\beta$ -D-maltoside* (II), m.p. 153° and, after resolidification, m.p. 220° (decomp.), (+4H<sub>2</sub>O), m.p. 85°,  $[\alpha]^{20}_D +16.9^\circ$  in H<sub>2</sub>O [p-nitrophenyl-hydrazone, m.p. 208—209° (decomp.)]. Reductometric and polarimetric observation of the course of the hydrolysis of (I) or (II) by sweet almond emulsin (III) affords no evidence of the intermediate formation of cellobiose or maltose; the presence of maltosidases or cellobiosidases in (III) could not be detected.

H. W.

**New hesperidin.** F. KOLLE and K. E. GLOPPE (Pharm. Zentr., 1936, 77, 421—425).—Unripe bitter oranges extracted with  $\text{CHCl}_3$  and with EtOH yield, together with hesperidin (I) (A., 1931, 1041), *neo-hesperidin*, (C<sub>28</sub>H<sub>34</sub>O<sub>15</sub>) (II), m.p. 244°. (I) and (II) are not interconvertible. (II) differs from (I) in being easily hydrolysed by dil. H<sub>2</sub>SO<sub>4</sub>, giving rhamnose and *glucohesperitin*, C<sub>22</sub>H<sub>24</sub>O<sub>11</sub>·H<sub>2</sub>O, m.p. 206°, which is further hydrolysed to hesperitin and glucose. (II) is thus a *rhamnoglucosesperitin*. (II) is not found in ordinary oranges or in ripe bitter oranges.

**Determination of nitrate groups in carbohydrate derivatives.** J. DEWAR and (Miss) G. W. BROUGH (J.S.C.I., 1936, 55, 207—208r).—The nitrate content of a sugar derivative may be accurately determined by heating with excess of Devarda's alloy and KOH-EtOH, the N being removed as NH<sub>3</sub> and determined volumetrically; the nitro-group is not affected by this reagent.

F. R. S.

**X-Ray structure of animal and plant polysaccharides.**—See this vol., 1011.

**Hydrolysis and acetolysis of starch and Schardinger's dextrins.** K. FREUDENBERG, G. BLUMQVIST, L. EWALD, and K. SOFF (Ber., 1936, 69, [B], 1258—1266).—Titrimetric and polarimetric observation of the rate of hydrolysis of amylopectin and amyloamylose in 51% H<sub>2</sub>SO<sub>4</sub> and polarimetric observation of the acetolysis of starch triacetate show that starch must be regarded as the  $\alpha$ -analogue of cellulose. Other linkings alternating with maltose unions are excluded and, if present at all, do not form > one of 30 linkings. The cause of slight deviations in the initial parts of the curves cannot yet be established. The graph of the hydrolysis of  $\alpha$ -dextrin (I) in 51% H<sub>2</sub>SO<sub>4</sub>, determined iodometrically, lies between that of starch and maltose; ultimately the reducing power corresponds exactly with that of an equivalent amount of glucose.  $\beta$ -Dextrin (II) shows unexplained reducing power immediately after dissolution in acid; subsequently other CHO groups are developed and the full reducing val. of glucose is attained. The polarimetric curve of (I) rapidly passes through a max., then follows the same course as that of starch, and finally has  $[\alpha]$  for glucose.

The possible presence of one or more rapidly hydrolysed  $\beta$ -linkings is suggested. The graph of (II) exhibits a rise, does not then follow that of starch, and finishes with  $[\alpha]$  of glucose. The presence of I-consuming groups is not here observed. During acetolysis,  $[\alpha]$  of (I), (II), and  $\gamma$ -dextrin increases, and finally attains the val. of glucose. The not very pronounced downward mutarotation of the  $\alpha$ -linkings is > compensated by a pronounced upward action of a linking which is developed at about the same small rate as the fission of the  $\beta$ -linkings in cellulose and cellobiose.  $\beta$ -Glucosan as termination of the chain of the dextrins is excluded. Anhydric or glucosidic termination becomes less probable, particularly since completely methylated (I) does not appear to afford a tetramethylhexose. The possibility of large rings is therefore very cautiously suggested.

H. W.

**Hydrolysis of starch by vegetable amylases.**—See this vol., 894.

**Degradation of starch by acetyl bromide.** K. FREUDENBERG and K. SOFF (Ber., 1936, 69, [B], 1252—1257).—The substance is treated with a mixture of Ac<sub>2</sub>O, AcBr, AcOH, and HBr; the product is poured into H<sub>2</sub>O and extracted with Et<sub>2</sub>O. The extract is shaken with Ag<sub>2</sub>CO<sub>3</sub>, and the maltose hepta-acetate (I) is weighed. Under these conditions starch triacetate gives 21% of (I) at 20° and 22% at 0°. At 0° or 20° the max. yield of (I) from maltose octa-acetate is 56—57%, whereas with AcOH-HBr the max. yield is > 90%. The yields of (I) from maltose anhydride hexa-acetate are 42% and 46% at 20° and 0°, respectively, whereas  $\beta$ -glucosan triacetate gives 83% of acetobromoglucose. Contrary to Karrer (A., 1921, i, 313), therefore, the behaviour of starch differs widely from that of maltose. Polarimetric, reaction-kinetic, and reaction-static observations show that starch is uniformly or greatly preponderantly formed by  $\alpha$ -linkings.

H. W.

**Reducing power and average molecular chain-length of starch and its hydrolysis products, and the constitution of their aqueous pastes.** W. A. RICHARDSON, R. S. HIGGINBOTHAM, and F. D. FARROW (J. Text. Inst., 1936, 27, T131—157).—In determinations of the Cu no. of starch a part of the Cu<sub>2</sub>O produced is lost owing either to its solubility or to accidental oxidation. This is avoided by adding a fixed wt. of glucose to each determination, and deducting the "blank" found with this alone. Cu nos. so determined are independent of the wt. of starch taken, and when starch is hydrolysed with dil. acids there is a linear increase of Cu no. with time, with no initial lag period. Unmodified starches have definite Cu nos. (2.8—8.9 mg. Cu per g.), and if it is assumed that each chain mol. terminates at one end in a reducing group, and that each of these groups reduces as much Cu as does the reducing group in maltose, the average chain-lengths of starches are 460—1470 glucose units. Prolonged acid hydrolysis results in a solution of reducing power equal to that of glucose. It is assumed that during hydrolysis glucosidic linkings are broken in a random manner along the chain mol., and in this case the fracture of a small proportion of the linkings will have a great effect on the average chain length and hence on the  $\eta$ .

Thus if 3% of the linkings in a chain of 1000 units are broken the average length becomes 32.3 units. The production of sol. starch represents this stage of a continuous hydrolytic process. By the cold storage or freezing of a paste a starch can be analysed into a pptd. insol. fraction of low Cu no. and great chain-length and a sol. fraction of high Cu no. and small chain-length. Analysis into amylose and amylopectin is a separation of this type. A. G.

**Fibrous structure of native cellulose in Japanese Kozo and Ganpi.**—See this vol., 927.

**Molecular size of cellulose from different sources.** I. J. K. CHOWDHURY and T. P. BARDHAN (J. Indian Chem. Soc., 1936, 13, 240—252).—Mol. wts. of purified cellulose are determined by the ultracentrifuge method. Cotton (I), jute (II), and bamboo cellulose (III) in Schweitzer's reagent contain 978, 516, and 189 anhydroglucose units, respectively, but above 0.042, 0.058, and 0.122%, respectively (called the "limiting concns."), the mol. wts. appear to rise with concn., indicating breakdown of the method. In viscose (I), (II), and (III) contain 894, 468, and 158 units, respectively, limiting concns. being 0.054, 0.072, and 0.185%, respectively. The triacetates of (I) and (II) in *m*-cresol contain 138 and 56 units, limiting concns. being 0.16 and 0.18%, respectively. After treatment with 42% HCl at 0° (I) and (II) in Schweitzer's reagent contain 13 and 9 units, respectively. The progressive breakdown of the mol. is clearly shown and also that (I), (II), and (III) are not identical. R. S. C.

**Reactions relating to carbohydrates and polysaccharides.** L. Chemical identity of cotton and wood cellulose. J. BARSHA and H. HIBBERT (J. Amer. Chem. Soc., 1936, 58, 1006—1007).—Repeated methylation ( $\text{Me}_2\text{SO}_4$ , 30% wt. NaOH) of spruce- and maple-pulps (dispersed in  $\text{COMe}_2$ ) gives products containing 43.32—43.54% OMe, which if pptd. from  $\text{CHCl}_3$  by light petroleum can be methylated further. The resultant methylcelluloses (44.39—44.63% OMe) are hydrolysed ( $\text{MeOH-HCl}$ ) to 2 : 3 : 6-trimethylmethylglucoside. Bell's assumption (A., 1932, 934) of a "resistant portion" in wood cellulose appears to be unwarranted. H. B.

**Chemical changes occurring during the dissolution of cellulose in Schweitzer's reagent.** W. TRAUBE and A. FUNK (Ber., 1936, 69, [B], 1476—1483).—The dissolution of cellulose (I) in Schweitzer's reagent is considered analogous to that of aliphatic polyhydroxy-compounds or biuret. The isolation of the compound  $[\text{C}_{12}\text{H}_{16}\text{O}_{10}\text{Cu}][\text{Cu en.}]$  (II) indicates also the formation of the substance.

$[\text{C}_{12}\text{H}_{16}\text{O}_{10}\text{Cu}][\text{Cu}(\text{NH}_3)_4]$  (III), although in different compounds the valency of  $[\text{C}_{12}\text{H}_{16}\text{O}_{10}\text{Cu}]$  varies between 1 and 2. The passage of Cu from Cu en. or  $\text{Cu}(\text{NH}_3)_4$  to the anion of a "cupriphile" compound necessitates the assumption that Cu is more firmly united in the latter than in the former; evidence in favour of this view is furnished by the behaviour of biuret. (II) and (III) in solution behave as salts and by double pptn. give salts of which *Tl* and *Ba cupricellulose* are described. For the dissolution of (III) it is necessary that Schweitzer's reagents supplies Cu to both anion and cation, and since the equilibrium

$\text{Cu}(\text{OH})_2 + 4\text{NH}_3 \rightleftharpoons [\text{Cu}(\text{NH}_3)_4](\text{OH})_2$  lies markedly towards the left, a solution obtained with conc.  $\text{NH}_3$  can *per se* dissolve only small amounts of (III) and the presence of solid  $\text{Cu}(\text{OH})_2$  is necessary for considerable dissolution. Indirectly (III) can be dissolved in solutions obtained with 5—6%  $\text{NH}_3$ . Addition of  $\text{NH}_3$  to  $\text{CuSO}_4$  gives  $[\text{Cu}(\text{NH}_3)_4]\text{SO}_4$  which with NaOH affords  $[\text{Cu}(\text{NH}_3)_4](\text{OH})_2$ ; if addition of (III) is made simultaneously with NaOH and the mixture is vigorously agitated, dissolution is accomplished before the dissociation of the complex into  $\text{Cu}(\text{OH})_2$  and  $4\text{NH}_3$  has been realised: alternatively, the solution may be cooled to 0° or below, whereby dissociation is retarded and dissolution is more effectively achieved.

H. W.

**Behaviour of salts of cupricellulose towards alkylating agents.** I. W. TRAUBE, R. PIWONKA, and A. FUNK (Ber., 1936, 69, [B], 1483—1493).—*Tl* cupricellulose suspended in dil.  $\text{TlOH}$  is readily converted by MeI at 50° into *hemimethylcellulose* (I), which is freed from *Tl* by dissolution in Schweitzer's reagent and re-pptn. by acid. The product has OMe:cellulose C=1:12—16. It appears homogeneous. Hydrolysis with  $\text{MeOH-HCl}$  and separation of the methylglucoses by distillation in high vac. shows that (I) of lower OMe content contain > one Me per glucose residue, whereas those richer in OMe contain 2 Me in some glucose residues. The possibility of degradation of cellulose during the various reactions is lessened by using Na cupricellulose obtained by action of NaOH and  $\text{Cu}(\text{OH})_2$  on cellulose, or more simply by treating an intimate mixture of cellulose and powdered  $\text{CuCl}_2$  or  $\text{CuSO}_4$  with 16—18% NaOH. The products are readily methylated, and are partly sol. in  $\text{H}_2\text{O}$  when containing 13% OMe, completely sol. in hot and cold  $\text{H}_2\text{O}$  when 14—16% of OMe is present. The stability in boiling  $\text{H}_2\text{O}$  is not due to degradation of the cellulose mol., since the solutions are highly viscous and the products have a very low Cu no. Entry of Me into the mol. beyond the stage of (I) is less uniform, but in no case is the presence of 3 Me per glucose residue observed, so that one OH is shielded from attack. A single methylation does not proceed far beyond the Me stage, but these products can be converted into the Na-Cu derivatives, which with a large excess of NaOH and  $\text{Me}_2\text{SO}_4$  give products with 34.6% OMe in which singly, doubly, and trebly substituted glucose residues are present. The aq. solutions of these products are not stable to boiling. Initial entry of Me occurs in position 3 of the glucose residue, but a uniform entry of 1 Me per cellobiose unit does not occur.

H. W.

**Osmometric investigations of dilute solutions of polymeric carbohydrates.** IX. Mol. size of technical cellulose acetate (cellite) in acetone. M. ULMANN (Ber., 1936, 69, [B], 1442—1447).—Determinations of the mol. wt. of cellite II in  $\text{COMe}_2$  by the method of isothermal distillation gives va's. about 75,000 for the most dil. solutions to those of concn. 1.25%. If, on the basis of observations in  $\text{AcOH}$ , it is assumed that the complexes are formed of even multiples of  $(\text{C}_6)_n$ , a degree of polymerisation  $(\text{C}_6)_{256}$  is indicated. The behaviour of less viscous cellite fraction IV in  $\text{COMe}_2$  indicates a rupture of the mol.

dependent on concn., but even in the most dil. solution the aggregates are more complex than in AcOH at equal concn.

H. W.

**Determination of the osmotic pressure of cellulose derivatives by the membrane method.** M. ULMANN and K. HESS (Ber., 1936, 69, [B], 1426—1437).—Measurements are recorded for a cellite fraction II, m.p. 245°,  $[\alpha]_D^{25} + 6.5^\circ$  in  $\text{COMe}_2$ , in methylglycol acetate,  $\text{COMe}_2$ , and AcOH and of a cellite fraction IV, m.p. 225° (decomp.),  $[\alpha]_D^{25} + 4.8^\circ$  in  $\text{COMe}_2$ , in  $\text{COMe}_2$ . In the normal case the establishment of pressure difference is preceded by a more or less rapid increase of pressure, depending on concn., to the final value. Normal curves are usually obtained in those regions of concn. in which the osmotic pressure obeys van 't Hoff's law. Formation of well-marked max., great delay, and irregularities greatly restrict, the applicability of the method to cellulose esters in org. media. Even if these abnormalities are excluded, great differences ( $>$  experimental error) are observed in the systems when the concn. is  $> 0.6\%$ , so that the influence of the solvent cannot be evaluated. With solutions of medium concn. these differences tend to disappear, whilst in more dil. solution the phenomena are complicated by differences in the state of dissolution in one and the same solvent at a given concn.

H. W.

**Membrane method and method of isothermal distillation with highly polymerised compounds.** K. HESS and M. ULMANN (Ber., 1936, 69, [B], 1448—1456).—The results obtained by determination of the mol. wt. of cellite fractions in AcOH and  $\text{COMe}_2$  by the membrane and isothermal distillation methods are compared; the concordance observed establishes the validity of the latter method. A marked influence of the solvent on the state of dissolution or mol. size is observed. The anomalies observed, particularly at low concn., when the membrane method is used are not attributable to inherent errors of the method caused by the membrane; they occur also when the distillation method is employed, and are a very important indication of the condition of the dissolved substance. The generally accepted idea of the stability of the mols. of cellulose derivatives in org. media is not in harmony with the observations. Dependent on concn. and nature of solvent, the mols. suffer reversible fission, and the size is not const. It is characteristic that the changes in the mol. do not lead to mixtures of indefinite size as required by the kinetic considerations of chain-like unions of mol. groups (Freudenberg *et al.*), but occur in stoichiometric relationships (degradation into fractions which are integral multiples of  $\text{C}_{12}$ ). It is therefore doubtful whether it is advisable to regard the cellulose mol. as a chain in which the  $\text{C}_{10}$  groups are uniformly linked by strict main valencies: rather it must be assumed to be formed by polar or non-polar association of  $\text{C}_{12}$  groups. It appears unlikely that the state of dissolution of a cellulose ester in an org. medium is strictly reproducible. In consequence of retardation phenomena, appreciable variation under apparently comparable conditions may occur.

H. W.

**Reactivity and structure of the primary aliphatic amines.** G. VAVON and L. BOURGEOIS

(Compt. rend., 1936, 202, 1593—1595; cf. this vol., 836).—The rates of interaction of  $\alpha$ - and  $\delta$ -aminoheptane,  $\gamma$ -amino- $\beta\delta$ -dimethylpentane, and  $\gamma$ -amino- $\gamma$ -ethylpentane with  $\text{CH}_3\text{PhBr}$ , 2 : 4 : 6- $\text{C}_6\text{H}_2\text{Me}_3\text{CH}_2\text{Br}$ ,  $(\text{CH}_3\text{Ph})_2\text{C}_6\text{O}_4$ , and piperonal in PhMe or EtOH are found to decrease as the C chain branches and the hydrocarbon substituent interferes in space with  $\text{NH}_2$ .

J. L. D.

**Use of tetrachlorobenzoquinone for identification of the methylamines.** A. BERTHELOT and G. AMOUREUX (Bull. Soc. Chim. biol., 1936, 18, 649—651).—Improvements in the technique of the method are described.

A. L.

**Bouveault's method of preparing aldehydes from mixed organo-magnesium compounds and N-disubstituted formamides.** N. MAXIM and R. MAVRODINEANU (Bull. Soc. chim., 1936, [v] 3, 1084—1093).—By use of an excess of the Grignard reagent the reaction can be used for the prep. of *tert.* bases if aq.  $\text{NH}_4\text{Cl}$  is used in the final decomp.; if acid is used the bases are hydrolysed to the aldehyde. Thus formpiperidylamide (I) and  $\text{MgPr}^n\text{Br}$  (1 : 2 mols.) give 1- $\delta$ -n-heptylpiperidine, b.p. 220° (picrate, m.p. 74°), (I) and  $\text{Mg isobutyl chloride}$  (II) afford 1- $\delta$ - $\beta\gamma$ -dimethylheptylpiperidine, b.p. 230° (picrate, m.p. 129°), whilst (I) and  $\text{CH}_3\text{Ph.MgCl}$  give 1- $\beta$ - $\alpha\gamma$ -diphenylpropylpiperidine, b.p. 345°. (I) and  $\text{MgPhBr}$  (3 mols.) yield PhCHO and  $\text{C}_2\text{Ph}$ , if decomp. is effected with  $\text{H}_2\text{SO}_4$ , whereas 1-benzhydrylpiperidine, b.p. 189°/19 mm., results when aq.  $\text{NH}_4\text{Cl}$  is used. (II) and  $\text{HCO.NMe}_2$  yield dimethyl- $\beta\gamma$ -dimethyl- $\delta$ -heptylamine, b.p. 176° (picrate, m.p. 116°). With  $\text{Mg isoamyl bromide}$   $\text{HCO.NMe}_2$  gives isohexaldehyde and dimethyl- $\beta\delta$ -dimethyl- $\epsilon$ -octylamine, b.p. 198° (picrate, m.p. 104°), and with  $\text{MgPhBr}$  it yields, according to conditions, PhCHO,  $\text{CHPh}_2\text{OH}$ ,  $\text{C}_2\text{Ph}_4$ , or benzhydryldimethylamine, b.p. 265°/13 mm., m.p. 105°.  $\text{HCO.NEt}_2$  is converted by  $\text{MgPhBr}$  into PhCHO,  $\text{C}_2\text{Ph}_4$ , and benzhydryldiethylamine, b.p. 170°/17 mm., m.p. 56°.  $\text{HCO.NPhMe}$  and  $\text{MgPhBr}$  yield PhCHO and  $\text{CHPh}_2\text{OH}$  without  $\text{C}_2\text{Ph}_4$  or *tert.* base. Diphenyl- $\gamma$ -n-amyamine, b.p. 195°/12 mm., is derived from  $\text{HCO.NPh}_2$  and  $\text{MgEtBr}$  whereas PhCHO and  $\text{CHPh}_2\text{OH}$  without  $\text{C}_2\text{Ph}_4$  or *tert.* base are derived from  $\text{HCO.NPh}$ , and  $\text{MgPhBr}$ .

**Constitution of the condensation product of glucosamine with ethyl acetoacetate.** F. GARCÍA GONZÁLEZ and R. TRUJILLO TORRES (Anal. Fís. Quím.,

1935, 33, 566—569).—Glucosamine hydrochloride (from the shells of crustaceans) exactly neutralised ( $\text{Na}_2\text{CO}_3$ ) with  $\text{CH}_3\text{Ac}\cdot\text{CO}_2\text{Et}$  yields *Et* 2-methyl-5- $\alpha\beta\gamma\delta$ -tetrahydroxybutylpyrrole-3-carboxylate (I), m.p.  $142^\circ$ ,  $[\alpha]_D^{25} +49.7^\circ$ , oxidised ( $\text{KMnO}_4$ ) to 3-carbethoxy-2-methylpyrrole-5-carboxylic acid, m.p.  $200^\circ$  (decomp.), the *Et* ester of which appears to be identical with that of Fischer *et al.* (A., 1932, 281). The compound, m.p.  $128^\circ$ , described by Pauly *et al.* (A., 1922, i, 953) as (I) is considered to be

F. R. G.

Exchange reactions between heavy water and amino-acids and carbohydrates. E. OGAWA (Bull. Chem. Soc. Japan, 1936, 11, 367—374).—For the exchange reactions between heavy water and substances containing exchangeable radicals, expressions for the equilibrium const., where the exchanges are (a) random and (b) stepwise, are derived. Several types of exchange reactions are considered on the basis (a). It is thus shown that a Pt catalyst has no effect on the equilibrium in the case of glucose and heavy water. From a consideration of the equilibrium const. for glutamic acid and asparagine, the structure A is deduced for  $\text{NH}_2$ -acids, and from the electronic structures involved therein, a mechanism is suggested for reactions between aldehydes and ketones and  $\text{NH}_3$ ,  $\text{NH}_2\text{OH}$ ,  $\text{NH}_2\cdot\text{CO}\cdot\text{NH}\cdot\text{NH}_2$ , and  $\text{NHPh}\cdot\text{NH}_2$  e.g.,  $-\text{C}\cdot\text{O}+\text{H}_3\text{N}\cdot\text{OH}_2 \rightarrow$

$-\text{C}\cdot\text{O}\cdot\text{H}_2+\text{HN}\cdot\text{OH}_2 \rightarrow -\text{C}(\text{NH})\cdot\text{OH}_2+\text{H}_2\text{O}$ . The equilibrium const. for exchange reactions between heavy water and glycerol, fructose, glucose, galactose, maltose, lactose, starch, and inulin are examined and suggestions are made as to the structure of some of the carbohydrates.

J. T. A.

Oxidation of amino-acids with sodium hypobromite. A. H. FRIEDMAN and S. MORGULIS (J. Amer. Chem. Soc., 1936, 58, 909—913).—Determinations of the  $\text{NaOBr}$  consumed and the  $\text{N}_2$  and  $\text{CO}_2$  produced during oxidation of various  $\text{NH}_2$ -acids lead to the following mechanisms: (a)  $\text{NH}_2\cdot\text{CHR}\cdot\text{CO}_2\text{H} \rightarrow \text{NHBr}\cdot\text{CHR}\cdot\text{CO}_2\text{H}$  (I); (b) in neutral solution at room temp.: (I)  $\rightarrow \text{NBr}\cdot\text{CHR}\cdot\text{CO}_2\text{H} \rightarrow \text{RCN}+2\text{HBr}+\text{CO}_2$ ; (c) at higher temp. and in alkaline solution: (I)  $\rightarrow \text{NH}\cdot\text{CR}\cdot\text{CO}_2\text{H} \rightarrow \text{RCHO}+\text{CO}_2+\text{NH}_3$ ;  $2\text{NH}_3+3\text{NaOBr} \rightarrow \text{N}_2+3\text{H}_2\text{O}+3\text{NaBr}$ . Little or no  $\text{N}_2$  is produced from glycine, aspartic acid, cysteine hydrochloride, histidine dihydrochloride, and creatinine.

H. B.

Amino-acids. I. Application of Curtius reaction to the synthesis of glycine. P. P. T. SAH (J. Chinese Chem. Soc., 1936, 198—207).—By a modification of the Curtius reaction,  $\text{CN}\cdot\text{CH}_2\cdot\text{CO}_2\text{Et}$  is converted successively into cyanoacet-hydrazide and -azide and cyanomethylurethane, which is hydrolysed by  $\text{Ba}(\text{OH})_2$  to glycine.

F. R. S.

Electrolytic reduction and oxidation of amino-acetic acid and alanine.—See this vol., 943.

Action of hydroxylamine and phenylhydrazine on glycine anhydride and glycyglycine. A. SPIRIDONOVA (J. Gen. Chem. Russ., 1936, 6, 137—

139).—No reaction takes place, indicating that condensation with the  $\text{CO}$  group is inhibited by the adjacent  $\text{NH}$ .

R. T.

Preparation of  $\epsilon$ -trimethylhexobetaine. F. GIRAL (Anal. Fis. Quím., 1935, 33, 752—753).— $\epsilon$ -Aminohexoic lactam (cf. Ruzicka, A., 1921, i, 591) with 50%  $\text{HCl}$  yields the hydrochloride, m.p.  $131$ — $132^\circ$  (corr.), which with conc.  $\text{KOH}$  and  $\text{Me}_2\text{SO}_4$  gives  $\epsilon$ -dimethylaminohexoic acid methochloride, m.p.  $180^\circ$  (corr.), which with freshly pptd.  $\text{Ag}_2\text{O}$  gives the betaine obtained by Prelog (A., 1931, 204).

F. R. G.

Spontaneous decomposition of cystine dimethyl ether. R. D. COGHILL (J. Biol. Chem., 1936, 114, 419—424).—Cystine  $\text{Me}_2$  ether decomposes at room temp. usually completely in 6 weeks or more rapidly in hot  $\text{MeOH}$  into S (one third of the total amount),  $(\text{NH}_4)_2\text{SO}_4$ , *dl*-alanine anhydride (I), a solid substance (contains S), insol. in  $\text{H}_2\text{O}$ ,  $\text{Et}_2\text{O}$ , and  $\text{EtOH}$ , a solid substance (N 11.8—14.5: S 16—25%) (II), sol. in  $\text{EtOH}$ , insol. in  $\text{Et}_2\text{O}$ , and a liquid substance, about  $\text{C}_{14}\text{H}_{23}\text{O}_6\text{NS}_3$ , b.p.  $155^\circ/17$  mm. Decomposition probably occurs by formation of cystine anhydride, which is expected to be unstable and yield  $\text{CH}_2\cdot\text{C} \begin{smallmatrix} \text{CO}\cdot\text{NH} \\ \text{NH}\cdot\text{CO} \end{smallmatrix} \text{C}\cdot\text{CH}_2$ , which would afford (I) by reduction and (II) by polymerisation and reaction with S.

R. S. C.

Synthesis of djenkolic acid. V. DU VIGNEAUD and W. I. PATTERSON (J. Biol. Chem., 1936, 114, 533—538).—The Na derivative of *l*-cysteine and  $\text{CH}_2\text{Cl}_2$  in liquid  $\text{NH}_3$  give djenkolic acid,  $[\alpha]_D^{25} -44.5^\circ$  in 1%  $\text{HCl}$ , identical with the natural product; the latter is, however, partly racemised during isolation by  $\text{Ba}(\text{OH})_2$ .

R. S. C.

$\alpha$ -Aminoketones. III.  $\beta$ -Ketoheptylamine hydrochloride. J. PASCUAL and J. GARCÍA BOADA. IV. Ethyl aminobutyrylacetate and 2-keto-n-amyamine hydrochlorides. J. PASCUAL and L. HALCÓN (Anal. Fis. Quím., 1935, 33, 804—807, 808—812).—III. The well-cooled oximino-derivative of  $n\text{-C}_5\text{H}_{11}\cdot\text{CO}\cdot\text{CH}_2\cdot\text{CO}_2\text{Me}$  (obtained by hydrolysis of the *Me* ester, b.p.  $156$ — $160^\circ/10$ — $11$  mm., of  $\beta$ -diethylamino- $\beta$ -amylacrylic acid) reduced by  $\text{SnCl}_2$  in conc.  $\text{HCl}$ , followed by  $\text{Sn}$  foil, gives  $\beta$ -ketoheptylamine hydrochloride, decomp.  $157$ — $158^\circ$ .

IV. The oximino-derivative of  $\text{COPr}\cdot\text{CH}_2\cdot\text{CO}_2\text{Et}$  similarly yields *Et*  $\alpha$ -aminobutyrylacetate hydrochloride, decomp.  $126$ — $127^\circ$ , and  $\beta$ -keto-n-amyamine hydrochloride, decomp.  $155$ — $156^\circ$ .

F. R. G.

Derivatives of  $\epsilon$ -azidohexoic acid. E. GRISCHKIEVITSCH-TROCHIMOVSKI and A. SPORZYNSKI (Rocz. Chem., 1936, 16, 37—40).— $\epsilon$ -Bromohexonitrile and  $\text{NaN}_3$  in 50%  $\text{MeOH}$  yield  $\epsilon$ -azidohexonitrile (I), b.p.  $107$ — $108^\circ/3$  mm., from which the expected cyclopentanetetrazole was not obtained by heating at  $160$ — $200^\circ$ , alone, or with  $\text{HgCl}_2$ , or by ultra-violet light. (I) in  $\text{EtOH}$  and  $\text{HCl}$  at  $0^\circ$  afford *Et*  $\epsilon$ -azidohezoate, b.p.  $100^\circ/5$  mm., which with aq.  $\text{NH}_3$  and  $\text{EtOH}$  at  $100^\circ$  yields  $\epsilon$ -azidohezoamide, m.p.  $64.5$ — $65.5^\circ$ .

1.

Interaction of selenium oxychloride with substituted malonamides. R. K. TRIVEDI (J. Univ.

Bombay, 1935, 4, Part II, 114—117).— $\text{SeOCl}_2$  and  $\text{CH}_2(\text{CO}\cdot\text{NHPh})_2$  in dry  $\text{Et}_2\text{O}$  at room temp. give  $\text{CCL}_2(\text{CO}\cdot\text{NHPh})_2$ , but in hot dry  $\text{C}_6\text{H}_6$  mesoxanilide is obtained, probably by way of  $(\text{NHPh}\cdot\text{CO})_2\text{C}\cdot\text{SeO}$ .  $\text{CH}_2(\text{CO}\cdot\text{NH}\cdot\text{C}_6\text{H}_4\text{Me})_2$  gives similarly mesoxdi-o-, m.p.  $172^\circ$  [hydrate, m.p.  $127\text{--}130^\circ$  (decomp. from  $100^\circ$ )], and -p-toluidide, m.p.  $187^\circ$  (hydrate, m.p.  $122\text{--}130^\circ$ ).

R. S. C.

**Thiocarbamide as key reagent for preparation of aliphatic sulphonyl chlorides and bromides.** T. B. JOHNSON and J. M. SPRAGUE (Science, 1936, 83, 528).— $\text{CS}(\text{NH}_2)_2$  is used in place of P halides in the prep. of these aliphatic halides. The method is illustrated by the synthesis of  $\text{MeSO}_2\text{Cl}$ . L. S. T.

**Ethers of ethane- $\alpha\beta$ -dioxamic acid and their derivatives.** II. W. GAUDE (Rec. trav. chim., 1936, 55, 541—559).—Further esters of the type  $(\text{CO}_2\text{R}\cdot\text{CO}\cdot\text{NH}\cdot\text{CH}_2)_2$  are prepared from  $(\cdot\text{CH}_2\cdot\text{NH}_2)_2$  and  $\text{R}_2\text{C}_2\text{O}_4$  (cf. A., 1935, 202): *Pr*<sup>a</sup>, m.p.  $137^\circ$ , *Bu*<sup>a</sup>, m.p.  $142^\circ$ , *di-n-amyl*, m.p.  $137^\circ$ , *di-n-hexyl*, m.p.  $141^\circ$ , and *di-n-heptyl ethane-dioxamate*, m.p.  $139^\circ$ . The  $\text{Et}_2$  ester (I) (*loc. cit.*) reacts with  $\text{NH}_2\text{R}$  to form *Et ethylene- $\alpha$ -oxamate- $\beta$ -oxam-ethyl*, m.p.  $194^\circ$ , -n-propyl-, m.p.  $191^\circ$ , -n-butyl-, m.p.  $187^\circ$ , -n-amyl-, m.p.  $182^\circ$ , -n-hexyl-, m.p.  $181^\circ$ , -n-heptyl-, m.p.  $183^\circ$ , -n-octadecyl-, m.p.  $152^\circ$ , -isopropyl-, m.p.  $204^\circ$ , -isobutyl-, m.p.  $203^\circ$ , -isoamyl-, m.p.  $179^\circ$ , -isohexyl-, m.p.  $178^\circ$ , -allyl-, m.p.  $184^\circ$ , and -benzyl-amide, m.p.  $204^\circ$ , - $\beta$ -oxam-anilide, m.p.  $183^\circ$ , -o-, -m-, and -p-toluidides, m.p.  $190^\circ$ ,  $167^\circ$ , and  $204^\circ$ , and -p-aniside, m.p.  $199^\circ$ . *sec*-Amines do not react with (I). Diamines give compounds of type  $M(\text{NH}\cdot\text{CO}\cdot\text{CO}\cdot\text{NH}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{NH}\cdot\text{CO}\cdot\text{CO}_2\text{Et})_2$ ; thus  $\text{CH}_2(\text{CH}_2\cdot\text{NH}_2)_2$ ,  $\text{CH}_2(\text{CH}_2\cdot\text{CH}_2\cdot\text{NH}_2)_2$  and o-, m-, and p- $\text{C}_6\text{H}_4(\text{NH}_2)_2$  give *Et*, trimethylene-, m.p.  $330^\circ$  (+ $2\text{H}_2\text{O}$ ), pentamethylene-, m.p.  $285^\circ$ , and o-, m.p.  $250^\circ$ , m-, m.p.  $253^\circ$ , and p-phenylene-bis(oxamido-ethyleneoxamate), m.p.  $320^\circ$ . Treatment of  $(\text{CO}_2\text{R}\cdot\text{CO}\cdot\text{NH}\cdot\text{CH}_2)_2$  with  $\text{N}_2\text{H}_4\cdot\text{H}_2\text{O}$  (or  $\text{NHR}'\cdot\text{NH}_2$ ) in ROH yields ester-hydrazides and dihydrazides. The following are described. *Pr*<sup>a</sup>, m.p.  $171^\circ$ , *Bu*<sup>a</sup>, m.p.  $170^\circ$ , -n-amyl, m.p.  $179^\circ$ , and -n-hexyl, m.p.  $178^\circ$ , ethylene- $\alpha$ -oxamate- $\beta$ -oxamhydrazides; *Et ethylene- $\alpha$ -oxamate- $\beta$ -oxam-phenyl*, m.p.  $196^\circ$ , -o-, m.p.  $193^\circ$ , -m-, m.p.  $163^\circ$ , and -p-tolyl-hydrazide, m.p.  $195^\circ$ ; and ethylene- $\alpha\beta$ -bis(oxamphenyl-, m.p.  $265^\circ$ , and -bis(oxam-o-, m.p.  $259^\circ$ , -m-, m.p.  $260^\circ$ , and -p-tolyl-hydrazide), m.p.  $261^\circ$ . The ester-hydrazides with RCHO give hydrazones, suitable for the identification of aldehydes. The following are prepared. Benzaldehyde *Me*, m.p.  $320^\circ$ , *Pr*<sup>a</sup>, m.p.  $216^\circ$ , *Bu*<sup>a</sup>, m.p.  $230^\circ$ , -n-amyl, m.p.  $213^\circ$ , and -n-hexyl, m.p.  $220^\circ$ , ethylene- $\alpha$ -oxamate- $\beta$ -oxamhydrazones; and *acet*-, m.p.  $245^\circ$ , *propion*-, m.p.  $221^\circ$ , -n-butyl-, m.p.  $218^\circ$ , -n-valer-, m.p.  $215^\circ$ , -n-hex-, m.p.  $213^\circ$ , -n-hept-, m.p.  $212^\circ$ , *phenylacet*-, m.p.  $218^\circ$ , o-, m.p.  $226^\circ$ , m-, m.p.  $223^\circ$ , and p-chlorobenz-, m.p.  $273^\circ$ , o-, m.p.  $237^\circ$ , m-, m.p.  $250^\circ$ , and p-nitrobenz-, m.p.  $267^\circ$ , p-tolu-, m.p.  $232^\circ$ , *anis*-, m.p.  $229^\circ$ , *cumin*-, m.p.  $228^\circ$ , *salicyl*-, m.p.  $241^\circ$ , *furfur*-, m.p.  $247^\circ$ , 5-methyl-, m.p.  $199^\circ$ , and 5-hydroxymethyl-furfur-, m.p.  $221^\circ$ , and piperon-aldehyde, m.p.  $254^\circ$ , and *vanillin*, m.p.  $221^\circ$ , *Et ethylene- $\alpha$ -oxamate- $\beta$ -oxamhydrazones*.  $\text{CH}_2\text{O}$ ,  $\text{COMe}$ ,  $\text{COEt}$ , glucose, and mannose, failed to react.

Treatment of ester-amides with  $\text{N}_2\text{H}_4$  gives the amide-hydrazides. *Ethylene- $\alpha$ -oxam*-, m.p. about  $300^\circ$

(impure), - $\alpha$ -oxam-ethyl-, m.p.  $297^\circ$ , -n-propyl-, m.p.  $288^\circ$ , -n-butyl-, m.p.  $287^\circ$ , -n-amyl-, m.p.  $283^\circ$ , -n-hexyl-, m.p.  $276^\circ$ , and -n-heptyl-amide- $\beta$ -oxamhydrazide, m.p.  $274^\circ$ , are prepared. *Ethylene- $\alpha$ -oxam-anilide- $\beta$ -oxamhydrazide*, m.p.  $309^\circ$ , is obtained from the ester-hydrazide and  $\text{NH}_2\text{Ph}$ . With  $\text{PhCHO}$  these give benzaldehyde ethylene- $\alpha$ -oxam-, m.p.  $340^\circ$ , - $\alpha$ -oxam-ethyl-, m.p.  $320^\circ$ , -n-propyl-, m.p.  $319^\circ$ , -n-butyl-, m.p.  $319^\circ$ , -n-amyl-, m.p.  $317^\circ$ , and -n-hexyl-amide- $\beta$ -oxamhydrazone, m.p.  $313^\circ$ , and - $\alpha$ -oxamanilide- $\beta$ -oxamhydrazone, m.p.  $330^\circ$ . p-Chlorobenzaldehyde ethylene- $\alpha$ -oxam-methylamide- $\beta$ -oxamhydrazone, m.p.  $> 340^\circ$ , is also prepared. Action of  $\text{NHPh}\cdot\text{NH}_2$  on the ester-hydrazide yields ethylene- $\alpha$ -oxamhydrazide- $\beta$ -oxamphenylhydrazide, m.p.  $261^\circ$ , from which benzaldehyde ethylene- $\alpha$ -oxamhydrazide- $\beta$ -oxamphenylhydrazide, m.p.  $310^\circ$ , is obtained.

E. W. W.

**Organic reactions with silicon compounds.** II. Reaction of silicon tetrafluoride with Grignard reagent. J. A. GIERUT, F. J. SOWA, and J. A. NIEUWLAND (J. Amer. Chem. Soc., 1936, 58, 897—898).— $\text{SiF}_4$  and  $\text{MgAlkBr}$  or, better,  $\text{MgAlkCl}$  give 45—70% of  $\text{MgAlk}_3\text{F}$ , the F atom of which is unreactive. The following are described:  $\text{SiEt}_3\text{F}$ , b.p.  $109^\circ/745$  mm. (accompanied by an approx. equal amount of  $\text{SiEt}_4$ , b.p.  $153^\circ$ ); *Si tripropyl*, b.p.  $175^\circ/745$  mm., *tributyl*, b.p.  $224^\circ/745$  mm., and *triaryl*, b.p.  $267^\circ/745$  mm., fluorides.

H. B.

**Resolution of co-ordinated inorganic compounds into optical isomerides.** Co-ordinated cadmium compounds with racemic and active propylenediamine. P. NEOGI and K. L. MANDAL (J. Indian Chem. Soc., 1936, 13, 224—227).—*Cd r-tripropylenediamine chloride*, bromide, iodide, thiocyanate, camphornitronate,  $[\alpha]_D^{25} +195^\circ$ , camphorsulphonate,  $[\alpha]_D^{30} +23.5^\circ$ , bromocamphorsulphonate,  $[\alpha]_D^{30} +66^\circ$ , and tartrate,  $[\alpha]_D^{30} +27.5^\circ$ , have been obtained; no evidence of resolution was found. The corresponding chloride,  $[\alpha]_D^{30} -37.5^\circ$ , bromide,  $[\alpha]_D^{30} -25.8^\circ$ , iodide,  $[\alpha]_D -26^\circ$ , and thiocyanate,  $[\alpha]_D -23.5^\circ$ , of the *l*-base and chloride,  $[\alpha]_D +26^\circ$ , bromide,  $[\alpha]_D^{30} +26.5^\circ$ , iodide,  $[\alpha]_D^{30} +25^\circ$ , and thiocyanate,  $[\alpha]_D^{30} +24.7^\circ$ , of the *d*-base are described.

C. R. H.

**Triheptylstibine and its derivatives.** C. L. TSENG and W. Y. SHIH (J. Chinese Chem. Soc., 1936, 4, 183—186).—*Triheptylstibine*, b.p.  $229\text{--}231^\circ/50$  mm., is obtained in 18% yield from Mg n-heptyl bromide and  $\text{SbCl}_3$ , and forms *triheptylstibine iodide*, oxide, and metantimonite.

F. R. S.

**Reaction of thallous chloride with certain organic lithium compounds.** N. N. MELNIKOV and G. P. GRATSCHIEVA (J. Gen. Chem. Russ., 1936, 6, 634—635).—The reaction  $2\text{LiR} + \text{TlCl}_3 \rightarrow \text{TlR}_2\text{Cl} + 2\text{LiCl}$  ( $\text{R} = \text{Et}$ ,  $\text{Ph}$ , p- $\text{C}_6\text{H}_4\text{Me}$ ) takes place in  $\text{Et}_2\text{O}$ .

R. T.

**Double salts of indium and organic bases.**—See this vol., 945.

**Kinetics of cyclopentadiene.**—See this vol., 939.

**Phenylcyclopentane and its behaviour during catalytic hydrogenation.** J. I. DENISSENKO (Ber., 1936, 69, [B], 1353—1356).—*cyclopentanone* is converted by  $\text{MgPhBr}$  into phenylcyclopentanol, dehydrated to phenylcyclopentene, which is hydrogenated

to phenylcyclopentane (I), b.p. 216—218°/750 mm. (I) is very readily decomposed by Pt-C at 305—310° into  $\text{CH}_2\text{Ph}[\text{CH}_2]_4\text{Me}$ ,  $\text{CHMePr}^a\text{Ph}$ , and, possibly,  $\text{CHPhEt}$ . H. W.

**Polyatomic peroxides formed in the initial stages of combustion of cyclohexane.** K. I. IVANOV (J. Gen. Chem. Russ., 1936, 6, 470—477).—A non-volatile peroxide (I),  $\text{C}_6\text{H}_9(\text{O}_2\text{H})_2\cdot\text{O}_2\cdot\text{CH}_2\cdot\text{OH}$ , is obtained in 25% yield from atm.  $\text{O}_2$  and cyclohexane at 316°. (I) is probably formed by condensation of  $\text{CH}_2\text{O}$  with  $\text{C}_6\text{H}_9(\text{O}_2\text{H})_3$ . R. T.

**Velocity of the reaction between organic peracids and cyclohexene.**—See this vol., 939.

**Alkylation of naphthenes with olefines in presence of catalysts.** V. N. IPATIEV and A. V. GROSSE [with V. I. KOMAREVSKI] (J. Gen. Chem. Russ., 1936, 6, 433—438).—cycloHexane (I) and  $\text{C}_2\text{H}_4$  in presence of  $\text{AlCl}_3$  at 50—75°/1—15 atm. yield a mixture of 1:3-dimethyl-, 1:2:3:4- and 1:2:4:5-tetramethyl-cyclohexane, and hexaethylbenzene. Methyl- and isopropyl-cyclohexane combine with  $\text{C}_2\text{H}_4$  in presence of  $\text{AlCl}_3$  or  $\text{BF}_3$  at 30—80°/1—15 atm. to yield higher homologues (unidentified) of (I).  $\text{BF}_3$  catalyses condensation of  $\text{C}_2\text{H}_4$  only with hydrocarbons having a tert. C atom. R. T.

**Destructive alkylation with a hydrogenating catalyst.** V. N. IPATIEV and V. I. KOMAREVSKI (J. Amer. Chem. Soc., 1936, 58, 922—923).—Dehydrogenation of cyclohexane over a  $\text{NiO-Al}_2\text{O}_3$  catalyst (A., 1913, i, 65) at 350° is accompanied by "destructive alkylation" (this vol., 322);  $\text{CH}_4$  and  $\text{PhMe}$  are formed with  $\text{H}_2$  and  $\text{C}_6\text{H}_6$ . Ethylcyclohexane (I) or  $\text{PhEt}$  may be an intermediate. (I) similarly gives  $\text{H}_2$ ,  $\text{CH}_4$ ,  $\text{C}_6\text{H}_6$ , and  $\text{PhMe}$  whilst  $\text{PhEt}$  affords  $\text{H}_2$ ,  $\text{CH}_4$ ,  $\text{C}_6\text{H}_6$ ,  $\text{PhMe}$ , and  $\text{C}_{10}\text{H}_8$ . The  $\text{Al}_2\text{O}_3$  is considered to effect alkylation:  $\text{Al}_2\text{O}_3 + \text{H}_2\text{O} \rightarrow 2\text{AlO}(\text{OH})$ ;  $\text{AlO}(\text{OH}) + \text{C}_2\text{H}_4 \rightarrow \text{AlO}(\text{OEt})$ ;  $\text{AlO}(\text{OEt}) + \text{C}_6\text{H}_6 \rightarrow \text{PhEt} + \text{AlO}(\text{OH})$ . No alkylation occurs with Pt-C or Pd-asbestos. H. B.

**Addition and additive products of halogens and benzene derivatives.** VI. Addition of chlorine to the three tetrachlorobenzenes. T. VAN DER LINDEN (Rec. trav. chim., 1936, 55, 421—430).—1:2:3:4- $\text{C}_6\text{H}_2\text{Cl}_4$  (I) and liquid  $\text{Cl}_2$  in sunlight at room temp. give, after 1 month, 1:2:3:3:4:5:6:6-octachloro- $\Delta^1$ -cyclohexene (II), m.p. 178°, which with  $\text{MeOH-NaOH}$  eliminates  $\text{HCl}$ , giving  $\text{C}_6\text{Cl}_6$ , and is reduced by  $\text{Zn-EtOH}$  to (I). The structure of (II) is based on addition of  $\text{Cl}_2$  first to the unsubstituted positions, and then to the ends of the resulting conjugated system. (II) does not lose  $\text{HCl}$  when treated with  $\text{EtOH}$ , and crystallises unchanged from fuming  $\text{HNO}_3$ . As by-products with (II), substances of m.p. 101—104° and 89—93° are obtained, which at room temp. yield  $\text{C}_6\text{Cl}_6$ , and are reduced (Zn) to  $\text{C}_6\text{HCl}_5$ ; these are regarded as mixed crystals of 1:2:3:3:4:4:5:5:6- with 1:2:3:3:3:4:4:5:6:6-enneachloro- $\Delta^1$ -cyclohexene (III), the structures of which are discussed. Both with  $\text{MeOH-NaOH}$  form  $\text{C}_6\text{Cl}_6$ . 1:2:4:5- $\text{C}_6\text{H}_2\text{Cl}_4$  and  $\text{Cl}_2$  give, after 3 months, two products. One is regarded as 1:2:3:3:4:4:5:6:6-enneachloro- $\Delta^1$ -cyclohexene (IV), m.p. 89—91°; it is reduced (Zn)

to  $\text{C}_6\text{HCl}_5$  with some  $\text{C}_6\text{Cl}_6$ , and differs from (III) in being converted by  $\text{MeOH-NaOH}$  into  $\text{C}_6\text{Cl}_8$ . The other product, m.p. 120—125°, is reduced to  $\text{C}_6\text{HCl}_5$  and 1:2:4:5- $\text{C}_6\text{H}_2\text{Cl}_4$ , and is a mixture, probably of  $\text{C}_6\text{H}_2\text{Cl}_{10}$  and  $\text{C}_6\text{HCl}_9$ . The mother-liquors treated with  $\text{MeOH-NaOH}$  give *p*-quinonoid  $\text{C}_6\text{Cl}_8$ . 1:3:4:5- $\text{C}_6\text{H}_2\text{Cl}_4$  and  $\text{Cl}_2$  in sunlight give, after 4 months, a mixture of  $\text{C}_6\text{Cl}_6$ , enneachloro-cyclohexenes [m.p. 94—95°, mainly (IV)]; converted by  $\text{MeOH-NaOH}$  into  $\text{C}_6\text{Cl}_6$  and  $\text{C}_6\text{Cl}_8$ . 1:2:3:3:4:5:5:6-octachloro- $\Delta^1$ -cyclohexene, and 1:1:2:3:3:4:4:5:5:6-decachlorocyclohexane, m.p. 178°, which is reduced to 1:3:4:5- $\text{C}_6\text{H}_2\text{Cl}_4$ . E. W. W.

**Aromatic nitro-derivatives.** VII. Reactivity of substituents and nuclear substitution in benzene derivatives. A. MANGINI (Gazzetta, 1936, 66, 300—308).—Theoretical. Aromatic substitution, and especially the position of entry of further substituents in di- and tri-substituted  $\text{C}_6\text{H}_6$  derivatives, is considered in relation to Bonino's view that substituents stabilise one of the two possible "tricentric" linkings in  $\text{C}_6\text{H}_6$ . Multiple substituents are either in "concordance" or in "opposition," and the influence of this, and of dipole moments, on stability and on further substitution is discussed. E. W. W.

**Raman effect of homocyclic compounds.**—See this vol., 923.

**Normal frequencies of vibration of benzene compounds in ultra-violet absorption.**—See this vol., 921.

**Benzene rings.** P. LAROSE (Chem. and Ind., 1936, 547—548).—A plea for the consistent use of regular hexagons to represent  $\text{C}_6\text{H}_6$  rings in the literature. F. N. W.

**Interference measurements with benzene derivatives.** R. SCHOPPE (Z. ges. Naturwiss., 1935, 1, 122—124; Chem. Zentr., 1935, ii, 2041; cf. this vol., 976).—X-Ray measurements with  $\text{C}_6\text{H}_6$  and  $\text{PhCl}$  confirm the planar hexagonal structure of  $\text{C}_6\text{H}_6$ ; "buckled" models are excluded. The following distances are found:  $\text{C}_{\text{Ar}}-\text{C}_{\text{Ar}}=1.42$  Å.,  $\text{C}_{\text{Ar}}-\text{Cl}=1.65$  Å.,  $\text{C}_{\text{Ar}}-\text{Br}=1.86$  Å., and  $\text{Br}-\text{Br}=6.56$  Å. (in *p*- $\text{C}_6\text{H}_4\text{Br}_2$ ) and 3.80 Å. (in *o*- $\text{C}_6\text{H}_4\text{Br}_2$ ). H. N. R.

**Olefine-benzene condensation with the sulphuric acid catalyst.** H. L. WUNDERLY, F. J. SOWA, and J. A. NIEUWLAND (J. Amer. Chem. Soc., 1936, 58, 1007—1009; cf. A., 1935, 1358).—The effects of temp., time, amount of  $\text{H}_2\text{SO}_4$ , and  $\text{BF}_3$  on the reaction between  $\text{C}_6\text{H}_6$  and  $\text{C}_3\text{H}_6$  are studied. Contrary to Ipatiev *et al.* (see below),  $\text{BF}_3$  is a promoter.  $\text{C}_6\text{H}_6$  and  $\text{C}_2\text{H}_4$  with  $\text{H}_2\text{SO}_4 + \text{BF}_3$  (not with  $\text{H}_2\text{SO}_4$  alone) at 10—20° give some  $\text{PhEt}$  and  $\text{C}_6\text{H}_4\text{Et}_2$ . A reaction mechanism (involving an "activated" olefine) is discussed. H. B.

**Influence of sulphuric acid concentration on reaction between olefines and benzene.** V. N. IPATIEV, B. B. CARSON, and H. PINES (J. Amer. Chem. Soc., 1936, 58, 919—922).—Alkylation is the main reaction when  $\text{C}_6\text{H}_6$  is treated with  $\text{C}_3\text{H}_6$  in presence of cold 96%  $\text{H}_2\text{SO}_4$  and leads to  $\text{PhPr}^{\beta}$ , *p*- $\text{C}_6\text{H}_4\text{Pr}^{\beta}_2$ ,  $\text{C}_6\text{H}_3\text{Pr}^{\beta}_3$ , and 1:2:4:5- $\text{C}_6\text{H}_2\text{Pr}^{\beta}_4$ ;  $\text{PhPr}^{\beta}$  and

$C_6H_4Pr^s$  similarly give  $C_6H_3Pr^s$  and  $C_6H_2Pr^s$ . In 80%  $H_2SO_4$  alkylation and ester formation ( $Pr^s_2SO_4$ ) occur to about the same extent. *iso*Butene (I),  $C_6H_6$ , and 96%  $H_2SO_4$  give (mainly)  $PhBu^r$ ,  $p$ - $C_6H_4Bu^r_2$  (chief product under conditions used), and  $C_6H_3Bu^r_3$ ; (I) is largely polymerised by 80%  $H_2SO_4$ , whilst  $Bu^r_2SO_4$  is the sole product with 70%  $H_2SO_4$ .  $PhMe$ ,  $C_3H_6$ , and 96%  $H_2SO_4$  afford  $p$ - $C_6H_4MePr^s$  and (probably)  $C_6H_3MePr^s_2$ ;  $C_{10}H_8$  similarly gives  $C_{10}H_7Pr^s$  (?).  $C_6H_6$  with  $\Delta^o$ -butene, pentene, octene, nonene, and dodecene (mixtures) in 96%  $H_2SO_4$  gives (usually) mono- and di-alkylbenzenes; the following are described: mono- and di-*sec*.-butyl-, *tri*amyl-, b.p. 282–288° and 312–318°, *di*octyl-, b.p. 338–343°, *dinonyl*-, b.p. 153–163°/5 mm., and *didodecylbenzene*, b.p. 197–211°/5 mm. Alkylation is considered to occur through the intermediate  $Alk_2SO_4$ .  $BF_3$  is unnecessary for the reaction between  $C_6H_6$ ,  $C_3H_6$ , and  $H_2SO_4$  under the conditions used by Slanina *et al.* (A., 1935, 1358). H. B.

**Alkylation accompanying depolymerisation.** V. N. IPATIEV and H. PINES (J. Amer. Chem. Soc., 1936, 58, 1056).—*Diisobutene* (I),  $C_6H_6$ , and 96%  $H_2SO_4$  at 0° give  $PhBu^r$ ,  $p$ - $C_6H_4Bu^r_2$  (II), and  $C_6H_3Bu^r_3$ . (II) is similarly obtained from  $PhBu^r$  and (I) or *triisobutene*, whilst  $C_6H_6$  and *dibutene* afford *p*-di- and *tri-sec*.-butylbenzenes. The same type of reaction occurs with (I),  $C_6H_6$  or *cyclohexane*, and  $AlCl_3$ . The term “depolyalkylation” is proposed for such reactions. H. B.

**Phosphoric acid as catalyst for destructive alkylation of hydrocarbons.** V. N. IPATIEV, V. I. KOMAREVSKI, and H. PINES (J. Amer. Chem. Soc., 1936, 58, 918–919).—“Destructive alkylation” (this vol., 322) occurs when  $C_6H_6$  is treated with  $\beta\beta$ -trimethylpentane or  $n$ - $C_6H_{14}$  in presence of 100%  $H_3PO_4$  and  $N_2$ . The following reactions take place: (i)  $CMe_3 \cdot CH_2 \cdot CHMe_2 + C_6H_6 \rightarrow CHMe_3 + PhBu^r$ ; (ii)  $2C_6H_{14} + 2C_6H_6 \rightarrow C_3H_8 + C_2H_6 + PhBr^s + PhBu$ . H. B.

**Action of excess of bromine on benzene derivatives in presence of beryllium bromide.** R. PAJEAU (Compt. rend., 1936, 202, 1795–1796; cf. this vol., 461).— $C_6H_6$ ,  $PhMe$ , *o*-, *m*-, and *p*-xylene with excess of  $Br$  in presence of  $BeBr_2$  at room temp. afford  $p$ - $C_6H_4Br_2$ , 2:4:5- $C_6H_3MeBr_3$ , and the 3:4:5:6-, 2:4:5:6-, and 2:3:5:6-tetrabromoxylene, respectively.  $PhCl$  and  $PhI$  similarly afford  $p$ - $C_6H_4ClBr$  and  $p$ - $C_6H_4ClI$  on heating.  $o$ - $C_6H_4MeCl$  affords a  $Br_2$ -derivative, m.p. 98.5°, which is oxidised ( $HNO_3$ , *d* 1.2) to a chlorodibromobenzoic acid, m.p. 190°. *m*- and *p*- $C_6H_4MeCl$  similarly afford  $Br_2$ -derivatives, m.p. 96.5° and 99°, respectively; the latter is oxidised to an acid, m.p. 185°. J. L. D.

**“ortho-Effect” in dihalogenobenzenes.** R. SCHOPPE and K. L. WOLFF (Z. ges. Naturwiss., 1935, 1, 67–68; Chem. Zentr., 1935, ii, 2040–2041).—Possible modes of interaction of *o*-substituents are discussed. By X-ray measurements on the vapours, the Cl–Cl distance is found to be  $6.1 \pm 0.09$  Å. in *p*- and  $3.3 \pm 0.05$  Å. in *o*- $C_6H_4Cl_2$ . The latter val. is > that calc. for an angle of 60° between the C–Cl linkings. H. N. R.

**Behaviour of aromatic compounds at the anode in nitric acid solutions.** C. B. MEDINSKI (Acta Univ. Asiae Mediae (Tashkent), 1933, Ser. VI, No. 6, 5 pp.).—Experiments on the electrolytic nitration of  $OH \cdot C_6H_3(NO_2)_2$ ,  $PhSO_3H$ , and  $C_6H_6$  in presence of  $KNO_3$  and  $Na_2SO_4$  show that only the compounds insol. in  $H_2O$  were nitrated.  $H_2O$ -sol. compounds were predominantly oxidised.

CH. ABS. (e)

**Synthesis of *s*-tridiphenylbenzene and *s*-tri(benzylphenyl)benzene.** Z. SKROWACZEWSKA and E. SUCHARDA (Rocz. Chem., 1936, 16, 151–155).—*p*-Diphenylmethyl ketone and conc.  $HCl$  (180°; 34 hr.) or  $PhSO_3H$  (100°; 7 hr.) yield *s*-tridiphenylbenzene, m.p. 232°, oxidised by  $CrO_3$  in  $AcOH$  to  $p$ - $C_6H_4Ph \cdot CO_2H$ .  $CH_2Ph \cdot C_6H_4 \cdot COMe$  and conc.  $HCl$  (180°; 60 hr.) afford *s*-tri(benzylphenyl)benzene, m.p. 168–169°, oxidised similarly to  $p$ - $C_6H_4Ph \cdot CO_2H$ . R. T.

**Friedel and Crafts reaction. I. Polyhalogen derivatives of triphenylmethane.** S. D. WILSON and H. T. HUANG (J. Chinese Chem. Soc., 1936, 4, 142–148).— $p$ - $C_6H_4Cl_2$ ,  $CHCl_3$ , and  $AlCl_3$  in the absence of solvents give 2:5:2':5':2'':5''-hexachlorotriphenylmethane, m.p. 206–208°, and with  $p$ - $C_6H_4Br_2$ , the  $Br_6$ -compound, m.p. 225–227°, is obtained.  $p$ - $C_6H_4Cl_2$ ,  $CCl_4$ , and  $AlCl_3$  afford two isomeric substances, m.p. 179–180°, and m.p. 70–100°, probably forms of 1:4:7:9-tetrachloro-9-2':5'-dichlorophenylfluorene. F. R. S.

**Preparation of diphenyldiacetylene.** J. S. SALKIND and B. M. FUNDLER (J. Gen. Chem. Russ., 1936, 6, 530–533).— $CPh \cdot CH$  is added to  $CuCl$  in 30% aq.  $NH_4Cl$  containing 0.2% of  $HCl$ , at the b.p., and the salt,  $C_{16}H_{10}CuCl$ , separating out after 5–6 hr. is decomposed by  $Et_2O$  to give  $(CPh \cdot C)_n$  (18% yield). R. T.

**Anthracene derivatives. I.** B. P. FEDOROV (J. Gen. Chem. Russ., 1936, 6, 444–454).—9:10-Dichloroanthracene in  $PhNO_2$  and 20% oleum at 12–15° yield the 2-sulphonic acid (I), m.p. 212.1° (decomp.) [ $+2.5H_2O$ , m.p. 158–159°; *chloride* (II), m.p. 221–225° (decomp.); *amide*, m.p. 279°; *Et* ester, m.p. 159°; *anilide*, m.p. 247.8°], the Na salt of which yields Na anthrone-2-sulphonate when heated with 30%  $NaOH$  (190–200°; 10 hr.). (II) and Zn in  $PhMe$  (110°; 12 hr.) yield the corresponding Zn sulphinate, which with Zn and  $HCl$  (100°; 8 hr.) affords 9:10-dichloro-2-thiolanthracene, readily oxidised by atm.  $O_2$  to the *disulphide*, m.p. 235°. R. T.

**1-Methylnaphthalene derivatives. III.** K. DZIEWONSKI and E. KOWALCZYK (Bull. Acad. Polonaise, 1935, A, 559–563; cf. A., 1935, 1116).—Treatment of 1- $C_{10}H_7Me$  with 100%  $H_2SO_4$  at 165–175° affords 1:3- and 1:6- $C_{10}H_6Me \cdot SO_3H$ , separated by means of the sparing solubility of their Ba salts in  $H_2O$ , and 1:7- $C_{10}H_6Me \cdot SO_3H$  isolated as the Ba salt (I) which is freely sol. in  $EtOH$ . The corresponding Na and  $NH_2Ph$ , m.p. 209–211°, salts, 1-methylnaphthalene-7-sulphonyl chloride, m.p. 88°, and -sulphonamide, m.p. 116°, are described. (I) is converted by  $KOH$  at 180° into 1:7- $C_{10}H_6Me \cdot OH$  (*Bz* derivative, m.p. 85–86°), transformed by  $(NH_4)_2SO_3 \cdot NH_3$  at 150–190° into 1:7- $C_{10}H_6Me \cdot NH_2$  (*Ac* derivative, m.p. 158–159°). H. W.

**Spatial configuration of fluorene and its derivatives.**—See this vol., 927.

**Action of sulphuryl chloride on polynuclear, aromatic hydrocarbons.** I. A. PONGRATZ and E. EICHLER (Ber., 1936, 69, [B], 1292—1294).—The reaction is studied under conditions which appear to exclude the possibility of dissociation of  $\text{SO}_2\text{Cl}_2$  into  $\text{SO}_2$  and  $\text{Cl}_2$ . Pyrene and  $\text{SO}_2\text{Cl}_2$  in  $\text{CCl}_4$  at room temp. slowly give chloropyrene, m.p. 119—120°, in small yield. Perylene in boiling  $\text{C}_6\text{H}_6$  gives a mixture of dichloroperylene. Chrysene does not react.  $\text{C}_{10}\text{H}_8$  affords 1:2:3:4-tetrachlorotetrahydronaphthalene, m.p. 187° (decomp.), and  $\text{SO}_2$ , probably amongst other products. A parallelism appears to exist between readiness of reaction with  $\text{SO}_2\text{Cl}_2$  and ease of hydrogenation. H. W.

**2-Methyl-1:9-aceanthrene.** A. DANSI and A. SEMPRONJ (Gazzetta, 1936, 66, 182—186).— $\beta$ -Methylanthracene with  $\text{C}_2\text{O}_2\text{Cl}_2$  in  $\text{CS}_2$  and  $\text{AlCl}_3$  yields a methylaceanthrenequinone, m.p. 258° [semicarbazone, m.p. 278—280° (decomp.)] [insol. in  $\text{NaHSO}_3$  and oxidised ( $\text{CrO}_3$ ) to 2-methylanthraquinone-1-carboxylic acid, m.p. 268°, isolated by Mayer (A., 1930, 1042)], and an isomeride, m.p. 206—208°, oxidised to anthraquinone-2-carboxylic acid, m.p. 295° (Butescu, A., 1913, i, 273). The quinones on distillation with Zn powder and sublimation of the product in a vac. yield methylaceanthrenes of m.p. 122° and 99°, respectively, the former being 2-methyl-1:9-aceanthrene. F. O. H.

**Ergostatriene and  $\Delta^7$ -dehydrocholestene.** K. DIMROTH and G. TRAUTMANN (Ber., 1936, 69, [B], 669—675).—The absorption spectra of ergostatriene (I) and  $\Delta^7$ -dehydrocholestene are precisely similar to that of ergosterol (III). The OH of (III) has therefore no significance with respect to the marked absorption bands between 260 and 290  $\mu$ ; these are due solely to the conjugated double linkings in ring B of the cyclopentanohydrophenanthrene skeleton. Ergosteryl acetate-maleic anhydride is oxidised by  $\text{CrO}_3$  in AcOH to ergoster-3-one-maleic anhydride, m.p. 178—179°, which is reduced (Clemmensen) to deoxy-

ergosterol-maleic anhydride, m.p. 176—177°, which passes when heated at 220°/12 mm. into (I), m.p. 99—100°. 7-Ketocholestene is reduced by  $\text{Al}(\text{OPr}^i)_3$  in boiling  $\text{Pr}^i\text{OH}$  to 7-hydroxycholestene (IV), m.p. 93—94°, which with boiling  $\text{Ac}_2\text{O}$  gives a hydrocarbon,  $\text{C}_{27}\text{H}_{44}$ , m.p. 91°. (IV) is transformed by  $\text{BzCl}$  in anhyd.  $\text{C}_6\text{H}_5\text{N}$  into the benzoate, m.p. 108—109°, which passes at 120—125°/high vac. into  $\text{BzOH}$  and (III), m.p. 88—89°,  $[\alpha]_D^{25}$  —127° in  $\text{CHCl}_3$ . H. W.

**Oxidation of cyclo-pentyl- and -propyl-amine.** N. J. DEMJANOV and Z. I. SCHUKINA (J. Gen. Chem. Russ., 1936, 6, 350—358).—cyclopentylamine in  $\text{H}_2\text{O}$  and  $\text{O}_2$  in presence of Cu or  $\text{OsO}_4$  afford cyclopentanone and  $\text{NH}_3$ . cyclopropylamine in  $\text{Et}_2\text{O}$  or  $\text{H}_2\text{O}$  and Cu yield  $\text{CH}_2\text{:CH}\cdot\text{CHO}$  (I) and  $\text{NH}_3$ ,

whilst in presence of  $\text{OsO}_4$ , cyclopropanone and its hydrate are formed as intermediate products, which isomerise to yield (I) and  $\text{EtCO}_2\text{H}$ . R. T.

**Action of primary aromatic amines on ethyl hypophosphate.** A. E. ARBUSOV and B. P. LUGOVKIN (J. Gen. Chem. Russ., 1936, 6, 394—403).— $\text{Et}_4$  hypophosphate yields the following compounds, of the probable structure  $\text{NR:P}(\text{OH})(\text{OEt})_2$ : with  $\text{NH}_2\text{Ph}$ , m.p. 70.5—71.5°; with *p*-toluidine, m.p. 74—75°; with 3:4-dimethylaniline, m.p. 94—95°; with  $\beta$ - $\text{C}_{10}\text{H}_7\cdot\text{NH}_2$ , m.p. 67—68°. The products are sol. in  $\text{H}_2\text{O}$ , and are readily hydrolysed by aq.  $\text{NaOH}$ . R. T.

**Molecular dissymmetry due to symmetrically placed hydrogen and deuterium. I. Resolution of  $\alpha$ -pentadeuterophenylbenzylamine.** G. R. CLEMO and A. MCQUILLEN (J.C.S., 1936, 808—810).— $\text{C}_6\text{D}_6$  with  $\text{BzCl}$  in boiling  $\text{CS}_2$  containing  $\text{AlCl}_3$  affords pentadeuterobenzophenone, b.p. 160°/15 mm. (oxime, m.p. 140°, undepressed by benzophenoneoxime) (cf. A., 1935, 806; this vol., 604). The oxime in dil.  $\text{NaOH}$  at 100° with Na-Hg affords *dl*- $\alpha$ -pentadeuterophenylbenzylamine, which rapidly absorbs  $\text{CO}_2$ , and is resolved into *d*- $\alpha$ -pentadeuterophenylbenzylamine 1-*H* tartrate (I), m.p. 181°,  $[\alpha]_D^{25}$  —13.2°, and *l*- $\alpha$ -pentadeuterophenylbenzylamine *d*-*H* tartrate (II), m.p. 181°,  $[\alpha]_D^{25}$  +13.2°. (I) and (II) afford with  $\text{NaOH}$  and then  $\text{H}_2\text{C}_2\text{O}_4$ , oxalates,  $[\alpha]_D^{25}$  +2.2° and —2.5°, respectively, from which the free *d*-,  $[\alpha]_D^{25}$  +5.0°, and *l*-bases,  $[\alpha]_D^{25}$  —5.7° (cf. A., 1934, 832; this vol., 604), are prepared. J. L. D.

**Molecular compounds of acid anhydrides with amines.** R. KOJIMA (Sci. Rept. Tokyo Bunrika Daigaku, 1936, 3, 71—88).—The constitution of mol. compounds of acid anhydrides with amines has been determined by measurement of eutectic points, with the following results:  $\text{C}_6\text{H}_4(\text{CO})_2\text{O}$  with  $\beta$ - $\text{C}_{10}\text{H}_7\cdot\text{NH}_2$  (1:1);  $\text{C}_6\text{H}_2(\text{CO})_2\text{O}$ , with  $\beta$ - $\text{C}_{10}\text{H}_7\cdot\text{NH}_2$  (2:1),  $\text{NHPH}_2$  (1:1), antipyrine (3:2), pyrimidone (1:1);  $\text{Bz}_2\text{O}$  with  $\beta$ - $\text{C}_{10}\text{H}_7\cdot\text{NH}_2$  (1:1), antipyrine (1:1), pyrimidone (1:1); and  $\text{C}_6\text{H}_4(\text{CO})_2\text{O}$  with  $\beta$ - $\text{C}_{10}\text{H}_7\cdot\text{NH}_2$  (1:1),  $\text{NHPH}_2$  (2:1). F. R. S.

***p*-Toluidine in binary systems with certain phenols.**—See this vol., 931.

**Manufacture of substituted aromatic amino-compounds [sulphones].**—See B., 1936, 488.

**Relative hypnotic effects of some aryl- and unsymmetrical arylalkyl-thiocarbamides.** E. J. DEBEER, J. S. BUCK, W. S. IDE, and A. M. HJORT (J. Pharm. Exp. Ther., 1936, 57, 19—33).—The following new *as*. thiocarbamide derivatives have been prepared by condensing the appropriate amine (1 mol.) with KCNS (1.1 mol.) in aq. solution containing conc.  $\text{HCl}$  (1.3 mol.), the *sec*. amines prepared by alkylation of the primary amines (I), being freed from unchanged (I) by treatment with a conc.  $\text{PhCHO}\cdot\text{NaHSO}_3$  solution; *m*-, m.p. 166°, and *p*-anisyl, m.p. 218°, *o*-, m.p. 109°, and *m*-tolylmethyl, m.p. 76°, *o*-, m.p. 104°, *m*-, m.p. 145°, and *p*-anisylmethyl, m.p. 148°, *o*-, m.p. 97°, *m*-, m.p. 111°, and *p*-phenetilmethyl, m.p. 144°, *o*-, m.p. 93°, *m*-, m.p. 108°, and *p*-tolylethyl, m.p. 101°, *o*-, m.p. 118°, *m*-, m.p. 128°, and *p*-anisylethyl, m.p. 140°, *o*-, m.p. 99°, *m*-, m.p. 152°, and *p*-

*phenylethyl*, m.p. 106°, *n-phenylpropyl*, m.p. 108°, *o-*, m.p. 87°, *m-*, m.p. 115°, and *p-tolyl-n-propyl*, m.p. 78°, *o-*, m.p. 85°, *m-*, m.p. 153°, and *p-anisyl-n-propyl*, m.p. 122°, *o-*, m.p. 124°, *m-*, m.p. 173°, and *p-phenetyl-n-propyl*, m.p. 103°, *phenyl-*, m.p. 89°, *o-*, m.p. 68°, *m-*, m.p. 66°, and *p-tolyl-n-butyl*, m.p. 98°, *o-*, m.p. 94°, *m-*, m.p. 106°, and *p-anisyl-n-butyl*, m.p. 129°, *o-*, m.p. 126°, *m-*, m.p. 126°, and *p-phenetyl-n-butyl*, m.p. 78°, *phenyl-*, m.p. 78°, *o-*, m.p. 73°, *m-*, and *p-tolyl-n-amyl*, m.p. 78°, *o-*, m.p. 80°, *m-*, m.p. 85°, and *p-anisyl-n-amyl*, m.p. 139°, *o-*, m.p. 122°, *m-*, m.p. 103°, and *p-phenetyl-n-amyl*, m.p. 123°. In a homologous series, the hypnotic effect on mice increases with increase in mol. wt. until the Pr or amyl member (according to the series) is reached, after which it remains approx. const. The lower members of the series are more potent than the corresponding carbamide analogue; the higher members are approx. equally active.

W. O. K.

**Optically active imides.** O. LUTZ (Ber., 1936, 69, [B], 1333—1337).—*l*-Anilinosuccinoanil has m.p. 211.5—212°,  $[\alpha]_D^{20}$  —12.4° in  $C_5H_5N$ . *p-Toluidine* *l-p-toluidinosuccinate*, m.p. 157°,  $[\alpha]_D^{20}$  +44.8°, +53.3°, and +57.8° in presence of 1, 4, and 39 mols. of HCl, respectively, obtained from *p-C\_6H\_4Me-NH\_2* and *l*-bromosuccinic acid under defined conditions, passes when slowly heated to 155° into *l-p-toluidinosuccino-p-tolil*, m.p. 215—215.5°,  $[\alpha]_D^{20}$  —11.2° in  $C_5H_5N$ . *m-Toluidine* *l-m-toluidinosuccinate*, m.p. 126—126.5°,  $[\alpha]_D^{20}$  +32.7°, +40.8° and +46.2° in presence of 1, 5, and 40 mols. of HCl, respectively, *l-m-toluidinosuccino-m-tolil*, m.p. 120—121°,  $[\alpha]_D^{20}$  —21.9° in  $C_5H_5N$ , *o-toluidine* *l-o-toluidinosuccinate*, m.p. 104°, and *l-o-toluidinosuccino-o-tolil*, m.p. 109—111°,  $[\alpha]_D^{20}$  —3.7°, are described.

H. W.

**Ethyl esters of  $\beta$ -arylaminoacrotonic acids.** S. COFFEY, J. K. THOMSON, and F. J. WILSON (J.C.S., 1936, 856—859).—Carefully purified  $CH_3Ac-CO_2Et$  (1 mol.) with  $NH_2Ph$  (1 mol.) and a little  $NH_2Ph.HCl$  at room temp. affords Et  $\beta$ -anilinocrotonate (cf. A., 1884, i, 302). A drop of HCl or I catalyses the reaction. The following are similarly prepared, with or without a catalyst: Et  $\beta$ -*p*-phenetidino-, m.p. 54—54.5° (lit., 60—61°),  $\beta$ -*m*-4-xyloidino-, b.p. 123—124°/2 mm. (cf. A., 1919, i, 453),  $\beta$ -*p*-xyloidino- (I), b.p. 132—133°/2—3 mm.,  $\beta$ -*p*-phenylaminoanilino-, m.p. 77—78°,  $\beta$ -*o*- (II), b.p. 141—143°/2 mm., and  $\beta$ -*m*-chloroanilino-crotonate, b.p. 145—148°/1—1.5 mm. Nitroanilines do not enter into reaction as above. (I) with *p*-xylidine in boiling petroleum (b.p. > 120°) affords  $\beta$ -*p*-xylidinocrotono-*p*-xylidine in poor yield. Similarly, (II) affords  $\beta$ -*o*-chloroanilinocrotono-*o*-chloroanilide. The other Et  $\beta$ -arylaminoacrotates do not react similarly, which indicates that they do not form an intermediate stage in the prep. of  $\beta$ -arylaminoacrotanoarylamides.

J. L. D.

**Amidines. I. Synthesis of symmetrical and unsymmetrical benzdiphenylamidines, and new reactions of amidines.** S. P. JOSHI, A. P. KHANOLKAR, and T. S. WHEELER (J.C.S., 1936, 793—797).—Many arylamines with benzotrichloride in  $PhNO_2$  at 165° afford *s*-benzdiphenylamidines. The following are prepared using the appropriate arylamine: *s-benzdi-p-nitrophenyl-* (I), m.p. 190° [also prepared

from benzo-*p*-nitroanilideimidochloride (which may be an intermediate product in the above reaction),  $-NO_2 \cdot C_6H_4 \cdot NH_2$ , and  $NPhEt_2$  at 100°] (*hydrochloride*, sinters at 265°; *Ac* and *N-Me* derivatives, m.p. 182—183° and 188°, respectively), *m-nitrophenyl-* (II), m.p. 147—148° (*hydrochloride*, m.p. 275°; *sulphate*, m.p. 196°; *Ac*, *Bz*, and *N-Me* derivatives, m.p. 135—136°, 195—196°, and 114—115°, respectively), *m-tolyl-* (III), m.p. 135° (*N-Me* derivative, m.p. 90°), *p-chlorophenyl-* (IV), m.p. 143° (*hydrochloride*, decomp. > 250°; *sulphate*, m.p. 201°; *Bz* and *N-Me* derivatives, m.p. 155—156°, and 153—154°, respectively), *s-tribromophenyl-amidine*, m.p. 196—197° (*Ac*, *Bz*, and *N-Me* derivatives, m.p. 173—174°, 235—237°, and 160—161°, respectively). *o-* and *m*-Nitro-*p*- and *p*-nitro-*o*-toluidine and 2:4-dinitroaniline will not react.  $CPhCl_3$  reacts with  $NHPhAc$  at 150° to give *s*-acetdiphenylamidine and  $NHPhBz$ .  $p-C_6H_4Cl-NHBz$  with  $NH_2Ph$  in dry boiling  $C_6H_6$  containing  $PCl_5$  (A., 1927, 144) affords *benz-N-p-chlorophenyl-N'-phenylamidine* (V), m.p. 120—122° (also obtained from  $CPhCl_3$ ,  $NH_2Ph$ ,  $p-C_6H_4Cl-NH_2$ , and  $PhNO_2$ ; and from benzo-*p*-chloroanilideimidochloride,  $NH_2Ph$ , and  $NPhEt_2$ ) (*hydrochloride*, m.p. 260—262°; *Bz* derivative, m.p. 155—156°). The following are prepared similarly: *benz-N-p-bromophenyl-N'-phenyl-* (VI), m.p. 123° (*hydrochloride*, m.p. 265—266°), *N-p-chlorophenyl-N'-p-methoxyphenyl-*, m.p. 117—119° (*hydrochloride*, m.p. 260°; *picrate*, m.p. 165—166°), *N-p-chlorophenyl-N'-p-ethoxyphenyl-*, m.p. 95—98° (*hydrochloride*, m.p. 242—244°; *picrate*, m.p. 147—148°), *N-p-chlorophenyl-N'-p-tolyl-*, m.p. 134° [*hydrochloride*, m.p. 283° (decomp.); *picrate*, m.p. 189—190°], *N-p-nitrophenyl-N'-m-nitrophenyl-*, m.p. 170° (*hydrochloride*, sinters at 238°), *p-nitrophenyl-N'-p-tolyl-*, m.p. 159—160° (*hydrochloride*, sinters at 258°), *N-p-nitrophenyl-N'-m-4-xylyl-*, m.p. 143—144° (*hydrochloride*, sinters at 237°), *N'-p-chlorophenyl-N-p-nitrophenyl-*, m.p. 174—175° (*hydrochloride*, sinters at 272°), *N'-p-bromophenyl-N-p-nitrophenyl-amidine*, m.p. 170—171° (*hydrochloride*, sinters at 270°), and *p-nitrobenz-N-p-nitrophenyl-N'-phenylamidine*, m.p. 223° (*hydrochloride*, sinters at 250°). (III) with  $MeI$  at 105° affords *benz-N-p-chlorophenyl-N'-phenyl-N-methylamidine*, m.p. 112° (synthesised from  $p-C_6H_4Cl-NHMe$ , benzoanilideimidochloride, and  $NPhEt_2$ ) (*hydrochloride*, m.p. 226°; *picrate*, m.p. 157—158°), and *benz-N'-p-chlorophenyl-N-phenyl-N-methylamidine*, m.p. 102° (synthesised from  $NHPhMe$ , benzo-*p*-chloroanilideimidochloride, and  $NPhEt_2$ ) (*picrate*, m.p. 150—151°). (IV) similarly affords *benz-N-p-bromophenyl-N'-phenyl-N-methylamidine*, m.p. 123—124° (*picrate*, m.p. 179—180°), and *N'-p-bromophenyl-N-phenyl-N-methylamidine*, m.p. 120—121° (*picrate*, m.p. 158—159°). *s*-Benzdiphenylamidine with  $KMnO_4$  in dil.  $H_2SO_4$  at 100° affords *s-diphenyldi(phenyliminobenzyl)hydrazine*, m.p. 112°. (I) and (II) similarly afford *s-di-p-nitrophenyldi(p-nitrophenyliminobenzyl)hydrazine*, m.p. 236°, and *s-di-m-nitrophenyldi(m-nitrophenyliminobenzyl)hydrazine*, m.p. 262—264°, respectively. (II) in  $C_6H_6$  containing  $ClCO_2Et$  with  $NaHCO_3$  at room temp. affords *N-carbethoxy-s-benzdi-m-nitrophenylamidine*, m.p. 153°, also obtained from (II) and  $COCl_2$  in  $PhMe$  at room temp. (I), (III), and (IV) similarly yield *N-carbethoxy-s-benzdi-p-nitrophenyl-*, m.p. 169—170°,

-*m*-tolyl-, m.p. 94–95°, and -*p*-chlorophenyl-amidine, m.p. 118–119°.

J. L. D.

Attempts to prepare [optically] active complex salts containing an asymmetric nitrogen atom. Y. NAKATSUKA and H. INUMA (Bull. Chem. Soc. Japan, 1936, 11, 353–357; cf. this vol., 598).—Attempts were made to prepare complex salts of the type  $[\text{CoA}_2(\text{DH})_2]\text{X}$  ( $\text{DH}$ =dimethylglyoxime,  $\text{A}$ =*sec.* or *tert.* base), the optical activity of which would depend on *as*-N centres only. Using  $\text{NPhMe}_3$ , no compound could be obtained, and with  $\text{NPhMe}$  the salt  $[\text{CoA}(\text{DH})_2]\text{X}$  resulted. Attempts to prepare  $[\text{CoA}'(\text{DH})_2]\text{X}$  ( $\text{A}'=\text{NPhMe}$ :  $\text{A}'$ =primary base) failed when  $\text{A}'$  was  $\text{NH}_3$  or  $\text{NH}_2\text{Ph}$ , but succeeded when  $\text{A}'$  was  $\alpha$ - or  $\beta$ - $\text{C}_{10}\text{H}_7\text{-NH}_2$ . Definite proof of the resolution of the compounds, using optically active acids, could not be obtained. The prep. and properties of the following salts are described: *di-dimethylglyoxime- $\alpha$ -naphthylamine-methylanilinecobaltic chloride*, acetate, *d-camphorsulphonate*, *d- $\alpha$ -bromo--camphorsulphonate*, *d-tartrate*, and *d-camphornitroso-compound*. The corresponding  $\beta$ - $\text{C}_{10}\text{H}_7\text{NH}_2$  acetate, *d-camphorsulphonate*, and *d-camphornitroso-compound* were prepared.

J. T. A.

Theory of oxidative dyeing. II. Oxidation of *p*-phenylenediamine at different  $p_{\text{H}}$ . III. Colloidal properties of oxidative dyeing baths. V. PTSCHELIN (J. Appl. Chem. Russ., 1936, 9, 846–854, 855–861).—II. The velocity of oxidation of  $p\text{-C}_6\text{H}_4(\text{NH}_2)_2$  (I) by  $\text{H}_2\text{O}$  at  $p_{\text{H}}$  4.45 and 8.05 is  $>$  at  $p_{\text{H}}$  3.05 and 10.35; the amount of sol. oxidation products formed is greatest at  $p_{\text{H}}$  4.45. Production of  $\text{NH}_3$  is at a min. at  $p_{\text{H}}$  8.05.

III. During oxidation of (I) by atm.  $\text{O}_2$ , colloidal and sol. products are formed at  $p_{\text{H}}$  3–11, both of which have dyeing properties, and both are produced in greatest amounts at  $p_{\text{H}}$  4.45 and 8. The colloidal particles have a positive charge at  $p_{\text{H}}$  3, and a negative one at  $p_{\text{H}}$  11; the magnitude of the charge is small, and is of no importance in the process of dyeing. Bandrowski's base (II), but not the above oxidation products, is rapidly coagulated at high  $p_{\text{H}}$ . The dyeing power of (II) is intensified in presence of (I). The oxidation processes are retarded in gelatin, which is only very faintly dyed by the products.

R. T.

Thiocyanate co-ordination compounds.—See this vol., 948.

Azoxycarboxylic derivatives. E. JOLLES (Atti R. Accad. Lincei, 1936, [vi], 23, 67–72).—The views of Oddo and Indovina (this vol., 328–329, Part XI), and their experimental findings, are criticised. Benzeneazoxycarboxylamide (I) and Br give a substance of m.p. 107–110°, not 102–103°; the “benzeneazoxycarboxylic acid” of m.p. 142° (*loc. cit.*) is impure (I). The protective action of the group  $\cdot\text{NO}$  is shown by the fact that benzeneazoxycarboxyanilide and Br give the monosubstituted *p*-bromoanilide, whilst benzeneazocarboxyanilide yields 2 : 4-dibromobenzeneazocarboxy-*p*-bromoanilide. The velocity of hydrolysis of azoxy-esters in  $\text{PhNO}_2$  and  $\text{NH}_3$  is infinitely greater than that of formation of diazo-hydroxides, whilst with the amides the reverse is the case. Benzene-, m.p. 163°, and *p*-chlorobenzene-

azoxycarboxydiphenylamide, m.p. 162°, are prepared; neither of these gives  $\text{RNO}$ , on hydrolysis.

E. W. W.

Azo-dyes. II. A. MIRONESCU and I. V. NICOLIESCU (Bul. Soc. Chim. Romania, 1935, 17, 293–296; cf. A., 1933, 1286).—Arylideneamines couple normally with diazonium salts, halogenoarylideneamines unusually readily. Benzylidenediamines give vat dyes. Diazotised benzidine and  $\text{NPh}:\text{CH}:\text{C}_6\text{H}_4\text{Cl-}p$  with  $\text{NaOAc}$  in hot  $\text{EtOH}$  give 4-*p*-chlorobenzylidenaminobenzeneazo-4'-hydroxydiphenyl, m.p. 112°;  $\alpha\text{-C}_{10}\text{H}_7\text{N}:\text{C}_6\text{H}_4\text{Cl-}p$  gives 4-*p*-chlorobenzylidenaminonaphthaleneazo-4'-hydroxydiphenyl, m.p. 173°.  $\text{NPh}:\text{CHPh}$  with the appropriate diazonium salts gives *Na* 2-(benzylidenaminobenzeneazo)naphthalene-4-sulphonate, m.p. 137°, and  $\alpha$ -benzylidenaminobenzeneazonaphthalene, m.p. 194°. Diazotisation of  $m\text{-NH}_2\text{C}_6\text{H}_4\text{N}:\text{CHPh}$  in very dil.  $\text{HCl}$  and coupling gives *m*-benzylidenaminobenzeneazo-dimethylaniline hydrochloride, m.p. 290°, and -resorcinol, m.p. 322°. All the dyes are hydrolysed by  $\text{HCl}$  to  $\text{NH}_2$ -compounds. The compounds containing the  $\text{C}_{10}\text{H}_8$  ring have great stability.

R. S. C.

Action of amines on esters. I. H. IRVING (J.C.S., 1936, 797–801).— $\beta\gamma\gamma$ -Tetrachloro- $\alpha$ -nitropropane (I) with  $\text{NPh}:\text{NH}_2$ ,  $p\text{-C}_6\text{H}_4\text{Me}:\text{NH}_2$ , or dry  $\text{NH}_3$  in  $\text{EtOH}$  affords  $\gamma\gamma\gamma$ -trichloro- $\alpha$ -nitro- $\beta$ -phenylhydrazino-,  $\beta$ -*p*-toluidino-, and  $\beta$ -amino-propane, respectively, but  $\gamma\gamma\gamma$ -trichloro- $\alpha$ -nitro- $\beta$ -hydroxypropane is unreactive, unlike the corresponding  $\beta$ -OAc-compound (cf. this vol., 595). Picryl acetate, in which the  $\text{C}_{(1)}$  is definitely cationoid, gives neither picramide with  $\text{NH}_3$  nor  $\beta$ -picrylphenylhydrazine with  $\text{NPh}:\text{NH}_2$  (cf. A., 1895, i, 140; 1920, i, 99).  $\beta\beta\beta$ -Trichloro- $\alpha$ -acetoxypromionamide,  $\gamma\gamma\gamma$ -trichloro- $\alpha$ -acetamido- $\beta$ -acetoxypromion,  $\gamma\gamma\gamma$ -trichloro- $\beta$ -acetoxypromion,  $\beta\beta\beta$ -trichloro- $\alpha$ -acetoxypromion, and chloral diacetate do not react readily with  $\text{NH}_3$  or  $\text{NPh}:\text{NH}_2$ , in spite of the electron-restraining  $\cdot\text{CCl}_3$  in the mol. *O*-Acetylchloral cyanohydrin, *O*-acetylchlorolactic acid, or the dimeride of  $\text{AcCN}$  does not react with  $\text{NH}_3$ ,  $\text{NH}_2\text{Ph}$ , or  $\text{NPh}:\text{NH}_2$  to give amines, in spite of the presence of two electron-restraining groups (cf. this vol., 595). The mechanism of amination probably involves loss of  $\text{HCl}$  or  $\text{AcOH}$ , followed by addition of the amine to the double linking.

J. L. D.

Anomalous decomposition of the tetrazo-derivative of 2 : 2'-diamino-1 : 1'-dinaphthyl. III. A. CORBELLINI, C. BOTRUGNO, and P. VILLA (Gazzetta, 1936, 66, 186–196).—1 : 2- $\text{C}_{10}\text{H}_6\text{Bz}:\text{NH}_2$  (Dziwonski *et al.*, A., 1935, 336), diazotised and treated with  $\text{SnCl}_2\text{-HCl}$  at 0° and the  $\text{Et}_2\text{O}$ -sol. part treated with  $\text{HCl}$ , yields a hydrochloride which with aq.  $\text{NH}_3$  gives 3-phenyl-4 : 5-1' : 2'-naphthopyrazole [1-phenyl- $\beta$ -naphthindazole] (I), m.p. 199–5° (picrate, m.p. 154–155°; Ac derivative, m.p. 159–5°). 1-Phenyl- $\beta$ -naphthindazole-2'-acrylic acid (II) (A., 1932, 524) fused with  $\text{KOH}$  and treated with  $\text{HCl}$  yields the corresponding carboxylic acid (*loc. cit.*), m.p. 269–270–5° (decomp.) [*Me* ester (impure), m.p. 110–120° (picrate, m.p. 168–171°); *Et* ester (impure), m.p. 85–90° (picrate, m.p. 148–149°); lactam, m.p. 230°], decarboxylated to (I). The constitution

of (II) from tetrazotised 2:2'-diamino-1:1'-dinaphthyl (A., 1931, 966), is thus confirmed. Oxidation ( $\text{Na}_2\text{O}_2$ ) of naphthisatin affords 2:1- $\text{NH}_2\cdot\text{C}_{10}\text{H}_6\cdot\text{CO}_2\text{H}$  (Friedlander and Littner, A., 1915, i, 246) [*Bz*, m.p. 196° (decomp.), and *CHPh*: derivative, m.p. 197.5—198° (decomp.)], the former with  $\text{SOCl}_2$  yielding benzoylbenzoanthranil,  $\text{C}_{10}\text{H}_6\text{N} \begin{smallmatrix} \text{CO}\cdot\text{O} \\ \text{N}=\text{CPh} \end{smallmatrix}$  or  $\text{C}_{10}\text{H}_6\text{N} \begin{smallmatrix} \text{CO} \\ \text{NBz} \end{smallmatrix}$ , m.p. 187—187.5°. F. O. H.

**Diazo-resins.** III. E. JOLLES (Gazzetta, 1936, 66, 204—208).—Recent papers by Oddo and Indovina (cf. this vol., 328) are criticised. E. W. W.

**Nitro-amino-hydroxy-derivatives of benzene.** G. I. GERSCHZON (J. Appl. Chem. Russ., 1936, 9, 879—884).—The prep. of 4-nitro-2-aminophenol from 1:2:4- $\text{C}_6\text{H}_3\text{Cl}(\text{NO}_2)_2$ , picramic acid from picric acid, 2-aminophenol-4-sulphonic acid (I) from 2-nitrophenol-4-sulphonic acid, and 6-nitro-2-aminophenol-4-sulphonic acid from (I) are described. R. T.

**Preparation of thymol from *m*-cresol [by the phosphoric acid method].** I and II. K. ONO and M. IMOTO (J. Soc. Chem. Ind. Japan, 1936, 39, 170—171B).—The method of B.P. 200,151 (cf. A., 1923, i, 1006), using *m*-cresol (I),  $\text{Pr}^\beta\text{OH}$ , and  $\text{H}_3\text{PO}_4$ , affords thymol (II) (identified as 1:4:3- $\text{C}_6\text{H}_3\text{MePr}^\beta\cdot\text{O}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$ ), an isomeride (III) of (II), m.p. 114°, diisopropyl-*m*-cresol (IV), b.p. 260—266°, *m*- $\text{C}_6\text{H}_4\text{Me}\cdot\text{OPr}^\beta$  (V), thymol isopropyl ether (VI), b.p. 210—220°, and an isomeride, b.p. 220—230°. Steam-distillation of the reaction mixture leaves (V) (insol. in 10% aq. KOH), (IV) and probably the  $\text{Pr}^\beta$  ether of (IV); the distillate contains (I), (II), (III) (all three sol. in 10% aq. KOH), (V), (VI), and (IV). P. G. C.

**Effect of halogen substituents on rearrangement of aryl alkyl ethers.** I. Ethers which rearrange normally. C. D. HURN and C. N. WEBB (J. Amer. Chem. Soc., 1936, 58, 941—942).—*o*-Bromophenyl allyl ether, b.p. 130—134°/20 mm., heated to about 220° in  $\text{N}_2$  or  $\text{CO}_2$  rearranges exothermally to 82% of 6-bromo-2-allylphenol, b.p. 87—88°/2 mm. 2:4-Dibromophenyl allyl ether, b.p. 127—134°/0.5 mm., heated in tetrahydronaphthalene gives 69% of 4:6-dibromo-2-allylphenol, b.p. 118—122.5°/1 mm., and 11% of phenolic material, b.p. 109.5—118°/1 mm. Contrary to Raiford and Howland (A., 1931, 615), 3:5- $\text{C}_6\text{H}_3\text{Br}_2\cdot\text{O}\cdot\text{CH}_2\cdot\text{CH}(\text{CH}_3)_2$  rearranges exothermally to 72% of 3:5-dibromo-2-allylphenol, b.p. 138—139°/2 mm., and 6% of (probably) 3:5-dibromo-1-methylcoumarone, b.p. 143—147°/1 mm. 4:6-Dibromo-2-allylphenoxyacetic acid has m.p. 115—117.5°. The above ethers are prepared by Claisen's method (A., 1913, i, 1175). H. B.

**Action of organo-magnesium compounds on phenolic ethers.** V. GRIGNARD and J. RITZ (Bull. Soc. chim., 1936, [v], 3, 1181—1184).—The scission of phenolic ethers  $\text{ArOR} + \text{MgR}'\text{X} \rightarrow \text{ArO}\cdot\text{MgX} + \text{RR}'$  is accompanied by the production of mixtures of hydrocarbons. Thus  $\text{PhOEt}$  and  $\text{MgEtHal}$  afford  $\text{C}_2\text{H}_6$ ,  $\text{C}_3\text{H}_8$ , and  $\text{C}_4\text{H}_{10}$  and with  $\text{MgMeI}$  yields  $\text{C}_2\text{H}_6$ ,

$\text{C}_2\text{H}_4$ , and  $\text{C}_3\text{H}_8$ . The formation of  $\text{MeI}$  from  $\text{MgPr}^\beta\text{I}$  and  $\text{PhOMe}$  is due to secondary change:  $2\text{Pr}^\beta\text{I} + \text{Mg} = \text{MgI}_2 + \text{CHMe}\cdot\text{CH}_3 + \text{C}_3\text{H}_8$  and  $\text{PhOMe} + \text{MgI}_2 \rightarrow \text{OPh}\cdot\text{MgI} + \text{MeI}$ ; gas is not evolved. The change is better explained on the basis of Grignard's formulation than by that of Baeyer and Villiger. Iodides are greatly superior to bromides for the conversion of phenolic ethers into phenols. H. W.

**Action of chloroacetic acid on naphthols.** R. SHIBATA and M. OKUYAMA (Tech. Rep. Tohoku, 1936, 12, 119—135).— $\alpha$ -Naphthyloxyacetic acid (Spitzer, A., 1901, i, 715; Ingham *et al.*, A., 1931, 737) with  $\text{HNO}_3$  at 20—30° gives its 4- $\text{NO}_2$ -derivative [unstable  $\text{NH}_2\text{Ph}$  salt, converted by heat into the anilide (I), m.p. 181.5°, also obtained from  $\text{NH}_2\text{Ph}$  and the acid chloride, m.p. 96°;  $\alpha$ -naphthylamide, m.p. 241°], reduced ( $\text{Sn}\text{--HCl}\text{--AcOH}$ ) to the 4- $\text{NH}_2$ -derivative {*m*-nitrobenzylidene derivative, m.p. 182.5°; anilide, m.p. 142.5°, [by reduction of (I) with  $\text{Sn}\text{--HCl}$ ] (*m*-, m.p. 217.5°, and *p*-nitrobenzylidene derivative, m.p. 243°)}, the hydrochloride of which with  $\text{S}_2\text{Cl}_2$  in dry  $\text{C}_6\text{H}_6$  at 40—80° gives a thiazthionium salt ( $\text{O}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$  replaced by Cl), converted by  $\text{NH}_2\text{Ph}$  into the thiazthionium chloride (II) which is a bordeaux-red basic dye. Nitration of  $\beta$ -naphthyloxyacetic acid (Spitzer, *loc. cit.*) affords mainly its 1- $\text{NO}_2$ -derivative, m.p. 191—192° [anilide (III), m.p. 169° (lit. m.p. 139°)], and an isomeric (?) 6- $\text{NO}_2$ -derivative, m.p. 157—185° [anilide (IV), m.p. 217°]. Reduction of (III) with  $\text{Sn}\text{--HCl}$  gives the lactam of 1-amino-2-naphthyloxyacetic acid; (IV) is reduced to (?) 6-amino-2-naphthyloxyacetic acid, m.p. 187—188°. 2:6- $\text{OH}\cdot\text{C}_{10}\text{H}_6\cdot\text{SO}_3\text{Na}$  and  $\text{CH}_2\text{Cl}\cdot\text{CO}_2\text{H}\text{--NaOH}$  afford the  $\text{Na}_2$  salt +  $2\text{H}_2\text{O}$  (converted by crystallisation from dil. HCl into the  $\text{Na}_1$  salt) of 6-sulpho-2-naphthyloxyacetic acid, converted by  $\text{HNO}_3$  (d 1.397) into its 1- $\text{NO}_2$ - (V) and (from the mother-liquor) (?) 4- $\text{NO}_2$ -derivative. Reduction of (V) with  $\text{Fe}\text{--}20\%$   $\text{AcOH}$  and subsequent neutralisation gives the  $\text{Na}$  salt of the lactam of 6-sulpho-1-amino-2-naphthyloxyacetic acid, hydrolysed by  $\text{NaOH}$  to the  $\text{Na}$  salt of the corresponding  $\text{NH}_2$ -acid. 2:3:6- $\text{C}_{10}\text{H}_5(\text{OH})_2\cdot\text{SO}_3\text{H}$  and  $\text{CH}_2\text{Cl}\cdot\text{CO}_2\text{H}$  give the 2:3-dioxyacetic acid (as its  $\text{Na}$  salt), but 1:8:3:6- $\text{C}_{10}\text{H}_4(\text{OH})_2(\text{SO}_3\text{H})_2$  affords only a mono-oxyacetic acid (as its  $\text{Na}$  salt), and 1:8:4- $\text{C}_{10}\text{H}_5(\text{OH})_2\cdot\text{SO}_3\text{H}$  gives the 1-oxyacetic acid. J. W. B.

**Preparation of resorcinol.** N. I. VOLINKIN (J. Appl. Chem. Russ., 1936, 9, 885—888).—A process for the prep. of resorcinol consists in sulphonating  $\text{C}_6\text{H}_6$  with oleum, fusing the  $\text{Na}$  salt of the  $\text{m}\text{--C}_6\text{H}_4(\text{SO}_3\text{H})_2$  with an equal wt. of  $\text{NaOH}$  at 300—320°, and recrystallising from  $\text{PhMe}$ . R. T.

**Raman spectra of isoeugenol and the safrole series.**—See this vol., 922.

**Polymeric phenols having a tetramethylene structure.** E. PUXEDDU (Rend. semin. fac. sci. Univ. Cagliari, 1933, 3, 64—66; Chem. Zentr., 1934, ii, 934).—Polemical against Haworth and Mavin (A., 1931, 954); it is suggested that disoeugenol is 2:6-dihydroxy-3:7-dimethoxy-9:10-diethyl-9:10-dihydroanthracene. H. N. R.

Structural isomerides and stereo-isomerides of methylcyclo-[1:2:2]-heptanols and -heptanones. II. G. KOMPPA and S. BECKMANN (Annalen, 1936, 523, 68—86; cf. A., 1935, 1123).—When boiled for some hr., cyclopentadiene (I) and CHMe:CH:CO<sub>2</sub>H (II) give much dicyclopentadiene (III) and about 30% of trans-3-exomethylcyclo-[1:2:2]-heptene-2-endocarboxylic acid (IV), b.p. 137—139°/18 mm., m.p. 95° (amide, m.p. 131—132°; anilide, m.p. 111—112°) (cf. A., 1929, 820), hydrogenated to trans-3-exomethylcyclo-[1:2:2]-heptene-2-endocarboxylic acid (A), m.p. 68—69° (chloride, b.p. 87—89°/14 mm.; amide, m.p. 140—141°; anilide, m.p. 144—145°). (I) or (III) with (II) at about 170° gives a mixture of (IV) and its cis-isomeride (called

the iso-acid), m.p. 62—63°, b.p. 133—134°/13 mm. (amide, m.p. 146° anilide, m.p. 129—130°), hydrogenated (Pd) to iso-3-methylcyclo-[1:2:2]-heptene-2-carboxylic acid, m.p. 40—41°, b.p. 125—126°/9 mm. (amide, m.p. 146—147°; chloride, b.p. 87—89°/16 mm.). Curtius degradation leads to trans-3-exomethylcyclo-[1:2:2]-heptyl-2-endoamine (hydrochloride; carbamide derivative, m.p. 200—201°) and the isoamine (hydrochloride, m.p. > 275°; carbamide derivative, m.p. 206—207°), respectively. The structure of these bases, though probable, is not certain, since each with HNO<sub>2</sub> gives a mixture of isoposantenol (7-methylcyclo-[1:2:2]-heptan-2-ol) (V), b.p. 89—90°/17 mm., m.p. 85—86° (H phthalate, m.p. 165—166°), apocamphenilol (3-methylcyclo-[1:2:2]-heptan-2-ol) (VI), b.p. 80—81°/12 mm., m.p. 21—22° (H phthalate, m.p. 131—132°), and aposantenol (VII) [not obtained pure; a stereoisomeride of (VI)], b.p. 83—84°/9 mm., m.p. about 50—55°, separable only by way of the H phthalates. With K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>-H<sub>2</sub>SO<sub>4</sub> (V) gives isoposantenone, b.p. 181—183°/767 mm. (semicarbazone, m.p. 199—200°), and with KMnO<sub>4</sub>-NaOH at 40—50° cis-isoposantenic acid (methylcyclopentane-2:5-dicarboxylic acid), m.p. 155° (anhydride, m.p. 174°; anilido-acid, m.p. 197—198°), rearranged by HCl at 170—210° to a mixture of a cis-isomeride (VIII), m.p. 154—155° (anhydride, m.p. 151—152°; anilido-acid, m.p. 167—168°), with a little of an impure acid, probably a trans-isomeride. (VI) gives similarly apocamphenilone (6-methylnorcamphor) (semicarbazone, m.p. 187—188°). (VII), as isolated, is shown by K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>-oxidation to contain >5% of (V) and 25—30% of (VI); crude (VII) with KMnO<sub>4</sub> gives (VIII), which is largely unchanged by HCl at 180°, yielding only a little trans-aposantenic acid, m.p. 116—117°. Et<sub>2</sub> methylcyclopenta-3:4-dione-2:5-dicarboxylate (from Et<sub>2</sub> β-methylglutarate and Et<sub>2</sub>C<sub>2</sub>O<sub>4</sub>), when hydrogenated (PtO<sub>2</sub>) and distilled with KHSO<sub>4</sub>, gives Et<sub>2</sub> methylcyclopentadiene-2:5-dicarboxylate, which by hydrogenation and hydrolysis affords (VIII). R. S. C.

Catalytic hydrogenation of β-nitro-α-methoxy-α-arylethanes. B. REICHERT (Arch. Pharm., 1936, 274, 369—372).—The nitromethoxystyrene and NaOMe-MeOH give β-nitro-α-methoxy-p-, m.p. 57—58° (lit. an oil), and -o-anisylethane, m.p. 54°, which are hydrogenated (PtO<sub>2</sub>) in dry EtOH in presence of

H<sub>2</sub>C<sub>2</sub>O<sub>4</sub> in 70% yield to β-methoxy-β-p-, b.p. 140°/12 mm. [hydrochloride, m.p. 186—187° (decomp.; lit. 165—166.5°)], and -o-anisylethylamine [hydrochloride, m.p. 197—198° (decomp.); oxalate]. β-Methoxy-β-3:4-dimethoxyphenylethylamine is obtained similarly in 80% yield. R. S. C.

Reducing action of halogeno-organomagnesium derivatives. Optically active triarylcannabinols. A. GARCÍA BANÚS and J. MONCHE (Anal. Fis. Quim., 1935, 33, 655—679).—By reaction of the appropriate Mg aryl halides with ketones the following new carbinols were obtained; these with AcCl give chloromethanes, which in C<sub>6</sub>H<sub>6</sub> with Hg yield in certain cases triarylmethyls: phenyl-p-tolyl-p-anisyl-carbinol, a resin [chloromethane, m.p. 99—100°; triarylmethyl, orange solution (peroxide, m.p. 140—143°)], phenyl-p-tolyl-α-naphthylmethyl Et ether, m.p. 131—132° [triarylmethyl, red solution (peroxide, m.p. 179—182°)], 2:3-diphenyl-1-α-naphthylinden-1-ol, m.p. 155—158° (Et ether, m.p. 158—160°; chloride, m.p. 163°), -1-p-anisylinden-1-ol, a resin (Et ether, m.p. 205°; chloride, m.p. 145°), 1:2:3-triphenylinden-1-ol Me ether, m.p. 153°. Phenyldiphenyl-1-α-naphthylmethyl chloride (Karagunis *et al.*, A., 1933, 1041) yields the isoamyl ether, m.p. 154—155°, and an active amyl ether, m.p. 106°, [α]<sub>D</sub><sup>20</sup> +13.25° in Et<sub>2</sub>O. Attempts to prepare phenyl-o-tolyl-p-anisyl- and -p-tolyl-carbinols resulted in resins or pinacones.

F. R. G.

Differences in behaviour of cis- and trans-cyclohexanediols during dehydration. M. TIFFE-NEAU and (MLLE.) B. TCHOUBAR (Compt. rend., 1936, 202, 1931—1934).—cis-1-Methylcyclohexane-3:4-diol with Al<sub>2</sub>O<sub>3</sub> at 270—290° affords mainly 3-methylcyclohexanone (which indicates that mainly the 4-OH is eliminated) and some 1-methyl-3-cyclopentylformaldehyde, which is the only product of dehydration of the trans-isomeride (cf. A., 1935, 340; 1934, 1098). cis-1-Ethylcyclohexane-1:2-diol similarly affords 90—95% of 2-ethylcyclohexanone (I) and 5—10% of ethylcyclopentylformaldehyde (II) whereas the trans-isomeride gives 80—85% of (I) and 15—20% of (II). The cis-isomerides suffer a vinyl dehydration and the trans- a hydrobenzoin type of change (cf. A., 1935, 616).

J. L. D.

cis-trans-Transformations of cyclic systems in the light of the solvate theory. A. A. NIKOLAEV (J. Gen. Chem. Russ., 1936, 6, 182—184).—In presence of high concn. of KOH cyclohexene iodohydrin affords a mixture of the trans- and cis-diols, whilst with low [KOH] the former is the sole product. The results are explained on the basis of solvation. R. T.

Sterol group. XXII. 3-Chloroallonorcholonic acid and its epimeride. T. BARR, I. M. HEILBRON, and F. S. SPRING. XXIII. Location of the ethenoid linkage of α-dihydrofucosterol and the identity of sitostanol, fucostanol, stigmastanol, and orestastanol. D. H. COFFEY, I. M. HEILBRON, and F. S. SPRING (J.C.S., 1936, 737—738, 738—741).—XXII. Since the OH of ergosterol is now known to be attached to C<sub>3</sub>, (cf. A., 1935, 210), the chloroallonorcholonic acid of Heilbron *et al.* (A., 1933, 1290) must be the 3-Cl-compound; with reference to the H attached to C<sub>3</sub>, it is suggested that the Cl is cis.

(*trans*.-?) 3-Chloroallocholanolic acid, m.p. 195—196°, is converted by  $\text{CH}_2\text{N}_2$  into *Me* (*trans*.-?) 3-chloroallocholanate, m.p. 134—135°, which, when treated with  $\text{MgPhBr}$  and the product oxidised by  $\text{CrO}_3$  in  $\text{AcOH}$ , affords 3-(*trans*.-?) chloroallonorcholanolic acid. The *Me* ester of this is identical with the product from chloroergostane.

**XXIII.**  $\alpha$ -Dihydrofucosterol (I) with  $\text{BzO}_2\text{H}$  affords  $\alpha$ -dihydrofucosterol oxide (II), m.p. 134°,  $[\alpha]_D^{20} -35.6^\circ$  in  $\text{CHCl}_3$  [acetate, m.p. 141°, from (II) or by the action of  $\text{BzO}_2\text{H}$  on the acetate of (I)]. (II) with  $\text{H}_2\text{SO}_4$ , or the acetate of (I) with  $\text{H}_2\text{O}_2$ , affords  $\alpha$ -fucostanetriol, m.p. 248—250°, converted by  $\text{CrO}_3$  in  $\text{AcOH}$  into  $\alpha$ -fucostanedionol, m.p. 256°. This with  $\text{HCl}$  in  $\text{CHCl}_3$  gives  $\alpha$ -fucostenedione, m.p. 166°, converted by  $\text{Zn-AcOH}$  into  $\alpha$ -fucostanediol (III), m.p. 192—194°, giving a pyridazine derivative, m.p. 200°, the formation of which proves the 3:6-positions of the CO groups in (III), whence (I) contains an ethylenic linking between  $\text{C}_{(5)}$  and  $\text{C}_{(6)}$ . The  $\text{Br}_2$ -derivative of (I), treated with  $\text{CrO}_3\text{-AcOH}$  and then with  $\text{Zn-AcOH}$ , affords  $\alpha$ -fucostenone (IV), m.p. 81—82° (*semicarbazone*, m.p. 250°); the substance, m.p. 158°, previously described as this is a mixture. (IV) shows the absorption spectrum of an  $\alpha\beta$ -unsaturated ketone, so that wandering of the  $\Delta^{5:6}$  ethylenic linking to the  $\Delta^{4:5}$  position must occur during oxidation of (I). Fucostanol (V) (3:5-dinitrobenzoate, m.p. 214—215°,  $[\alpha]_D^{20} +13.8^\circ$  in  $\text{C}_6\text{H}_6$ ; benzoate, m.p. 135—136°) is converted by oxidation into fucostanone (VI) and fucostanedicarboxylic acid, m.p. 227—229° (*Me* ester, m.p. 89—90°). Reduction of (VI) affords epifucostanol, m.p. 200°,  $[\alpha]_D^{20} +25.5^\circ$  in  $\text{CHCl}_3$  (acetate, m.p. 86—87°,  $[\alpha]_D^{20} +27.4^\circ$  in  $\text{CHCl}_3$ ). It is maintained that (V) and stigmastanol, and that (I) and  $\Delta^{5:6}$ -sitosterol, are identical pairs; comparative tables of m.p. and  $[\alpha]_D$  are given.

P. G. C.

#### Introduction of nitrogen into sterol molecules.

M. VANGHELOVICI and G. VASILIU (Bul. Soc. Chim. Romania, 1935, 17, 249—265).—3-Chloro-6-oximinocholestene, m.p. 178°, and  $\text{Na-EtOH}$  give 6-aminocholestane, m.p. 126° (*hydrochloride*, decomp. 270°; *Ac* derivative, m.p. 187°). 3-Bromositostene (prep. by  $\text{PBr}_3\text{-C}_6\text{H}_6$ ), m.p. 75°, and  $\text{HNO}_3\text{-NaNO}_2$  give a poor yield of the 6- $\text{NO}_2$ -derivative, m.p. 130°. 3-Bromocholestene (I) gives similarly the 6- $\text{NO}_2$ -derivative, m.p. 154°, reduced by  $\text{Zn dust-AcOH}$  to cholestan-6-one, m.p. 90° (oxime, m.p. 197°), probably identical with, but possibly a stereoisomeride of, Windaus' ketone, m.p. 98° (A., 1920, i, 434). The reactivity of the halogen in sterol derivatives is greatly influenced by other groups present. Thus, 3-chlorocholestane is stable to hot  $\text{Na-Hg}$ , 3-chlorocholestan-6-one loses its Cl to this reagent, whilst the Cl of the acid (II) is removed by hot aq.  $\text{NaOH}$ . (I), 3-chlorocholestene at 170°, or its dibromide with  $\text{NHPh-NH}_2$ , give *N-phenyl-N-3-cholesterylhydrazine*, m.p. 196° (*Ac* derivative, m.p. 138°; *picrate*, m.p. 182°), the *as*-structure of which is proved by formation of benzylidene, m.p. 150°, *salicylidene*, m.p. 137°, *cinnamylidene*, m.p. 156°, *p-hydroxybenzylidene*, m.p. 158°, *phenylmethylmethylen*, m.p. 159°, *propylidene*, m.p. 83°, and *p-nitrobenzylidene*, m.p. 165°, derivatives, a *hydrazone* with *Et acetoacetate*, m.p. 127°, and a *tetrazine*, m.p. 165°. *N-p-Tolyl-N-3-cholesterylhydrazine*, m.p. 163°, and *N-phenyl-N-3-sitosterylhydrazine*, m.p. 193° (*Ac*, m.p. 110°, *benzylidene*, m.p. 105°, and *phenylmethylmethylen*, m.p. 185°, derivatives; *tetrazine*, m.p. 132°), are similarly prepared. (I) and the appropriate base give 3-anilino-, m.p. 177°, *o-toluidino*-, m.p. 170°, and *o-anisidin*ositostene, m.p. 134°. Ergosterol and  $\text{PCl}_5\text{-C}_6\text{H}_6$  give a *cholestatriene*, m.p. 102° (*hydrochloride*, m.p. 106°), probably stereoisomeric with the known compound, m.p. 105°.

R. S. C.

**Antirachitic irradiation product of 7-dehydrocholesterol.** A. WINDAUS, F. SCHENCK, and F. VON WERDER (Z. physiol. Chem., 1936, 241, 100—103; cf. A., 1935, 1363).—The ultra-violet irradiation product of 7-dehydrocholesterol, vitamin- $D_3$  [3:5-dinitrobenzoate (I), m.p. 129°; *allophanate*, m.p. 173—174°], antirachitic val. 24,000 international units per mg., obtained from the crude material by chromatographic adsorption on  $\text{Al}_2\text{O}_3$ , occurs in the liver oil of the tunny.  $-D_3$  obtained on hydrolysis of (I) exhibits absorption max. at 265 m $\mu$  and differs from calciferol in having  $\text{-CH}_2\text{-CH}_2\text{Bu}^\beta$  instead of  $\text{-CH:CH-CHMePr}^\beta$  in the side-chain.

W. McC.

**7-Dehydrositosterol.** W. WUNDERLICH (Z. physiol. Chem., 1936, 241, 116—124).—Sitosteryl acetate with  $\text{CrO}_3$  in  $\text{AcOH}$  at 55—60° yields 7-ketositosteryl acetate, m.p. 176°,  $[\alpha]_D^{17} -9.4^\circ$  in  $\text{CHCl}_3$  (*semicarbazone*, m.p. 250—252° decomp.,  $[\alpha]_D -265^\circ$  in  $\text{CHCl}_3$ ), which with  $\text{Al(OPr}^\beta)_3$  in  $\text{Pr}^\beta\text{OH}$  and subsequent hydrolysis gives 7-hydroxysitosterol, m.p. 151—153° [*dibenzoate* (I), m.p. 179°,  $[\alpha]_D^{19} +96^\circ$  in  $\text{CHCl}_3$ ], and isomerides. (I) heated at 200°/1 mm. gives the benzoate, m.p. 149°,  $[\alpha]_D^{21} -5.4^\circ$  in  $\text{CHCl}_3$ , which on hydrolysis in  $\text{N}_2$  at  $>64^\circ$  yields 7-dehydrositosterol (II), m.p. 144—145°,  $[\alpha]_D^{21} -116^\circ$  in  $\text{CHCl}_3$  [acetate (III), m.p. 151—152°,  $[\alpha]_D^{21} -71^\circ$  in  $\text{CHCl}_3$ ]; compound with maleic anhydride, m.p. 182—183°. (II) has absorption spectrum very similar to that of ergosterol and is converted by ultra-violet light into an antirachitic substance. Visible light converts (II) in presence of eosin and absence of  $\text{O}_2$  into a sparingly sol. substance, m.p. 200—201° (decomp.),  $[\alpha]_D -165^\circ$  in  $\text{C}_6\text{H}_5\text{N}$  [*diacetate* (IV), m.p. 202—203°,  $[\alpha]_D^{20} -105^\circ$  in  $\text{CHCl}_3$ ]. (IV) is also obtained by the action of light on (III) in presence of eosin and absence of air.

W. McC.

**7-Dehydrostigmasterol.** O. LINSERT (Z. physiol. Chem., 1936, 241, 125—128).—Stigmasteryl acetate oxidised with  $\text{CrO}_3$  in  $\text{AcOH}$  at 50° for 9 hr. yields 7-ketostigmasteryl acetate, m.p. 183°, which when boiled for 5 hr. in  $\text{Pr}^\beta\text{OH}$  with  $\text{Al(OPr}^\beta)_3$  and subsequently hydrolysed gives 7-hydroxystigmasterol (I), m.p. 154° [*di-3:5-dinitrobenzoate*, m.p. 197° decomp.; *dibenzoate* (II), m.p. 156—158°]. (II) in a vac. at 195° gives the benzoate, m.p. 180°, which on hydrolysis yields 7-dehydrostigmasterol (III), m.p. 154°,  $[\alpha]_D^{20} -113.15^\circ$  in  $\text{C}_6\text{H}_6$  (acetate, m.p. 172°). (I), (II), and (III) give a blue colour with  $\text{CCl}_3\text{-CH(OH)}_2$ . (III) exhibits almost the same absorption spectrum as does ergosterol (IV) and its structure differs from that of (IV) in having  $\text{Et}$  at  $\text{C}_{(24)}$ .

W. McC.

m.p. 137°, *cinnamylidene*, m.p. 156°, *p-hydroxybenzylidene*, m.p. 158°, *phenylmethylmethylen*, m.p. 159°, *propylidene*, m.p. 83°, and *p-nitrobenzylidene*, m.p. 165°, derivatives, a *hydrazone* with *Et acetoacetate*, m.p. 127°, and a *tetrazine*, m.p. 165°. *N-p-Tolyl-N-3-cholesterylhydrazine*, m.p. 163°, and *N-phenyl-N-3-sitosterylhydrazine*, m.p. 193° (*Ac*, m.p. 110°, *benzylidene*, m.p. 105°, and *phenylmethylmethylen*, m.p. 185°, derivatives; *tetrazine*, m.p. 132°), are similarly prepared. (I) and the appropriate base give 3-anilino-, m.p. 177°, *o-toluidino*-, m.p. 170°, and *o-anisidin*ositostene, m.p. 134°. Ergosterol and  $\text{PCl}_5\text{-C}_6\text{H}_6$  give a *cholestatriene*, m.p. 102° (*hydrochloride*, m.p. 106°), probably stereoisomeric with the known compound, m.p. 105°.

**Synthesis of vitamin-A. II.** I. M. HEILBRON, W. E. JONES, A. LOWE, and H. R. WRIGHT (J.C.S., 1936, 561—563; cf. A., 1935, 978).—When  $\beta$ -keto- $\delta$ -hydroxy- $\theta$ -(2:2:6-trimethyl- $\Delta^6$ -cyclohexenyl)- $\zeta$ -methyl- $\Delta^{\alpha\gamma\epsilon\eta}$ -octadiene (I) (p-tolylsemicarbazone, m.p. 168—169°; p-chlorobenzoylhydrazone, m.p. 204°) is heated at 160° with anhyd.  $\text{H}_2\text{C}_2\text{O}_4$ , it is dehydrated to  $\beta$ -keto- $\theta$ -(2:2:6-trimethyl- $\Delta^6$ -cyclohexenyl)- $\zeta$ -methyl- $\Delta^{\alpha\gamma\epsilon\eta}$ -octatriene (II), m.p. 138—144°. (II) with  $\text{CH}_3\text{Br}\cdot\text{CO}_2\text{Et}$  gave *Et*  $\theta$ -(2:2:6-trimethyl- $\Delta^6$ -cyclohexenyl)- $\beta\zeta$ -dimethyl- $\Delta^{\alpha\gamma\epsilon\eta}$ -octatetraene- $\alpha$ -carboxylate, b.p. 150°/2 $\times$ 10<sup>-4</sup> mm., which could not be easily distilled even at 0.1 mm., and was hydrolysed in the cold to an acid which could not be obtained pure as it was partly converted into alkali-insol. material on attempted recrystallisation, but gave a Me ester, b.p. 135—140°/2 $\times$ 10<sup>-4</sup> mm. (I) with  $\text{CH}_3\text{Br}\cdot\text{CO}_2\text{Et}$  yielded *Et*  $\delta$ -hydroxy- $\theta$ -(2:2:6-trimethyl- $\Delta^6$ -cyclohexenyl)- $\beta\zeta$ -dimethyl- $\Delta^{\alpha\gamma\epsilon\eta}$ -octatriene- $\alpha$ -carboxylate, b.p. 140—142°/4 mm., which was hydrolysed and converted into the *Ba* salt, which when distilled with  $(\text{HCO}_2)_2\text{Ba}$  at 2 $\times$ 10<sup>-4</sup> mm. gave  $\alpha$ -aldehydo- $\delta$ -hydroxy- $\theta$ -(2:2:6-trimethyl- $\Delta^6$ -cyclohexenyl)- $\beta\zeta$ -dimethyl- $\Delta^{\alpha\gamma\epsilon\eta}$ -octatriene (phenylsemicarbazone, m.p. 181—182°) and not  $\alpha$ -aldehydo- $\theta$ -(2:2:6-trimethyl- $\Delta^6$ -cyclohexenyl)- $\beta\zeta$ -dimethyl- $\Delta^{\alpha\gamma\epsilon\eta}$ -octatetraene.  $\epsilon$ -(2:2:6-Trimethyl- $\Delta^6$ -cyclohexenyl)- $\gamma$ -methylpent- $\delta$ -en- $\alpha$ -yn-ol treated with  $\text{AcOH}$  in presence of 2:7- $\text{C}_{10}\text{H}_6(\text{SO}_3)_2\text{Hg}$  gave a semi-solid product, probably a mixture of the mono- and di-acetate. From the product of hydrolysis by cold alkali, a OH-ketone, b.p. 90—100°/2 mm. (phenylsemicarbazone, m.p. 174—178°), was obtained, probably  $\text{R}\cdot\text{CH}\cdot\text{CH}\cdot\text{CMe}(\text{OH})\cdot\text{COMe}$ , but possibly  $\text{R}\cdot\text{CH}\cdot\text{CH}\cdot\text{CMe}(\text{OH})\cdot\text{CH}_2\cdot\text{CHO}$  ( $\text{R}=\text{CH}_2\langle\text{CH}_2\cdot\text{CMe}\rangle\text{C}\cdot$ ). The p-tolylsemicarbazone, m.p. 172—173°, and p-chlorobenzoylhydrazone, m.p. 202—203°, of  $\alpha$ -aldehydo- $\delta$ -(2:2:6-trimethyl- $\Delta^6$ -cyclohexenyl)- $\beta$ -methyl- $\Delta^{\alpha\gamma}$ -butadiene have been prepared. W. O. K.

**Naturally occurring chicken provitamin-D.**—See this vol., 1033.

**Preparation of pentadeuterobenzoic acid.** H. ERLÉNMEYER, H. LOBECK, and A. EPPRECHT (Helv. Chim. Acta, 1936, 19, 793—794).— $\text{MgBr}\cdot\text{C}_6\text{D}_5$  (prep. from  $\text{C}_6\text{D}_6$  by  $\text{Br}\cdot\text{Fe}$  etc.) and  $\text{CO}_2$  give nearly pure pentadeuterobenzoic acid,  $\text{C}_6\text{D}_5\text{H}_0\cdot\text{CO}_2\text{H}$ , m.p. 120.9°. 1.21 times as sol. in  $\text{H}_2\text{O}$  at 18° as is  $\text{BzOH}$ .

R. S. C.

**Action of hydrogen peroxide on organic sulphur compounds.** J. J. HERRERA (Anal. Fis. Quim., 1935, 33, 877—886).—A review of the methods of replacing S by O. The reaction  $\text{CS} + 2\text{NaOH} + 4\text{H}_2\text{O}_2 = \text{CO} + \text{Na}_2\text{SO}_4 + 5\text{H}_2\text{O}$  (cf. Kitamura, J. Pharm. Soc. Japan, 1934, 54, 1) has been attempted with the following results:  $\text{CSPH}\cdot\text{NH}_2$  gives  $\text{NH}_2\text{Bz}$ ;  $\text{Me}\cdot\text{CS}\cdot\text{OH}$  gives  $\text{AcOH}$ ;  $\text{Bz}_2\text{S}$  and  $\text{Bz}_2\text{S}_2$  are unchanged;  $\text{CS}(\text{NH}_2)_2$  and  $\text{OEt}\cdot\text{CS}_2\cdot\text{K}$  yield unidentified S compounds. F. R. G.

**Benzoyl persulphide.** E. MONESS, W. A. LOTT, and W. G. CHRISTIANSEN (J. Amer. Pharm. Assoc., 1936, 25, 397—402).— $\text{Bz}_2\text{S}_2$  is prepared by treating KSH with  $\text{BzCl}$  to give  $\text{KSBz}$ , which is oxidised by I or, more economically, by  $\text{H}_2\text{O}_2$  after addition of

$\text{HCl}$ , the yields being respectively 95 and 91% calc. on  $\text{BzCl}$ . F. O. H.

**Synthesis of toluic acids.** N. S. KOZLOV, P. N. FEDOSEEV, and V. S. LAZAREV (J. Gen. Chem. Russ., 1936, 6, 485—486).—4-Methyl- or 4:4'-dimethylbenzophenone and  $\text{KOH}$  (200—270°; 55 min.) yield p-toluic acid and  $\text{C}_6\text{H}_5$  or  $\text{PhMe}$ , whilst 2:4-dimethylbenzophenone affords  $\text{BzOH}$  and 2:4- $\text{C}_6\text{H}_3\text{Me}_2\cdot\text{CO}_2\text{H}$ . R. T.

**Oxidation of  $\alpha$ - and  $\beta$ -naphthyl methyl ketones.** L. F. FIESER, H. L. HOLMES, and M. S. NEWMAN (J. Amer. Chem. Soc., 1936, 58, 1055).— $\beta$ - $\text{C}_{10}\text{H}_7\cdot\text{CO}_2\text{H}$  is conveniently prepared in 87% yield by oxidation of  $\beta$ - $\text{C}_{10}\text{H}_7\cdot\text{COMe}$  (I) with aq.  $\text{KOCr}$  [from  $\text{Ca}(\text{OCl})_2$ ,  $\text{K}_2\text{CO}_3$ , and  $\text{KOH}$ ] at 60—70°.  $\alpha$ - $\text{C}_{10}\text{H}_7\cdot\text{CO}_2\text{H}$  is most conveniently prepared from  $\alpha$ - $\text{C}_{10}\text{H}_7\cdot\text{MgBr}$  and  $\text{CO}_2$ . Caille's method (A., 1911, i, 792) of prep. of  $\alpha$ - $\text{C}_{10}\text{H}_7\cdot\text{COMe}$  gives a product containing <30% of (I); separation is best effected through the picrates (cf. Pfau and Ofner, A., 1926, 837).  $\alpha$ - $\text{C}_{10}\text{H}_7\cdot\text{COMe}$  [picrate, m.p. 119—120° (corr.); oxime, m.p. 139.5—140.5° (corr.); semicarbazone, m.p. 228.5—229.5°] [from  $\alpha$ - $\text{C}_{10}\text{H}_7\cdot\text{CO}_2\text{Me}$  and  $\text{EtOAc}$  (method: Mosettig and van de Kamp, A., 1933, 1052)] has b.p. 151.5—152° (corr.)/9 $\pm$ 0.5 mm., 302° (corr.)/760 mm.

H. B.

**Constitution of bile acids. LIV. Unsaturated acids.** H. WIELAND, K. KRAUS, H. KELLER, and H. OTTAWA. **LV. Weak acids of ox bile.** H. WIELAND and G. HANKE (Z. physiol. Chem., 1936, 241, 47—67, 93—99; cf. A., 1933, 1161; 1934, 653).—**LIV.** Lithocholic acid (I) (probably  $\Delta^{2:3}$ -cholic acid), m.p. 156°,  $[\alpha]_D +16.3^\circ$  in  $\text{EtOH}$ , obtained from lithocholic acid by elimination of  $\text{H}_2\text{O}$ , yields with  $\text{BzO}_2\text{H}$  an oxide, m.p. 185°, and with  $\text{Br}$  in  $\text{AcOH}$  dibromides (probably *cis*- and *trans*-), m.p. (II) 171° and (III) 233°, respectively, together with a difficulty hydrolysable dibromide, m.p. 240°, which, on removal of  $\text{Br}_2$  with  $\text{Zn}$  and  $\text{AcOH}$ , yields an acid (probably  $\Delta^{3:4}$ -cholic acid), m.p. 160°,  $[\alpha]_D +18.7^\circ$ . (II) heated with 0.1N- $\text{KOH}$  at 135—140° for 5 hr. yields two hydroxy-cholic acids, m.p. (IV) 144—147° and (V) 188°, respectively, which are also obtained from (I) by oxidation with  $\text{SeO}_2$ , together with a dihydroxycholic acid (VI), m.p. 248°. With  $\text{PtO}_2\cdot\text{H}_2$  (IV) and (V) give cholic acid (VII) and (VI) gives *epi*-3-hydroxy-allocholic acid and (VII). When heated slowly to 230° (IV) gives, after subsequent distillation in a vac. at 270°,  $\Delta^{2:3:4:5}$ (?)-choladienic acid, m.p. 156°, and (V) gives an impure acid, m.p. about 145°. (II) with  $\text{KOH}$  in boiling  $\text{MeOH}$  gives methoxycholic acid, m.p. 187°, and with  $\text{KOH}$  in boiling  $\text{EtOH}$  ethoxycholic acid, m.p. 175°. The cholic acid (VIII),  $[\alpha]_D -38.6^\circ$  (probably a mixture of  $\Delta^{5:6}$ - and  $\Delta^{6:7}$ -cholic acid), obtained from 6-hydroxyallocholic acid by elimination of  $\text{H}_2\text{O}$  gives with  $\text{Br}$  in  $\text{AcOH}$ , together with unstable  $\text{Br}$ -compounds, a stable dibromide (IX), m.p. 227° (decomp.), which with  $\text{Zn}$  and  $\text{AcOH}$  yields an acid (X), m.p. 160°,  $[\alpha]_D -66.8^\circ$ . (IX) loses  $2\text{HBr}$  on boiling with  $\text{KOH}$  in  $\text{H}_2\text{O}\cdot\text{EtOH}$  for 6 hr. giving  $\Delta^{4:5:6:7}$ -choladienic acid (XI), m.p. 171—173° [*Me* ester (XII), m.p. 95—96°, and its dibromide, m.p. 178°]. (X) and (XI) with  $\text{PtO}_2\cdot\text{H}_2$  give (VII) and allocholic acid. (VIII) in  $\text{CHCl}_3$  shaken for 22 hr. with

SeO<sub>2</sub> in AcOH gives 7-hydroxycholenic acid, m.p. 217—218°. The cholenic acid, m.p. 148—151°, obtained from 7-hydroxycholenic acid by elimination of H<sub>2</sub>O, when shaken for 4 hr. with SeO<sub>2</sub> in CHCl<sub>3</sub>-Ac<sub>2</sub>O gives an acid, m.p. 160—162°. The choladienic acid (XIII) obtained from deoxycholic acid by elimination of H<sub>2</sub>O is a mixture of < 2 isomerides one of which has m.p. 134—136°, [α]<sub>D</sub> +36.5°. (XIII) gives with Br in AcOH two tetrabromides, m.p. (XIV) 236—237° (decomp.) and (XV) 183—184° (decomp.), respectively. Removal of Br<sub>4</sub> with Zn and AcOH from (XIV) and (XV) gives choladienic acids, m.p. (XVI) 135—138° and (XVII) 133—135° and [α]<sub>D</sub> +37.8° and +29.9°, respectively. Rebromination of (XVI) gives (XIV) and a substance, m.p. 180—184°, and of (XVII) gives (XV) and (XIV).

LV. The fraction of ox bile which contains the fatty and very weak acids yields sapocholic acid (XVIII), probably C<sub>29</sub>H<sub>46</sub>O<sub>3</sub>, m.p. 198—201° [K salt; Me ester (XIX), m.p. 146°; bromolactone (XX), m.p. 215—217°]. The alkali salts of (XVIII) are insol. in H<sub>2</sub>O. (XIX) is not hydrolysed on boiling for several hr. with KOH in MeOH. Zn and AcOH convert (XX) into (XVIII). (XVIII) is closely related to the sapogenins and is accompanied in the bile by an acid, m.p. > 250°.

W. McC.

**Preparation of γ-m-methoxyphenylbutyric acid.** C. K. CHUANG and Y. T. HUANG (Ber., 1936, 69, [B], 1505—1508).—Gradual addition of conc. H<sub>2</sub>SO<sub>4</sub>-HNO<sub>3</sub> (d 1.4) to CH<sub>2</sub>Bz·CH<sub>2</sub>·CO<sub>2</sub>H in conc. H<sub>2</sub>SO<sub>4</sub> at >0° gives β-m-nitrobenzoylpropionic acid, m.p. 165—166°, reduced by FeSO<sub>4</sub>-NH<sub>3</sub> is β-m-aminobenzoylpropionic acid (I), m.p. 130—131° (Et ester, m.p. 66—67°). (I) is converted into β-m-hydroxybenzoylpropionic acid, m.p. 146—147°, transformed by NaOH and Me<sub>2</sub>SO<sub>4</sub> into β-m-methoxybenzoylpropionic acid, m.p. 110°, which is reduced by Zn-Hg and HCl to γ-m-methoxyphenylbutyric acid, m.p. 49—50°.

H. W.

**Phenolic esters of p-methoxycinnamic acid.** C. W. SONDERN (J. Amer. Pharm. Assoc., 1936, 25, 418—419).—Heating the acid and phenol in PhMe in presence of PCl<sub>3</sub> or P<sub>2</sub>O<sub>5</sub> affords the following esters of p-methoxycinnamic acid: *guaiacyl*, m.p. 102—103°, *α-naphthyl*, m.p. 102° (cf. Foote, A., 1928, 1374), *resorcinol diester*, m.p. 173—173.5° [monoester (?), m.p. 135—137° (decomp.)].

F. O. H.

**Synthesis of cis- and trans-dl-1-isopropylcyclopropane-1:2-dicarboxylic acids.** E. O. PHILLIPS, G. R. RAMAGE, and J. L. SIMONSEN (J.C.S., 1936, 828—829).—Et α-isopropylacrylate (A., 1905, i, 626) with Et diazoacetate at 75—80° (A., 1933, 1160) affords *Et* 1-isopropylcyclopropane-1:2-dicarboxylate, b.p. 130—135°/20 mm., hydrolysed (MeOH-KOH) to dl-trans- (I), m.p. 194—195° (p-phenylphenacyl ester, m.p. 175—176°), and dl-cis-1-isopropylcyclopropane-1:2-dicarboxylic acid (II), m.p. 117—118° (+1H<sub>2</sub>O, m.p. 97—98°, loses 1H<sub>2</sub>O at 100°; p-phenylphenacyl ester, m.p. 116—117°). (I) with Ac<sub>2</sub>O at 220° gives the anhydride of (II), b.p. 138—140°/20 mm., from which the monohydrate is obtained with H<sub>2</sub>O.

J. L. D.

**Chemiluminescence of phthalic acid derivatives.** A. I. PORTNOV (J. Gen. Chem. Russ., 1936,

6, 626—633).—The intensity of the luminescence obtained when H<sub>2</sub>O<sub>2</sub> is added to aq. NaOH solutions of derivatives of phthalhydrazide (I) increases in the order Cl<sub>1</sub>=Cl<sub>4</sub><Cl<sub>3</sub><(I)<Cl<sub>2</sub> (II) (all of type C<sub>6</sub>H<sub>3</sub>Cl<CO·NH<CO·NH<NH<sub>2</sub>·C<sub>6</sub>H<sub>3</sub><CO·NH<CO·NH and its Ac<sub>2</sub> derivative. The intensity rises with increasing concn. of (I) or its derivatives to a max., falling at higher concns. Addition of fluorescent substances intensifies luminescence only in those cases, such as (II), in which the products of the reaction are not themselves fluorescent.

R. T.

**Condensation of 3- and 4-nitrophthalic anhydride with phenol and anisole.** P. C. MITTER and P. N. DUTT (J. Indian Chem. Soc., 1936, 13, 228—235).—3-NO<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>(CO)<sub>2</sub>O, AlCl<sub>3</sub>, and PhOH at 135° give 3-nitro-2-salicylbenzoic acid, m.p. 237—238° (Ac derivative, m.p. 158°; Me ester, m.p. 162°), reduced [Fe(OH)<sub>2</sub>] to the 3-NH<sub>2</sub>-acid, m.p. 217° (decomp.), the diazonium salt of which in boiling H<sub>2</sub>O gives the 3-OH-acid, m.p. 199—200° (Ac<sub>2</sub> derivative, m.p. 186°), converted by H<sub>3</sub>BO<sub>3</sub>-H<sub>2</sub>SO<sub>4</sub>-SO<sub>3</sub> into chrysazin, the formation of which proves the structure of its predecessors. With PhOMe and AlCl<sub>3</sub> at room temp. (I) gives much 3- (II), m.p. 207° (Me ester, m.p. 123°), and a little 6-nitro-2-p-anisoylbenzoic acid (III), m.p. 215°. The structure of (II) is proved by conversion into the 3-NH<sub>2</sub>-, m.p. 169—170°, and 3-OH-acid, m.p. 211—213°, and thence into 1:6-dihydroxyanthraquinone; that of (III) is probable, since the acid resists esterification; the 6-NH<sub>2</sub>-acid has m.p. 186°. 4-NO<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>(CO)<sub>2</sub>O does not condense with PhOH, but with PhOMe and AlCl<sub>3</sub> at 20—25° gives 4-, m.p. 217—218° (Me ester, m.p. 178°), and 5-nitro-2-p-anisoylbenzoic acid, m.p. 219—220° (Me ester, m.p. 188°), converted into the 4-, m.p. 156°, and 5-NH<sub>2</sub>-acid, m.p. 160°, the 4-, m.p. 203°, and 5-OH-acid, m.p. 225°, and 2:6- and 2:7-dihydroxyanthraquinone, respectively.

R. S. C.

**Retene. VI. Retenediphenic [3-methyl-4'-isopropylidiphenic] acid and its derivatives.** D. E. ADELSON, T. HASSELSTROM, and M. T. BOBERT (J. Amer. Chem. Soc., 1936, 58, 871—872).—Oxidation (30% H<sub>2</sub>O<sub>2</sub>, AcOH) of retenequinone gives 65% of retenediphenic acid (I), m.p. 191—191.5° (all m.p. are corr.) (cf. Fogelberg, A., 1928, 290) [Me H, m.p. 126—126.5°, and Et H, m.p. 105—105.5°, esters; monoanilide, m.p. 251—252°, and monoamide, m.p. 201—202° (lit. 196—197°), all prepared from the anhydride, m.p. 112—112.5°], and a little of a hydroxymethylisopropylidiphenylcarboxylic acid lactone (II), m.p. 137—137.5°. (II) is methylated (Me<sub>2</sub>SO<sub>4</sub>, alkali) to the corresponding OMe-acid, m.p. 122—122.5°, which with cold conc. H<sub>2</sub>SO<sub>4</sub> affords a methoxymethylisopropylfluorenone, m.p. 126—126.5°. The bornyl and glyceryl esters of (I) resemble artificial resins.

H. B.

**Di-substituted derivatives of naphthalic acid.** K. DZIEWOŃSKI, T. MAJEWICZ, and L. SCHIMMER (Bull. Acad. Polonaise, 1936, A, 43—55; cf. A., 1929, 186).—The compound obtained by the action of fuming H<sub>2</sub>SO<sub>4</sub> (25% SO<sub>3</sub>) on naphthalic anhydride at 200—230° is 3:6-disulphonaphthalic anhydride, since it is

converted by  $\text{PCl}_5$  at  $300^\circ$  into 3:6-dichloronaphthalic anhydride (I), m.p.  $253^\circ$  [phenylhydrazone, m.p.  $232-233^\circ$ ; corresponding imide, m.p.  $327-328^\circ$ ; 3:6-dichloronaphthalfluorescein, m.p.  $326-328^\circ$  (decomp.)], transformed by  $\text{HgO}$  in  $\text{H}_2\text{O}$  at  $160-170^\circ$  into 3:6-dichloro-1-naphthoic acid, m.p.  $238-239^\circ$ , [ $\text{Ba} (+4\text{H}_2\text{O})$  salt;  $\text{Me}$  ester, m.p.  $112^\circ$ ], which is decarboxylated to 3:6- $\text{C}_{10}\text{H}_6\text{Cl}_2$ , also obtained directly from (I),  $\text{HgO}$ , and  $\text{H}_2\text{O}$  at  $200-210^\circ$ . 3:6-Dihydroxynaphthalic anhydride (II), m.p.  $330^\circ$ , from  $\text{Na}_4$  disulphonaphthalate and  $\text{KOH}$  at  $230-250^\circ$  [corresponding imide, m.p.  $395^\circ$  (decomp.)], is transformed by  $\text{Me}_2\text{SO}_4$  and  $\text{NaOH}$  into 3:6-dimethoxynaphthalic anhydride, m.p.  $280^\circ$ , decarboxylated to 3:6- $\text{C}_{10}\text{H}_6(\text{OMe})_2$ . 4-p'-Nitrobenzeneazo-3:6-dihydroxynaphthalic anhydride has m.p.  $330-332^\circ$  (decomp.). (II) and  $\text{NH}_3-\text{H}_2\text{O}$  at  $200-210^\circ$  give 3:6-diaminonaphthalimide (III), m.p.  $406^\circ$  (decomp.) [ $\text{Ac}_2$  derivative, m.p.  $>400^\circ$  (decomp.)], which when tetrarazotised and coupled with  $\beta\text{-C}_{10}\text{H}_7\text{-OH}$  yields 6:2'-hydroxynaphthalene-1'-azo-3-hydroxynaphthalimide, m.p.  $333-335^\circ$  (decomp.). (III) and boiling 60%  $\text{H}_2\text{SO}_4$  give 3:6-diaminonaphthalic anhydride, m.p.  $>450^\circ$ .

H. W.

**Condensation of ethyl  $\beta$ -methyladipate with ethyl oxalate.** A. S. BROWN (J. Gen. Chem. Russ., 1936, 6, 612-615).— $\text{Et}_2\beta$ -methyladipate,  $\text{Et}_2\text{C}_2\text{O}_4$ , and  $\text{Na}$  in  $\text{EtOH}-\text{Et}_2\text{O}$  yield, amongst other unidentified products,  $\text{Et}_2$  6-methyl-2:3-diketocyclohexane-1:4-dicarboxylate, b.p.  $206-207^\circ/15$  mm. (monoxime, m.p.  $124-125.5^\circ$ ).

R. T.

**Constituents of natural phenolic resins. V. Synthesis of dl-matairesinol dimethyl ether and dl-cubebinolide.** R. D. HAWORTH, W. KELLY, and T. RICHARDSON. VI. **Synthesis of compounds related to cubebinolide (hinokinin).** R. D. HAWORTH and W. KELLY (J.C.S., 1936, 725-730, 745-747).—V.  $\alpha$ -Acetyl- $\beta$ -(3:4-dimethoxybenzyl)-butyrolactone (I), m.p.  $69-70^\circ$ , is obtained from  $\text{CH}_3\text{Ac}\cdot\text{CO}_2\text{Et}$  and  $O$ -methyleugenol oxide; its constitution is proved by treatment of its  $\text{Na}$  compound with 3:4-( $\text{OMe}$ ) $_2\text{C}_6\text{H}_3\cdot\text{COCl}$  to give  $\alpha$ -(3:4-dimethoxybenzoyl)- $\beta$ -(3':4'-dimethoxybenzyl)butyrolactone, m.p.  $125-126^\circ$ , and thence ( $\text{MeOH}-\text{HCl}$ ) into 1-hydroxy-6:7-dimethoxy-1-(3':4'-dimethoxyphenyl)-3-hydroxymethyl-1:2:3:4-tetrahydronaphthalene-2-carboxylic acid lactone, m.p.  $124-126^\circ$ , dehydrated by  $\text{KHSO}_4$  to the known 6:7-dimethoxy-1-(3':4'-dimethoxyphenyl)-3-hydroxymethyl-3:4-dihydronaphthalene-2-carboxylic acid lactone. The  $\text{Na}$  derivative of (I) with 3:4-( $\text{OMe}$ ) $_2\text{C}_6\text{H}_3\cdot\text{CH}_2\text{Cl}$  affords  $\alpha$ -acetyl- $\alpha\beta$ -bis-(3:4-dimethoxybenzyl)butyrolactone, b.p.  $270-280^\circ/0.5$  mm., converted by  $\text{MeOH}-\text{Ba}(\text{OH})_2$  into  $\alpha\beta$ -bis-(3:4-dimethoxybenzyl)butyrolactone (dl-matairesinol  $\text{Me}_2$  ether) (II), m.p.  $106-107^\circ$ , in small yield. Better yields of (II) are obtained by the action of conc.  $\text{HCl}$  on the condensation product from  $\text{Me}$  3:4-dimethoxybenzyl- $\alpha$ -cyanoacetate, m.p.  $75-76^\circ$ , and  $O$ -methyleugenol oxide. dl-Dibromomatairesinol  $\text{Me}_2$  ether, from (II) in  $\text{AcOH}$  and  $\text{Br}$ , has m.p.  $109-110^\circ$ ; dl-dinitro-, m.p.  $179-180^\circ$ , and dl-tetranitro-matairesinol  $\text{Me}_2$  ether, m.p.  $185-186^\circ$ . The  $\text{Na}$ -compound of  $\text{Me}$  3:4-methylenedioxybenzyl- $\alpha$ -cyanoacetate, m.p.  $79-80^\circ$ , treated with safrole oxide, and the condens-

ation product boiled with conc.  $\text{HCl}$ , affords  $\alpha\beta$ -bis-(3:4-methylenedioxybenzyl)butyrolactone (dl-cubebinolide) (III), m.p.  $106-107^\circ$ . dl-Dibromo-, m.p.  $119-120^\circ$ , and dl-dinitro-cubebinolide, m.p.  $160-161^\circ$ , are described.  $\beta$ -(3:4-Dimethoxybenzoyl)- $\alpha$ -(3':4'-dimethoxybenzylidene)propionic acid  $\gamma$ -lactone with  $\text{H}_2\text{-PtO}_2$  affords  $\alpha$ -(3:4-dimethoxybenzyl)- $\gamma$ -(3':4'-dimethoxyphenyl)butyrolactone, m.p.  $126-127^\circ$ , converted by  $\text{MeOH}-\text{KOH}-\text{KMnO}_4$  into  $\beta$ -(3:4-dimethoxybenzoyl)- $\alpha$ -(3':4'-dimethoxybenzyl)propionic acid, m.p.  $107-108^\circ$ .  $\text{Na}$   $\beta$ -(3:4-dimethoxybenzoyl)propionate, 2-bromo-4:5-dimethoxybenzaldehyde, and  $(\text{AcO})_2\text{O}$  afford  $\beta$ -(3:4-dimethoxybenzoyl)- $\alpha$ -(2'-bromo-4':5'-dimethoxybenzylidene)propionic acid  $\gamma$ -lactone, m.p.  $202^\circ$  (free acid, m.p.  $225^\circ$ ;  $\text{Me}$  ester, m.p.  $140-141^\circ$ ). Ultra-violet spectrographic data for (II), (III), and  $l$ -matairesinol  $\text{Me}_2$  ether [same as for (II)] are given.

VI.  $\text{Na}$   $\beta$ -(3:4-methylenedioxybenzoyl)propionate, piperonaldehyde, and  $\text{Ac}_2\text{O}$  afford  $\beta$ -(3:4-methylenedioxybenzoyl)- $\alpha$ -(3':4'-methylenedioxybenzylidene)-propionic acid  $\gamma$ -lactone, m.p.  $236-237^\circ$  (free acid, m.p.  $193^\circ$ ). The latter with aq.  $\text{NaOH}$  and  $\text{CH}_2\text{O}$  affords  $\beta$ -(3:4-methylenedioxybenzoyl)- $\alpha$ -(3':4'-methylenedioxybenzylidene)- $\beta$ -methylene- $\gamma$ -propionic acid, m.p.  $184-185^\circ$ , converted into 6:7-methylenedioxy-1-(3':4'-methylenedioxyphenyl)-2-hydroxymethylnaphthalene-3-carboxylic acid lactone (IV), m.p.  $264^\circ$ . Oxidation of (IV) with  $\text{KMnO}_4$  affords 6:7-methylenedioxy-1-(3':4'-methylenedioxyphenyl)naphthalene-2:3-dicarboxylic acid (anhydride, m.p.  $244-246^\circ$ ;  $\text{Me}$  ester, m.p.  $214-215^\circ$ ), also obtained from 3:4-( $\text{CH}_2\text{O}_2\text{C}_6\text{H}_3\cdot\text{C}\cdot\text{C}\cdot\text{CO}_2\text{H}$  and  $(\text{AcO})_2\text{O}$ . Bis-(3:4-methylenedioxyphenyl)methylsuccinic acid, shrinks from  $130^\circ$ , m.p.  $140^\circ$ , prepared from  $\text{C}_6\text{H}_4\cdot\text{O}_2\text{CH}_2$  (prep. given) and  $\text{Et}$  hydroxymethylenesuccinate, could not be converted into the corresponding 4-ketotetrahydronaphthalene derivative. The  $\text{Na}$  derivative of  $\alpha$ -acetyl- $\beta$ -(3:4-methylenedioxybenzyl)butyrolactone with 3:4-( $\text{CH}_2\text{O}_2\text{C}_6\text{H}_3\cdot\text{COCl}$ ) affords  $\alpha$ -(3:4-methylenedioxybenzoyl)- $\beta$ -(3:4-methylenedioxybenzyl)butyrolactone, m.p.  $136-137^\circ$ , which when treated with  $\text{MeOH}-\text{HCl}$  followed by  $\text{KHSO}_4$  at  $155^\circ$  gives 6:7-methylenedioxy-1-(3':4'-methylenedioxyphenyl)-3-hydroxymethyl-3:4-dihydronaphthalene-2-carboxylic acid lactone, m.p.  $228-229^\circ$ , hydrogenated ( $\text{Pd}$ -black) to 6:7-methylenedioxy-1-(3':4'-methylenedioxyphenyl)-3-hydroxymethylnaphthalene-2-carboxylic acid lactone (V), m.p.  $273-275^\circ$ . Neither  $l$ - nor  $dl$ -hinokinin could be converted into (IV) or (V) by  $\text{Pb}(\text{OAc})_2$ .

P. G. C.

**Structure of abiestic acid. II. Attempted synthesis of 1:3-dimethylcyclohexane-1:2:3-tricarboxylic acid.** B. A. ARBUSOV and O. M. SCHAPCHINSKAJA (J. Gen. Chem. Russ., 1936, 6, 404-416).— $\text{CH}_2\text{Br}\cdot\text{CH}_2\cdot\text{CH}_2\text{Br}$  and  $\text{CNaMe}(\text{CO}_2\text{Et})_2$  in  $\text{EtOH}$  (at the b.p.) yield the  $\text{Et}_4$  ester of  $\alpha\epsilon$ -dimethylpentane- $\alpha\alpha\epsilon\epsilon$ -tetracarboxylic acid (I), together with by-products, amongst which  $\text{OEt}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{CMe}(\text{CO}_2\text{Et})_2$  is identified. (I) and aq.  $\text{EtOH}-\text{KOH}$  (5 hr. at the b.p.) afford  $\alpha\epsilon$ -dimethylpimelic acid, which, with red  $\text{P}$  and  $\text{Br}$  (2 hr. at  $100^\circ$ ), followed by  $\text{EtOH}$  (3.5 hr. at the b.p.), yields  $\text{Et}_2\alpha\epsilon$ -dibromo- $\alpha\epsilon$ -dimethylpimelate, b.p.  $182.5-184^\circ/2.4$

mm., and this is condensed with  $\text{CNa}_2(\text{CO}_2\text{Et})_2$  in EtOH (100°; 3 hr.) to give the  $\text{Et}_3$  ester of 1:3-dimethylcyclohexane-1:2:3-tetracarboxylic acid (II), b.p. 206—208°/2 mm., together with some  $\text{Et}_2$   $\alpha$ -dimethyl- $\Delta^{6,8}$ -pentadiene- $\alpha$ -dicarboxylate, b.p. 138—139°/2 mm., from which the acid  $\text{CH}_2(\text{CH}:\text{CMe}:\text{CO}_2\text{H})_2$ , m.p. 168—171°, is obtained by hydrolysis. The acid obtained by hydrolysis of (II) ( $\text{EtOH-KOH}$ ) yields a glassy mass,  $\text{C}_{11}\text{H}_{14}\text{O}_5$  ( $\text{Me}_3$  ester, b.p. 158—162°/0.7 mm.), when heated in vac. at 160—165°. The structure of the final product was not definitely established.

R. T.

**Lichen substances. LXVII. Stictic acid. III.** Y. ASAHINA, M. YANAGITA, and I. YOSIOKA (Ber., 1936, 69, [B], 1370—1375).—The isolation of stictic acid (I) and a trace of norstictic acid (II) from *Lobaria pulmonaria* (from Oregon) and of *l*-usnic acid, (I), and a little (II) from *L. oregana* (from Oregon) is described. Transformation of the monoanil of (I) into the dianil of (II) is effected by MeI or  $\text{NH}_2\text{Ph.HI}$ . Treatment of (I) with MeI and  $\text{Ag}_2\text{CO}_3$  (cf. Curd and Robertson, A., 1935, 1501) gives a Me ether Me ester, m.p. 176°, having structure A, since it yields a di-*p*-nitrophenylhydrazone, m.p. 245° (decomp.), and is

hydrogenated to hyposalazinolide  $\text{Me}_2$  ether, m.p. 283°; the isomeric Me ether Me ester, m.p. 243°, has structure B, since it gives a mono-*p*-nitrophenylhydrazone, m.p. 259°, and is hydrogenated to Me hypostictate Me ether (III), m.p. 230°, also obtained from hypostictic acid, MeI, and  $\text{Ag}_2\text{O}$ . Similar methylation of salazic acid leads to Me salazate Me ether, m.p. 246°, which loses Me (from OMe) when hydrogenated and gives (III). Stictinic acid di-*p*-nitrophenylhydrazone, decomp. 200° after darkening at 160°, is described.

H. W.

**Oil of *Primula auricula*, L.**—See this vol., 911.

**Synthesis of safranal.** R. KUHN and G. WENDT (Ber., 1936, 69, [B], 1549—1555).—Oxidation of  $\beta$ -cyclocitral [2:6:6-trimethyl- $\Delta^{1,2}$ -cyclohexene-1-aldehyde] [thiosemicarbazone, m.p. 202° (decomp.)] by  $\text{H}_2\text{SeO}_3$  in boiling EtOH- $\text{H}_2\text{O}$  gives rise to safranal [ $\beta$ -trimethyl- $\Delta^{6,7}$ -hexadien- $\alpha$ -aldehyde] (I). The yield is very small, and the desired product is isolated by fractional distillation followed by conversion into a mixture of semicarbazones which is separated by fractional sublimation in high vac. The oxime, m.p. 65°, thiosemicarbazone, m.p. 199—200°, and 2:4-dinitrophenylhydrazone, m.p. 186°, of (I) are described. The following substances are incidentally described: Me  $\alpha$ -cyclogeranyl dibromide, m.p. 71—72°;  $\alpha$ -cyclogeranyl acetate dibromide, m.p. 112°;  $\alpha$ -cyclocitralsemicarbazone dibromide, m.p. 148.5° (decomp.);  $\alpha$ -cyclocitral Et. acetal, b.p. 67—68°/1.3 mm. The prep. of homogeneous  $\alpha$ - (II) and  $\beta$ -cyclocitral is described. (II) is transformed by reduction with  $\text{Al}(\text{OPr}^i)_3$  in  $\text{Pr}^i\text{OH}$  into  $\alpha$ -cyclogeraniol.

H. W.

# System benzaldehyde-ammonia-malonic acid.

T. BOEHM and (FRL.) M. GROHNWALD (Arch. Pharm., 1936, 274, 329—342).— $\text{PhCHO}$ ,  $\text{CH}_2(\text{CO}_2\text{H})_2$  (I), and  $\text{NH}_3$ -EtOH at 0° ppt. immediately a mixture of hydrobenzamide (II) and  $\text{NH}_4$  H malonate, which in hot EtOH gives  $\text{NH}_4$  H benzylidenemalonate (III), m.p. 148° (cf. A., 1927, 137). (III) is best obtained from (I) and (II) alone in EtOH, and hydrofurfuramide and (I) similarly give a good yield of furfurylidene-malonic acid; reaction probably occurs by hydrolysis to  $\text{R}\cdot\text{CH}(\text{OH})\cdot\text{NH}_2$  and condensation thereof with (I). Evaporation of (III) in 50% aq. EtOH to dryness during 5 hr. and treatment of the residue with hot HCl affords  $\text{NH}_2\cdot\text{CHPh}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$  (IV) and  $\text{CHPh}\cdot\text{CH}\cdot\text{CO}_2\text{H}$  (V); no (IV) is obtained by heating (III) directly with HCl (cf. loc. cit.) and it is probable that reaction occurs by decarboxylation of some (III) to (V) and hydrolysis of the remainder to (I) and  $\text{PhCHO}$ , followed in the more conc. solution by formation of (II) and thence of (IV). (II) and (I) in dry Et<sub>2</sub>O give an unstable 1:2 additive compound, decomp. about 70°, which in hot MeOH yields  $\alpha$ -( $\alpha'$ -benzylideneaminobenzylamino)benzylmalonic ("tribenzylidenedi-iminomalonic") acid,  $\text{CHPh}\cdot\text{N}\cdot\text{CHPh}\cdot\text{NH}\cdot\text{CHPh}\cdot\text{CH}(\text{CO}_2\text{H})_2$ , m.p. 142°. With hot 5% HCl this yields  $\text{PhCHO}$  and the lactone (6-keto-2:4-diphenyltetrahydro-1:3-oxazine), m.p. 243° (hydrochloride, m.p. 253°; Ac derivative, m.p. 201°), of  $\beta$ - $\alpha$ -hydroxybenzylamino- $\beta$ -phenylpropionic acid and thence (IV). *p*-Methylhydrobenzamide (VI) (1 mol.) and (I) (2 mols.) in Et<sub>2</sub>O give  $\alpha$ -( $\alpha'$ -*p*-methylbenzylideneamino-*p*-methylbenzylamino)-*p*-methylbenzylmalonic acid, very unstable. (II) and  $\text{CH}_3(\text{CN})_2$  give  $\alpha$ -( $\alpha'$ -benzylideneaminobenzylamino)benzylmalondinitrile (VII),  $\text{CHPh}\cdot\text{N}\cdot\text{CHPh}\cdot\text{NH}\cdot\text{CHPh}\cdot\text{CH}(\text{CN})_2$ , m.p. 142°, which is hydrolysed by cold KOH or 25% HCl or hot 5% HCl to  $\text{PhCHO}$  and  $\text{CHPh}\cdot\text{C}(\text{CN})_2$  (VIII). (VI) gives a similar dinitrile, m.p. 128°.  $\text{CH}_3(\text{CN})_2$  (2 mols.),  $\text{PhCHO}$  (3 mols.), and  $\text{NH}_3$ -EtOH give a compound,  $\text{C}_{27}\text{H}_{19}\text{N}_5$ , m.p. 192° (decomp.), also obtained in good yield from (VIII) and cold  $\text{NH}_3$ -EtOH or in poor yield by boiling (VII) in EtOH; it is stable to cold conc. HCl, but is hydrolysed by warm dil. KOH and is thus probably

$\text{CHPh} \begin{array}{c} \text{C}(\text{CN})_2\cdot\text{CHPh} \\ \text{C}(\text{CN})_2\cdot\text{CHPh} \end{array} \text{NH}$ .  $p\text{-C}_6\text{H}_4\text{Me}\cdot\text{CH}:\text{CH}(\text{CN})_2$  and  $\text{NH}_3$ -MeOH give a similar  $(\text{CN})_4$ -compound, +MeOH or +0.5 dioxan, m.p. 162° (decomp.). (II) and  $\text{CN}\cdot\text{CH}_2\cdot\text{CO}\cdot\text{NH}_2$  in EtOH give the mononitrile-monoamide, +EtOH or  $\text{C}_6\text{H}_6$ , decomp. 158° [decomposed by cold, conc. HCl to  $\text{CHPh}\cdot\text{CH}(\text{CN})\cdot\text{CO}\cdot\text{NH}_2$ ], derived from (VII), and (VI) gives a similar compound, decomp. 155°.

R. S. C.

**Products of the transformation of 2:4:6-trinitro- and 2:4-dinitro-benzylideneaniline under the action of sodium carbonate in alcoholic solution.** S. SECAREANU and I. LUPAS (Bull. Soc. chim., 1936, [v], 3, 1161—1164).—2:4:6-Trinitrobenzaldehyde is converted by insolation in sunlight into 4:6-dinitro-2-nitrosobenzoic acid, which, with  $\text{NH}_2\text{Ph}$  in AcOH, gives a mixture of products none of which is similar to the substances obtained from

tri- or di-nitrobenzylideneaniline under the action of  $\text{Na}_2\text{CO}_3$  in EtOH; the indazolone structure of these compounds is thus indirectly confirmed.

H. W.

***o*-Chlorobenzaldehyde diacetate.** S. M. SCHERLEN (J. Gen. Chem. Russ., 1936, 6, 508—510).—The substance described by Erdmann and Schwechten (cf. A., 1891, 448) as *o*-chlorobenzaldehyde diacetate (I) is actually *o*-chlorocinnamic acid. (I), m.p. 53°, is obtained from *o*-chlorobenzaldehyde and  $\text{Ac}_2\text{O}$  in AcOH (170°; 5 hr.), and condenses with *o*-toluidine in presence of Cu (160—175°; 4 hr.) to yield  $\text{C}_6\text{H}_4\text{Cl}\cdot\text{CH}:\text{N}\cdot\text{C}_6\text{H}_4\text{Me}$ , m.p. 74—75°. R. T.

**Elimination of methyl from an *o*-methoxybenzaldehydeanil.** Y. ASAHINA and I. YOSIOKA (Ber., 1936, 69, [B], 1367—1369).—Removal of Me from an *o*-methoxybenzaldehydeanil by MeI or, more correctly, by  $\text{NH}_2\text{Ph}\cdot\text{HI}$  occurs readily only when OH or OAlk is also present in position 3 or 6. 2:3:4-Trimethoxybenzaldehydeanil, m.p. 75°, and  $\text{NH}_2\text{Ph}\cdot\text{HI}$  at 100° give 2-hydroxy-3:4-dimethoxybenzaldehydeanil, m.p. 153—154°, whence 2-hydroxy-3:4-dimethoxybenzaldehyde, m.p. 73°. Similarly the anil of cotarninemethine methiodide gives the substance,  $\text{C}_{13}\text{H}_{18}\text{O}_4\text{NI}$ , m.p. 271° (decomp.), and benzoyl-cotarnineanil affords benzoylnorcotarnine, isolated as the benzoate, m.p. 159°. Atranol Me<sub>2</sub> ether is converted by  $\text{NH}_2\text{Ph}$  into the anil, m.p. 102—103°, converted with some difficulty by  $\text{NH}_2\text{Ph}\cdot\text{HI}$  into atranol Me<sub>2</sub> ether. *o*-Methoxybenzaldehydeanil and 3-nitro-2-methoxybenzaldehydeanil, m.p. 60—61°, are scarcely affected by  $\text{NH}_2\text{Ph}\cdot\text{HI}$ . H. W.

**Complex chemical ring systems with para-linkages. I. Copper derivatives of bis-*p*-hydroxybenzylidene- and bis-vanillylidene-*o*-phenylenediamine.** Y. NAKATSUKA and H. IINUMA (Bull. Chem. Soc. Japan, 1936, 11, 358—362).—When  $\text{Cu}(\text{OAc})_2$  is warmed with *p*-OH- $\text{C}_6\text{H}_4\cdot\text{CHO}$  and *o*- $\text{C}_6\text{H}_4(\text{NH}_2)_2$  in  $\text{H}_2\text{O}$ , *Cu* bis-*p*-hydroxybenzylidene-*o*-phenylenediamine (+2 $\text{H}_2\text{O}$ ; anhyd. from MeOH) is obtained, for which a formula is suggested. A compound could not be obtained using  $\text{NH}_3$ ,  $\text{NH}_2\text{Ph}$ , *m*- or *p*- $\text{C}_6\text{H}_4(\text{NH}_2)_2$  as base. Vanillin and *o*- $\text{C}_6\text{H}_4(\text{NH}_2)_2$  give a similar *Cu* bis-vanillylidene-*o*-phenylenediamine (+ $\frac{3}{2}\text{C}_5\text{H}_5\text{N}\cdot\text{H}_2\text{O}$ ), and a more complex compound, probably  $\text{C}_6\text{H}_4(\text{N})_2[\text{CH}\cdot\text{C}_6\text{H}_3(\text{OMe})\cdot\text{O}\cdot\text{Cu}\cdot\text{O}\cdot\text{C}_6\text{H}_3(\text{OMe})\cdot\text{CH}:\text{N}\cdot\text{C}_6\text{H}_4\cdot\text{NH}_2]_2\cdot 5\text{H}_2\text{O}$ . Copper divanillin,  $\text{Cu}[\text{CHO}\cdot\text{C}_6\text{H}_3(\text{OMe})\cdot\text{O}]_2$ , and *Cu* diguaiacol are also described. J. T. A.

**Cannizzaro reaction. V. Derivatives of 3:5-dimethoxybenzaldehyde.** G. LOCK and G. NOTTES (Monatsh., 1936, 68, 51—67; cf. A., 1935, 1238).—3:5-Disulphobenzoic acid (from BzOH and 65% oleum at 240—250°) (as Ba salt) with NaOH+KOH at 280—310° gives 3:5-(OH)<sub>2</sub>- $\text{C}_6\text{H}_3\cdot\text{CO}_2\text{H}$  (I), m.p. 237—240° (decomp.) (lit. 220—240°). 3:5-(OMe)<sub>2</sub>- $\text{C}_6\text{H}_3\cdot\text{CHO}$  (II), prepared from 3:5-(OMe)<sub>2</sub>- $\text{C}_6\text{H}_3\cdot\text{COCl}$  by Mauthner's method (A., 1920, i, 743), is converted by warm 50% KOH into 3:5-(OMe)<sub>2</sub>- $\text{C}_6\text{H}_3\cdot\text{CO}_2\text{H}$  and 3:5-(OMe)<sub>2</sub>- $\text{C}_6\text{H}_3\cdot\text{CH}_2\cdot\text{OH}$ . (II) and Br (1 mol.) in AcOH afford 85% of 2-bromo-3:5-dimethoxybenzaldehyde (III), m.p. 107° (phenylhydrazone, m.p. 108°), converted by 50% KOH into

2-bromo-3:5-dimethoxybenzyl alcohol, m.p. 96° (*p*-nitrobenzoate, m.p. 165°), and 2-bromo-3:5-dimethoxybenzoic acid, m.p. 202—203° (corr.) (Ag salt) [also obtained by oxidation ( $\text{KMnO}_4$ ) of (III)]. 4-Bromo-3:5-dimethoxybenzoic acid, m.p. 251° (corr.), is prepared by methylation ( $\text{Me}_2\text{SO}$ , 5% NaOH) of 3:5:4-(OH)<sub>2</sub>- $\text{C}_6\text{H}_2\cdot\text{Br}\cdot\text{CO}_2\text{H}$ . 2:6-Dibromo-3:5-dimethoxybenzaldehyde, m.p. 222—223° (corr.) (with darkening) [phenylhydrazone, m.p. 158° (corr.)], from (II) or (III) and Br in AcOH, is oxidised to the acid, m.p. 256° (corr.) (darkening) (Ag salt), and converted by 50% KOH into  $\text{HCO}_2\text{H}$  and 4:6:1:3- $\text{C}_6\text{H}_2\text{Br}_2(\text{OMe})_2$ . 2-Chloro-3:5-dimethoxybenzaldehyde (IV), m.p. 119.5° [semicarbazone, m.p. 218° (corr.)], and 50% KOH give 2-chloro-3:5-dimethoxybenzyl alcohol, m.p. 127°, and -benzoic acid (V), m.p. 181—182° (corr.). (V) is also prepared by oxidation of (IV) and by methylation of 2-chloro-3:5-dihydroxybenzoic acid, m.p. 249° (corr.) [from (I) and  $\text{SO}_2\text{Cl}_2$  in Et<sub>2</sub>O]. (II) or (IV) and  $\text{Cl}_2$  in AcOH afford 2:6-dichloro-3:5-dimethoxybenzaldehyde, m.p. 180—181° (corr.) [semicarbazone, m.p. 272° (decomp.)], which is oxidised to the acid, m.p. 209° (corr.), and converted by 50% KOH into  $\text{HCO}_2\text{H}$  and 4:6:1:3- $\text{C}_6\text{H}_2\text{Cl}_2(\text{OMe})_2$ . (III) [in  $\text{HNO}_3$  (d 1.4)] with  $\text{HNO}_3$  (d 1.5) gives 2-bromo-6-nitro-3:5-dimethoxybenzaldehyde, m.p. 213° (corr.) [phenylhydrazone, m.p. 153° (corr.)]; corresponding acid, m.p. 232° (corr.) (decomp.), which with 50% KOH affords  $\text{HCO}_2\text{H}$  and 4-bromo-6-nitroresorcinol Me<sub>2</sub> ether. (II) and  $\text{HNO}_3$  (d 1.5) at -5° give 2:6-dinitro-3:5-dimethoxybenzaldehyde, m.p. 228° (corr.) [phenylhydrazone, m.p. 211° (corr.) (decomp.)]; corresponding acid, m.p. 232—233° (corr.) (decomp.), readily converted by 50% KOH into  $\text{HCO}_2\text{H}$  and 4:6-dinitroresorcinol Me<sub>2</sub> ether. All the above substitution reactions with (II) result in the exclusive introduction of substituents *ortho* to CHO. H. B.

**Alicyclic compounds. II. Electrolytic oxidation of cyclohexanone.** F. PIRRONE (Gazzetta, 1936, 66, 244—253).—Electrolysis of cyclohexanone in  $\text{H}_2\text{SO}_4$  or MeOH, using  $\text{PbO}_2$  or Pt anodes, under varying conditions, gives a mixture of a ketone  $\text{C}_{18}\text{H}_{14}\text{O}$ , b.p. 253—257°/760 mm. (oxime, m.p. 145—146°), probably represented by (I); a ketone

$\text{C}_{18}\text{H}_{14}\text{O}$ , b.p. 268—270°/760 mm. (oxime, m.p. 152—154°), for which formula (II) is suggested, triphenylene, and maleic acid. E. W. W.

**Ethyl acetal of cyclohexanone, and its transformation into cyclohexenyl ether.** A. E. ARBU-SOV and B. M. MICHAÏLOVA (J. Gen. Chem. Russ., 1936, 6, 390—393).—cycloHexanone (I) and  $\text{CH}(\text{OEt})_2$  in EtOH afford the acetal (II) of (I). A 1:2:4 mixture of (II),  $\text{P}_2\text{O}_5$ , and  $\text{C}_5\text{H}_5\text{N}$  (100°; 5 hr.)

yields the *Et* ether, b.p. 56—56.5°/15 mm., of  $\Delta^1$ -cyclohexenol. R. T.

**Cyclic thioketones. I. Synthesis of non-polymerised thiocyclo-hexanone and -pentanone and their derivatives.** D. C. SEN (J. Indian Chem. Soc., 1936, 13, 268—272).—Passage of dry HCl and H<sub>2</sub>S into cyclohexanone in EtOH for 3 hr. gives the trimeride of thiocyclohexanone, m.p. 102°, but after 1—1.5 hr. monomeric thiocyclohexanone (I), b.p. 76°/15 mm. (*Pb* salt), is obtained. With NHPH.NH<sub>2</sub> and semicarbazide (I) affords cyclohexanone-phenylhydrazones (II) and -semicarbazones, respectively. When freshly distilled, it is pink, changing to orange, and then colourless; titration with I (which reacts with SH, but not with CS) in EtOH shows 38% of the thiol form immediately and 70% 1 hr. after distillation. The Na salt of (I) with MeI in Et<sub>2</sub>O gives methylthiol- $\Delta^1$ -cyclohexene, b.p. 55°/15 mm., unstable to Br and KMnO<sub>4</sub>, which with NHPH.NH<sub>2</sub> affords (II) and SHMe. (I), NaOAc, and hot Ac<sub>2</sub>O afford acetylthiol- $\Delta^1$ -cyclohexene, pink (stable), b.p. 85°/10 mm., unsaturated to Br and KMnO<sub>4</sub>, which with NHPH.NH<sub>2</sub> yields (II) and H<sub>2</sub>S. Thiocyclopentanone (III), b.p. 86—88°/10 mm., and acetylthiol- $\Delta^1$ -cyclopentene, b.p. 67°/8 mm., are similarly prepared and have similar properties. The mol. wts. in cold C<sub>6</sub>H<sub>6</sub> of the Ac derivatives are normal, but those of (I) and (III) are 50% too high, indicating partial association. R. S. C.

**General methods of synthesis of poly-alicyclic  $\alpha$ -ketones with angular methyl group.** C. K. CHUANG, Y. L. TIEN, and C. M. MA (Ber., 1936, 69, [B], 1494—1505).—Two general methods are illustrated. Et  $\beta$ -cyclohexan-2-one-1-propionate is hydrolysed by boiling conc. HCl to cyclohexanonepropionic acid, m.p. 66—67°, the Me ester, b.p. 140—141°/10 mm., of which is transformed by MgMeI into Me  $\beta$ -2-hydroxy-2-methylcyclohexylpropionate. This is converted by SOCl<sub>2</sub> in C<sub>5</sub>H<sub>5</sub>N—Et<sub>2</sub>O into Me  $\beta$ -2-methyl- $\Delta^1$ -cyclohexenylpropionate (I), b.p. 149—150°/10 mm., which does not dissolve in NaOH or Na<sub>2</sub>CO<sub>3</sub> and is hydrolysed by KOH—EtOH to  $\beta$ -2-methyl- $\Delta^1$ -cyclohexenylpropionic acid, b.p. 117—120°/0.6 mm. (dibromide, m.p. 137°; *p*-bromophenacyl ester, m.p. 73—73.5°; Ag salt). (I) is converted by the successive action of SOCl<sub>2</sub> in Et<sub>2</sub>O—C<sub>5</sub>H<sub>5</sub>N and SnCl<sub>4</sub> in CS<sub>2</sub> into 1-keto-8-methylhexahydroindene (II), b.p. 106—110°/9 mm. (semicarbazone, m.p. 187°), and the lactone, CH<sub>2</sub>·CH<sub>2</sub>·CMe·O·CO·CH<sub>2</sub>·CH<sub>2</sub>·CH·CH<sub>2</sub>·CH<sub>2</sub>, b.p. 135—137°/6 mm. Catalytic hydrogenation of (II) affords 1-keto-8-methylhexahydroindene, b.p. 97—98°/9 mm. [semicarbazone, m.p. 213° (decomp.)], which is oxidised by boiling HNO<sub>3</sub> (d 1.4) to 2-methylcyclohexane-2-carboxylic-1-acetic acid, m.p. 163—164°.

2-Methylcyclohexanone is converted by CH<sub>2</sub>Br·CO<sub>2</sub>Et into Et 2-methylcyclohexan-1-ol-2-acetate, b.p. 134—135°/18 mm., dehydrated by SOCl<sub>2</sub> in C<sub>5</sub>H<sub>5</sub>N to Et 2-methyl- $\Delta^1$ -cyclohexenylacetate, b.p. 110—111.5°/14 mm., reduced (Bouveault) to  $\beta$ -2-methyl- $\Delta^1$ -cyclohexenylethyl alcohol, b.p. 97—98.5°/8 mm. Unstable  $\beta$ -2-methyl- $\Delta^1$ -cyclohexenylethyl bromide and CHK(CO<sub>2</sub>Et)<sub>2</sub> afford Et  $\beta$ -2-methyl- $\Delta^1$ -cyclohexenylethylmalonate, b.p. 142—

145°/2 mm., whence  $\beta$ -2-methyl- $\Delta^1$ -cyclohexenylethylmalonic acid, m.p. 92—93°, and  $\gamma$ -2-methyl- $\Delta^1$ -cyclohexenylbutyric acid (III), b.p. 115—116°/0.5 mm. (*p*-bromophenacyl ester, m.p. 65—66°). (III) is converted through its chloride into 1-keto-9-methyloctahydronaphthalene (IV), b.p. 110—112°/9 mm. (semicarbazone, m.p. 226—227°; oxime, m.p. 99—100°). (IV) is reduced (Clemmensen) to the corresponding hydrocarbon, which does not react with Se at 320—350° or 350—400°, but passes at 430—450° into C<sub>10</sub>H<sub>8</sub>, thus establishing the position of Me. Hydrogenation (Pt sponge in abs. EtOH) of (IV) leads to 1-keto-9-methyldecahydronaphthalene (semicarbazone, m.p. 225—226°), oxidised by conc. HNO<sub>3</sub> to 1-methylcyclohexene-1-carboxylic-2- $\beta$ -propionic acid (Ag salt). H. W.

**Tertiary  $\alpha$ -keto-alcohols, and the influence of radicals (methyl and phenyl) entering into their composition.** A. M. CHALETZKI (J. Gen. Chem. Russ., 1936, 6, 1—14).—CHPhMe·CHO or  $\text{CPhMe} \cdot \text{CH} \cdot \text{O}$  and MgBu<sup>+</sup>Cl yield a mixture of C<sub>2</sub>Me<sub>6</sub>,  $\beta$ -phenyl-*n*-propyl alcohol, b.p. 113—114°/10 mm., and  $\beta$ -phenyl- $\alpha$ -tert.-butyl-*n*-propyl alcohol (I), b.p. 106—108°/10 mm., which is oxidised by aq. H<sub>2</sub>CrO<sub>4</sub> in presence of KHSO<sub>4</sub> to yield CPhMe (II) and Bu<sup>+</sup>CO<sub>2</sub>H (III); with more mild oxidation the products are a mixture of (I), (II), (III), and  $\alpha$ -phenylethyl Bu<sup>+</sup> ketone (IV), b.p. 103—104°/10 mm. A mixture of (I) and (IV) reacts with Br in H<sub>2</sub>O in presence of CaCO<sub>3</sub> to yield  $\alpha$ -bromo- $\alpha$ -phenylethyl Bu<sup>+</sup> ketone (V), b.p. 152—153°/10 mm., and  $\beta$ - $\gamma$ -dibromo- $\beta$ -phenyl-*dimethyl-n-pentane*, m.p. 167—168°, whilst with PBr<sub>3</sub> in light petroleum the products are  $\gamma$ -bromo- $\alpha$ -phenyl- $\delta$ -*dimethyl-n-pentane*, b.p. 122—124°/10 mm., and (V). (V) decomposes when heated at 100° with BaCO<sub>3</sub> to yield  $\alpha$ -hydroxy- $\alpha$ -phenylethyl Bu<sup>+</sup> ketone (VI) (semicarbazone, m.p. 196—197°). The cyanohydrin of (II) and MgBu<sup>+</sup>Cl at -10° afford C<sub>2</sub>Me<sub>6</sub>, (II), and (VI), the products of oxidation (KMnO<sub>4</sub>) of which are (II) and (III). (VI) is converted into  $\alpha$ -phenylvinyl Bu<sup>+</sup> ketone (VII), b.p. 88—89°/18 mm., when heated in EtOH with a few drops of H<sub>2</sub>SO<sub>4</sub>. (VII) and MgMeBr afford  $\gamma$ -hydroxy- $\beta$ -phenyl- $\gamma$ -*trimethyl- $\Delta^2$ -n-pentene*, b.p. 106—107°/18 mm., oxidised by KMnO<sub>4</sub> to give a mixture of HCO<sub>2</sub>H, BzOH, and COMeBu<sup>+</sup>. R. T.

**Direct synthesis of 2'-halogenomesobenzanthrones.** I. M. HEILBRON, R. N. HESLOP, and F. IRVING (J.C.S., 1936, 781—785).—*s*-C<sub>6</sub>H<sub>4</sub>Cl<sub>2</sub> with AlCl<sub>3</sub> in dry CHCl<sub>3</sub> at 30° affords *s*-pentachloropropane, converted by the theoretical amount of EtOH—KOH into  $\alpha$  $\beta$  $\gamma$ -tetrachloro- $\Delta^2$ -propylene (I) (cf. A., 1914, i, 648), which with anthrone in conc. H<sub>2</sub>SO<sub>4</sub> at 50° gives 2'-chloromesobenzanthrone, identical with the product obtained by the interaction of Cu<sub>2</sub>Cl<sub>2</sub> and HCl with mesobenzanthrone-2'-diazonium sulphate. Similarly, 1:4- (cf. A., 1929, 1289) and 1:5-dichloroanthrone (cf. J.C.S., 1923, 123, 2549) afford 2':5-*S*, m.p. 180—181°, and 2':4-*S*-trichloromesobenzanthrone, m.p. 190—191°, respectively. 4-Chloroanthrone similarly yields 2':4-dichloro-, m.p. 203—204°, and 2':5-dichloromesobenzanthrone, m.p. 240°, oxidised (CrO<sub>3</sub>—AcOH) to

4- and 5-chloroanthraquinone-1-carboxylic acid, respectively. 2-Chloro-, 2':5-dichloro-, and 2':5:8-trichloro-*mesobenzanthrones* when fused with EtOH-KOH afford purple vat dyes, whereas the 2':4-Cl<sub>2</sub>- and 2':4:8-Cl<sub>2</sub>-compounds do not, probably because the Cl<sub>4</sub> renders the 2 position unreactive. *s*-C<sub>2</sub>H<sub>5</sub>Br<sub>2</sub> with CHCl<sub>3</sub> in presence of AlCl<sub>3</sub> gives  $\alpha\gamma$ -trichloro- $\alpha\beta$ -dibromopropane, converted by EtOH-KOH into a mixture of chlorobromopropylenes (II), hydrolysed by conc. H<sub>2</sub>SO<sub>4</sub> at 30–40° to bromomalondialdehyde (III), m.p. 139–140° (cf. A., 1914, i, 648). (II) gives no *mesobenzanthrone* with anthrone in conc. H<sub>2</sub>SO<sub>4</sub>, but with anthrone, conc. H<sub>2</sub>SO<sub>4</sub> at 60°, and SO<sub>2</sub>, (III) gives 1'-bromomesobenzanthrone, m.p. 174–175° (lit., 170°), identical with the product of bromination of *mesobenzanthrone*, which with boiling CH<sub>3</sub>Ph-CN containing Cu<sub>2</sub>(CN)<sub>2</sub> gives 1'-cyanomesobenzanthrone. 2'-Bromo-, m.p. 194–195° (converted by fusion with EtOH-KOH into a dibenzanthrone), and 2'-cyano-*mesobenzanthrone*, m.p. 285–286°, are obtained from the 2'-NH<sub>2</sub>-compound and are different from the 1'-compounds (above). The latter with boiling 50% H<sub>2</sub>SO<sub>4</sub> gives *mesobenzanthrone*-2'-carboxylic acid, m.p. 341–342° (lit., 347°) (*Et* ester, m.p. 172–173°). J. L. D.

**Reagents for isolation of carbonyl compounds from unsaponifiable material.** (MISS) M. ANCHEL and R. SCHOENHEIMER (J. Biol. Chem., 1936, 114, 539–546).—Cholestanone (I), cholestenone (II), and coprostanone (III) give with aminoxyacetic acid, *oxime O-carboxymethyl ethers*, m.p. 151–152°, 158–159° (decomp.), and 150–151° (decomp.), and with NH<sub>2</sub>·NH·C<sub>6</sub>H<sub>4</sub>·CO<sub>2</sub>H autoxidisable *p*-carboxyphenylhydrazones, decomp. > 200° [those of (I) and (III) are hydrolysed by CH<sub>2</sub>O; that of (II) is stable to CH<sub>2</sub>O, but is hydrolysed by AcCO<sub>2</sub>H]. (I) gives readily with hydrazinoacetic acid a *carboxymethylhydrazone*, sol. in Et<sub>2</sub>O and rapidly hydrolysed by alkali; the *carboxymethylhydrazone* of (II) is formed only slowly, is not readily extracted by Et<sub>2</sub>O, is stable to CH<sub>2</sub>O, but is hydrolysed by AcCO<sub>2</sub>H. NH<sub>2</sub>·NH·CO·CH<sub>2</sub>·NMe<sub>3</sub>Cl gives with (I) a compound, hydrolysed by H<sub>2</sub>O. The separation of (I), (II), and cholesterol in mineral oil by means of *p*-NH<sub>2</sub>·NH·C<sub>6</sub>H<sub>4</sub>·CO<sub>2</sub>H is described. Hydrazones of  $\alpha\beta$ -unsaturated ketones are generally more resistant to hydrolysis than are those of saturated ketones.

R. S. C.

**Synthesis of substances related to the sterols.** IX. R. ROBINSON and J. WALKER. X. Condensation of furfurylidene-tetralone with ethyl acetoacetate, and analogous studies. D. A. PEAK, R. ROBINSON, and J. WALKER. XI. Constitution of the condensation products from acetylcyclopentene or acetylcyclohexene and methoxytetralone. D. M. CROWFOOT, W. S. RAPSON, and R. ROBINSON. XII. Some hydrochrysene derivatives. D. A. PEAK and R. ROBINSON. XIII. Hydrocyclopentanophenanthrene derivatives. J. R. HAWTHORNE and R. ROBINSON (J.C.S., 1936, 747–752, 752–757, 757–759, 759–763, 763–765).—IX. The Grignard reagent from  $\gamma$ -*m*-methoxyphenylpropyl chloride with CH<sub>2</sub>Cl·CH<sub>2</sub>·COCl gives, probably,  $\beta$ -chloroethyl  $\gamma$ -*m*-methoxyphenylpropyl ketone, b.p.

200–212°/0.27 mm.  $\gamma$ -*m*-Methoxyphenylbutyryl chloride and Et sodio- $\alpha$ -acetylglutarate afford, after intermediate treatment, *Me* 5-*keto*-8-*m*-methoxyphenyl-octoate, b.p. 180–187°/0.2 mm., converted by NaOEt into  $\beta$ -*m*-methoxyphenylethylcyclohexane-2:6-dione, m.p. 150°. Treatment by the known method affords 1-*keto*-7-methoxy-1:2:3:4:9:10-hexahydrophenanthrene, hydrogenated (Pd-SrCO<sub>3</sub>, or colloidal Pd) to 7-methoxy-1:2:3:4:9:10:11:12-octahydrophenanthrene-1-ol- $\alpha$  (I); from MeOH, (I) softens at 99–104° and clears at 105°; from EtOAc, it sinters at 106°, softens from 108°, and clears at 111° (*p*-nitrobenzoate, m.p. 125–126° after sintering at 120°). (I) is probably stereoisomeric with the substance described by Robinson and Schlittler (A., 1935, 1499). Beckmann's mixture converts it into 1-methoxy-1:2:3:4-tetrahydrophenanthrene [2:4-dinitrophenylhydrazone, m.p. 304° (decomp.)], but CrO<sub>3</sub>-AcOH affords 1-*keto*-7-methoxy-1:2:3:4:9:10:11:12-octahydrophenanthrene (II), m.p. 109°, isolated by way of the semicarbazone, m.p. 225°, or Girard's reagent; the material so obtained is only partly cryst., the oily portion affording further crystals when treated with hot aq. H<sub>2</sub>C<sub>2</sub>O<sub>4</sub>. X-Ray analysis indicates that (II) is the *trans*-form; 2:4-dinitrophenylhydrazone, sinters 205°, m.p. 209.5° (decomp.). (II) and Et<sub>2</sub>C<sub>2</sub>O<sub>4</sub> afford *Et* 1-*keto*-7-methoxy-1:2:3:4:9:10:11:12-octahydrophenanthrene-2-carboxylate (III), b.p. 195–205°/0.35 mm. From NHPh·NH<sub>2</sub> and (III), 5-hydroxy-1-phenyl-3:4-(1'-ethoxy-3':4':9':10':11':12'-hexahydrophenanthreno-1':2')-pyrazole (IV) is obtained, sinters at approx. 230°, softens from 245°, m.p. 258–260° (decomp.). The K derivative of (III) and MeI afford *Et* 1-*keto*-7-methoxy-2-methyl-

1:2:3:4:9:10:11:12-octahydrophenanthrene-2-carboxylate, b.p. 180–192°/0.13 mm.

X. Et  $\beta$ -formylpropionate (V) (from Et hydroxymethylenesuccinate), CH<sub>3</sub>Ac·CO<sub>2</sub>Et, and Ac<sub>2</sub>O afford *Et*  $\gamma$ -carbethoxypropylideneacetoacetate, b.p. 168–170°/10 mm.; a purer product is obtained using HCl in place of (AcO)<sub>2</sub>O. Neither this substance nor (V) could be condensed with 6-methoxytetralone. Furfuraldehyde and  $\alpha$ -tetralone (VI) afford 2-furfurylidene- $\alpha$ -tetralone, m.p. 75–76°, which condenses with CHNaAc·CO<sub>2</sub>Et to give two forms of *Et* 3-*keto*-1- $\alpha$ -furylhexahydrophenanthrene-2-carboxylate,  $\alpha$ -form (probably VII), m.p. 119–120°,  $\beta$ -form (probably VIII), m.p. 120–121°. (VII) is also obtained from *Et* furfurylideneacetoacetate and the Na derivative

of (VI). Hydrolysis of (VIII), or a modified prep. of (VII), affords 3-*keto*-1-furyl-1:2:3:4:9:10-hexahydro-

phenanthrene, m.p. 113—114°. Hydrogenation (Pd-SrCO<sub>3</sub> catalyst) of (VII) affords *Et* 3-keto-1-furyl-1:2:3:4:9:10:11:12-octahydrophenanthrene-2-carboxylate, m.p. 134.5—135.5°, converted by way of its K derivative and MeI into *Et* 3-keto-1-furyl-2-methyl-1:2:3:4:9:10:11:12-octahydrophenanthrene-2-carboxylate, m.p. 93—93.5°. 6-Methoxy-2- $\alpha$ -furfurylidene- $\alpha$ -tetralone, m.p. 104.5°, is obtained from 6-methoxy- $\alpha$ -tetralone (IX) and C<sub>5</sub>H<sub>4</sub>O<sub>2</sub>; with CHNaAc.CO<sub>2</sub>Et it affords *Et* 3-keto-7-methoxy-1- $\alpha$ -furyl-1:2:3:4:9:10-hexahydrophenanthrene-2-carboxylate, m.p. 137—138°, and a second substance, m.p. 122°, probably formed by dehydrogenation during the reaction. Veratraldehyde and (IX) afford 6-methoxy-2-veratrylidene- $\alpha$ -tetralone, m.p. 111—112°; if the reaction is effected in EtOH a substance (X), m.p. 110—111°, of unknown structure is obtained, possibly containing OEt in place of OMe. Condensation of *m*-OEt.C<sub>6</sub>H<sub>4</sub>.CHO and CH<sub>2</sub>(CO<sub>2</sub>Et)<sub>2</sub>, followed by esterification, affords *Et* *m*-ethoxycinnamate, b.p. 158°/1 mm., hydrogenated (Pd-SrCO<sub>3</sub> catalyst) to *Et*  $\beta$ -*m*-ethoxyphenylpropionate, b.p. 148°. Na-EtOH reduction gives  $\gamma$ -*m*-ethoxyphenylpropyl alcohol, b.p. 130°/3 mm., converted by SOCl<sub>2</sub> into  $\gamma$ -*m*-ethoxyphenylpropyl chloride, b.p. 111°/1 mm. The corresponding  $\gamma$ -*m*-ethoxyphenylbutyronitrile, b.p. 127°/0.6 mm., is hydrolysed to  $\gamma$ -*m*-ethoxyphenylbutyric acid, m.p. 65—66° (amide, m.p. 84—85°), which with H<sub>2</sub>SO<sub>4</sub> affords 6-ethoxy- $\alpha$ -tetralone, m.p. 46—47°. The veratrylidene derivative, m.p. 119—120°, is not identical with (X).

XI. The structure, 2-keto-10-methoxydecahydrochrysene, ascribed (A., 1935, 1498) to the condensation product from (IX) and acetylcyclohexene, is confirmed by the formation on addition of H<sub>2</sub> of a substance (XI) of alcoholic rather than ketonic function; this also applies to the substance (XII) obtained by addition of H<sub>2</sub> to the condensation product of (IX) and acetylcyclopentene. (XI) and Ac<sub>2</sub>O afford 2-acetoxy-10-methoxy-1:2:3:4:5:6:7:8:13:14:15:16-dodecahydrochrysene, m.p. 155—156°, whilst 3-acetoxy-7-methoxy-3:4:9:10:11:12-hexahydro-1:2-cyclopentanophenanthrene, m.p. 102—103°, is obtained similarly from (XII). The X-ray crystal analyses of (XI), (XII), and the two OAc-derivatives confirm the ascribed structures.

XII. Condensation of the Na derivative of (VI) with acetylcyclohexene affords three isomeric 2-keto-decahydrochrysenes; (A), m.p. 200—200.5°, and (B), m.p. 152—153°, have identical absorption spectra, similar to that of benzylideneacetone, whilst (C), m.p. 115—115.5°, has an entirely different spectrum; it is suggested that (A) and (B) are stereoisomeric 2-keto-2:3:4:5:6:7:8:14:15:16-decahydrochrysenes, and that (C) is 2-keto-1:2:3:4:5:6:7:8:15:16-decahydrochrysene. (A) is converted by EtOH-NaOEt into 2-hydroxy-2:3:4:5:6:7:8:14:15:16-decahydrochrysene, m.p. 136° (phenylurethane, m.p. 173—173.5°), and by the action of MeI on its Na derivative into 2-methoxy-3:4:5:6:7:8-hexahydrochrysene (?), m.p. 95.5—96°. Catalytic reduction of (A) affords 2-hydroxy-1:2:3:4:5:6:7:8:13:14:15:16-dodecahydrochrysene- $\alpha$  (XIII), m.p. 114—115° (phenylurethane, m.p. 197—198°), whereas reduction by Na-EtOH affords 2-hydroxy-1:2:3:4:5:6:7:8:13:14:15:16-dodecahydrochrysene- $\beta$  (XIV), m.p. 134—135° (phenylurethane, m.p.

197—198°). (XIII) is converted into (XIV) by a hot solution of Na in *iso*-C<sub>5</sub>H<sub>11</sub>.OH, and with CrO<sub>3</sub>-AcOH both give 2-keto-1:2:3:4:5:6:7:8:13:14:15:16-dodecahydrochrysene, m.p. 145—146° [oxime, m.p. 220—221° (decomp.); semicarbazone (XV), m.p. 223—224°]; a benzylidene derivative could not be prepared, neither could the ketone be methylated. Clemmensen reduction of (A) affords a mixture of decahydrochrysenes, but NaOEt converts (XV) into a homogeneous decahydrochrysene, m.p. 93—94°. This substance and (A) both afford chrysene when heated with Se; a by-product of the second of these dehydrogenations is a substance, C<sub>18</sub>H<sub>12</sub>O, m.p. 210—220° (decomp.) after darkening at 205°.

XIII. Condensation of the Na derivative of (IX) with acetylcyclopentene affords a mixture of substances containing 3-keto-3:9:10:11-tetrahydro-1:2-cyclopentanophenanthrene, m.p. 169—170° [oxime, m.p. 235.5° (decomp.)]. Catalytic reduction gives 3-hydroxy-3:4:9:10:11:12-hexahydro-1:2-cyclopentanophenanthrene (XVI), m.p. 106° (phenylurethane, m.p. 175°), oxidised (CrO<sub>3</sub>-AcOH) to 3-keto-3:4:9:10:11:12-hexahydro-1:2-cyclopentanophenanthrene (XVII), m.p. 115—116.5°; the semicarbazone, m.p. 191—192°, is converted by NaOEt (sealed tube) into 3:9:10:11-tetrahydro-1:2-cyclopentanophenanthrene, b.p. 164—165°/3 mm. Reduction of (XVII) (Clemmensen) affords 3:4:9:10:11:12-hexahydro-1:2-cyclopentanophenanthrene, b.p. 201°/16 mm. (XVI) is converted by Se into 1:2-cyclopentanophenanthrene. 6-Ethoxy- $\alpha$ -tetralone and acetylcyclopentene condense by the usual method to give 3-keto-7-ethoxy-3:9:10:11-tetrahydro-1:2-cyclopentanophenanthrene, m.p. 154—156°.

Attempted synthesis of natural sterols. I. Possibility of ring closure of hydrogenated naphthylbutyric acids and a ready method of preparing 1-keto-7-methoxy-1:2:3:4-tetrahydrophenanthrene. G. HABERLAND (Ber., 1936, 69, [B], 1380—1386).—1-Keto-6-methoxy-1:2:3:4-tetrahydronaphthalene (I) is converted by boiling AcOH-HBr (*d* 1.48) into 1-keto-6-hydroxy-1:2:3:4-tetrahydronaphthalene, m.p. 150°. (I) is transformed by Zn and CH<sub>2</sub>Br.CO<sub>2</sub>Et into the corresponding 1-hydroxy-1-acetic ester, dehydrated to a mixture of esters (II) which with Na and boiling MeOH gives *r*- $\beta$ -6-methoxy-1:2:3:4-tetrahydro-1-naphthylethanol (III), b.p. 162°/0.5 mm. (3:5-dinitrobenzoate, m.p. 108°), and *r*-6-methoxy-1:2:3:4-tetrahydro-1-naphthylacetic acid, m.p. 87° (whence *r*-6-hydroxy-1:2:3:4-tetrahydro-1-naphthylacetic acid, m.p. 137°). (III) is converted by PBr<sub>3</sub> in presence of CHCl<sub>3</sub>-NPhMe, into the corresponding bromide, which is condensed with CHNa(CO<sub>2</sub>Et)<sub>2</sub>, hydrolysed, and decarboxylated to  $\gamma$ -6-methoxy-1:2:3:4-tetrahydro-1-naphthylbutyric acid (IV), b.p. 170°/0.08 mm., m.p. 79°, accompanied by 1-keto-7-methoxy-1:2:3:4:9:10-hexahydrophenanthrene (2:4-dinitrophenylhydrazones, m.p. 257°). The following dehydrogenations are effected by S at about 200°: a mixture of 6-methoxy-1-methyl-3:4-dihydronaphthalene and 6-methoxytetrahydronaphthylidene-methane to 6-methoxy-1-methylnaphthalene, m.p. 48°; (II) to 6-methoxy-1-naphthylacetic acid, m.p. 155°; (IV) to  $\gamma$ -6-methoxy-1-naphthylbutyric acid (V), m.p.

151°. Treatment of (V) with 90%  $H_2SO_4$  affords 1-keto-7-methoxy-1:2:3:4-tetrahydrophenanthrene, m.p. 101° [2:4-dinitrophenylhydrazone, m.p. 300—310° (decomp.) according to the rate of heating; semicarbazone, m.p. 304—308° (decomp.) after softening at 293°]. Ring-closure of (IV) by  $SnCl_4$  or 40%  $H_2SO_4$  is described. H. W.

**Sex hormones.** XIV. Preparation of enolic derivatives of ketones of the cholesterol and androsterol series. L. RUZICKA and W. H. FISCHER. XV. *cis*-Testosterone and other 17-*cis*-derivatives of androstane and androstene. L. RUZICKA and H. KAGI (Helv. Chim. Acta, 1936, 19, 806—810, 842—849; cf. this vol., 606).—XIV. Cholestanone and  $AcCl$  at 100° (sealed tube) give 3-chlorocholestene, m.p. 81°. Cholestanone and  $BzCl$  (excess) at 100° (sealed tube) give 3-chlorocholestadiene, m.p. 61.5—62.5°, but at 160—170° (open flask) or in boiling  $PhMe$  or ligroin (b.p. 100—110°) give the benzoate, m.p. 117.5 (gives liquid crystals, stable to >153°), of the enolic form; with boiling  $Ac_2O$  it gives slowly the corresponding acetate, m.p. 78°. Androstene-3:17-dione and  $BzCl$  (3 mols.) in boiling ligroin (not without a solvent) give an enolic benzoate, m.p. 176—180° (decomp.; sintering from 168°).

XV. Crude 3-*trans*-acetoxy-17-benzoyloxy- $\Delta^5$ -androstene contains some 3-*trans*-acetoxy-17-*cis*-benzoyloxy- $\Delta^5$ -androstene, m.p. 133—134°, converted by cold  $NaOH$ - $MeOH$  into 17-*cis*-benzoyloxy- $\Delta^5$ -androstene-3-*trans*-ol (I), m.p. 150—151°, and by hot  $NaOH$ - $MeOH$  into  $\Delta^5$ -androstene-3-*trans*-17-*cis*-diol (II), m.p. 198—198.5° (diacetate, m.p. 169.5—170.5°), which with  $Br$ - $CrO_3$ - $AcOH$  gives *trans*-androstenedione and with  $H_2$ - $PtO_2$ - $AcOH$ - $EtOH$  gives androstane-3-*trans*-17-*cis*-diol, m.p. 213.5—214.5° (diacetate, m.p. 146—147.5°), oxidised by  $CrO_3$  to androstenedione. (I) and  $Br$ - $CrO_3$ - $AcOH$  give a benzoate, m.p. 136.5—138°, hydrolysed to  $\Delta^4$ -androstene-3-*trans*-ol-17-*cis*-ol (*cis*-testosterone) (III), m.p. 220—221°,  $[\alpha]^{20} + 71.5^\circ$  in  $EtOH$  [oxime, m.p. 220—225° (decomp. from 200°); semicarbazone, m.p. 221—222° (decomp.); acetate, m.p. 115.5—116.5°], oxidised by  $CrO_3$  (no protection by  $Br$  necessary) to  $\Delta^4$ -androstene-3:17-dione. The ethylenic linking in (III) is relatively unreactive. (II) and (III) have very little physiological action. The supposed 3-*trans*-17-*cis*-compounds of Ruzicka and Rosenberg (*loc. cit.*) have considerable physiological activity and are probably mixtures; one of them contained the 3-*cis*-17-*trans*-, another the 3-*trans*-17-*trans*-derivative. M.p. are corr. R. S. C.

**Migration reactions in polycyclic systems.** I. Fries rearrangement of 4-benzoyloxydiphenyl. D. H. HEY and E. R. B. JACKSON (J.C.S., 1936, 802—806).—4-Benzoyloxydiphenyl in  $C_2H_5Cl_4$  with  $AlCl_3$  at 140° affords 4-hydroxydiphenyl and 4-hydroxy-3-benzoyldiphenyl, m.p. 89° [*Bz* and *Ac* derivatives, m.p. 95—96° and 136—137°, respectively; *OMe*-derivative (I), m.p. 93° (2:4-dinitrophenylhydrazone, m.p. 218—219°)], but no alkali-sol. product (cf. A., 1932, 273). 4-Methoxydiphenyl with  $BzCl$  in  $CS_2$  containing  $AlCl_3$  at room temp. affords 4-methoxy-4'-benzoyldiphenyl (II), m.p. 166° (2:4-dinitrophenylhydrazone, m.p. 221°), and 4-methoxy-

3:4'-dibenzoyldiphenyl, m.p. 170° (2:4-dinitrophenylhydrazone, m.p. 221°). The Grignard derivative of 3-bromo-4-methoxydiphenyl (cf. A., 1930, 904) with  $PhCHO$  in boiling  $Et_2O$  affords a sec. alcohol (III) which with  $K_2Cr_2O_7$ - $H_2SO_4$  at 40—50° gives (I). 4-Hydroxy-3-aldehyddiphenyl (A., 1927, 145) with  $MeI$  in  $EtOH$ - $KOH$  gives 4-methoxydiphenyl-3-aldehyde, m.p. 79°, which with  $MgPhBr$  in dry  $Et_2O$  gives (III) and thence (I). 4-Benzoyldiphenyl with  $HNO_3$  ( $d$  1.46) at 0—5° affords 4-nitro-4'-benzoyldiphenyl (IV), m.p. 154—156°, reduced ( $SnCl_4$ - $HCl$ ) to the 4- $NH_2$ -compound, m.p. 143—144° (*Ac* derivative, m.p. 206—207°), the diazonium sulphate of which at 100° yields 4-hydroxy-4'-benzoyldiphenyl, methylated to (II).  $Ph_2$  with *p*- or *m*- $NO_2$ - $C_6H_4$ - $COCl$  in  $C_6H_6$  containing  $AlCl_3$  gives 4-*p*-, m.p. 165°, and 4-*m*-nitrobenzoyldiphenyl, m.p. 130°, different from (IV). Neither 4'-bromo- nor 4'-iodo-4-methoxydiphenyl reacts with  $Mg$ .

J. L. D.

**Action of ethyl hydrogen peroxide on  $\alpha$ -diketones. Mechanism.** R. P. BARNES and R. E. LEWIS (J. Amer. Chem. Soc., 1936, 58, 947—948).—Fission of  $\alpha$ -diketones by  $EtO_2H$  in aq.  $MeOH$ - $NaOH$  occurs thus (cf. Weitz and Scheffer, A., 1921, i, 868):  $COR \cdot COR + EtO_2H \rightarrow COR \cdot CR(OEt) \cdot O \cdot OH \rightarrow RCO_2Et + RCO_2H$ . Benzil thus gives  $BzOH$  and  $EtOBz$ : 4:4'-dimethoxybenzil affords anisic acid (I) and its *Et* ester (II); *p*-methoxybenzil yields (I), (II),  $BzOH$ , and  $EtOBz$  (owing to addition at either CO);  $COPh \cdot CO \cdot CH_2Ph$  gives  $BzOH$  and  $CH_2Ph \cdot CO_2H$ ; *s*- $C_6H_5Me_3CO \cdot CO \cdot CH_2Ph$  affords *s*- $C_6H_5Me_3CO_2H$  and  $CH_2Ph \cdot CO_2H$ . In the last two cases fission is slow and the intermediate esters undergo hydrolysis.

H. B.

**Constitution of benzoylformoin.** P. KARRER and F. LITWAN (Helv. Chim. Acta, 1936, 19, 829—831).—The dienolic and not the semi-acetal form of benzoylformoin (I) is responsible for the absorption of I, since 2-deoxy-*l*-ascorbic acid is inert to I. In aq.  $EtOH$  (I) absorbs 0.4 mol. of I at once, a further 0.2 mol. in 20 sec., and the remaining 0.4 mol. very slowly. In pure  $EtOH$  very little I is absorbed at once. Thus, equilibrium between the two forms varies with the solvent. R. S. C.

**Quinhydrones.** II. R. CIUSA, L. BRULL, and G. OTTOLINO (Gazzetta, 1936, 66, 209—215).—Prep. of mixed quinhydrones in the benzoquinone, benzoquinoneanil, and benzoquinonedianil series is attempted. Benzoquinone (I) and chloroquinol heated in  $EtOH$  or  $C_6H_6$  do not give either of the possible mixed quinhydrones. In absence of solvent, a product is obtained of lower Cl content than chloroquinhydrone. *p*- $NHPh \cdot C_6H_4 \cdot OH$  (II) and (I) mixed in cold  $C_6H_6$  give benzoquinhydrone (III). In light petroleum, (III) is again obtained, but also benzoquinoneanil (IV), and an additive compound, m.p. 104°, of (II) and (IV), also prepared by mixing (II) and (IV). *p*- $NHPh \cdot C_6H_4 \cdot NHPh$  (V) and (I) give benzoquinonedianil (VI), with a compound, m.p. 132°, of (V) and (VI). (VI) and quinol give, by the reverse reaction, (V) and (III). (II) and (VI) mixed in cold  $EtOH$  and treated with  $HBr$

give the blue *meri*-quinonoid salt,  $C_{30}H_{16}ON_3Br$ , m.p. 168°, of type  $[NH:C_6H_4:NH_2 \cdot OH \cdot C_6H_4 \cdot NH_2]Br$ , while (V) and (VI) give the blue *meri*-quinonoid salt,  $C_{36}H_{32}N_4Br_2$ , m.p. 195°, of type  $[NH_2 \cdot C_6H_4 \cdot NH_2 \cdot NH_2 \cdot C_6H_4 \cdot NH_2]Br_2$ , also obtained when HBr is added to a hot mixture of (II) and (VI) in EtOH. E. W. W.

**Molecular forces between benzoquinone and cyclopentadiene.**—See this vol., 781.

**Potentiometric study of [sodium]  $\beta$ -naphthaquinonesulphonate. Semiquinone problem.** L. MICHAELIS (J. Amer. Chem. Soc., 1936, 58, 873—878).—Reduction (method: A., 1933, 97) of Na  $\beta$ -naphthaquinonesulphonate (I) at  $p_H$  9—12 gives a brown intermediate (II), which is a semiquinone radical. The max. amount of (II) which can exist in equilibrium with the other forms of (I) is about 50% (at  $p_H$  10—12.5); the concn. of (II) decreases with fall in  $p_H$  and is nil at  $< 7.5$ . H. B.

**Manufacture of alkylated and aralkylated polyaminoanthraquinones.**—See B., 1936, 537.

**Synthesis of rubrene.** C. F. H. ALLEN and L. GILMAN (J. Amer. Chem. Soc., 1936, 58, 937—940).—Naphthacene-5:12-quinone (I) and MgPhBr (6 equivs.) in  $Et_2O-Bu^a_2O$  give two stereoisomeric 6:11-diphenyltetrahydronaphthacene-5:12-quinones (II), m.p. 224—225° and 293—297°, both of which are oxidised (atm.  $O_2$  in EtOH-KOH) to 6:11-diphenylnaphthacene-5:12-quinone (III), m.p. 284°, KOH-fusion of which affords BzOH, 1:4- $C_{10}H_6Ph_2$ , and 1:4:2- $C_{10}H_5Ph_2 \cdot CO_2H$  (Ag salt). The production of (II) and (III) confirms the structure suggested by Fieser (A., 1935, 1509) for (I). (III) is converted by LiPh (not by MgPhBr) into 5:12-dihydroxy-

5:6:11:12-tetraphenyl-5:12-dihydronaphthacene [the dihydroxydihydrrubrene of Dufraisse and Badoche, A., 1931, 1052], m.p. 308—310°, reduced (Fe, AcOH) to 5:6:11:12-tetraphenylnaphthacene [rubrene] (cf. Dufraisse and Velluz, this vol., 462). The mechanism of the formation of rubrenes from, e.g.,  $CPh_2C \cdot CPh_2Cl$  is discussed. H. B.

**Addition of dienes to naphthacenediquinone.** L. F. FIESER and J. T. DUNN (J. Amer. Chem. Soc., 1936, 58, 1054—1055).—Naphthacene-5:6:11:12-diquinone and  $\beta\gamma$ -dimethylbutadiene in AcOH at 100° give 87% of the adduct (A, R=Me), m.p. 255—256°, which is cleaved by 25% MeOH-KOH in air to  $o$ - $C_6H_4(CO_2H)_2$  and 2:3-dimethylantraquinone. The adduct (A, R=H), m.p. 243—244°, from butadiene similarly affords anthraquinone. H. B.

***m*-Xylylacetic acid. Preparation from pinonic acid.** J. V. HARRISPE (Compt. rend., 1936, 202, 1591—1593; cf. A., 1909, i, 301).—Pinonic acid with Br in conc. HCl at 100° gives a Br-derivative which is converted into *m*-xylylacetic acid, isolated from its

Me ester, b.p. 138°/20 mm. A mechanism for the reaction is suggested. J. L. D.

**Rotatory dispersion and circular dichroism of 2:2-dinitrocamphane in the ultra-violet.**—See this vol., 925.

**Isomerisation of oxides of terpenes. I. Isomerisation of  $\alpha$ -pinene oxide by Reformatski's reaction.** B. A. ARBUSOV (J. Gen. Chem. Russ., 1936, 6, 417—422).— $\alpha$ -Pinene oxide (I), Zn, and  $CH_2Br \cdot CO_2Et$  in  $C_6H_6$  (2 hr. at the b.p.) afford the substance  $\begin{matrix} CHMe \cdot CMe \\ | \\ CH-CH_2 \end{matrix} > CH \cdot CH(OH) \cdot CH_2 \cdot CO_2Et$  (II), b.p. 146—147°/4 mm., from which the corresponding acid, m.p. 74—75°, is obtained by hydrolysis (MeOH-NaOH). (I) and ZnBr, in  $C_6H_6$  (at the b.p.) afford campholenaldehyde, which yields (II) when treated with Zn and  $CH_2Br \cdot CO_2Et$ . R. T.

**Synthesis of camphor from pinene. II.** B. G. S. ACHARYA and T. S. WHEELER (J. Univ. Bombay, 1935, 4, Part II, 118—122; cf. A., 1935, 496).—Details are given for the prep. of camphor from pinene by way of the hydrochloride and camphene and thence (a) by direct oxidation or (b) through isobornyl acetate and isoborneol in over-all yields of 43 and 45%, respectively. R. S. C.

**Isomerisation of  $\alpha$ -pinene into the aliphatic terpene *alloocimene*. III. Conditions of formation and properties of the terpene. IV. Structure of the terpene.** B. A. ARBUSOV (J. Gen. Chem. Russ., 1936, 6, 206—216, 217—226).—III. *alloocimene* (I) is obtained by passing  $\alpha$ -pinene over reduced CuO (26.5% yield) or glass (24.6% yield), at 340—350°. (I) in EtOH and naphthaquinone (100°; 3 hr.) yield the substance (II), m.p. 122°, from which 2 H are eliminated (C atoms 11 and 12) by atm.  $O_2$  in presence of KOH, to afford a product, m.p. 120—120.5°. This is oxidised by  $HNO_3$  (200°; 5 hr.) to yield a substance, m.p. 331°, probably a naphthaquinonedicarboxylic acid. (I) in AcOH and  $H_2SO_4$  afford dipentene, a diterpene, b.p. 142—143°/4 mm., and polyterpenes (not isolated).

IV.  $CMc_2 \cdot CH \cdot CH_2Br$  and  $CHMe \cdot CMe \cdot CHO$  in  $Et_2O$  are added to Mg, when an alcohol,  $C_{10}H_{18}O$ , b.p. 82—83°, is obtained. This is dehydrated by  $KHSO_4$  at 180° to yield an unidentified terpene, b.p. 160.5°, not identical with the expected (I), and condensing with maleic anhydride to afford a product, m.p. 70—71°. (I) obtained from pinene is shown to be identical with natural (I), and with that obtained synthetically by the method of Fischer and Lowenberg (A., 1933, 592). R. T.

**Preparation and toxicity of bismuth salts of camphoric acid esters.** W. M. LAUTER and H. A. BRAUN (J. Amer. Pharm. Assoc., 1936, 25, 394—397).—Interaction of the appropriate Na alkyl camphorate (Edminson and Hilditch, J.C.S., 1910, 97, 223) with  $Bi(NO_3)_3$  in aq. glycerol affords *Bi tri(methyl camphorate)*, m.p. 60.5—62.5° [7.06% sol. in oil of sweet almonds (I); 10.07% in (I) containing 10% of camphor (II)], *Bi tri(ethyl camphorate)*, m.p.

54—57° [16.03% sol. in (I); 38.18% in (I) containing 10% of (II)], and *Bi tri-(n-butyl camphorate)*. The 50% min. lethal dose for intramuscular injection in rats is respectively 0.35, 0.25, and 0.15 g. of Bi per kg. body-wt.

F. O. H.

**$\alpha$ - and  $\beta$ -Camphylic acids.** J. R. LEWIS and J. L. SIMONSEN (J.C.S., 1936, 734—737).— $\alpha$ -Camphylic acid (I) has been shown to be 2 : 2 : 3-trimethyl- $\Delta^{1,4}$ -cyclopentadiene-1-carboxylic acid and the  $\beta$ -acid (II) is 2 : 3 : 3-trimethyl- $\Delta^{1,4}$ -cyclopentadiene-1-carboxylic acid (dehydroisauronic acid). (I) is reduced (Pd-H<sub>2</sub>) to dihydro- $\alpha$ -campholytic acid (*p-phenylphenacyl* ester, m.p. 93°), and is oxidised (KMnO<sub>4</sub>) to COMePr<sup>8</sup> (*phenylsemicarbazone*, m.p. 101—102°) and H<sub>2</sub>C<sub>2</sub>O<sub>4</sub>. Me  $\alpha$ -camphylate with  $\alpha$ -naphthaquinone yields an additive product, m.p. 106°, showing the presence of a system of conjugated linkings. Titration of (II) with percamphoric acid shows 2 ethylenic linkings and hydrogenation (Pt-H<sub>2</sub>) gives dihydroisauronic acid (*p-phenylphenacyl* ester, m.p. 68—69°). Oxidation of (II) gives COMePr<sup>8</sup> and H<sub>2</sub>C<sub>2</sub>O<sub>4</sub>, and condensation of the Me ester with  $\alpha$ -naphthaquinone yields an additive product, m.p. 135°. Oxidation (O<sub>3</sub>) of isobromodihydro- $\beta$ -camphylic acid gives an unstable Br-acid, which after treatment with NaOH is oxidised with NaOBr to *as-dimethylsuccinic acid*. The relationships of the acids are discussed.

F. R. S.

**Synthesis of umbellularic acid; a synthetic proof of the presence of the cyclopropane bridge in the terpenes of the thujane series.** H. N. RYDON (J.C.S., 1936, 829—832).—Et isopropylfumarate and CH<sub>2</sub>N<sub>2</sub> give Et 1-isopropylcyclopropane-1 : 2-dicarboxylate, b.p. 121—122°/13 mm., hydrolysed (KOH) to a mixture of di-trans-, m.p. 197°, and di-cis-1-isopropylcyclopropane-1 : 2-dicarboxylic acid, m.p. 126—127° (+H<sub>2</sub>O, m.p. 98—99°). The trans-acid is resolved through *brucine* 1- (+6H<sub>2</sub>O), m.p. 149—151° (decomp.), [ $\alpha$ ]<sub>D</sub><sup>25</sup><sub>401</sub> -98.8° in CHCl<sub>3</sub>, and *brucine* d-salts, [ $\alpha$ ]<sub>D</sub><sup>25</sup><sub>461</sub> -15.39° in CHCl<sub>3</sub>, into l-, m.p. 155°, [ $\alpha$ ]<sub>D</sub><sup>21</sup><sub>461</sub> -236.2° in COMe<sub>2</sub>, and d-trans-1-isopropylcyclopropane-1 : 2-dicarboxylic acid, m.p. 155°, [ $\alpha$ ]<sub>D</sub><sup>17</sup><sub>461</sub> +232.1° in COMe<sub>2</sub>. The cis-acid is resolved through *brucine* d-, m.p. 110—120° (decomp.), [ $\alpha$ ]<sub>D</sub><sup>20</sup><sub>61</sub> +6.2° in COMe<sub>2</sub>, and *brucine* l-salts, [ $\alpha$ ]<sub>D</sub><sup>16</sup><sub>461</sub> -29.5° in COMe<sub>2</sub>, into d-, m.p. 119—120°, [ $\alpha$ ]<sub>D</sub><sup>10</sup> +86.9° in CHCl<sub>3</sub> (+H<sub>2</sub>O, m.p. 78—79°), and l-cis-1-isopropylcyclopropane-1 : 2-dicarboxylic acid, m.p. 119—120°, [ $\alpha$ ]<sub>D</sub> -88.8° in CHCl<sub>3</sub> [+H<sub>2</sub>O (I), m.p. 78—79°]. The monohydrate of umbellularic acid is identical with (I) and this confirms the structure assigned by Semmler.

F. R. S.

**Fenchene series. VI. Two homologous fenchenes. Racemisation of hydrocarbons of the pentocean system.** G. KOMPPA and G. A. NYMAN (Annalen, 1936, 523, 87—100; cf. A., 1934, 415).—dl-2-Methylisofenchol (I), b.p. 91°/15 mm., m.p. 50—51° (*phenylurethane*, m.p. 100—101°), when heated for 30 min. with KHSO<sub>4</sub> at 170° and then distilled at 230°, gives a mixture containing about equal parts (determined by ozonisation) of 1-methyl- $\gamma$ - (II), b.p. 154—156°,  $d_4^{20}$  0.8439,  $n_D^{20}$  1.45284 (*nitrosochloride*, m.p. 165°, readily formed), and  $\beta$ -fenchene (III), b.p. 163—164°,  $d_4^{20}$  0.8497,  $n_D^{20}$  1.46212 (*nitrosochloride*, m.p.

121—121.5°, not readily formed), separable with difficulty by fractionation (cf. A., 1929, 1076). The l-form (IV), [ $\alpha$ ]<sub>D</sub><sup>20</sup> -10.2°, of (I) with KHSO<sub>4</sub> gives the same inactive mixture, probably owing to retropinacol inversion rearrangement of (IV). Analogies to this inversion are discussed. (I) is obtained from MgMeI and dl-isofenchone (V), b.p. 193—196° (semicarbazone, m.p. 225—226°), prepared in 80% yield from dl-isofenchol by HNO<sub>3</sub> (mixture of conc. and fuming) at < 25°. (IV) is obtained similarly from l-isofenchone, [ $\alpha$ ]<sub>D</sub><sup>20</sup> -8.13° [semicarbazone, m.p. 230—231° (lit. 221—222°)]. The structure of (II) is proved by ozonisation to 4-acetyl-1 : 1 : 4-trimethylcyclopentane-2-aldehyde [*disemicarbazone*, m.p. 234.5—235° (decomp.)], the corresponding acid (dl-isofenchocamphoric acid), and a little (V) [derived from (III) present as impurity]. The structure of (III) is proved by ozonisation to (V) and oxidation by KMnO<sub>4</sub> to dl-1-methyl- $\beta$ -hydroxyfenchonic acid (VI), m.p. 119—120° (K salt) [with PbO<sub>2</sub> and 60% H<sub>2</sub>SO<sub>4</sub> gives (V)]. The mixture of (II) and (III) is slowly hydrated by AcOH-H<sub>2</sub>SO<sub>4</sub>-H<sub>2</sub>O at 60—65° to the nearly homogeneous acetate, b.p. 97—100°/15 mm., of (I), and with

HCl-Et<sub>2</sub>O gives a hydrochloride, b.p. 95—96°/19 mm., which with CaO-H<sub>2</sub>O at 50—60° gives "1-methyl- $\beta$ -fenchene hydrate," an isomeride of (I), m.p. 30° (*phenylurethane*, m.p. 110—111°).

R. S. C.

**Volatile plant products. IV. Constitution of the azulenes.** A. S. PFAU and P. PLATTNER (Helv. Chim. Acta, 1936, 19, 858—879; cf. A., 1935, 1128).—Previously proposed formulae for azulenes are refuted. Eucazulene [from the sesquiterpenes of *Eucalyptus globulus* labill. (mostly aromadendrene)] and gurgunazulene (from an oil composed mostly of  $\alpha$ -gurgunene by Se or Ni) are identical with S-guajazulene (I), which is also obtained from geranium oil [Barbier and Bouveault's formula, C<sub>20</sub>H<sub>34</sub>O (A., 1895, i, 4), is incorrect], *Geranium macrorrhizum*, L., patchouli, and vetiver oils.  $\alpha$ -Gurgunene gives, however, also other products which are possibly azulenes. Pterates and styphnates are unsuitable for identification of azulenes, which is best effected by the C<sub>6</sub>H<sub>5</sub>(NO<sub>2</sub>)<sub>3</sub> or C<sub>6</sub>H<sub>2</sub>Me(NO<sub>2</sub>)<sub>3</sub> compounds, from which the hydrocarbons are recovered by heating with (NH<sub>4</sub>)<sub>2</sub>S-EtOH, followed by distillation in steam. The best conditions for preparing (S and Se) and purifying azulenes are detailed. The Br test in CHCl<sub>3</sub> or AcOH is best for determining whether a sesquiterpene hydrocarbon or alcohol will yield azulenes, but it is not sp. Guaiol and boiling HI-red P give 1 : 4 : 6-C<sub>10</sub>H<sub>5</sub>Me<sub>2</sub>Pr<sup>8</sup>; vetiver oil gives 1 : 5 : 7-C<sub>10</sub>H<sub>5</sub>Me<sub>2</sub>Pr<sup>8</sup>. C<sub>10</sub>H<sub>8</sub> derivatives are also obtained with SiO<sub>2</sub> gel at 300° in vac. The oxidation products from the sesquiterpenes give ketones with 1 C less in the ring, which yield phenols on catalytic dehydrogenation. Thus, these sesquiterpenes contain a 7-ring. 2 : 3-

Trimethylene- $\Delta^2$ -cycloheptanone (II) and MgMeI give 1-methyl-2:3-trimethylene- $\Delta^{1:6}$ -cycloheptadiene, b.p. 103—106°/10 mm., dehydrogenated by Ni at 335—375° to 3-methylcyclopentadieno-1':2':1:2-cycloheptatriene (called 4-methylazulene) (III) (5% yield), blue [picrate, black, m.p. 144°;  $C_6H_3(NO_2)_3$  compound, black, m.p. 177.5—178°]. MgEtBr and MgPhBr

give 1-ethyl-, b.p. 109—111°/10 mm., and 1-phenyl-2:3-trimethylene- $\Delta^{1:6}$ -cycloheptadiene, b.p. 160—190°/10 mm., and 4-ethyl-, blue (prep. by S at 175—210° or Ni at 340—400°) [picrate, m.p. 128.5°; impure styphnate, m.p. 123°;  $C_6H_3(NO_2)_3$  compound, m.p. 147.5°], and 4-phenylazulene, blue [picrate, m.p. 80—81°;  $C_6H_3(NO_2)_3$  compound, m.p. 86—87°; a pale green compound,  $C_{16}H_{22}$ , m.p. 210—211°, unstable to  $KMnO_4$ , is also formed]. Hydrogenation and reduction (Na-EtOH) of (II) gives an alcohol, which gives a cycloheptene, dehydrogenated by S or Ni to a blue mixture. (I) is the 1:4-dimethyl-7-isopropyl and vetivazulene the 4:8-dimethyl-2-isopropyl derivative corresponding with (III). The position of the ethylenic linkings in the azulenes is uncertain. R. S. C.

**Caryophyllenes.** IV. G. R. RAMAGE and J. L. SIMONSEN (J.C.S., 1936, 741—742; cf. A., 1935, 489).—*trans-d*-Caryophyllenic acid when heated with  $Ac_2O$  gives *caryophyllenic anhydride*, b.p. 157—158°/12 mm., which is hydrolysed to *cis-caryophyllenic acid*, m.p. 77—78°,  $[\alpha]_{5461}^{20} -7.4^\circ$  in  $CHCl_3$ . The *trans*-acid forms a *dianilide*, m.p. 282°, and *di-p*-phenylphenacyl ester, m.p. 121—122°, and the *cis*-acid yields a *dianilide*, m.p. 120°. The keto-acid,  $C_{11}H_{18}O_3$ , is oxidised (NaOBr) to homocaryophyllenic acid (*dianilide*, m.p. 179—180°) (cf. Ruzicka and Wind, A., 1931, 734). F. R. S.

**Derivative of sciadopitene and reduction of the two isomerides.**—See this vol., 1037.

**Saponin from *Primula elatior*.** H. RUTKOFF and P. MOHS (Ber., 1936, 69, [B], 1522—1527).—Treatment of *P. elatior* with dil.  $NH_3$  extracts non-cryst. *elatioric acid* (I), m.p. 220° (decomp.),  $[\alpha]_D^{20} -67.2^\circ$  in  $C_5H_5N$ ,  $-29.9^\circ$  in MeOH ( $NH_4$  salt, m.p. 220° (decomp.),  $[\alpha]_D^{20} -28.8^\circ$  in  $H_2O$ ; K salt, m.p. 251° (decomp.),  $[\alpha]_D^{20} -28.1^\circ$  in  $H_2O$ ), dehydrogenated by Se at 320—340° to 1:2:5:6- $C_{10}H_4Me_4$ , m.p. 116° (picrate, m.p. 156°). Cautious acidic hydrolysis of (I) gives *elatigenin* (II),  $C_{32}H_{52}O_3$ , m.p. 241°,  $[\alpha]_D^{20} +25.5^\circ$  in  $C_5H_5N$ , which contains 2 active H (*diacetate*, m.p. 213.5°,  $[\alpha]_D^{20} +28.7^\circ$  in  $CHCl_3$ ; *di-p*-nitrobenzoate, m.p. 245°,  $[\alpha]_D^{20} +40.4^\circ$  in  $CHCl_3$ ). Since cautious treatment with  $CrO_3$ -AcOH gives exclusively neutral products, a primary OH is not present. The third O atom is presumably in a ring, since the product does not react with ketonic reagents. Catalytic hydrogenation (Adams-Shriner or Willstätter) does not disclose the presence of an unsaturated linking, but such is probably present, since 1.5 O is absorbed from  $BzO_2H$ . The sugar component of the saponin is present as a uronic acid and, probably, a

disaccharide. Hydrolysis appears to occur thus:  $C_{50}H_{80}O_{19} + 2H_2O \rightarrow C_{32}H_{52}O_3 + C_6H_{10}O_7 + C_{12}H_{22}O_{11}$ .

**Lignin. X. Lignin from oat straw.** M. PHILLIPS and M. J. GOSS (J. Biol. Chem., 1936, 114, 557—565; cf. A., 1935, 214).—Lignins from oat straw closely resemble those from barley straw. 2% NaOH-EtOH extracts a *lignin*,  $C_{36}H_{32}O_7(OH)_4(OMe)_4$  (*tetraacetate*), which with  $Cl_2$  gives a *substance*,  $C_{40}H_{32}O_{15}Cl_6$ , of lower OMe content, with molten KOH gives protocatechuic acid, with hot 12% HCl gives  $CH_2O$ , with  $CH_2N_2$  affords an *ether*,  $C_{36}H_{34}O_9(OMe)_6$ , but with  $Me_2SO_4$ -40% NaOH by fission an *ether*,  $C_{36}H_{31}O_6(OMe)_9$ . Hot 4% aq. NaOH then removes a *lignin*,  $C_{36}H_{26}O_8(OH)_4(OMe)_4$  (*tetraacetate*), giving with  $CH_2N_2$  an *ether*,  $C_{36}H_{28}O_{10}(OMe)_6$ , and with HCl  $CH_2O$ . A third fraction, obtained by cold, fuming HCl, gives  $CH_2O$  with 12% hot HCl. R. S. C.

**Lignin.** S. A. WAKSMAN and T. C. CORDON (J. Amer. Chem. Soc., 1936, 58, 969—972).—The lignin (I) extracted by 80%  $H_2SO_4$  from wheat straw (II) at 2° (Ia, yield 27.07%) contains less OMe and C than those isolated at 8.5—9° (Ib, 21.38%) and 18—20° (Ic, 21.86%), owing to incomplete hydrolysis of the carbohydrates. Subsequent treatment of (Ia)—(Ic) with 80%  $H_2SO_4$  at room temp. gives approx. the same yield of "final lignins" (III) containing the same amount of OMe. Analogous differences are found with the (I) similarly isolated from (II) which has been pre-treated with 2% HCl at 100°; the final yields are somewhat smaller, probably because the pre-treatment destroys some hemicellulose (IV) [i.e., (III) contain this (IV)]. Less (I) is extracted from (II) by 5% NaOH at room temp. than at 100° [at which temp. some of the (I) is probably destroyed]. The sum of the (I) extracted by the cold alkali and that left in the residue is practically the same as the amount removed by 80%  $H_2SO_4$  alone. Hilpert's view (A., 1935, 344, 550) that (I) does not exist in plant materials has no foundation. H. B.

**Wood lignins.** E. E. HARRIS (J. Amer. Chem. Soc., 1936, 58, 894—896).—In accordance with previous findings (A., 1934, 653), the lignins isolated ( $H_2SO_4$  method) in 19—25.8% yield from (a) hardwoods (sugar maple, aspen, beech, basswood, white oak) contain 6 OMe, whilst those from (b) softwoods (yield 25.5—30%) (spruce, slash pine, Eastern hemlock) contain 5 OMe. Extraction with MeOH-HCl gives (a) 6—7% and (b) 4% of lignins which contain approx. 7.5 and 6.5 OMe, respectively; the residual lignins (subsequently extracted with  $H_2SO_4$ ) have about 5 and 4 OMe, respectively. All the lignins isolated are methylated ( $Me_2SO_4$ ) to methyl-lignin (32% OMe, i.e., 10 OMe); treatment with  $Cl_2$  in  $CCl_4$  results in the loss of 2 OMe and introduction of 8 Cl. H. B.

**Beech lignin.** E. WEDEKIND and O. MÜLLER (Ber., 1936, 69, [B], 1517—1521).—Beech lignin (I) has been prepared according to Freudenberg's method and in parallel experiments the wood is subjected between treatments with  $Cu(OH)_2-NH_3$  to the action of 1%  $H_2SO_4$ , 7%  $H_2C_2O_4$ , and 3% NaOH, respectively. The three products do not differ externally from one another or from (I) obtained by other methods.

The analytical composition is not influenced by treatment with 64%  $\text{H}_2\text{SO}_4$ . Acetylation of (I) gives a product with 20–21%  $\text{Ac}$  = 7.9–8.3% of  $\text{OH}$ . Treatment of (I) with  $\text{PhOH}$  and conc.  $\text{HCl}$  at 90–95° gives a phenol-lignin ( $\text{C}$  66.2,  $\text{H}$  5.7,  $\text{OMe}$  17.5%) which contains phenolic  $\text{OH}$  and is transformed by  $\text{NaOH-Me}_2\text{SO}_4$  into an alkali-insol. product with 31.1%  $\text{OMe}$ . There appears no reason therefore to doubt the existence of lignin, since humification processes are avoided as completely as possible. Hilpert's introduction of a hypothetical carbohydrate appears unnecessary. H. W.

**Separation of the ligninsulphonic acids precipitable with amines.** W. NIRPE (Ber., 1936, 69, [B], 1239–1245).—Treatment of a sulphite liquor with  $\text{NaCl}$  and of the filtrate with  $\alpha\text{-C}_{10}\text{H}_7\text{-NH}_2\text{-SO}_2\text{-NaCl}$  causes separation of a ligninsulphonate- $\alpha$ , (I) in which one of the firmly united  $\text{SO}_3\text{H}$  groups is satisfied with  $\alpha\text{-C}_{10}\text{H}_7\text{-NH}_2$  and the remaining two with  $\text{Na}$ . Treatment of the compound with  $\text{NaCl-H}_2\text{O}$  followed by  $\text{EtOH}$  gives the  $\text{Na}_3$  salt (II). Addition of benzidine in dil.  $\text{HCl}$  to the filtrate from (I) ppts. ligninsulphonic acid- $\alpha_3$  as *tribenzidine* salt, converted into the  $\text{Na}_3$  compound (III). (I) and (III) contain one and two loosely combined  $\text{SO}_3\text{H}$  groups, respectively (per 100 $\text{Me}$ ), removal of which by dil. alkali is accompanied by great liability to autoxidation and by dil. acid to condensation. (II) and (III) give *nona-* and *deca-p-toluenesulphonyl* derivatives, respectively. The formulae of the  $\alpha_1$  salt (IV), (II), and (III) can therefore be resolved into  $\text{C}_{90}\text{H}_{82}\text{O}_{14}(\text{OH})_4(\text{OH})_4(\text{OMe})_{10}(\text{SO}_3\text{Na})_3$ ,  $\text{C}_{85}\text{H}_{71}\text{O}_9(\text{OH})_4(\text{OH})_4(\text{OMe})_{10}(\text{SO}_3\text{Na})_3$ , and  $\text{C}_{80}\text{H}_{62}\text{O}_7(\text{OH})_4(\text{OH})_4(\text{OH})_2(\text{OMe})_{10}(\text{SO}_3\text{Na})_4$ , respectively. In each compound 4  $\text{OH}$  are phenolic, 4 aliphatic, and the remainder acidic, the no. of the last-named coinciding with that of loosely-united  $\text{SO}_3\text{H}$ . Possibly the unstable union with  $\text{H}_2\text{SO}_3$  is due to the presence of  $\text{CO}$ , but such groups could not be detected with  $\text{NH}_2\text{OH}$  or  $\text{N}_2\text{H}_4$ . The analytical homogeneity of the salts is established together with their producibility from different liquors, but it is probable that they are mixtures of isomerides. (II) and (III) resemble (IV) in their fluorescence in ultra-violet light and in its change with increasing alkalinity attributed to phenoxide formation. H. W.

**Lignin.** XV. K. FREUDENBERG, A. JANSON, E. KNOPF, and A. HAAG (Ber., 1936, 69, [B], 1415–1425).—Pine lignin is transformed by  $\text{KOH}$  at 210° into alkali-sol., phenol-like, complex degradation products which are converted by methylation and oxidation into veratric acid (I) (10–14%), veratroyl-formic acid, isohemipinic acid (2–4%), and a more complex acid containing two  $\text{C}_6\text{H}_6$  nuclei (3%); the most urgent requirements of the constitution assigned previously are thereby fulfilled. Pine wood is treated successively with  $\text{EtOH-C}_6\text{H}_6$ , cold alkali, and  $\text{HCO}_2\text{H}$ , thereby giving polysaccharide *A* and *B* and component *C*; these together comprise unorganised lignin, and of them *C* is the most important. Repeated treatment of the residue with Schweitzer's reagent alternated with 1%  $\text{H}_2\text{SO}_4$  leaves "organised lignin." Similar treatment of beech wood gives a much higher proportion of *B* and *C* and an "organised lignin" which contains 21%  $\text{OMe}$  and yields proto-

catechuic and gallic acid when fused with  $\text{KOH}$ . Unorganised pine lignin very closely resembles polymeric coniferyl alcohol, for which, since it affords (I) when oxidised, side-chain polymerisation must now be considered. The production of >20% of aromatic acids from organised lignin strengthens the conception of its aromatic nature. The possible transformations of lignin during its isolation and the relationship between the aromatic constituents of wood are discussed. H. W.

**Lignin and related compounds.** XXII. Fractionation of methanol-lignin. J. COMPTON, (Miss) M. GREIG, and H. HIBBERT (Canad. J. Res., 1936, 14, B, 115–119; cf. this vol., 609).—Fractionation of methanol-lignin with  $\text{C}_6\text{H}_6$ -dioxan gives an insol. fraction,  $\text{C}_{42}\text{H}_{32}\text{O}_5(\text{OMe})_6(\text{OH})_4$  [identical with that previously described (A., 1935, 1373)], and a sol. fraction with  $\text{OMe}:\text{OH}=5:3$  (*triacetate*; *Me ether*,  $\text{OMe}=32.6\%$ , prepared by  $\text{Me}_2\text{SO}_4\text{-aq. NaOH-COMe}_2$ ) in the proportions 4:1 if the extraction is effected at 70–75°, but 2:1 if at 90–100°.

R. S. C.  
**Bitter principles of Colombo root.** III. *Palmarin*. F. WESSELY, K. SCHÖNOL, and W. ISEMANN (Monatsh., 1936, 68, 21–28).—*Palmarin* (I),  $\text{C}_{20}\text{H}_{22}\text{O}_7$ , m.p. 258–260° (slight decomp.) (sinters at 246°),  $[\alpha]_D^{25}$  about +12.5° in  $\text{C}_5\text{H}_5\text{N}$ , is isolable from the crude  $\text{Et}_2\text{O}$ -extract of the root through its sparing solubility in  $\text{COMe}_2$ . Methylation ( $\text{Me}_2\text{SO}_4$ , 10%  $\text{NaOH}$ ,  $\text{EtOH}$ ) of (I) gives the *Me ether* (II), m.p. 254° (slight decomp.) (sinters at 245°),  $[\alpha]_D^{25} +39.47^\circ$  in  $\text{C}_5\text{H}_5\text{N}$ . (I), which appears to be isomeric with chasmanthin (Feist *et al.*, A., 1908, i, 100; 1935, 864), contains a lactone ring and 2 double linkings; reduction ( $\text{H}_2$ ,  $\text{Pd-C}$ ,  $\text{AcOH}$ ) results in the absorption of 6  $\text{H}$  and gives *hydropalmaric acid*,  $\text{C}_{20}\text{H}_{28}\text{O}_7$ , m.p. 213–218°,  $[\alpha]_D^{25} +29.78^\circ$  in  $\text{C}_5\text{H}_5\text{N}$ , which is methylated (as above) to the *Me ether*, m.p. 262° (sinters at 257°),  $[\alpha]_D^{25} +57.62^\circ$  in  $\text{C}_5\text{H}_5\text{N}$  [also obtained by reduction of (II)]. H. B.

**Tannin from the Indian gooseberry (*Phyllanthus emblica*).**—See this vol., 911.

**Grayanotoxins, active constituents of *Leucothoe grayana*.** II. S. MIYAJIMA and S. TAKEI (J. Agric. Chem. Soc. Japan, 1936, 12, 497–502; cf. A., 1934, 1359).—Grayanotoxin-I and -III in  $\text{C}_5\text{H}_5\text{N}$  yielded the same *Ac* derivative, m.p. 226°. Acetylation with  $\text{Ac}_2\text{O}$  and  $\text{NaOAc}$  gave amorphous products which with alkali gave *anhydrograyanotoxin-III*,  $\text{C}_{20}\text{H}_{30}\text{O}_5$ , m.p. 220–224°, isomeric with grayanotoxin-II. Both contain a double linking. With  $\text{Ac}_2\text{O}$  in  $\text{C}_5\text{H}_5\text{N}$  -II gave a *tetra-acetate*, m.p. 172°, and catalytic hydrogenation yielded *dihydro-tetra-acetyl-II*, m.p. 170°, which was obtained also by acetylation of dihydro-II in  $\text{C}_5\text{H}_5\text{N}$ . Spring leaves of *L. grayana* contain grayanotoxins-I, -II, and -III, whilst summer leaves contain only -II. J. N. A.

**Citrolimonin.** I. K. FEIST and L. S. OVERBERG (Ber., 1936, 69, [B], 1322–1323).—*Citrolimonin* (isolation from lemon pips described), m.p. 304°,  $[\alpha]$  about  $-135^\circ$  in  $\text{CH}_2\text{Cl}_2$ , is probably  $\text{C}_{28}\text{H}_{36}\text{O}_6$ . It does not contain active  $\text{H}$  and cannot be acetylated.  $\text{OMe}$  and  $\text{O}_2\text{CH}_2$  are absent. Two lactone groups are present. Catalytic hydrogenation gives *tetra-*

*hydrocitrolimonin* and more highly hydrogenated, acidic compounds. Distillation with Zn dust gives a mixture of hydrocarbons, one of which yields a picrate and (?) *o*-cresol. Fusion with KOH affords  $\text{COMe}_2$ , volatile oil, and a non-volatile acid. H. W.

**Vegetable cardiac poisons. X. Antiarin.** R. TSCHESCHE and W. HAUPT (Ber., 1936, 69, [B], 1377—1379).— $\alpha$ - (I) and  $\beta$ - (II) -antiarin give a positive Legal test, and hence are  $\alpha\beta$ -unsaturated lactones of the *Digitalis* type. Analyses and lactone titrations establish the composition  $\text{C}_{20}\text{H}_{42}\text{O}_{11}$ . When catalytically hydrogenated (II) absorbs 4 H, of which 2 are used in saturating the double linking of the lactone side-chain. Hydrolysis of (I) and (II) requires such energetic conditions that the genin cannot be isolated as such and the product is *dianhydroantiarigenin* (III),  $\text{C}_{23}\text{H}_{28}\text{O}_5$ , m.p. 200—205°,  $[\alpha]_D^{20} -160.2^\circ$  in MeOH, since it absorbs 8 H when hydrogenated, 2 of which are required by  $\text{C}=\text{O}$ . Although (III) does not give the typical aldehydic reactions (also not shown by strophanthidin) the presence of  $\cdot\text{CHO}$  rather than  $\cdot\text{CO}$  is considered probable, since the absorption spectrum shows absence of conjugation. (III) gives a *monobenzoate*, m.p. 249—250°; only one OH is therefore *sec*. H. W.

***l*-Pimaric acid.** R. G. R. BACON and L. RŮŽICKÁ (Chem. and Ind., 1936, 546).—Catalytic reduction of *l*-pimaric acid (I) yields firstly (in inert solvents) dihydro- and finally (in AcOH) mixed tetrahydro-*l*-pimaric acids from which an *acid*, m.p. 195—197°,  $[\alpha]_D +7^\circ$  (*Me* ester, m.p. 76—77°,  $[\alpha]_D +3^\circ$ ), is obtained. This, and the fact that with maleic anhydride a *compound*, m.p. 227°,  $[\alpha]_D -29^\circ$  (*Me* ester, m.p. 215°,  $[\alpha]_D -29^\circ$ ), identical with the analogous compound derived from abietic acid is formed, proves that (I) is tricyclic and contains a conjugated system.

F. N. W.

$\alpha$ - and  $\beta$ -Leprosol. XLVI. Phthiocerol.—See this vol., 1028.

**Drugs from Bolivia.**—See this vol., 1037.

**Catalytic hydrogenation of furan.** Tetrahydrofuran. I. I. SCHUJIKIN and E. M. TSCHILIKINA (J. Gen. Chem. Russ., 1936, 6, 279—282).—Furan is readily hydrogenated at 65—70° (Os-asbestos catalyst) to tetrahydrofuran (I); the reverse process does not take place at 300° (Pt catalyst). (I) is unchanged by heating at 110° with 30—60%  $\text{H}_2\text{SO}_4$ . R. T.

**Synthesis of furfuralazine.** S. A. TEBINOV (J. Gen. Chem. Russ., 1936, 6, 528—529).—Furfuraldehyde and  $\text{N}_2\text{H}_4\cdot\text{HCl}$  in  $\text{H}_2\text{O}$  at room temp. yield furfuralazine; the reaction does not proceed in non-aq. solvents. R. T.

**Hydrol character of furylphenylcarbinol.** R. PAUL (Compt. rend., 1936, 202, 1444—1446; cf. A., 1930, 923).—2-Furylphenylcarbinol (I) with aromatic amines in AcOH gives intensely coloured solutions; when distilled in  $\text{CO}_2$  or over  $\text{ThO}_2$  it gives furylphenylmethane (II) [also obtained when (I) is reduced with Na in EtOH] and with  $\text{PhNCO}$  at room temp. affords  $\text{CO}(\text{NHPh})_2$ . (I) with  $\text{Ni-H}_2$  affords tetrahydrofurylphenylcarbinol, b.p. 147—148°

10 mm., and no tetrahydrofurylphenylmethane, b.p. 112—113°/11 mm., which, however, is obtained when (II) is reduced, and with HBr in AcOH gives  $\alpha\delta$ -dibromo- $\epsilon$ -phenylpentane, b.p. 153—155°/4 mm. (decomp.). J. L. D.

**Theory of double linkings. VI. Condensation of "furanic" compounds.** V. N. TSCHELINCEV [with E. K. NIKITIN and M. A. ABRAMOVA] (Bull. Soc. chim., 1936, [v], 3, 1035—1047).—In alkaline or acid, but not in neutral solution, distyryl ketone (I) and MeCHO give styryl propylidene ketone and then dipropylidene ketone and PhCHO. Similarly, (I) and furfuraldehyde (II) afford difurfurylidene ketone (III) and PhCHO. Analogously (II) is formed from (III) and MeCHO. Reaction proceeds much more rapidly in alkaline than in acid solution. Displacement is characteristic of the group  $\cdot\text{CH}:\text{CH}:\text{CO}\cdot$ , which appears capable of hydrolysis, O becoming attached to C most distant from CO and H to that nearest CO. The reactions are particularly marked with compounds containing the group  $\text{CHPh}:$

or  $\begin{array}{c} \text{CH}:\text{CH} \\ \text{CH}=\text{O} \end{array} > \text{C}:\text{CH}:$ . The reactivity of fatty aldehydes shows that their double linkings have a peculiar character not possessed by the ordinary ethylenic linking. This peculiarity is shown also by pulegone, citral, mesityl oxide, and phorone, and seems general for compounds of this class, thus creating a resemblance to the oximes and hydrazones. The group  $\cdot\text{CH}:\text{CO}\cdot$  is designated "carbonyl-ethylenic" or "carbonylenic." H. W.

**Action of mixed organo-magnesium compounds on esters; furylidenemalononic, furylidene-cyanoacetic, and furylideneacetoacetic esters.** N. MAXIM and (MLE.) E. GEORGESCU (Bull. Soc. chim., 1936, [v], 3, 1114—1124).—Addition of the reagent occurs in the  $\alpha\delta$ -positions. Thus,  $\text{Et}_2$  furylidene-malonate and  $\text{MgBu}^n\text{Cl}$  give  $\text{Et}_2$   $\beta$ -2-furyl- $\delta$ -methyl-pentane- $\alpha\alpha$ -dicarboxylate, b.p. 153°/14 mm., hydrolysed and decarboxylated to  $\beta$ -2-furyl- $\alpha$ -methyl-*n*-hexoic acid, b.p. 153°/15 mm. (*amide*, m.p. 79°). Similarly,  $\text{Mg isoamyl bromide}$  yields  $\text{Et}_2$   $\beta$ -2-furyl- $\delta$ -methylhexane- $\alpha\alpha$ -dicarboxylate, b.p. 165°/12 mm., whence  $\beta$ -2-furyl- $\epsilon$ -methyl-*n*-heptoic acid, b.p. 156°/8 mm. (*amide*, m.p. 55°), and  $\text{MgPhBr}$  gives  $\text{Et}_2$   $\beta$ -2-furyl- $\beta$ -phenylethane- $\alpha\alpha$ -dicarboxylate, b.p. 203°/14 mm., whence  $\beta$ -2-furyl- $\beta$ -phenylethane- $\alpha\alpha$ -dicarboxylic acid, m.p. 151°, and  $\beta$ -2-furyl- $\beta$ -phenylpropionic acid, b.p. 186°/15 mm., m.p. 105°.  $\text{MgPr}^n\text{Br}$  and Et furylidene-cyanoacetate yield Et  $\alpha$ -cyano- $\beta$ -2-furylhexoate, b.p. 154°/8 mm., cautiously hydrolysed to  $\alpha$ -cyano- $\beta$ -2-furyl-*n*-hexoic acid, m.p. 140°, and drastically hydrolysed to the corresponding dicarboxylic acid, whence  $\beta$ -2-furyl-*n*-hexoic acid, b.p. 152°/15 mm. Et  $\alpha$ -cyano- $\beta$ -2-furyl- $\delta$ -methyl-*n*-hexoate has b.p. 171°/20 mm.  $\text{MgEtI}$  and Et furylideneacetoacetate afford Et  $\alpha$ -acetyl- $\beta$ -2-furyl-*n*-valerate, b.p. 152°/21 mm., hydrolysed to  $\beta$ -2-furyl-*n*-butyl Me ketone. Similarly Et  $\alpha$ -acetyl- $\beta$ -2-furyl-*n*-hexoate, b.p. 155°/15 mm., yields  $\beta$ -2-furylamyl Me ketone. Et  $\alpha$ -acetyl- $\beta$ -phenyl- $\beta$ -2-furylpropionate, b.p. 195°/14 mm., is hydrolysed to Me  $\beta$ -phenyl- $\beta$ -2-furylethyl ketone, b.p. 160°/14 mm. (semicarbazone, m.p. 142°). H. W.

**Condensation of benzoin and thymol. I. Preparation of 2-benzoylthymol** [2-hydroxy-6-methyl-3-isopropylbenzophenone] and constitution of desylthymol. O. DISCHENDORFER and A. VERDINO (Monatsh., 1936, 68, 10—20).—The "cymodiphenylfuran" obtained by Japp and Meldrum (J.C.S., 1899, 75, 1035) from benzoin, thymol, and 73%  $\text{H}_2\text{SO}_4$  is 1:2-diphenyl-3-methyl-6-isopropylcoumarone, m.p. 116—117° [5-Br-derivative (I), m.p. 152°], since it is oxidised ( $\text{CrO}_3$ , AcOH) to the benzoate, m.p. 104°, of 2-hydroxy-6-methyl-3-isopropylbenzophenone, m.p. 97° [5-Br-derivative, m.p. 128—129°, oxidised ( $\text{KMnO}_4$ ) to BzOH]. (I) is oxidised ( $\text{CrO}_3$ , AcOH) to the benzoate, m.p. 129.5°, of 4-bromo-2-hydroxy-6-methyl-3-isopropylbenzophenone, m.p. 91°. The desylthymol of Japp and Meldrum (*loc. cit.*) is 1:5:2:4-OH- $\text{C}_6\text{H}_2\text{MePr}^3\text{CHPhBz}$ ; its benzoate, m.p. 140° (sinters at 137°), is oxidised to the benzoate (not isolated) of 4-hydroxy-2-methyl-5-isopropylbenzophenone, m.p. 153°. H. B.

**Geometrical inversion of the acids derived from coumarins. II. Cis to trans.** T. R. SESHADRI and P. S. RAO (Proc. Indian Acad. Sci., 1936, 3, A, 293—296; cf. A, 1935, 211).—*o*-Coumaric acid (I) and its 4-Me (II) and 5- $\text{NO}_2$ -derivative (III) result from the interaction of  $\text{HgO}$  in aq. NaOH [(I) and (II) at room temp.; (III) at 100°] and coumarin (IV) and its 7-Me and 6- $\text{NO}_2$ -derivatives, respectively. With cold aq. NaOH and  $\text{Hg}(\text{OAc})_2$ , or hot aq. NaOH and  $\text{HgO}$ , (IV) affords mercurated coumaric acids which yield pure (I) with  $\text{H}_2\text{S}$  in aq.  $\text{NH}_3$  solution. F. N. W.

**Condensation of deoxybenzoin with aromatic aldehydes and ketones. I. Condensation with salicylaldehyde.** D. W. HILL (J.C.S., 1936, 806—807).—Salicylaldehyde and deoxybenzoin with  $\text{C}_5\text{H}_{11}\text{N}$  condense to *salicylidenedeoxybenzoin*, m.p. 129°, which with  $\text{HCl}$ -AcOH, followed by  $\text{FeCl}_3$ , forms 3-phenylflavylium ferrichloride (I), and with AcOH or  $\text{Ac}_2\text{O}$  yields 2:3-diphenylbenzo-2-pyranol Et ether, also obtained from (I) and KOH. F. R. S.

**Reaction of anthocyanins with the sulphites.** A. KOZLOWSKI (Science, 1936, 83, 465).—Treatment of citric acid extracts of the anthocyanins of *Pelargonium zonale* and other plants with powdered  $\text{Na}_2\text{SO}_3$  and  $\text{Na}_2\text{S}_2\text{O}_4$ , respectively, discharges the red colour, which is restored to its original intensity by the addition of tincture of I. Mg and HCl reduce flavonols giving a red pigment which is not decolorised by sulphites. Flavonols extracted from the yellow flowers of various plants give no red colour after treatment with  $\text{Na}_2\text{S}_2\text{O}_4$  or with Mg in presence of org. acids. Mg decolorised the above extracts of anthocyanins more or less irreversibly in absence of air. The results support the old hypothesis of the formation of anthocyanins by an oxidation of anthocyanogens. L. S. T.

**Condensation of benzoin and thymoquinol.** O. DISCHENDORFER and A. VERDINO (Monatsh., 1936, 68, 41—46; cf. this vol., 82).—Thymoquinol (1 mol.), benzoin (2 mols.), and 73%  $\text{H}_2\text{SO}_4$  at 150° give alkali-sol. resinous products (probably hydroxy-

coumarones) and about 8% of 2:3:5:6-di-4':5'-diphenyl-2':3'-furano-*cymene* (I), m.p. 261°, oxidised ( $\text{CrO}_3$ -AcOH in  $\text{C}_6\text{H}_6$ ) to the dibenzoate, m.p. 235°, of 3:6-dihydroxy-2:5-dibenzoyl-*p-cymene*, m.p. 205° (sinters from 190°) [diacetate, m.p. 141° (sinters at 134°)].

H. B.

**Action of sulphur on organic compounds. XII. Action of sulphur on coumarin.** L. SZFERL and A. CHMIELNICKA (Rocz. Chem., 1936, 16, 101—103).—Coumarin and S (220—230°; 48 hr.) yield a thiophen derivative,  $\text{C}_{18}\text{H}_8\text{O}_4\text{S}$ , m.p. 331—331.5°.

R. T.

**Catalytic transformations of heterocyclic compounds. IV. Catalytic dehydrogenation of tetrahydrothiophen (thiophan).** J. K. JURIEV and A. E. BORISSOV (Ber., 1936, 69, [B], 1395—1398).—Tetrahydrothiophen (I) (compound with  $\text{HgCl}_2$ , m.p. 124.5—125.5°) is dehydrogenated by Pt-C at 315°, 350°, or 400° with production of thiophen (V),  $\text{H}_2\text{S}$ , unsaturated hydrocarbons,  $\text{H}_2$ , and saturated hydrocarbons. Ni on  $\text{Al}_2\text{O}_3$  at 350° yields diene hydrocarbons, butene, saturated hydrocarbons, and  $\text{H}_2$ , whilst NiS on  $\text{Al}_2\text{O}_3$  gives similar products with  $\text{H}_2\text{S}$  and (II). Catalytic desulphurisation of petroleum fractions containing (I) appears impossible. H. W.

**Electrolytic reduction of pyrrole.**—See this vol. 943.

**Action of hydrazine on oximinotriphenylpyrrole. II.** T. AJELLO and S. GIANFERRARA (Gazzetta, 1936, 66, 228—235; cf. A., 1935, 763).—In absence of HCl,  $\text{N}_2\text{H}_4$  (I) reduces oximinotriphenylpyrrole (II) to the  $\text{NH}_2$ -compound (III). In presence of HCl, (I) and (II) yield a substance ( $\text{C}_{22}\text{H}_{18}\text{ON}_3$ ), (IV), m.p. 235—236° (dihydrochloride; sulphate; dipicrate, m.p. 218—220°;  $\text{Ac}_2$ , m.p. 181—182°, and  $\text{Bz}_2$ , m.p. 190°, derivatives), which is reduced to (III). In the prep. of (IV), by-products, m.p. 168°, 290°, and 176—178°, are also obtained. E. W. W.

**Action of the Grignard reagent on the amide group. IX. 6-Hydroxy-1-methyl-6-alkyl-2-piperidones and 1-methyl-6-alkyl-3:4-dihydro-2-pyridones.** R. LUKEŠ and J. GOROCHOLINSKIJ (Coll. Czech. Chem. Comm., 1936, 8, 223—235; cf. this vol., 82).—*N*-Methylglutarimide and  $\text{MgRX}$  give 6-hydroxy-1-methyl-6-alkyl-2-piperidones, which, when distilled at 12—15 mm., are more or less, or when distilled through a 25 cm. column, are completely, dehydrated to 1-methyl-6-alkyl-3:4-dihydro-2-pyridones. The lower members of both series are very sol. in or miscible with  $\text{H}_2\text{O}$ . The following are described. 6-Hydroxy-1:6-dimethyl-, m.p. 52—53°, -1-methyl-6-ethyl-, m.p. 69°, -6-propyl-, m.p. 70—71°, b.p. 175—177°/7 mm., -6-n-butyl-, m.p. 76—77°, b.p. 226°/6 mm., -6-n-amyl-, m.p. 83°, and -6-n-hexyl-2-piperidone, m.p. 88—89°, which with 5%  $\text{H}_2\text{SO}_4$  give  $\delta$ -keto-*n*-hexoic, + $\text{H}_2\text{O}$ , m.p. 38—39° (lit. 37°), -heptoic, m.p. 55° (lit. 50°), -octoic, -nonoic, m.p. 46° (lit. 40°), -decoic, m.p. 58° (*Ba* salt), and -undecoic acid, m.p. 62° (*Ba* salt). 1:6-Dimethyl-, b.p. 96—98°/9 mm., and + $\text{H}_2\text{O}$ , m.p. 52—53°, 1-methyl-6-ethyl-, b.p. 108.5—111°/11 mm., -6-n-propyl-, b.p.

116.5°/10 mm., -6-*n*-butyl, b.p. 134°/8 mm., -6-*n*-amyl-, b.p. 145.5°/9.5 mm., and -6-*n*-hexyl-3:4-dihydro-2-pyridone, b.p. 158—158.5°/8 mm.

R. S. C.

**Interaction of pyridine with the chloride and bromide of Blomstrand salt.** I. I. TSCHERNIAEV and A. M. RUBINSTEIN (Compt. rend. Acad. Sci. U.R.S.S., 1936, 2, 111—114).—The chloride of Blomstrand salt (I) dissolves in  $C_5H_5N$ , evaporation of the solution yielding the compound

$[Pt(NH_3)_2(NO_2)_2C_5H_5NCl]Cl$  which gives a cryst. oxalate, and with Reise's base forms the mol. compound  $[Pt(NH_3)_2(NO_2)_2Cl_2][Pt_2Cl_2(NH_3)_4]$ . The bromide of (I) gave similar results. Conductivity data are given.

H. J. E.

**Reactions of selenium oxychloride and selenium tetrachloride with pyridine.** B. EDGINGTON and J. B. FIRTH (J.S.C.I., 1936, 55, 192r).— $SeOCl_2$  (1 mol.) and  $C_5H_5N$  (2 mol.) give a compound,  $(C_5H_5N)_2SeOCl_2$ , whilst an equimol. mixture at 145° yields Se and a compound,  $(C_5H_5N)_2SeCl_4$ , which loses Cl on storing and with Br forms a compound,  $(C_5H_5N)_2SeCl_2Br_4$ .  $SeO_2$  (1 mol.) and  $C_5H_5N$  (2 mol.) afford a substance which is chiefly  $(C_5H_5N)_2SeO_2$ , and  $SeO_2$  with  $C_5H_5N$  and  $Cl_2$  give a compound,  $(C_5H_5N)_2SeO_2Cl_2$ .  $C_5H_5N$  and  $SeCl_4$  yield a compound,  $(C_5H_5N)_2SeCl_4$ , m.p. 73°.

F. R. S.

**Pyridine. XXI. Preparation of 3-aminopyridine from 3:5-diaminopyridine.** H. MATER-BODE (Ber., 1936, 69, [B], 1534—1537).—Gradual addition of Br to a mixture of  $C_5H_5N$ , HCl and  $HgCl_2$  at 212—215° affords 3-bromo- (I) and 3:5-dibromopyridine (II) in 55% and 27.5% yield, respectively. (I) is converted by 25%  $NH_3$  containing  $CuSO_4$  at 140° into 3-aminopyridine, whilst under similar treatment at 130° (II) gives 3:5-diaminopyridine, m.p. 110—111° (dicarbethoxy-derivative, m.p. 195—196°), in 56% yield. (I) is converted by NaOH,  $CuSO_4$ ,  $KNaC_4H_4O_6$ , and  $H_2O$  at 200° into 3-hydroxypyridine, m.p. 127°.

H. W.

**3-Aminopyridine. III. Iodination.** Z. RODEWALD and E. PŁAŻEK (Rocz. Chem., 1936, 16, 130—135).—3-Aminopyridine (I) and ICl in fuming HCl yield an additive compound, of variable composition, which, when boiled with  $H_2O$ , gives 2:6-di-iodo-3-aminopyridine (II), m.p. 153° (3-*N*-Ac derivative, m.p. 199—201°), also obtained when β-aminopicolinic acid is taken in place of (I). (II) in  $EtOH-H_2SO_4$  and  $NaNO_2$  afford 2:6-di-iodopyridine, m.p. 130—145°, together with some 2:6-di-iodo-3-ethoxypyridine, m.p. 96—98°. 3-Acetamidopyridine (III) and ICl in AcOH afford an additive compound, m.p. 163°, from which (III) or 3-aminopyridine (IV) is obtained by the action of acids or alkalis. The hydrochloride of (IV) and ICl at 200° yield dichloro-3-aminopyridine, m.p. 118°.

R. T.

**3-Aminopyridine derivatives substituted in position 5.** A. MARCINKOW and E. PŁAŻEK (Rocz. Chem., 1936, 16, 136—140).—3:5-Dibromopyridine (I) and  $NH_3$  in MeOH in presence of  $CuSO_4$  (135—140°; 20 hr.) yield 3-bromo-5-aminopyridine, m.p. 63—64°, from which 3-bromo-5-hydroxypyridine (II), m.p. 163—165°, is obtained by treating the diazo-derivative with boiling  $H_2O$ . (II) and aq.  $NH_3$  in

presence of  $CuSO_4$  (135—140°; 20 hr.) yield 3-amino-5-hydroxypyridine, m.p. 158—160°. (I) and aq.  $NH_2Me$  (200°; 20 hr.) afford 3-bromo-5-methylaminopyridine, m.p. 87—89° (picrate, m.p. 182—184°), which with aq.  $NH_3$  and  $CuSO_4$  (135—140°; 20 hr.) gives 3-amino-5-methylaminopyridine, b.p. 190—195°/10 mm. (picrate, m.p. 223—225°; 3:5-*N*-Ac<sub>2</sub> derivative, m.p. 162—163°). (I) and aq.  $NHMe_2$  (200°; 20 hr.) yield 3-bromo-5-dimethylaminopyridine, m.p. 175—177°, which affords 3-amino-5-dimethylaminopyridine, m.p. 133—135° (picrate, m.p. 214—216°; 3-*N*-Ac derivative, m.p. 194—195°), with aq.  $NH_3$  and  $CuSO_4$  (135—140°; 20 hr.).

R. T.

**Tryptophan metabolism.**—See this vol., 885.

**Preparation of substituted indoles by catalytic decomposition of phenylhydrazones.** A. E. ARBU-SOV, I. A. ZAITZEV, and A. I. RAZUMOV (J. Gen. Chem. Russ., 1936, 6, 289—291).—The phenylhydrazone of COEtPr<sup>a</sup>, b.p. 153°/12 mm., and CuCl at 200° yield 2:3-diethyl- and/or 3-methyl-2-propyl-indole, b.p. 167°/15 mm. (picrate, m.p. 144°). Similarly,  $NHPh:N:CMcBu$  affords 2-methyl-3-propylindole, b.p. 159—161°/11 mm. (picrate, m.p. 134°), and  $NHPh:N:CPhEt$ , m.p. 47°, gives 2-phenyl-3-methylindole, m.p. 112.5° (picrate, m.p. 139°).

R. T.

**Direct synthesis of chloro- and hydroxy-quinoline from nitrobenzene.** T. MAZONSKI and E. SUCHARDA (Rocz. Chem., 1936, 16, 146—150).— $PhNO_2$ , glycerol, and conc. HCl (160—170°; 8 hr.) yield chiefly 6-chloroquinoline, together with 6- and 8-hydroxy- and 6:8-dichloro-quinoline. The probable mechanism of the reaction is outlined.

R. T.

**Preparation of 8-hydroxyquinoline from 8-chloroquinoline.** N. N. VOROSCHCOV, jun., and S. P. MITZENGENDLER (J. Gen. Chem. Russ., 1936, 6, 63—67).—8-Hydroxyquinoline is obtained in 87% yield from 8-chloroquinoline (1 mol.) and 2.2% NaOH (4 mols.) (250°/40 atm.; 2 hr.).

R. T.

**Synthesis of lepidine and its derivatives by Knorr's method.** I. Synthesis of lepidine. G. MICHAÏLOV (J. Gen. Chem. Russ., 1936, 6, 511—515).—Acetoacetanilide and  $H_2SO_4$  at 90—95° yield 2-hydroxylepidine (95% yield), converted by heating with  $POCl_3$  into 2-chlorolepidine, from which a triple salt, m.p. 145—147°, of lepidine,  $SnCl_2$ , and HCl is obtained by heating at 70—80° for 10 hr. with Sn and conc. HCl. Lepidine is obtained by treating the salt with conc. aq. NaOH.

R. T.

**Colour reaction of isatin with pyridine and acetic anhydride.** W. BORSCHKE (Ber., 1936, 69, [B], 1376).—The hypotheses concerning the constitution of the coloured substance derived from isatin and  $Ac_2O$ ,  $C_5H_5N$ , tetrahydroisoquinoline, and NaOAc (Grassman *et al.*, this vol., 612) are weakened by the observation that the "oxindolemethinecarboxylic acid" is actually 2-hydroxyquinoline-4-carboxylic acid.

H. W.

**Behaviour of pyrroles towards *p*-quinones.** P. PRATESI (Gazzetta, 1936, 66, 215—223; cf. Zaucker, Diss., Munich, 1928).—2:4-Dimethylpyrrole (I) and benzoquinone (II) in EtOH give 2:5-bis-(2':4'-dimethyl-1'-pyrryl)benzoquinone; 2:3:4-trimethyl- (III) and 2:4-dimethyl-3-ethyl-pyrrole

(IV) react similarly with (II). (I) and toluquinone yield 5(or 6)-(2':4'-dimethyl-1'-pyrryl)-2-methylbenzoquinone. (I) and 2:5-dibromobenzoquinone yield 3:6-dibromo-2:5-bis-(2':4'-dimethyl-1'-pyrryl)quinol, m.p. 278° (*Ac*<sub>2</sub> derivative, m.p. 255°), which is oxidised to the corresponding benzoquinone. (I) and  $\alpha$ -naphthaquinone (V) form 2':4'-dimethyl-1'-pyrryl- $\alpha$ -naphthaquinone (reduced to leuco- and diacetyl-leuco-derivatives). (III) and (V) give 2':3':4'-trimethyl-1'-pyrryl- $\alpha$ -naphthaquinone (reduced as before). (IV) and (V) give 2':4'-dimethyl-3'-ethyl-1'-pyrryl- $\alpha$ -naphthaquinone (reduced as before). Opso-pyrrole reacts with (II) to form an unstable product, and with (V) to give a compound C<sub>17</sub>H<sub>15</sub>O<sub>2</sub>N, but not with thymoquinone. 2:3:5-Trimethyl-4-ethylpyrrole gives unstable products with quinones, but the fact that it does react shows that in these products the pyrryl group is attached through N. 1-Methylpyrrole reacts with quinones only when dil. H<sub>2</sub>SO<sub>4</sub> is added, but 1-methyl-2:5-diethylpyrrole reacts spontaneously, the product with (V) being 3- $\alpha$ -naphthaquinonyl-1-methyl-2:5-diethylpyrrole, m.p. 184—185° (reduced to a leuco-compound). The reaction product of (VI) and (V) is similarly reducible. The tendency of pyrroles in general to condense with quinones increases with the basicity of the pyrroles.

E. W. W.

**Acridine. XIV. *ms*-Acridine derivatives. V. Acridine 5:10-peroxide.** K. LEHMSTEDT and H. KLEE (Ber., 1936, 69, [B], 1514—1516).—Treatment of acridine with BzO<sub>2</sub>H in C<sub>6</sub>H<sub>6</sub> yields acridine 5:10-peroxide (I), decomp. 178° in bath preheated to 175°. (I) is unstable in solution, becoming either isomerised to 10-hydroxvacridone (conc. H<sub>2</sub>SO<sub>4</sub>; NaOH-EtOH) or converted into acridone and resinous substances.

H. W.

**3-Bromo-7-nitroacridone.** M. POLACZEK (Rocz. Chem., 1936, 16, 76—80).—2-Chloro-5-nitrobenzoic acid is heated at 175—180° for 4 hr. with p-C<sub>6</sub>H<sub>4</sub>Br·NH<sub>3</sub>, NaOAc, and CuO in PhNO<sub>2</sub>, to yield 5-nitro-2-p-bromoanilinobenzoic acid (I), m.p. 287—289° (chloride, m.p. 139—142°; amide, m.p. 245—247°; Et ester, m.p. 141—142°). (I) and POCl<sub>3</sub> (120°; 4 hr.) yield 3-bromo-7-nitroacridone, m.p. >370°, which with NPhMe<sub>2</sub> and POCl<sub>3</sub> (100°; 2 hr.) affords 3-bromo-7-nitro-5-p-dimethylanilinoacridine, m.p. 284—284.5°. 3-Bromo-5-p-dimethylanilinoacridine, m.p. 239—240° (decomp.), is prepared analogously from 3-bromoacridone.

R. T.

**Kinetics of formation of poly-membered rings.**—See this vol., 940.

**Decomposition of a binary molecular compound in a ternary system.** The systems: XI. Salicylic acid-salipyrine-thymol. XII. Salicylic acid-antipyrine-thymol. K. HRYNAKOWSKI and M. SZMYTÓWNA (Rocz. Chem., 1936, 16, 57—63).—The fusion curves indicate dissociation of salipyrine in presence of thymol, with formation of an unstable mol. compound of antipyrine with thymol (not isolable).

R. T.

**4-(or 5)-Guanidinoglyoxaline and 4-(or 5)-carbamidoglyoxaline from guanine.** G. HUNTER. Dissociation and ultra-violet absorption spectra. W. D. MCFARLANE (Biochem. J., 1936, 30, 1189—1201).—The base C<sub>4</sub>H<sub>7</sub>N<sub>5</sub> obtained by acid hydrolysis of guanine is 4-(or 5)-guanidinoglyoxaline (I) [dihydrochloride, m.p. 288° (decomp.); sulphate, m.p. 219°; dipicrate, m.p. 216—217°; carbonate]. Guanidine is obtained in 91 and 76% yield, respectively, on oxidation of (I) with Br and KMnO<sub>4</sub>, NH<sub>3</sub>, H<sub>2</sub>C<sub>2</sub>O<sub>4</sub>, HCO<sub>2</sub>H, and small amounts of glycine being produced at the same time. Hydrolysis in N<sub>2</sub> of (I) with aq. Ba(OH)<sub>2</sub> gives 4-(or 5)-carbamidoglyoxaline (II), m.p. 194—195° [hydrochloride, m.p. 210°; sulphate, m.p. 197° (and +2H<sub>2</sub>O); picrate, m.p. 210° (and +H<sub>2</sub>O)], NH<sub>3</sub>, and other products. (II) is hydrolysed by aq. Ba(OH)<sub>2</sub> with loss of NH<sub>3</sub> and is possibly an intermediate in the production of glycine. The titration curve of (I) (*pK*<sub>H</sub> 10.5) and the light absorption curves of (I) and glycine have been plotted.

W. McC.

**Aliphatic polyamines. I. J. VAN ALPHEN** (Rec. trav. chim., 1936, 55, 412—418).—Interaction of (CH<sub>2</sub>NH<sub>2</sub>)<sub>2</sub>·H<sub>2</sub>O with (CH<sub>2</sub>Br)<sub>2</sub> in EtOH yields triethylenetetramine [ $\alpha\beta$ -bis(aminoethylamino)ethane] (A., 1891, 414) (I). This forms NN'N''N'''-tetra-(phenylcarbamyl), m.p. 237°, -tetra-(phenylthiocarbamyl), m.p. 206°, -tetra-(2:4-dinitrophenyl), m.p. 285°, and tetrapicryl, m.p. 165° (decomp.) (obtained by nitration of the last derivatives). With PhCHO, the product is 2-phenyl-1:3-bis- $\beta$ -benzylideneaminoethyltetrahydroglyoxaline, m.p. 86°, decomposed by HCl; with CS<sub>2</sub>,  $\alpha\beta$ -bis(tetrahydro-2-thio-1-glyoxalanyl)ethane, m.p. 165°. A by-product with (I), "tetraethylenetetramine," is identified as 1-(aminoethylaminoethyl)piperazine, b.p. 266—270°/31 mm., since it yields a B<sub>3</sub> derivative, m.p. 221° (decomp.) [dipicrate, m.p. 221° (decomp.)]; it also forms a tetrapicrate, m.p. 212°, oxalate, m.p. 239° (decomp.), and a tri(phenylthiocarbamyl) derivative, m.p. 132—140°, and, with PhCHO, a product reduced by Na-EtOH to 1-(benzylaminoethylaminoethyl)piperazine, m.p. (+H<sub>2</sub>O) 50° [picrate, m.p. 212° (decomp.)].

E. W. W.

**Derivatives of barbituric acid.** V. PRELOG and V. HAHN (Coll. Czech. Chem. Comm., 1936, 8, 219—222).—OEt·[CH<sub>2</sub>]<sub>2</sub>·O·[CH<sub>2</sub>]<sub>2</sub>·CH(CO<sub>2</sub>Et)<sub>2</sub>, NaOEt, and EtBr give Et<sub>2</sub> ethyl- $\alpha\beta'$ -ethoxyethoxyethylmalonate ( $\alpha\beta'$ -ethoxyethoxy-n-pentane- $\gamma\gamma'$ -dicarboxylate), b.p. 173—175.5°/10 mm. (Ba salt of corresponding acid), which by hydrolysis and decarboxylation gives  $\alpha\beta'$ -ethoxyethoxy-n-pentane- $\gamma$ -carboxylic acid, b.p. 180—181°/11 mm., or by condensation with carbamide 5-ethyl-5- $\beta\beta'$ -ethoxyethoxyethylbarbituric acid (I), m.p. 96.5—97°. Methylcarbamide or its Ac derivative gives similarly the 1-Me derivative, m.p. 45.5—46.5°, of (I), which in doses of 140 mg. per kg. (intraperitoneal injection into white mice) produces hyperexcitability instead of hypnosis. In doses of 1.1 g. per kg. (I) produces hypnosis followed by spasms.

R. S. C.

**Action of thiocarbamide on aryl alkyl ketones.** K. DZIEWOŃSKI, L. BERNAKIEWICZ, and L. GIZLER (Rocz. Chem., 1936, 16, 41—48).—COPhMe and CS(NH<sub>2</sub>)<sub>2</sub> (170°; 8 hr.) yield 2-thiol-4:6-diphenyl-

6-methyl-1 : 2 : 3 : 6-tetrahydropyrimidine, (I), m.p. 172—174° (acetate, m.p. 140°; Ag salt, m.p. 190—195°; 1 : 3-Bz<sub>2</sub> derivative, m.p. 152—153°). (I) and MeI in MeOH (100°; 4 hr.) yield *s*-C<sub>6</sub>H<sub>5</sub>Ph<sub>3</sub> in small amount, together with 6-methylthiol-4 : 6-diphenyl-3 : 6-dihydropyrimidine hydriodide, m.p. 89—90°, from which the free base (II), m.p. 82—84° (picrate, m.p. 165—167°), is prepared (aq. Na<sub>2</sub>CO<sub>3</sub>). (I) with EtOH and HCl (100°; 3 hr.) gives the hydrochloride, m.p. 206—208° (decomp.), of the 6-ethylthiol homologue of (II). (I) is converted into the corresponding 2-keto-derivative by heating with HgO in AcOH. *p*-Tolyl Me ketone and CS(NH<sub>2</sub>)<sub>2</sub> (170°; 10—15 hr.) afford 2-thiol-4 : 6-di-*p*-tolyl-6-methyl-1 : 2 : 3 : 6-tetrahydropyrimidine, m.p. 170—171° (Ag salt, m.p. 188—189°), which decomposes when heated under reduced pressure to yield, amongst other unidentified products, *s*-C<sub>6</sub>H<sub>5</sub>Ph<sub>3</sub>. R. T.

**New organic reagent for metals, particularly silver.** S. E. SHEPPARD and H. R. BRIGHAM (J. Amer. Chem. Soc., 1936, 58, 1046—1049).—CO<sub>2</sub>Et·CH<sub>2</sub>·NH·CS<sub>2</sub>·NH<sub>2</sub>·CH<sub>2</sub>·CO<sub>2</sub>Et (from NH<sub>2</sub>·CH<sub>2</sub>·CO<sub>2</sub>Et and EtOH·CS<sub>2</sub>) with CS<sub>2</sub> in boiling EtOH gives (probably) *Et* 5-keto-2-thionhexahydropyrimidine-4-carboxylate (I), m.p. 276—280° (Pb, steel-blue, and Ag, deep purple, salts), which forms coloured compounds with neutral solutions of Cd, NH<sub>4</sub>, Cu, Fe, Pb, Zn, and Ag (also in acid) salts; 10<sup>-7</sup> g. of Ag per c.c. can be detected in slightly acid solution [(I) is thus more selective for Ag than Feigl's reagent (A., 1928, 1108)]. (I) could not be prepared from CS(NH<sub>2</sub>)<sub>2</sub> and CH<sub>2</sub>Cl·CO·CHCl·CO<sub>2</sub>Et; CO(CH<sub>2</sub>Cl)<sub>2</sub> and CS(NH<sub>2</sub>)<sub>2</sub> give 5-keto-2-thionhexahydropyrimidine, m.p. 241° (decomp.). *Et* 2-thiohydantoin-3-acetate, m.p. 95.5—96.6°, is prepared for comparison with (I). H. B.

**Complex salts of 2 : 2'-dipyridyl.**—See this vol., 944.

**Experiments in the heterocyclic series.** E. C. WAGNER and J. K. SIMONS (J. Chem. Educ., 1936, 13, 265—272).—Directions are given for the prep. of 1 : 4-dioxan, hydantoin, 5 : 5-dimethylhydantoin, benzimidazole, 8-hydroxyquinoline, trimeric methylene-*p*-toluidine, acridone, furoic acid, and furan.

L. S. T.

**Hydrolysis of guanine.** G. HUNTER (Biochem. J., 1936, 30, 1183—1188; cf. this vol., 744).—Guanine is converted by strong acids (e.g., HCl at 158° for 90 min.) into xanthine, glycine (I), a base (II) C<sub>4</sub>H<sub>7</sub>N<sub>5</sub>, NH<sub>3</sub>, guanidine, and glycoevamine. (II) is probably an intermediate in the production of (I). (II) gives a blue colour with alkaline diazo-reagent.

W. McC.

**Constitution of the purine nucleosides. IV. Adenosine and related nucleotides and coenzymes.** J. M. GULLAND and E. R. HOLIDAY (J.C.S., 1936, 765—769).—Comparisons of ultra-violet absorption spectra of aq. solutions of adenosine (I), obtained from yeast-nucleic acid, and of inosine (II), prepared from the acid by deamination (HNO<sub>3</sub>), at different *p*<sub>H</sub> vals., have been made. The spectra of (I) closely resemble those of 9- but not those of 7-methyladenine, and the spectra of (II) resemble more closely those of 9- than those of 7-methyl-

hypoxanthine. This indicates that the ribose radicals of (I) and (II) are attached to position 9 of adenine. Conversion of muscle-adenylic acid by bone-phosphatase gives (I), and the spectra of adenylic acid are identical with those of 9-methyladenine; it must therefore be adenine-9-riboside-5-phosphoric acid.

F. R. S.

**Synthesis of lactoflavin-5-phosphoric acid.** R. KUHN, H. RUDY, and F. WEIGAND (Ber., 1936, 69, [B], 1543—1547).—Lactoflavin is converted by CPh<sub>3</sub>Cl in C<sub>5</sub>H<sub>5</sub>N at 70—80° into 5'-triphenylmethyl-lactoflavin, m.p. > 250° (block) when slowly heated, transformed by Ac<sub>2</sub>O in dry C<sub>5</sub>H<sub>5</sub>N into 5'-triphenylmethyl-lactoflavin 2' : 3' : 4'-triacetate, m.p. 223—224°, hydrolysed by boiling 80% AcOH to lactoflavin 2' : 3' : 4'-triacetate (I), m.p. 202—203°. Treatment of (I) with POCl<sub>3</sub> and C<sub>5</sub>H<sub>5</sub>N followed by hydrolysis leads to lactoflavin-5'-phosphoric acid, identical with the natural product in solubility of its Ca and Na salts, behaviour on adsorption, dependence of fluorescence on *p*<sub>H</sub>, oxidation-reduction potential, and physiological activity.

H. W.

**Dihydropyrophosphoride-*a* and pyrophosphoride-*b*.**—See this vol., 886.

**Redox potential of murexide.** R. KUHN and J. C. LYMAN (Ber., 1936, 69, [B], 1547—1549).—Murexide (I) is immediately decolorised by Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> and the colour is completely restored when the solution is shaken with air. (I) can be sharply titrated with Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub>, and it is thus shown that most methods for the prep. of (I) give very impure products composed mainly of uramil. Piloty's method affords (I) in 97—98% purity, but the yield is only 2% of the allantoin taken. Potentiometric titration does not give sharp vals. if Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> is used owing to further reduction of leucomurexide. In feebly acidic solution titration can be effected with TiCl<sub>3</sub>, whereby harmonising vals. are obtained with Au or Pt electrodes. The redox potential of (I) is +0.02±0.01 volt.

H. W.

**Polyazines. I. Structure of the dimethyl-aziethan of Curtius and Thun.** B. G. ZIMMERMAN and H. L. LOCHTE (J. Amer. Chem. Soc., 1936, 58, 948—949).—Polyazines (I) of the type NH<sub>2</sub>·N'·CMe·[CMe·N·N'·CMe]<sub>*n*</sub>·COMe are formed (i) from Ac<sub>2</sub> and N<sub>2</sub>H<sub>4</sub>·H<sub>2</sub>O in aq. Na<sub>2</sub>CO<sub>3</sub>, whereby (·CMe·N·NH<sub>2</sub>)<sub>2</sub> (II) is also produced, (ii) by treatment of COMe·CMe·N·NH<sub>2</sub> with dil. HCl or EtOH-picric acid, (iii) from (II) and Ac<sub>2</sub> in EtOH, and (iv) decomp. of COMe·CMe·N·NHAc by Diels' method (A., 1902, i, 205; A., 1915, i, 127). (I) with EtOH·N<sub>2</sub>H<sub>4</sub>·H<sub>2</sub>O yields (II). The dimethylaziethan of Curtius and Thun (A., 1891, 1355) is a polyazine.

H. B.

**Spectrochemistry of nitrogenous organic compounds. Structure and absorption of benzoxazole, benzoxazolone, and phenmorpholones.** (MME.) RAMART-LUCAS and V. VANTU (Bull. Soc. chim., 1936, [v], 3, 1165—1173).—Benzoxazolone (I) and its *N*-Et derivative have almost identical absorption spectra in the region approaching the visible. The corresponding *O*-Et compound has a very similar graph which is somewhat displaced towards shorter  $\lambda$ . Each spectrum nearly resembles that of anisole. (I), therefore, exists in solution

mainly in the lactam form, but the evidence of the possible presence of the imino-alcohol variety is inconclusive. The spectra of phenmorpholine (II) and its derivatives are closely similar to that of ethoxy-methylene-*o*-anisidine which has the same chromophors. In solution, therefore, (II) exists mainly in the amide form but the graphs of the isomerides are so closely alike that it is impossible to decide whether the imino-alcohol variety is present in appreciable amount.

H. W.

**Dioximes.** CXI. Phenylloximinooacetoneitrile oxide. CXII. Phenylbenzoyloximinooacetoneitrile oxide. G. PONZIO. CXIII. E. DURIO and S. DUGONE. CXIV. G. LONGO and G. RANDONE (Gazzetta, 1936, 66, 127—134, 134—139, 139—145, 145—154).—CXI.  $\alpha$ -Phenylglyoxime peroxide (I) with aq.  $\text{Na}_2\text{CO}_3$  at  $0^\circ$  yields phenylloximinooacetoneitrile oxide (II),  $\text{OH}\cdot\text{N}:\text{CPh}\cdot\text{CN}:\text{O}$ , m.p. 112—113°, which with boiling  $\text{AcOH}$  affords phenylhydroxyglyoxime, m.p. 187—188° (*Ni* salt), with  $\text{NH}_3$  or primary amines (e.g.,  $\text{NH}_2\text{Ph}$ ) amino- $\alpha$ -phenylglyoxime, m.p. 154—155°, or derivatives (e.g.,  $\alpha$ -anilinophenylglyoxime, m.p. 189—190°), with  $\text{Bz}_2\text{O}$  dibenzoylphenylhydroxyglyoxime, m.p. 155—156° (decomp.) (cf. A., 1926, 850), and with 50% aq.  $\text{EtOH}$  phenylbenzamidofurazan and phenylmetazonic acid (cf. A., 1926, 1159). With boiling  $\text{EtCO}_2\text{H}$  or aq.  $\text{NaOH}$ , (II) yields 5-hydroxy-3-phenyl-azoxime, m.p. 201—203°, with  $\text{HCl}$  phenylchloroglyoxime (A., 1923, i, 472), and with  $\text{NaOEt}$  reacts like (I) forming an acid  $\text{Na}$  salt of hydroxyphenylglyoxime whilst (I) or (II) with  $\text{Ac}_2\text{O}\cdot\text{NaOAc}$  affords the  $\text{Ac}_2$  derivative [ $\text{OAc}\cdot\text{N}:\text{CPh}\cdot\text{C}_2\text{O}_2\text{N}_2$ , m.p. 117—118°]. (II) with  $\text{MgMeI}$  yields a complex,  $\text{CPh}\cdot\text{N}\cdot\text{OMgI}\cdot\text{CMe}\cdot\text{N}\cdot\text{OMgI}$ , reacting with  $\text{HCl}$  to give  $\text{CNPh}$  and  $\alpha$ -phenylmethylglyoxime. The reactions of (I) indicate the structure  $\text{OH}\cdot\text{N}:\text{CPh}\cdot\text{C}:\text{N}:\text{O}$ .

CXII.  $\text{OBz}\cdot\text{N}:\text{CPh}\cdot\text{CN}:\text{O}$  with  $\text{HCl}$  in  $\text{Et}_2\text{O}$  yields 2-benzoyl- $\alpha$ -phenylchloroglyoxime (A., 1931, 223) (corresponding *Br*-derivative, m.p. 172—173°) and with  $\text{Bz}_2\text{O}$  tribenzoylphenylhydroxyglyoxime, m.p. 163—165°. Phenylbromoglyoxime, m.p. 203—204° (decomp.), and phenylidoglyoxime (A., 1932, 1146) result from (II) and  $\text{HCl}$  or  $\text{HI}$ . The transformation of  $\beta$ -phenylfuroxan into (II) is analogous to that of  $\alpha$ -phenylfuroxan into phenyloximinocyanomethane; (I) has one of the *syn-anti* configurations of  $\text{NO}\cdot\text{CPh}\cdot\text{CH}\cdot\text{NO}$  and the peroxide of  $\beta$ -phenylglyoxime is 4-phenyl-1 : 2 : 3 : 6-dioxadiazine.

CXIII. Diaminoglyoxime with aq.  $\text{NH}_3$  at  $155^\circ$  does not yield 3 : 4-diaminofurazan but  $(\text{NH}_4)_2\text{C}_2\text{O}_4$ . The action of  $\text{NH}_2\text{OH}$  on the thioamide or amide of 3-carboxy-5-phenyl-1 : 2 : 4-oxadiazole yields the amidoxime (III), m.p. 158°, the *O*-*Bz* derivative, m.p. 206°, of which with hot 20%  $\text{NaOH}$  affords 5 : 5'-diphenyl-3 : 3'-di-(1 : 2 : 4-oxadiazole), m.p. 247—248° (cf. Zinkeisen, A., 1890, 122). (III) with boiling 10%  $\text{NaOH}$  for a few min. gives 3-amino-4-benzamidofurazan (IV), m.p. 145—146° (*Ag*, m.p. 190—205°, and *Cu* derivative), which with excess of  $\text{BzCl}$  at  $100^\circ$  affords 3 : 4-di(benzamido)furan, m.p. 178°. (IV) with 10%  $\text{NaOH}$  and slight excess of  $\text{Br}$  or  $\text{KMnO}_4$  yields 3 : 3'-azo-4 : 4'-di(benzamido)furan, m.p. 262—265° (decomp.), reduced ( $\text{Zn}\cdot\text{AcOH}$ ) to the corresponding hydrazo-compound,

m.p. 224—225° (decomp.) [*phenylhydrazone*, m.p. 211—212° (decomp.)]; also prepared by direct action of  $\text{NHPh}\cdot\text{NH}_2$  (6 mol.) on the azo-compound (1 mol.) in  $\text{Et}_2\text{O}$ . (IV) with  $\text{NaNO}_2\cdot\text{AcOH}$  at  $0^\circ$  yields 3 : 3'-azoimino-4 : 4'-di(benzamido)furan, m.p. 162° (decomp.); coupling with  $\mu\text{-C}_{10}\text{H}_7\cdot\text{OH}$  affords (red) 3- $\beta$ -naphtholazo-4-benzamidofurazan, m.p. 223—224°.

CXIV.  $\text{NH}_2\text{Me}$  with (I) or (II) yields  $\alpha$ -methylamino-phenylglyoxime,  $\text{OH}\cdot\text{N}:\text{CPh}\cdot\text{C}(\text{NMe})\cdot\text{NH}\cdot\text{OH}$ , m.p. 178° (decomp.) [ $\text{Ac}$ , m.p. 160° (decomp.),  $\text{Ac}_3$ , m.p. 117°, and  $\text{Bz}_2$  derivative, m.p. 170—171°]; the last two with  $\text{NaOH}$  yield 4-methylamino-3-phenylfuran, m.p. 62°, the isomeride  $\beta$ -methylaminophenylglyoxime,  $\text{OH}\cdot\text{N}:\text{CPh}\cdot\text{C}(\text{N}\cdot\text{OH})\cdot\text{NHMe}$ , m.p. 159—160° [hydrochloride, m.p. 202° (decomp.)];  $\text{Bz}_2$  derivative, m.p. 155°, being afforded by heating the  $\alpha$ -form in  $\text{AcOH}\cdot\text{Ni}(\text{OAc})_2$  or treating phenylchloroglyoxime with  $\text{NH}_2\text{Me}$  and pptn. of the *Ni* salt, m.p. 256° (decomp.). Similarly prepared are  $\alpha$ -benzylaminophenylglyoxime, m.p. 174° (decomp.) [*Na* salt, m.p. 219—220° (decomp.)];  $\text{Ac}_3$ , m.p. 126—127°, and  $\text{Bz}_2$  derivative, m.p. 150°, the last two affording 4-benzylamino-3-phenylfuran, m.p. 98°, and  $\beta$ -benzylaminophenylglyoxime, m.p. 158—159° [hydrochloride, m.p. 191—192° (decomp.)]; *Ni* salt, m.p. 218° (decomp.);  $\text{Ac}_2$ , m.p. 122—123° (decomp.),  $\text{Ac}_3$ , m.p. 114° and  $\text{Bz}_2$  derivative, m.p. 162°. The above compounds illustrate structural differences in explanation of m.p. anomalies between  $\alpha$ - and  $\beta$ -series of dioximes.

F. O. H.

**Synthesis of benzthiazole and its  $\mu$ -alkyl-derivatives.** A. I. KIPRIANOV, Z. P. SITNIK, and N. E. GRIGORIEVA (J. Gen. Chem. Russ., 1936, 6, 232—235).— $\text{HCO}_2\text{H}$  in  $\text{C}_6\text{H}_6$  and (*o*- $\text{NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{S}$ ) $_2\text{Zn}$  (I) (5 hr. at the b.p.) yield benzthiazole (80% yield),  $\text{Ac}_2\text{O}$  in  $\text{C}_6\text{H}_6$  and (I) (3 hr. at the b.p.) yield 1-methyl- (73% yield),  $\text{EtCO}_2\text{H}$  and (I) (18 hr. at the b.p.) afford 1-ethyl-, m.p. 185—185.5° (72% yield),  $\text{PrCO}_2\text{H}$  and (I) (6 hr. at the b.p.) give 1-*n*-propyl-, m.p. 181° (90% yield), and *n*-valeric acid and (I) (20 hr. at the b.p.) yield 1-*n*-butyl-benzthiazole, m.p. 160° (30% yield).

R. T.

**Metachromism: metachromatic dyes and chromotropic substances.** L. LISON (Arch. Biol., 1935, 46, 599—668).—The ability of basic dyes such as methylene-blue to produce metachromatic coloration, i.e., to colour certain histological specimens in different tints from the normal, is associated with their chemical constitution, and depends on the presence of at least one  $\text{NH}$ . A substrate is not necessary for the metachromatic colour change, which can be produced in solution by pure substances called by the author chromotropes. The colour change is not due to liberation of the free colour-base chromotrope, but to a chemically and spectroscopically different coloured substance. Metachromatic dyes in  $\text{H}_2\text{O}$  exist in two forms, "normal" and "metachromatic," in reversible equilibrium; increase of concn. or  $p_{\text{H}}$  or lowering of temp. favours production of the "metachromatic" form, whilst dilution, heat, acidification, electrolytes,  $\text{EtOH}$ , and  $\text{COMe}_2$  shift equilibrium towards the "normal" side. Chromotropes shift the equilibrium towards the "metachromatic" side without forming any new substances. Metachromism is a true sp. reaction, characteristic of higher

alkylsulphuric acids and their salts; the chromotropic power  $\propto$  the mol. wt. R. N. C.

**Cyanine dyes. I. Thiocarbocyanines.** A. I. KIPRIANOV, Z. P. SITNIK, and E. D. SITSCH (J. Gen. Chem. Russ., 1936, 6, 42—49).—The 8-methyl, 5:5'-dimethyl, 5:5':8-trimethyl, 5:5'-diethoxy-, 5:5'-diethoxy-8-methyl, 8-methoxy-, 8-methoxy-5:5'-diethoxy-, 8-phenyl, 8-methoxy-5:5'-dimethyl, and 8-phenyl-5:5'-dimethyl derivatives of 2:2'-diethylthiocarbocyanine iodide have been prepared by boiling a mixture of the appropriate substituted benzthiazole ethiodide with Et ortho-formate, -acetate, or -benzoate, in  $C_5H_5N$ . The above substances are violet dyes, exerting a sensitising action on photographic emulsions.

R. T.

**Ephedrine synthesis. I. Propiophenone diethyl acetal and  $\alpha$ -ethoxy- $\alpha$ -phenyl- $\Delta^a$ -propylene.** E. L. BEALS and F. A. GILFILLAN (J. Amer. Pharm. Assoc., 1936, 25, 426—427).—COPhEt condensed with  $CH(OEt)_3$  in EtOH-HCl affords *propiophenone Et<sub>2</sub> acetal*, b.p. 108—110°/14 mm., 226—228°/760 mm. (slight decomp.), which with  $C_5N_5N$  and AcCl yields  $\alpha$ -ethoxy- $\alpha$ -phenyl- $\Delta^a$ -propylene, b.p. 105°/19 mm., 220—221° (corr.)/760 mm. (slight decomp.).

F. O. H.

**Alkaloids of jaborandi leaves. IX. Synthesis of *r*-isopilocarpine.** A. M. POLJAKOVA, V. A. PREOBRASHENSKI, and N. A. PREOBRASHENSKI (Ber., 1936, 69, [B], 1314—1316).—*r*-isopilopyl  $CHN_2$  ketone (I) is transformed by  $Ag_2O$  and abs. EtOH into *Et r*-homoisopilopate, b.p. 106—108°/0.3 mm., hydrolysed to *r*-homoisopilocic acid (II), b.p. 163°/1 mm., m.p. 74.2°, also obtained from (I) and  $Na_2S_2O_3$ - $Ag_2O$ - $H_2O$  or  $AgNO_3$ - $NH_3$ - $H_2O$ -EtOH followed by hydrolysis. (II) is transformed through its chloride and  $CHN_2$  ketone into *r*-homoisopilopyl  $CH_2Cl$  ketone, m.p. 47—47.5°, whence *r*-homoisopilopyl phthalimido-methyl ketone, m.p. 129—130°, and *r*-homoisopilopyl  $CH_2$ - $NH_2$  ketone hydrochloride, m.p. 148—149°. The amine and KCNS afford 2-thiol-4(5)-*r*-homoisopilopyl-quinoxaline, m.p. 207—208.5°, oxidised by  $FeCl_3$  to *r*-isopilocarpidine (nitrate, m.p. 114—114.5°), which with MeI affords *r*-isopilocarpine (nitrate, m.p. 134—135°).

H. W.

**Alkaloids of Senecio. II. Senecionine and squalidine.** G. BARGER and J. J. BLACKIE (J.C.S., 1936, 743—745).—Pure senecionine (I),  $C_{18}H_{25}O_5N$  (nitrate, m.p. 214°,  $[\alpha]_D$  -34.2° in  $H_2O$ ), isolated from *S. viscosus*, has m.p. 232°,  $[\alpha]_D$  -54.6° in  $CHCl_3$ . (I) is obtained pure from *S. vulgaris* in April and September, but in summer it is mixed with another alkaloid. From *S. squalidus*, (I) is isolated along with squalidine,  $C_{18}H_{25}O_5N$ , m.p. 169°,  $[\alpha]_D$  -26.9° in  $CHCl_3$ , hydrolysed to squalineic acid, m.p. 129°. (I) is hydrolysed to retronecine and senecic acid, m.p. 153°, an unsaturated lactonic acid, which is reduced ( $H_2$ -PtO<sub>2</sub>) to dihydrosenecic acid, m.p. 106°, and oxidised ( $HNO_3$ ) to a substance,  $C_6H_8O_4$ , m.p. 142°.

F. R. S.

**Ergotocine, ergometrine, ergostetrine, and ergobasine.**—See this vol., 1022.

**Synthesis and reactions of natural substances under physiological conditions. VI. Biogenesis of vasicine (peganine). Synthesis of deoxyvas-**

**icine under physiological conditions.** C. SCHOFF and F. OECHLER (Annalen, 1936, 523, 1—29; cf. A., 1935, 981).—Under "physiological" conditions  $o$ - $NH_2$ - $C_6H_4$ -CHO (I), primary bases, and  $CH_2O$  give 4-hydroxy-3-alkyltetrahydroquinazolines, which react as  $\psi$ -bases of 3-alkyl-1:2-dihydroquinazol-3-inium salts, which in turn readily give 4-hydroxy-3-alkyl-3:4-dihydroquinazolines. (I) and  $NH_2$ - $[CH_2]_3$ - $CH(OEt)_2$  (II) in a citrate buffer solution of  $p_H$  4.8—5.0 at 30° give in 4 days a solution probably containing 4-hydroxy-2:3-cyclopentanotetrahydroquinazoline, since addition of  $C_6H_5(NO_2)_3 \cdot OH$  gives a 75% yield of 2:3-cyclopentano-1:2-dihydroquinazol-3-inium picrate (III), m.p. 168—170°, and shaking with Pd-black in  $H_2$  for 5 hr. prior to addition of  $C_6H_5(NO_2)_3 \cdot OH$  gives by a shift of 2 H from (III) a 18% yield of deoxyvasicine [with much  $o$ - $NH_2$ - $C_6H_4$ - $CH_2 \cdot OH$ , which necessitates assumption of an equilibrium between (I), (II), and their condensation product]. (I) may be derived from tryptophan.  $NH_2$ - $[CH_2]_2$ - $CH(OH) \cdot CHO$  may be derived from  $\alpha$ -hydroxyornithine and would lead similarly to vasicine or, by the acetonedicarboxylate synthesis, to hydroxytryptophan. Other hypothetical syntheses are discussed. If (I) in  $H_2O$  is treated first with  $CH_2$ - $CH$ - $CH_2$ - $NH_2$ - $HCl$  (IV) and then with  $CH_2O$  (natural  $p_H$  4.8—5.2, const.) and kept for 3 days at room temp., it affords 71—74% of 3-allyl-1:2-dihydroquinazol-3-inium picrate (V), m.p. 139—140°; if after admixture the  $p_H$  is adjusted to 7 or 9, the yield is only 55 and 25%, respectively. If the  $CH_2O$  is added before the base, there is formed instead of (V) a 65% yield of  $NN'$ -methylenebis- $o$ -aminobenzaldehyde (VI), m.p. 160—161°, whence it follows that the initial condensation must be extremely rapid, and

that (I) and  $CH_2O$  condense to  $o$ - $C_6H_4$ - $\begin{matrix} CH(OH) \\ | \\ NH-CH_2 \end{matrix}$ - $O$ ,

which reacts with  $CH_2O$  but not (or only very slowly) with (IV). The possibility of photosynthesis by reactions which must take place in a given order is discussed with reference to this and other cases. The structure of (V) is proved by oxidation ( $CrO_3$ -AcOH; 60°) to 3-allyl-4-quinazolinone, also obtained from isatic anhydride,  $NH_2$ - $CH_2$ - $CH$ - $CH_2$ , and  $HCO_2H$ , and by oxidation of 3-allyl-3:4-dihydroquinazoline. If (I), (IV), and  $CH_2O$  are allowed to react for 1 day at  $p_H$  7.1, then treated with  $K_3Fe(CN)_6$  at 0°, and kept for 4 days at room temp., the (V) is oxidised to the quinazolinium base, which is isolated as the  $\psi$ -base, 4-hydroxy-3-allyl-3:4-dihydroquinazoline, m.p. 136—137° after sintering at 135° [picrate, +EtOH (0.5 mol. lost at 70°/vac.), m.p. 138—139°], also obtained from (V) and  $Pb(OAc)_4$  at 60—70°. (I) reacts with  $NH_2Me$ - $HCl$  more slowly than with (IV); thus under analogous conditions much (VI) is formed with  $CH_2O$ ; however, if 30 min. elapse before addition of the  $CH_2O$ , there is obtained at  $p_H$  4.6—5.0 an 80% yield of 3-methyl-1:2-dihydroquinazol-3-inium picrate, m.p. 185—186°, which with  $CrO_3$  affords 3-methyl-4-quinazolinone, m.p. 103—104° [picrate, m.p. 211—212°; also obtained from isatic anhydride (modified procedure) and from 3-methyl-3:4-dihydroquinazoline], and with  $Pb(OAc)_4$  gives 4-hydroxy-3-methyl-3:4-dihydroquinazoline, m.p. 164—165° (lit. 162—163°) [picrate, +EtOH (0.5 mol. lost at 80°/vac.), m.p.

145—146° (decomp.). *Formylanthranilmethylamide* has m.p. 110—112°. If the prep. of (III) is carried out at 25°, some tris-*o*-aminobenzaldehyde is obtained. No (III) is obtained at  $p_H$  4.5, 5.7, or 9 if (II) is previously hydrolysed with  $H_2C_2O_4$ , which makes it probable that the free aldehyde is too unstable to exist. (III) is oxidised by  $CrO_3$  to 2:3-cyclopentano-4-keto-3:4-dihydroquinazoline ( $\Delta^9$ -pegen-8-one) and by  $Pb(OAc)_4$  to 2:3-cyclopentanoquinazol-3-inium picrate, +EtOH (retained at 70°/vac.), m.p. 146—147°, whence NaOH yields 2:3-cyclopentano-4-hydroxy-3:4-dihydroquinazoline (8-hydroxy- $\Delta^9$ -pegene), m.p. 176—177° (decomp.). *Vasicine picrate* has m.p. 190—191° (decomp.). (I),  $NH_4Cl$ , and  $CH_2O$  give only (VI). R. S. C.

$\alpha$ - and  $\beta$ -Hydroxylaudanosines. I. Their preparation from papaverinol. F. E. KING, P. L'ECUYER, and F. L. PYMAN (J.C.S., 1936, 731—733).—*Papaverinol methochloride*, m.p. 205—206°, is reduced ( $Sn-HCl$ ) to  $\alpha$ -hydroxylaudanosine (I), m.p. 138°, laudanosine, and a hydrochloride (II), m.p. 235°, whilst catalytic reduction ( $H_2$ -PtO<sub>2</sub>) affords (I) [*hydrochloride*, m.p. about 135° (efferv.)]; *picrate*, m.p. 198° (decomp.), and  $\beta$ -hydroxylaudanosine, m.p. 108—109° [*hydrochloride*, m.p. 235°, identical with (II)]; *picrate*, m.p. 178—179°. No other products are formed, the total yield being theoretical.

F. R. S.

Harmine and harmaline series. I. N-Alkyl derivatives of harmine and harmaline. R. A. KONOVALOVA and A. P. OREKHOV (J. Gen. Chem. Russ., 1936, 6, 487—498).—2-*N*-Methylbenzylideneharmine (I), m.p. 192—193°, and EtI in PhMe-PhNO<sub>2</sub> yield the *ethiodide*, m.p. 230—231°, of (I), not attacked by boiling 10% aq. NaOH or 25% aq.  $NH_3$ . 2-*N*-Ethylbenzylideneharmine, m.p. 199—200°, and MeI, under analogous conditions, yield a *methiodide*, m.p. 251—252°. 2-*N*-Methylnorharmine and EtI afford an *ethiodide*, m.p. 280—281°, not identical with the *methiodide*, m.p. 262°, of 2-*N*-ethylnorharmine, m.p. 221—222°. 2-*N*-Ethylharmaline, m.p. 163—164° [from harmaline *ethiodide*, m.p. 232—233° (decomp.)], and MeI in MeOH yield a *methiodide*, m.p. 241—243°, identical with that obtained from 2-*N*-methylharmaline and EtI in EtOH. The results are in accordance with the views of Perkin and Robinson (J.C.S., 1919, 115, 2481; 1924, 126, 657) on the structure of harmine and harmaline. R. T.

Chemical individuality of the alkaloids of ergot of rye. C. H. LIBERALLI (Rev. Quim. Farm., 1936, 1, 168—170).—A review. L. A. O'N.

Anhydromethylenecitrates of alkaloids. I. Salts of cinchona and nux vomica alkaloids. S. ANSELMi (Annali Chim. Appl., 1936, 26, 221—224).—Cinchonine, quinidine, strychnine, and brucine form salts 2 base, 1 acid with anhydromethylenecitric acid. Cinchonidine forms 1:1, quinine 2:1 and 1:1 salts. L. A. O'N.

Rhoeadine and rhoeagenine. E. SPATH, L. SCHMID, and H. STERNBERG (Monatsh., 1936, 68, 33—40).—Rhocadine (I),  $C_{20}H_{18}O_5 \cdot N \cdot OMe$ , m.p. 256—257.5° (vac.),  $[\alpha]_D^{25} +232^\circ$  in  $CHCl_3$  (*hydriodide*), is extracted (0.031% yield) from the dry flowers of

*Papaver rhoeas*, L., by aq. 2% AcOH. Successive treatment of (I) with warm 2*N*-HCl and aq. NaOH in absence (or presence) of air gives rhoeagenine (II),  $C_{19}H_{16}O_5 \cdot NMe$ , m.p. 236—238° (vac.),  $[\alpha]_D^{25} +168^\circ$  in AcOH (*hydriodide*), which is OMe-free. (I) and (II) contain 1 and 2 active H, respectively. (II) is oxidised (aq.  $KMnO_4$  in  $CO_2$  at room temp.) to 3:4-methylenedioxyphthalic acid and its methyl-imide; Zn-dust distillation affords isoquinoline. Reduction ( $Sn$ , 7% HCl, little MeOH) of (II) gives an oil, b.p. 230—240°/0.02 mm., which when distilled with Zn dust affords impure cryst. products, m.p. 136—143° and 172—179°. H. B.

Strychnine. VI. Alkali-fusion of strychnin-olone, strychninonic acid, and strychnine. M. KOTAKE (Proc. Imp. Acad., Tokyo, 1936, 12, 99; cf. this vol., 871).—

Fusion of strychnin-olone (I), strychninonic acid, or strychnine (II) for 10—15 min. with 3 parts of KOH gives  $\beta$ -3-indolyethylamine. (I) gives also a little

BzOH. (II) thus has not the formula proposed by Robinson or Leuchs, but contains the annexed grouping. R. S. C.

Constitution of chondodendrine. F. FALTIS, K. KADIERA, and F. DOBLHAMMER (Ber., 1936, 69, [B], 1269—1281).—*d*-Chondodendrine (I) has  $[\alpha]_D +262.8^\circ$  in  $CHCl_3$ . *d*-Chondodendrine  $Me_2$  ether,  $[\alpha]_D +335.0^\circ$  in  $C_5H_5N$ ,  $+314.5^\circ$  in  $CHCl_3$ , is converted by MeI in MeOH into *d*-O-methylchondodendrine *methiodide*,  $[\alpha]_{5461} +170^\circ$ ,  $[\alpha]_D +137^\circ$  in  $H_2O$  (corresponding *methochloride*,  $[\alpha]_{5461} +190^\circ$ ,  $[\alpha]_D +160^\circ$  in  $H_2O$ ). Methylation of (I) by  $Me_2SO_4$  and NaOH and treatment of the product with NaOH gives the following substances: optically inactive  $\alpha$ -*nordimethylchondodendrimethine*, m.p. 217—218° after softening at 214°;  $\beta$ -*nordimethyl-d-chondodendrimethine*, m.p. 154—155°,  $[\alpha]_D +136.3^\circ$  in  $CHCl_3$  (*methiodide*,  $[\alpha]_D +48^\circ$  in 50% MeOH);  $\alpha\alpha'$ -*dimethylchondodendrimethine* (II), m.p. 134—135°, also (+3 $H_2O$ ), m.p. (indef.) 80—93°, and (+1 $C_6H_6$ ), m.p. (indef.), 80—93°. Ozonisation of (II) followed by the conversion of the products into the *methiodides* and thence into the *methochlorides* and subsequent oxidation of the latter with  $KMnO_4$  yields 3:4-dimethoxy-2-*p*-carboxyphenoxy-6-vinylbenzoic acid (cf. A., 1934, 423) and 4-methoxy-3-6'-methoxy-4'-carboxyphenoxy-6-vinylbenzoic acid (III), m.p. 264—265° (decomp.). Decarboxylation of (III) by Cu powder in boiling quinoline and oxidation of the product with  $KMnO_4$  in  $COMe_2$  affords 3-methoxy-*p*-2'-methoxyphenoxybenzoic acid, m.p. 163.5° after softening at 160° (*Me ether*, m.p. 46° after softening at 40°), obtained synthetically from *Me vanillate* and *o*- $C_6H_4Br \cdot OMe$ . H. W.

N-Alkyl group of aconine (aconitine). W. A. JACOBS and R. C. ELDERFIELD (J. Amer. Chem. Soc., 1936 58 1059).—Fusion of aconine (hydrochloride) with KOH in  $H_2$  or  $Ba(OH)_2$  (cf. Ehrenberg and Purfürst A., 1892, 1254) gives  $NH_2Et$ , whilst treatment

with HI affords MeI (from OMe) and then EtI; the *N*-Et group is thus present. The production of oxonitine (I) from aconitine probably involves removal of this *N*-Et. A substance, m.p. 261°,  $[\alpha]^{20}_D$  -98° in CHCl<sub>3</sub>, is formed as a by-product during the prep. of (I). H. B.

**Pyridine. XX. Pyridine-3-arsinic acid and related compounds.** A. BINZ and O. VON SCHICKL (Ber., 1936, 69, [B], 1527—1534).—Addition of NaNO<sub>2</sub> in H<sub>2</sub>O to 3-aminopyridine, AsCl<sub>3</sub>, and CuCl in conc. HCl at 0° followed by treatment of the solution with KI and SO<sub>2</sub>, yields 3-pyridyldichloroarsine hydrochloride (+1H<sub>2</sub>O) (I), m.p. 217—230°, reduced by H<sub>3</sub>PO<sub>2</sub> in presence of KI and conc. HCl to 5:3'-arsenopyridine, from which it is regenerated by 3% H<sub>2</sub>O<sub>2</sub> in conc. HCl. (I) is transformed by NH<sub>3</sub>-H<sub>2</sub>O into 3-pyridylarsine oxide, m.p. 118—119° [oxidised by 30% H<sub>2</sub>O<sub>2</sub> to pyridine-3-arsinic acid (II), m.p. 156°], and by 30% H<sub>2</sub>O<sub>2</sub> to pyridine-3-arsinic acid hydrochloride, m.p. 195—197°. (II) is stable towards boiling H<sub>2</sub>O. Addition of CuCl and NaNO<sub>2</sub> to a solution of 5-amino-2-hydroxypyridine hydrochloride in conc. HCl at >10° affords 2-hydroxypyridine-5-arsinic acid (III) in 43% yield; 2-chloropyridine-5-arsinic acid is obtained similarly in 50% yield. When reduced to the arseno-compound and then treated with H<sub>2</sub>O<sub>2</sub> in conc. HCl, (III) yields 2-hydroxypyridyldichloroarsine hydrochloride (+0.5H<sub>2</sub>O), m.p. about 154° after softening at 92—110°. 3-Pyridyltetrachlorostibine hydrochloride, m.p. 240° (decomp.), is described. H. W.

**Configuration of heterocyclic compounds. IV. Optical resolution of 10-phenylphenoxarsine-2-carboxylic acid.** (Miss) M. S. LESSLIE and E. E. TURNER (J.C.S., 1936, 730—731).—10-Phenylphenoxarsine-10-oxide-2-carboxylic acid, m.p. 320°, prepared by oxidation (KMnO<sub>4</sub>) of 10-phenyl-2-methylphenoxarsine, is reduced (SO<sub>2</sub>; I) to dl-10-phenylphenoxarsine-2-carboxylic acid, m.p. 208—209°, which was resolved through the l- $\alpha$ -phenylethylamine d-, m.p. 208—209°,  $[\alpha]^{20}_{D_{91}} +184.3^\circ$  in MeOH, and l-10-phenylphenoxarsine-2-carboxylate, m.p. 199—200°,  $[\alpha]^{20}_{D_{91}} -191.2^\circ$  in MeOH, to give d-, m.p. 189—190°,  $[\alpha]^{20}_{D_{91}} +223.1^\circ$  in EtOH, and l-10-phenylphenoxarsine-2-carboxylic acid, m.p. 189—190°,  $[\alpha]^{20}_{D_{91}} -232.2^\circ$  in EtOH. The acid possesses high optical stability. F. R. S.

**Organic boron derivatives. I. Action of halogens and hydrogen peroxide on diarylboric acids.** N. N. MELNIKOV (J. Gen. Chem. Russ., 1936, 6, 636—639).—The reactions BR<sub>2</sub>·OH (I) + X<sub>2</sub> + H<sub>2</sub>O → BR(OH)<sub>2</sub> (II) + HX + RX; (II) + X<sub>2</sub> + H<sub>2</sub>O → RX + HX + H<sub>3</sub>BO<sub>3</sub>; (I) + H<sub>2</sub>O<sub>2</sub> → ROH + (II); (II) + H<sub>2</sub>O<sub>2</sub> → ROH + H<sub>3</sub>BO<sub>3</sub> (R = Ph, *p*-C<sub>6</sub>H<sub>4</sub>X, *p*-C<sub>6</sub>H<sub>4</sub>Me, *p*-OMe·C<sub>6</sub>H<sub>4</sub>·; X = Cl, Br) are shown to take place in H<sub>2</sub>O at room temp. R. T.

**Relative reactivities of organometallic compounds. IX. Cadmium.** H. GILMAN and J. F. NELSON (Rec. trav. chim., 1936, 55, 518—530).—CdCl<sub>2</sub> can be used in the Grignard reaction, for the prep. of organo-Cd compounds of type CdR<sub>2</sub> and CdRX from MgRX (X preferably = Br). Organo-Cd compounds are less reactive than organo-Zn, but more reactive than organo-Hg, compounds. Their colour

test with Michler's ketone is described. CdEt<sub>2</sub> (I) combines very slowly with PhCHO; in Bu<sub>2</sub>O with CPhMe at 50—60° CPh·CH·COPh is formed. Cd compounds prepared from MgRX, but not isolated, react readily with acyl chlorides to form ketones, in much better yields than from Zn compounds. The following are prepared by this means, using the appropriate chloride. From MgMeBr, CPhMe, *m*-C<sub>6</sub>H<sub>4</sub>Me·COMe, and *p*-OMe·C<sub>6</sub>H<sub>4</sub>·COMe; from MgEtBr, COMeEt, CPhEt, *n*-C<sub>17</sub>H<sub>35</sub>·COEt, and 2-furyl Et ketone; from MgPr<sup>*δ*</sup>Br, COPr<sup>*δ*</sup>·Pr<sup>*δ*</sup>; from MgBu<sup>*γ*</sup>Cl, COMeBu<sup>*γ*</sup>; from CH<sub>3</sub>Ph·MgCl, CH<sub>3</sub>Ph·COMe; from MgPhBr, CPhMe and CPh<sub>2</sub>; and from LiPh, CPhMe. (COCl)<sub>2</sub> and (I) react rapidly to form C<sub>2</sub>Et·Pr<sup>*δ*</sup>·OH; CO<sub>2</sub>Et·COCl and Et<sub>2</sub>C<sub>2</sub>O<sub>4</sub> both give OH·C<sub>2</sub>Et<sub>2</sub>·CO<sub>2</sub>Et. PhSO<sub>2</sub>Cl forms SO<sub>2</sub>Ph<sub>2</sub>, PhCl, and PhSO<sub>2</sub>H. E. W. W.

**Organic compounds of germanium. K. BURCHKIES** (Ber., 1936, 69, [B], 1313; cf. this vol., 871).—A lit. addendum. H. W.

**Mercury derivatives of o-cresotic acid.** A. LESPAGNOL and (Mlle.) D. BAR (Bull. Soc. chim., 1936, [v], 3, 1107—1114).—Na 2-hydroxy-*m*-toluate is converted by Hg(OAc)<sub>2</sub> at room temp. into the Hg<sup>II</sup> salt, which passes when heated into "basic Hg o-cresotate" (I), transformed by KCN into homogeneous K 2-hydroxy-5-cyanomercuritolate. Nitration of the latter or of (I) affords 5-nitro-2-hydroxy-*m*-toluic acid, m.p. 205°, reduced to 5-amino-2-hydroxy-*m*-toluic acid, m.p. 308°, which is decarboxylated to 1:3:4-OH·C<sub>6</sub>H<sub>2</sub>Me·NH<sub>2</sub> or diazotised and then decarboxylated to 1:2:5-C<sub>6</sub>H<sub>3</sub>Me(OH)<sub>2</sub>. H. W.

**Synthesis of organic tin compounds from diazo-compounds.** K. A. KOTSCHESCHKOV, A. N. NESMEJANOV, and V. A. KLIMOV (J. Gen. Chem. Russ., 1936, 6, 167—171).—Certain aryldiazonium stannichlorides react with Sn in boiling EtOAc, as follows: (R·C<sub>6</sub>H<sub>4</sub>·N<sub>2</sub>Cl)<sub>2</sub>·SnCl<sub>4</sub> + Sn → (R·C<sub>6</sub>H<sub>4</sub>)<sub>2</sub>SnO + C<sub>6</sub>H<sub>6</sub> + (R·C<sub>6</sub>H<sub>4</sub>)<sub>2</sub> (R = *o*-Me, *p*-Cl, *p*-Br). When R = *o*-OMe, the product is (OMe·C<sub>6</sub>H<sub>4</sub>)<sub>2</sub>SnCl<sub>2</sub>, m.p. 113°; when R = *o*-CO<sub>2</sub>Me the substance *o*-CO<sub>2</sub>Me·C<sub>6</sub>H<sub>4</sub>·SnCl<sub>3</sub>, m.p. 164°, is obtained. R. T.

**Arsenical azoproteins and ability of phenylalanine, tryptophan, proline, and hydroxyproline to couple with diazobenzenearsinic acid.** R. KAPPELLER-ADLER and G. BOXER (Biochem. Z., 1936, 285, 55—66).—Tables summarise the As and N contents of the coupling products of diazobenzenearsinic acid (I) with caseinogen, fibrin, zein, and gelatin. The N contents are close to those of the original proteins whilst the As contents of the azoproteins are, respectively, about 8, 4, 8, and 14.8%. Similar compounds are obtained with phenylalanine, tryptophan, proline, and hydroxyproline, the N and As contents of which corresponded closely with the requirements of the corresponding bis-(I) derivatives, indicating that coupling had occurred. P. W. C.

**Denaturation of proteins. XV. Formol titration of proteins in carbamide solution.** C. Y. CHOU and H. WU (Chinese J. Physiol., 1936, 10, 303—314).—The NH<sub>2</sub>-N content of glycine or cryst. oval-

bumin determined by  $\text{CH}_3\text{O}$  is the same whether the protein is dissolved in  $\text{H}_2\text{O}$  or in 40%  $\text{CO}(\text{NH}_2)_2$  solution, i.e., denaturation by  $\text{CO}(\text{NH}_2)_2$  does not affect the  $\text{NH}_2\text{-N}$ . This finding is used to determine the  $\text{NH}_2\text{-N}$  content of proteins insol. in  $\text{H}_2\text{O}$ , and sol. in  $\text{CO}(\text{NH}_2)_2$  solution. The  $\text{NH}_2\text{-N}$  of ovalbumin, cryst. pepsin, horse serum-albumin, edestin, and casein is 6.5, 11.9, 9.3, 9.0, 2.4, and 7.4 mg. per g., respectively.

F. A. A.

**Densities of protein crystals and hydration of proteins.** G. S. ADAIR and M. E. ADAIR (Proc. Roy. Soc., 1936, B, 120, 422—446).—The  $d$  of protein crystals as measured by a flotation method in aq. media depends on the composition and  $p_{\text{H}}$  of the medium, and is < that of the anhyd. protein, probably owing to greater hydration in the former. The  $d$  of heat-coagulated proteins is slightly > that of the crystals.

F. A. A.

**Acetylation of agar.** E. G. V. PERCIVAL and W. S. SIM (Nature, 1936, 137, 997—998).—Agar is readily (cf. this vol., 593) acetylated, with no apparent degradation, when suitably-prepared material is treated with  $\text{C}_5\text{H}_5\text{N}$  and  $\text{Ac}_2\text{O}$ . The  $\text{CHCl}_3$ -sol. acetates,  $[\alpha]_{\text{D}}^{25} -30^\circ$  approx., contain 36—43% Ac according to the time of acetylation. Evaporation of the  $\text{CHCl}_3$  solution of the acetate leaves a tough, colourless film.

L. S. T.

**Modifications of physico-chemical properties of protein solutions with age.**—See this vol., 1012.

**Raman effect in analytical chemistry.**—See this vol., 949.

**Addition of hydrogen peroxide in the determination of nitrogen in organic compounds.** C. F. POE and B. T. DEWEY (J. Amer. Pharm. Assoc., 1936, 25, 419—422).—Addition of 30%  $\text{H}_2\text{O}_2$  accelerates the oxidation of, and gives accurate results with, substances containing  $\text{-NH}_2$  but not  $\text{-NO}_2$  groups (Gunning-Kjeldahl method).

F. O. H.

**Colorimetric determination of peroxides in unsaturated compounds.** C. A. YOUNG, R. R. VOGT, and J. A. NIEUWLAND (Ind. Eng. Chem. [Anal.], 1936, 8, 198—199).—A method is described depending on the oxidation of  $\text{FeSO}_4$  in presence of  $\text{NH}_4\text{CNS}$ , using MeOH as solvent.

E. C. S.

**Determination of small concentrations. XII. Colorimetric determination of acetate.** R. V. TEIS and E. M. JOFINOVA-GOLDFEIN (J. Appl. Chem. Russ., 1936, 9, 957—964).—The blue colour developing when 5% aq.  $\text{La}(\text{NO}_3)_3$ , aq.  $\text{NH}_3$ , and I in EtOH are added to aq. acetates is not  $\propto$  the  $[\text{OAc}']$ . A more intense coloration is obtained by raising the  $[\text{La}''']$ , but the reaction does not become more sensitive, its limits of applicability remaining at 0.35—1.7 mg. of  $\text{OAc}'$ . The rate of colour development, and its intensity, fall with increasing  $[\text{NH}_3]$ , or in presence of neutral salts; at the same time tendency towards ppt. formation increases.

R. T.

**Utilisation of S-benzylthiuronium chloride for isolation and identification of organic acids.** J. J. DONLEAVY (J. Amer. Chem. Soc., 1936, 58, 1004—1005).—S-Benzylthiuronium chloride, two forms, m. p. 146—148° and 172—174° (all m.p. except

these are corr.) [from  $\text{CS}(\text{NH}_2)_2$  and  $\text{CH}_2\text{PhCl}$  in EtOH], and the appropriate Na or K salt in  $\text{H}_2\text{O}$  or aq. EtOH give S-benzylthiuronium formate, m.p. 146°, acetate, m.p. 134°, propionate, m.p. 148°, n-, m.p. 146°, and iso-, m.p. 143°, butyrate, isovalerate, m.p. 153°, laurate, m.p. 141°, myristate, m.p. 139°, palmitate, m.p. 141°, stearate, m.p. 143°, oxalate, m.p. 193°, succinate (+2 $\text{H}_2\text{O}$ ), m.p. 149°, H maleate, m.p. 163°, fumarate, m.p. 178°, crotonate, m.p. 162°, glycollate, m.p. 141°, lactate, m.p. 153°, diglycollate, m.p. 154°, benzoate, m.p. 166°, o-, m.p. 159°, m-, m.p. 163°, and p-, m.p. 182°, -nitrobenzoate, o-, m.p. 142°, m-, m.p. 149°, and p-, m.p. 166°, -aminobenzoate, o-, m.p. 140°, m-, m.p. 164°, and p-, m.p. 190°, -toluate, salicylate, m.p. 146°, m-chlorobenzoate, m.p. 155°, m-bromobenzoate, m.p. 168°, anisate, m.p. 177°, phthalate, m.p. 151°, cinnamate, m.p. 175°, mandelate, m.p. 166°, diphenylacetate, m.p. 145°, benzenesulphonate, m.p. 144°, m-nitrobenzenesulphonate, m.p. 140°, and p-toluenesulphonate, m.p. 178°. Some of the salts are hydrolysed readily.

H. B.

**Titration of weak acids and bases.**—See this vol., 949.

**Semicarbazides. IV. m-Tolylsemicarbazide** as a reagent for the identification of aldehydes and ketones. P. P. T. SAH, S. M. WANG, and C. H. KAO (J. Chinese Chem. Soc., 1936, 187—192).—m-Tolylsemicarbazide, m.p. 106—108°, condenses readily with aldehydes and ketones and the m-tolylsemicarbazones of the following substances may be used for identification: MeCHO, m.p. 104—105°; EtCHO, m.p. 88—89°; Pr<sup>n</sup>CHO, m.p. 76—78°; Bu<sup>n</sup>CHO, m.p. 81—82°; n-hex-, m.p. 112—113°; n-hept-, m.p. 119—121°; n-oct-, m.p. 115—117°; n-non-, m.p. 124—250°; n-dec-, m.p. 99—100°; benz-, m.p. 175—176°; m-nitrobenz-, m.p. 187—188°, and salicylaldehyde, m.p. 202—203°; furfuraldehyde, m.p. 142—143°; COMe<sub>2</sub>, m.p. 158—160°; COMeEt, m.p. 109—110°; Me hexyl ketone, m.p. 82—84°; COMe·CH<sub>2</sub>CHPh, m.p. 192—193°; CPhMe, m.p. 186—187°; p-methyl-, m.p. 200—201°; m-nitro-, m.p. 232—332°, and p-bromo-acetophenone, m.p. 206—207°; CPh<sub>2</sub>, m.p. 181—182°; lævulic acid, m.p. 186—187°; CH<sub>3</sub>Ac·CO<sub>2</sub>Et, m.p. 118—120°; Et, m.p. 97—98°, and CH<sub>2</sub>Ph, m.p. 112—113°, lævulate.

F. R. S.

**Use of 2:4-dinitrophenylhydrazine as a reagent for carbonyl compounds.** N. R. CAMPBELL (Analyst, 1936, 61, 391—395).—Tables of all recorded m.p. of 2:4-dinitrophenylhydrazones are given. Many are erroneous and many corrected m.p. have been determined. 2:4-Dinitrophenylhydrazones of the following are new: o-C<sub>6</sub>H<sub>4</sub>Cl·CHO, m.p. 206—207°; vanillin, m.p. 271° (decomp.); diacetone alcohol, m.p. 202—203°; dibenzylideneacetone, m.p. 180°; cinnamylideneacetone, m.p. 222—223°; dicinnamylideneacetone, m.p. 208°; CHAcBz·CO<sub>2</sub>Et, m.p. 223°; CH<sub>2</sub>Ac<sub>2</sub>, m.p. 209°; Ac<sub>2</sub>, charred > 300°; cinnamylideneacetophenone, m.p. 218—219° (decomp.); 2-C<sub>10</sub>H<sub>7</sub>·Ac, m.p. 262° (decomp.); piperitone, m.p. 119°; 2-C<sub>10</sub>H<sub>7</sub>·Bz, m.p. 257—258°; β-benzoyl-diphenyl, m.p. 214°; furoin, m.p. 216—217°; phenanthraquinone, m.p. 312—313° (decomp.), and chryssoquinone, m.p. 308—309° (decomp.). Recorded vari-

ations in the m.p. of acetaldehydedinitrophenylhydrazones are due to the presence of impurities and not to a metastable modification. Brady's method, using  $\text{Pr}^{\text{e}}\text{OH}$  instead of  $\text{EtOH}$ , was used for the prep.

E. H. S.

**Azides. VI. *p*-Brombenzazide as a reagent for the identification of primary and secondary amines.** P. P. T. SAH, C. H. KAO, and S. M. WANG (J. Chinese Chem. Soc., 1936, 4, 193—197).—*p*-Bromobenzazide, m.p.  $46^{\circ}$  (decomp.), prepared by diazotisation of the hydrazide, gives *p*-bromophenylcarbamides of the following amines and amides:  $\text{NH}_2\text{Ph}$ , m.p.  $230$ — $231^{\circ}$ ; *o*-, m.p.  $207$ — $208^{\circ}$ ; *m*-, m.p.  $215$ — $216^{\circ}$ , and *p*- $\text{NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{NH}_2$ , m.p.  $264$ — $266^{\circ}$ ; *p*- $\text{C}_6\text{H}_4\text{Br}\cdot\text{NH}_2$ , m.p.  $218$ — $219^{\circ}$ ; *o*-, m.p.  $198$ — $199^{\circ}$ ; *m*-, m.p.  $223$ — $224^{\circ}$ , and *p*- $\text{C}_6\text{H}_4\text{Me}\cdot\text{NH}_2$ , m.p.  $282$ — $284^{\circ}$ ; *m*-nitro-*p*-toluidine, m.p.  $214$ — $216^{\circ}$ ;  $\alpha$ -, m.p.  $272$ — $274^{\circ}$ , and  $\beta$ - $\text{C}_{10}\text{H}_7\cdot\text{NH}_2$ , m.p.  $223$ — $224^{\circ}$ ;  $\alpha$ - $\text{C}_{10}\text{H}_7\cdot\text{NHAc}$ , m.p.  $157$ — $158^{\circ}$ ;  $\text{NHPhAc}$ , m.p.  $141$ — $142^{\circ}$ ; *p*- $\text{C}_6\text{H}_4\text{Cl}\cdot\text{NHAc}$ , m.p.  $179$ — $180^{\circ}$ ; *p*- $\text{C}_6\text{H}_4\text{Br}\cdot\text{NHAc}$ , m.p.  $163$ — $165^{\circ}$ ; *m*- $\text{NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{NHAc}$ , m.p.  $152$ — $153^{\circ}$ ; *o*-, m.p.  $114$ — $115^{\circ}$ , and *p*- $\text{C}_6\text{H}_4\text{Me}\cdot\text{NHAc}$ , m.p.  $146$ — $147^{\circ}$ , and  $\text{NHPhMe}$ , m.p.  $123$ — $124^{\circ}$ .

F. R. S.

**Simplified copper reagent.** E. J. MUELLER (J. Pharm. Chim., 1936, [viii], 24, 18).—The reagent for sugars is made up of 100 c.c. of 29.9%  $\text{NaOH}$ , 1 g. of  $\text{CuSO}_4$ , and 10 c.c. of distilled  $\text{H}_2\text{O}$ .

H. D.

**Use of the ninhydrin reaction in the determination of amino-acids.** M. POLONOVSKI and F. MORENO-MARTÍN (Anal. Fís. Quím., 1935, 33, 574—587).—A more detailed account of work already published (A, 1935, 1044). In the method of Cherbuliez *et al.* (*ibid.*, 102) it is essential to work always with reagents of the same concn. Addition of  $\text{AcOH}$  to counteract increase in the  $p_{\text{H}}$  of the solution has been investigated and the method applied to the determination of  $\text{NH}_2$ -acids in milk.

F. R. G.

**Potentiometric determination of polypeptides and amino-acids. II. Formaldehyde titration.** E. W. BALSON and A. LAWSON (Biochem. J., 1936, 30, 1257—1263).—From measurements of the changes in the titration curves of  $\text{NH}_2$ -acids produced by the presence of  $\text{CH}_2\text{O}$  it is concluded that primary  $\text{NH}_2$ -acids and polypeptides react with up to three mols. of  $\text{CH}_2\text{O}$ , *sec.* with one only; *tert.* do not react.

H. D.

**Sullivan colorimetric test for guanidine.** C. E. BRAUN and F. M. REES (J. Biol. Chem., 1936, 114, 415—417).—*p*-Anilino-,  $\alpha$ -naphthyl-, *ar*-tetrahydro- $\alpha$ -naphthyl-, and *o*-tolyl-guanidine and *p*-tolylidiguanidine, but not 31 other guanidine derivatives, are indistinguishable from guanidine by the Sullivan colorimetric test.

R. S. C.

**Reaction of borneol.** O. CARLETTI (Boll. Chim. farm., 1936, 75, 299—303).—The Borisch reaction (development of a violet colour when commercial camphor and vanillin are mixed in  $\text{H}_2\text{SO}_4$  and diluted with  $\text{H}_2\text{O}$ ) is due to borneol (I), which gives the reaction as strongly as does menthol (II). The reaction may be used as a sensitive test for (I) and for isoborneol; also to distinguish (II) from menthone.

E. W. W.

**Approximate determination of furfuraldehyde in solutions.** E. K. NIKITIN (J. Appl. Chem. Russ., 1936, 9, 950—956).—The approx. concn.  $X$  of furfuraldehyde (I) is given by  $X/C=K$ , where  $C$  is the concn. of (I) in a standard solution (usually 0.2%), and  $K=1/\{1+(v-v_1)/(v_2-v_1)\}$  for solutions of pure (I), and  $2/\{1+2(v-v_1)/(v_2-v_1)\}$  for crude distillates, where  $v$  is the time elapsing before appearance of turbidity in a mixture of 2 ml. of neutral aq. (I) (approx. 0.2%), 2 ml. of 0.01% aq.  $\text{COMe}_2$ , and 2 ml. of 60%  $\text{KOH}$ , and  $v_1$  and  $v_2$  are respectively the times for 0.2 and 0.1% (I).

R. T.

**Micro-reaction of caffeine with iodine-potassium iodide.** C. VAN ZIJP (Pharm. Weekblad, 1936, 73, 767—768).—Exact details are given.

S. C.

**Determination of chlorophyll with the aid of the light of a Lange electrical colorimeter.** T. N. GODNEV and S. V. KALESEVITSCH (Compt. rend. Acad. Sci. U.R.S.S., 1936, 2, 77—79).—Chlorophyll in solutions containing 0.25 mg. per litre can be determined Lange's colorimeter;  $\geq 30$  c.c. of solution are needed. Using a Schott red filter  $\text{COMe}_2$  extracts can be used directly.

P. G. C.

**Determination of total creatine.**—See this vol., 1038.

**Iodometric determination of cysteine.** T. T. CHEN (Chinese J. Physiol., 1936, 10, 315—326).—High concns. of  $\text{HCl}$  and  $\text{KI}$  inhibit the reaction between cysteine and  $\text{I}$ , whilst low ones favour oxidation of cysteine beyond the cystine stage. In the presence of 1%  $\text{KI}$  and 0.9*M*- $\text{HCl}$ , cysteine may be titrated to cystine by  $\text{KIO}_3$ ; in the indirect procedure, adding excess  $\text{KIO}_3$  to cysteine and titrating the  $\text{I}$ , the  $[\text{HCl}]$  should be 3*M*.

F. A. A.

**Application of 5 : 7-dibromo-8-hydroxyquinoline to the determination of small amounts of iron, titanium, and aluminium in mixtures.**—See this vol., 952.

**Reaction of ferric salts with pyrimidone in presence of complex cyanides of iron.**—See this vol., 947.

**Colorimetric determination of carnosine and histidine.** N. P. MESCHKOVA (Z. physiol. Chem., 1936, 240, 199—207).—In presence of histidine (I) carnosine (II) cannot be determined by Kapeller-Adler's method (A., 1934, 574). The method which employs Pauly's diazo-reagent (A., 1904, i, 1068) gives satisfactory results if the optimal amount of reagent is used and the aq.  $\text{Na}_2\text{CO}_3$  is added at once in the case of (II) and after 1—3 hr. in that of (I). Interference by glycine, asparagine, and uric acid is overcome by adding excess of the reagent. Urea does not interfere. Equimol. solutions of (I) and (II) produce equal intensity of colour with the reagent.

W. McC.

**Determination of average lethal dose in the biological assay of digitalis by the frog method.**—See this vol., 892.

**Microchemical identification of -cocaine.** R. CECCONI (Annali Chim. Appl., 1936, 26, 218—220).—

With  $\text{KMnO}_4$  in acid solution, *d*-cocaine gives characteristic hexagonal crystals, whereas *l*-cocaine forms rectangular plates, tropacocaine minute prisms, and eucaine an irregular or non-cryst. mass. Other derivatives become oxidised. L. A. O'N.

**Berberine as a microchemical reagent.** C. VAN ZIJP (Pharm. Weekblad, 1936, 73, 764—767).—Characteristic micro-cryst. ppts. are formed when, solutions containing berberine- $\text{H}_2\text{SO}_4$  (I) are treated with solutions containing Na-luminal, Na salicylate, or meconic acid. Uric acid, theocine, atophan, luminal, rutonal, dial, propional, salicylic acid, saccharin, and fumaric acid give ppts. immediately when solutions containing (I) are treated with  $\text{NH}_3$ , preferably by the hanging-drop method. Veronal and evipan give ppts. with  $\text{NH}_3$  slowly. Theobromine, cystine, tyrosine, leucine, cotoine,  $\text{CO}(\text{NH}_2)_2$ , aspirin,

anisic, cinnamic, and succinic acids give no definite ppt. S. C.

**Biuret reaction of proteins.** F. LIEBEN and H. JESSERER (Biochem. Z., 1936, 285, 36—46).—The colours obtained in the biuret reaction, carried out under standardised conditions, with varying protein concns. obey the Beer-Lambert rule, the colour strength and tone for all the investigated proteins, peptones, etc. being the same for the same wt. concns. and independent of the mol. size and the  $\text{NH}_2$ -acid content of the substrate. A method is described for separation of the red and blue components of the colour, which are shown to give different extinction coeffs. in the step photometer. Clupein Me ester hydrochloride gives the same colour strength and tone and the same Cu content as the same concn. of caseinogen. P. W. C.

## Biochemistry.

**Influence of high and low concentrations of carbonic acid on oxygen consumption of frogs.** L. DONTCHEFF and C. KAYSER (Compt. rend. Soc. Biol., 1936, 122, 325—327).—Low concns. (0.6—0.8%) of  $\text{CO}_2$  increase and high concns. (25%) decrease the  $\text{O}_2$  consumption of frogs. F. O. H.

**Variation of respiratory exchange of active dormice with temperature.** L. DONTCHEFF and C. KAYSER (Compt. rend. Soc. Biol., 1936, 122, 328—330).—Diminution of temp. from  $30^\circ$  to  $-10^\circ$  produces a steady increase in heat production from 1.2 to 4.5 g.-cal. per kg. per hr. (cf. A., 1935, 387).

F. O. H.

**Modification of the Haldane-Henderson apparatus for the analysis of respiratory gases.** N. CORDERO (Chinese J. Physiol., 1936, 10, 373—376).—A 3-way stopcock allows either the  $\text{CO}_2$  absorber, or the  $\text{O}_2$  absorber only, to be connected with the temp.-control tube, and eliminates frequent turning of the stopcock communicating with the gas burette.

F. A. A.

**Conductivity curves of ox red corpuscles in relation to the number of dispersed elements and  $p_{\text{H}}$ .** G. ACHARD (Compt. rend. Soc. Biol., 1936, 122, 571—574).

H. G. R.

**Degradation of adenosine triphosphate in cells.** V. A. ENGELHARDT and G. G. LIPSHITZ (Bull. Biol. Med. Exp. U.R.S.S., 1936, 1, 104—105).—Degradation in nucleated avian (pigeon, fowl) erythrocytes (respiration inhibited by KCN) does not lead to liberation of free  $\text{H}_2\text{P}_2\text{O}_7$ .

W. McC.

**Phosphates and phosphate metabolism in red blood cells.** H. VON EULER and K. M. BRANDT (Z. physiol. Chem., 1936, 240, 215—231).—The state of combination of  $\text{PO}_4'''$  in erythrocytes varies greatly from species to species (sheep, ox, pigeon, rat, guinea-pig). Inorg. P is increased by  $\text{Mg}^{++}$  and decreased by NaF. Added muscle-adenylic acid and cozymase decrease the inorg. P and increase the amount of phosphoric esters hydrolysed in 3 hr. In rats on diets free from vitamin-D, inorg. P is decreased and

the content of readily-hydrolysed phosphoric esters is increased. W. McC.

**Effect of proteins on electrophoretic mobility and sedimentation velocity of red cells.** B. R. MONAGHAN and H. L. WHITE (J. Gen. Physiol., 1936, 19, 715—726).—The isoelectric point of red cells cannot be determined, but it is  $<$  that of any plasma-protein. With cells kept in acid solution, the surface is damaged so that they adsorb proteins from low concn. When bulk  $\eta$  is increased, the mobility of the cells is unchanged, indicating surface hydration, and the aggregating effect of certain proteins is said to be due to dehydration. H. G. R.

**Carbhaemoglobin.** F. J. W. ROUGHTON (Biochem. Z., 1936, 285, 150—152).—The method of Groscurth and Havemann (A., 1935, 1260) for determination of  $\text{CO}_2$  bound with haemoglobin as carbamyl derivative is not trustworthy, and the author's method is not invalidated by their observations. P. W. C.

**Carbhaemoglobin.** G. GROSCURTH and R. HAVE-MANN (Biochem. Z., 1936, 285, 153—155).—A reply to Roughton (preceding abstract). P. W. C.

**Effect of  $\text{CO}_2$  tension and temperature on the dissociation curves of the oxyhaemoglobin of blood.** S. SEVERIN, E. GEORGIEVSKI, and V. TUNIN (Bull. Biol. Med. Exp. U.R.S.S., 1936, 1, 137—138).—Changes in temp. ( $28^\circ$ ,  $33^\circ$ ,  $38^\circ$ ) at const. pressure (38 mm. of Hg) and in pressure (20.4, 56 mm.) at const. temp. ( $37.5^\circ$ ) considerably alter the positions of the curves, but not their shapes. The degree of aggregation of the haemoglobin mols. increases as the  $\text{O}_2$  tension increases, but is unaffected by changes in temp. or  $\text{CO}_2$  tension. W. McC.

**Methaemoglobin formed post-mortally, spontaneously, and by chemicals, and that formed by drying.** E. BECHTOLD (Z. Fleisch- u. Milchhyg., 1935, 45, 227—230, 267—270, 287—291, 326—329; Chem. Zentr., 1935, ii, 2146).—The processes occurring are discussed in detail. H. N. R.

**Methaemoglobinising action *in vivo* of sodium nitrite.** A. RABBENO and S. RAPPEPORT-LEWEY

(Boll. Soc. ital. Biol. sperim., 1936, 11, 34—35).—With rabbits approx. 0.12 g. of  $\text{NaNO}_2$  per kg. body-wt. is lethal. Death occurs when 80% of the hæmoglobin (I) is converted into methæmoglobin. With cats, the amount of (I) converted  $\propto$  time; with rabbits the conversion starts slowly and is accelerated in the final phase. E. P.

**Detection and determination of bilirubin.** G. B. ARBUINOV (Klin. Med. U.S.S.R., 1934, 12, 111—115).—Hæmolytic bilirubin A gives no direct colour reaction and is not pptd. by EtOH. It can be determined by the Herzfeld or the van den Bergh method. Bilirubin B gives a good colour reaction and is pptd. by EtOH. It can be determined by the Herzfeld method in serum not treated with EtOH.

CH. ABS. (e)

**Isoionic point of serum-proteins. I. Method of determination and results.** G. SANDOR (Bull. Soc. Chim. biol., 1936, 18, 877—907; cf. A., 1935, 822).—Methods of determination are discussed and details of an approx. and of an exact method are given. For the globulins of horse serum the val. varies between  $p_H$  5.8 and 6.0, and for the cryst. albumin between 5.10 and 5.14, although in some cases the latter val. is raised to 5.4. H. G. R.

**Nephelometry of blood-proteins. I. Rapid determination of globulin. II. Sulphosalicylic acid reaction in determination of proteins.** K. PLOTNER (Biochem. Z., 1936, 286, 128—134, 135—139).—I. The globulin content of normal and pathological sera (and of other biological fluids) is determined, without separation from albumin, by half-saturating with aq.  $(\text{NH}_4)_2\text{SO}_4$  and measuring in a nephelometer the degree of turbidity produced.

II. The determination of protein in body-fluids by measuring the turbidity produced by sulphosalicylic acid is untrustworthy. W. McC.

**Albumin/globulin ratio of normal and pathological human sera.** A. ROCHE, M. DORIER, and L. SAMUEL (Compt. rend., 1936, 202, 1720—1722).—Fractional salting-out with  $(\text{NH}_4)_2\text{SO}_4$  indicates unchanged solubilities of serum-albumin and -globulin during cirrhosis, but modifications of their micellar character during hypertension. F. O. H.

**Influence of intravenously injected carbon suspensions on blood-proteins and albumin/globulin quotient.** A. LUMIERE, P. MEYER, and M. A. THIBAUDET (Compt. rend. Soc. Biol., 1936, 122, 308—310).—Injection of C suspensions into fasting rabbits decreases blood-proteins, but increases the albumin/globulin ratio. F. O. H.

**Influence of intravenously injected carbon suspensions on blood-sugar.** A. LUMIERE and P. MEYER (Compt. rend. Soc. Biol., 1936, 122, 311—313).—Injection of C suspensions into fasting rabbits produces a hyperglycæmia inhibited by ergotamine, but not by atropine, and therefore related to the adrenal-sympathetic system. F. O. H.

**Physiological variations of the blood-sugar level in rabbits and dogs.** S. G. GENESS and V. P. KOMISSARENKO (Biochem. Z., 1936, 285, 420—428).—Tables and curves summarise the blood-sugar vals. of large nos. of dogs and rabbits, including

the normal fasting levels, variation over periods of days and months, and variations on administering glucose. The normal fasting level for 1020 rabbits was 0.06—0.16% (mean 0.108%) and for 100 dogs 0.60—0.13% (mean 0.92%). The variations from day to day and over months are considerable, but are less for dogs than for rabbits. The mean increase in the vals. for 8 rabbits receiving glucose 128 times is 0.41—0.51%. P. W. C.

**Changes in blood-sugar content after ligation of arteries.** H. HUNGERLAND (Arch. exp. Path. Pharm., 1936, 181, 435—443).—Tying the carotid and femoral arteries in dogs caused a rise in blood-sugar; the max. occurred earlier after carotid ligation. Anomalous results were obtained by ligation under morphine-pernoctone narcosis. J. N. A.

**New experimental hyperlipæmia in rabbits. Genesis of venesection lipæmia.** T. HATAKEYAMA (Biochem. Z., 1936, 285, 11—28).—Hyperlipæmia can be brought about in rabbits merely by suction on the ear and without venesection. The suction lipæmia is seen first as an alimentary lipæmia and later as a persistent lipæmia, and can be obtained without decrease of either erythrocytes or serum-protein. Neither suction nor venesection lipæmia is obtained with animals in the fasting condition. The mechanism is discussed. P. W. C.

**Combined and free lipins in blood plasma.** L. REALE (Boll. Soc. ital. Biol. sperim., 1935, 10, 886—889).—Plasma-lipins are separated into 3 fractions, (a) not pptd. by saturation with  $(\text{NH}_4)_2\text{SO}_4$ , (b) pptd. by  $(\text{NH}_4)_2\text{SO}_4$  and directly extracted from the ppt. by  $\text{Et}_2\text{O}$ , and (c) pptd. by  $(\text{NH}_4)_2\text{SO}_4$  and not extracted by  $\text{Et}_2\text{O}$  but by boiling EtOH. Variations in (a), (b), and (c) with fasting and fat-containing and -free diets are tabulated. F. O. H.

**Dependence of the composition of the blood-plasma and -serum on the nature of the diet.** (A) E. G. SCHENCK. (B) E. ABDEHJALDEN (Z. physiol. Chem., 1936, 240, 232—236, 237—240; cf. A., 1935, 1261).—Polemical. W. McC.

**Determination of hippuric acid in blood.** H. MINIBECK and N. NEUMANN (Mikrochem., 1936, 20, 91—103).—The hippuric acid (I) is extracted from the albumin-free filtrate with  $\text{Et}_2\text{O}$  and titrated as  $\text{NH}_2\text{-N}$  in  $\text{COMe}_2$  with 0.025N-HCl in EtOH (indicator  $\alpha$ -naphthyl-red). Satisfactory results are obtained with 1—1.5  $\times 10^{-3}\%$  of (I) in blood. (I) does not occur in health, but develops in cases of heart, kidney, and liver complaints and in febrile pneumonia. J. W. S.

**Level of certain phenylamines ("tyramine equivalent") in hypertensive sera.** M. LOEPER and A. LESURE (Compt. rend. Soc. Biol., 1936, 122, 292—294).—The tyramine equiv. (determined colorimetrically with phosphomolybdic acid) is increased (average 4.6 mg. per litre) in sera of hypertensive patients. Normally there exists a vasotonic equilibrium between acetylcholine and adrenaline, and pathologically between tyramine and histamine, the ratio of the last two being characteristic. F. O. H.

**Determination of urea in blood-serum by the action of hypobromite and titration of excess of the reagent.** J. RENAUDIN (Bull. Soc. Chim. biol., 1936, 18, 908—910).—Levinson's method (A., 1935, 1525) gives good results with pure solutions of urea, but is less precise with serum.  
H. G. R.

**Determination of alcohol in blood and urine.** R. HEIDUSCHKA and G. STEULMANN (Pharm. Zentr., 1936, 77, 405—409).—A modification of Liebesny's method for 1 c.c. of blood or urine is described in which excess of 0.15N-K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> is determined by liberation of I from KI and titration with 0.1N-Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>.  
P. G. M.

**Determination of alcohol in blood.** W. BRANDT (Chem.-Ztg., 1936, 60, 485—488).—Methods of determining blood-EtOH, the course of blood- and cerebrospinal fluid-EtOH following ingestion or injection of EtOH, and the bearing of the methods and results on jurisprudence are discussed.  
F. O. H.

**Blood-ammonia in eviscerated and anoxæmic dogs.** F. D'ARBELLA and A. BILLI (Boll. Soc. ital. Biol. sperim., 1935, 10, 958—959).—Removal of the intestines or deprivation of O<sub>2</sub> increases blood-NH<sub>3</sub> in dogs.  
F. O. H.

**Adsorption of blood-calcium.** L. BUTTURINI and V. BIANCHI (Boll. Soc. ital. Biol. sperim., 1935, 10, 941—942).—Data for the adsorption (in no case complete) of Ca from serum by Ca<sub>3</sub>(PO<sub>4</sub>)<sub>2</sub>, C, BaSO<sub>4</sub>, kaolin, talc, and powdered bone are tabulated and discussed.  
F. O. H.

**Adsorption of blood-calcium.** L. BUTTURINI and V. BIANCHI (Boll. Soc. ital. Biol. sperim., 1936, 11, 13—15).—Blood-serum is treated with Ca<sub>3</sub>(PO<sub>4</sub>)<sub>2</sub>, animal C, BaSO<sub>4</sub>, kaolin, talc, and powdered bones, and the Ca contents of the serum are measured before and after treatment.  
E. P.

**Calcium content of the blood of adenoids.** C. F. PORTA (Boll. Soc. ital. Biol. sperim., 1936, 11, 30).—The average Ca content was 9.5%, of which 63.3% was dialysable. Normal vals. were 12.7 and respectively.  
E. P.

**Effect of the irritation of vagus and sympathetic nerves on composition of blood.** E. ZAKRSHEVSKI (Platz. Utschen. Med., 1936, 124—131).—Stimulation of the vagus in cats decreases blood-Ca and increases -K, whilst stimulation of the sympathetic has the opposite effect. The blood-lipase and -diastase are not significantly altered.  
W. O. K.

**Nature, properties, and determination of iron in blood.** E. M. WALL and F. M. SHORLAND (J. New Zealand Inst. Chem., 1936, 1, 15—21).—Non-hæmoglobin Fe is determined by treating fresh whole blood with 4% aq. Na<sub>4</sub>P<sub>2</sub>O<sub>7</sub>. After 15 min. an equal vol. of 20% CCl<sub>3</sub>·CO<sub>2</sub>H is added, and the solution is filtered. The filtrate is treated with 0.0012M-2:2'-dipyridyl in 5N-NH<sub>4</sub>OAc, and reduced with Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub>. Fe is determined colorimetrically.  
J. S. A.

**Influence of alkalosis on serum-magnesium.** R. WOLFF, M. RANGIER, and A. BOURQUARD (Compt.

rend. Soc. Biol., 1936, 122, 391—392).—Serum-Mg is increased by ingestion of NaHCO<sub>3</sub>.  
H. G. R.

**Magnesium in parturient women and in the new-born.** Z. KARAMAN, A. ALEXIU, and A. URSU (Compt. rend. Soc. Biol., 1936, 122, 705—707).—Blood-Mg is < normal after pregnancy, whilst that of the new-born child tends to be > normal.  
H. G. R.

**Blood-iodine level.** G. PFEIFFER, W. MÖBIUS, and K. POHL (Arch. exp. Path. Pharm., 1936, 181, 444—450).—A discussion on methods for determining I in org. substances.  
J. N. A.

**Absorption apparatus for micro-determination of volatile substances.** V. Micro-determination of bromide with application to blood and urine and observations on the normal human subject. E. J. CONWAY and J. C. FLOOD (Biochem. J., 1936, 30, 716—727).—For the micro-determination of Br' the Br' is oxidised by acid K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> to free Br, which is absorbed in KI and the liberated I, when Br is >8×10<sup>-5</sup> g., determined by titration with 0.05N-Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> or with smaller amounts colorimetrically after addition of starch. When the [Cl<sup>-</sup>] is ≥1% NaCl, the determination is independent of Cl<sup>-</sup>. I<sup>-</sup>, however, must be completely removed by a preliminary treatment, which can be made the basis of an I<sup>-</sup> determination. The method is applied to determination of Br in 1 ml. of blood or urine and, after administration of Br, in 0.2 ml. of finger-blood. [Br<sup>-</sup>] in normal blood was 227—572×10<sup>-6</sup> g. per 100 ml.; the mean vals. for blood and urine were 372 and 656×10<sup>-6</sup> g. per 100 ml., respectively, and the average urinary Br:Cl ratio (in milliequiv.) was 1:2150.  
P. W. C.

**Phosphatæmia induced by daily ingestion of disodium phosphate.** L. CORBIAU (Compt. rend. Soc. Biol., 1936, 122, 474—475).—Hyperphosphatæmia cannot be maintained by this means.  
H. G. R.

**Electrolyte balance and cellular and refractometric changes in blood during pneumothorax and after phrenectomy.** A. RISI (Z. Biol., 1936, 97, 173—179).—Hypotensive pneumothorax and unilateral phrenectomy produce a slight shifting of the anion-cation balance towards the basic side; a corrective mechanism is, however, evident. The protein balance and (consequently) *n* rise and, whilst erythrocytes vary only slightly, a marked leucocytosis occurs. Correlations between these and changes in the lung ventilation and capacity are discussed (cf. A., 1935, 385).  
F. O. H.

**Presence of hypertensive substances in dog's blood during permanent compression of the renal arteries.** E. DICKER (Compt. rend. Soc. Biol., 1936, 122, 476—477).  
H. G. R.

**Are the vasopressor substances found in the serum of nephritis also present in normal serum?** P. GOVAERTS and E. DICKER (Compt. rend. Soc. Biol., 1936, 122, 807—809).—Highly conc. EtOH extracts of normal sera had no hypertensive action on the chloralised dog.  
A. L.

**Hæmolytic power of extracts of various organs.** R. D. DE LA RIVIÈRE, N. KOSOVITCH,

and S. ISHII (Compt. rend. Soc. Biol., 1936, **122**, 555—558).—Hæmolysing extracts from stomach, pancreas, and duodenum are completely inactivated by EtOH and slightly inactivated by heating at 56° for 30 min.

H. G. R.

**Influence of alexin on the flocculating power of serum.** C. MOREL (Compt. rend. Soc. Biol., 1936, **122**, 254—256).—The protective action of serum towards hydrophobic sols is greatest at 37° and  $\propto$  the content of alexin.

F. O. H.

**Multiplicity of flocculation zones and gelation of serum.** I. KOPACZEWSKA and W. KOPACZEWSKI (Compt. rend., 1936, **202**, 1716—1718).—Addition of HCl (to 6*N*) and of NaOH (to 8*N*) to normal human serum produces 5 zones of flocculation interspaced by 5 zones of gelation.

F. O. H.

**Venom of *Lachesis (Bothrops)* snakes. III. Separation of coagulatory principle from bothropotoxin and other constituents.** D. VON KLOBU-SITZKY and P. KÖNIG (Arch. exp. Path. Pharm., 1936, **181**, 387—398; cf. this vol., 622).—Fractionation of the venom by  $(\text{NH}_4)_2\text{SO}_4$  pptn. of the globulin fraction by Pb acetate, electrodialysis, adsorption, etc. yields the blood-coagulating principle (the properties of which indicate it to be a coagulase) practically free from bothropotoxin.

F. O. H.

**Precipitation reaction [antisera]. Multiple zones.** G. L. TAYLOR and M. E. ADAIR (J. Hyg., 1935, **35**, 169—173).—An antiserum containing antibodies for two unrelated antigens, cryst. ovalbumin and cryst. horse serum-albumin, when titrated with mixtures of the antigens could produce a single or two zones of optimal particulation according to the concn. of the components of the antigenic mixture. A single zone does not necessarily indicate a single antigen-antibody mixture but multiple zones imply the presence of  $\geq$  one system.

CH. ABS. (p)

**Increase of globulin in diphtheria antitoxins, shown by the precipitation reaction.** G. L. TAYLOR (J. Hyg., 1935, **35**, 174—179).—By titration against horse serum the antisera fall into three classes according to the antibodies responsible for the main or earliest particulating zone, i.e., antibodies against globulin, albumin, or both. To determine the protein fraction in a horse serum it is necessary to use an antiserum containing a main-zone antibody acting with that protein only.

CH. ABS. (p)

**Concentrated anti-plague serum.** J. H. H. PIRIE and E. GRASSET (Brit. J. Exp. Path., 1935, **16**, 126—128).—The method of prep. is based on fractional pptn. by  $\text{Na}_2\text{SO}_4$ .

CH. ABS. (p)

**Antibodies with multiple affinities.** K. MEYER (Ann. Inst. Pasteur, 1936, **56**, 684—699).—The union of antibody with antigen is more stable (to heat at 60°) when it is effected through two affinities. This can be explained by the assumption of two different fixative groups, in the case of antibody *F* to *B. dysenteriae* (Shiga).

P. G. M.

**Antibodies compared with carbohydrates. III. Experiments with a carbohydrate preparation prepared by degradation of gum-arabic**

with respect to nitrogen, according to the method of Sevag, and with glycogen. P. UHLENHUTH and E. REMY (Z. Immunitats., 1935, **85**, 328—336).—The carbohydrate, the C, H, and O contents of which are approx. the same as those of gum-arabic, but the N content only half, produces antibodies only in isolated cases in rabbits, and is non-anaphylactogenic. Continued removal of N weakens the antigenic effect still more; glycogen is without effect. The antigenic effect of gum-arabic hence depends on the sp. protein.

R. N. C.

**Polysaccharide of the typhus bacillus. I. Toxic and immunising action. II. Attenuation by means of formaldehyde, benzaldehyde, and salicylaldehyde.** A. SPANEDDA (Boll. Soc. ital. Biol. sperim., 1936, **11**, 21—22, 22—24).—I. An agar culture of the bacillus was dialysed and the polysaccharide pptd. by means of  $\text{COMe}_2$  and dissolved in a little sterile  $\text{H}_2\text{O}$ . Injected into rabbits, this solution is toxic. It produces agglutinin (two types) and bacteriolysin and has a notable immunising action.

II. By treatment with aldehydes the toxic but not the immunising action is diminished. A solution containing 0.4% of PhCHO is the most efficient.

E. P.

**Analysis of the antigens of *Vibrio cholerae*.** R. T. SCHOLTENS (Ann. Inst. Pasteur, 1936, **56**, 710—716).—The antibody *B* and its antigen are concerned in the fixation of complement. Strains which have two antigens *A'* and *B'* absorb agglutinin *A* less readily than those which have only antigen *A'*.

P. G. M.

**Hæmatology of the fowl. (A) Normal chick and normal adult blood. (B) Hæmatology of chicks with pullorum infection: adult carriers of pullorum disease.** J. W. KELLY and R. S. DEARSTYNE (North Carolina Agric. Exp. Sta. Tech. Bull., 1935, No. 50, 69 pp.).

A. G. P.

**Bioelectric and oxidation-reduction potentials of the amphibian egg.** V. A. DOREMAN (Bull. Biol. Med. Exp. U.R.S.S., 1936, **1**, 135—136).—A p.d. of about 10 mv. exists between the poles of the unfertilised frog's egg (animal pole positive,  $p_H$  6.18; vegetative pole negative,  $p_H$  5.64). The bioelectric and redox potentials are distributed in different ways. Regular correlation exists between distribution of  $p_H$  and aerobic redox potentials.

W. McC.

**Composition of healthy and rachitic bone.** J. MAREK, O. WELLMANN, and L. URBANYI (Z. physiol. Chem., 1936, **240**, 208—214; cf. A., 1935, 1004).—In young pigs the composition of the various parts of the bones and the Ca : P and Ca : Mg ratios are altered by the disease. The results confirm the view that the mineral matter of bone consists chiefly of a mixture of  $\text{Ca}_3(\text{PO}_4)_2$  and  $\text{CaCO}_3$ .

W. McC.

**Orientation of crystallites in tooth-enamel.** W. I. SCHMIDT (Naturwiss., 1936, **24**, 361; cf. Bale and Hodge, this vol., 623).—The orientation has been investigated by the polarisation-microscopical method. The val. of the data obtained by this method in confirming the results of X-ray analysis is discussed.

A. J. M.

**Crystal orientation in tooth-enamel.** H. MÖLLER and G. TROMEL (*Naturwiss.*, 1936, 24, 377—378).—Repetition of earlier work (A., 1933, 296) on the examination of tooth-enamel by X-ray analysis shows, in agreement with Bale and Hodge (this vol., 623), that no new type of crystal is present in the surface of the enamel. A. J. M.

**Bromine content of the pituitary.** G. MORUZZI and P. GUARESCHI (*Boll. Soc. ital. Biol. sperim.*, 1936, 11, 28—29).—The [Br] in the pituitary and in the blood is the same. The larger amounts of non-diffusible Br in the pituitary and the absence of inorg. Br suggest that the pituitary is not an accumulating but an elaborating organ for Br. The Br content of the human pituitary varies with age and sex. With oxen the amount in the middle-posterior is much > that in the anterior lobe. E. P.

**Biochemistry of bromine.** I. A. H. NEUFELD (*Canad. J. Res.*, 1936, 14, B, 160—194).—Methods of determining Br in plant and animal tissues are critically examined. A modified Francis-Harvey incineration (A., 1933, 1317) followed by oxidation according to Yates (A., 1934, 202) gives satisfactory results. The distribution of Br in marine and land animals and plants is examined. Marine algae always contain Br, but there is no apparent relation between their Br and I contents. Land plants contain much less Br. No relation can be found between the distribution of Br and I in mammalian tissues, and no functional significance can as yet be ascribed to Br. The Br content of mammalian blood and thyroid is > that of other tissues. E. A. H. R.

**Change in the solubility of sodium compounds during the autolysis of muscle tissue.** I. A. SMORODINCEV and J. N. LIASKOVSKAJA (*Bull. Soc. Chim. biol.*, 1936, 18, 741—746).—The ratio Na/Ca in the aq. extract of fresh cow muscle is 20—28; after 24—72 hr. autolysis, however, the val. falls to 10—13. A. L.

**Titanium content of mammals.** L. C. MAILLARD and J. ETTORI (*Compt. rend.*, 1936, 202, 1459—1461).—Many analyses (accuracy  $10^{-6}$  g.; cf. this vol., 652) show that Ti is distributed irregularly. J. L. D.

**Distribution of titanium in the tissues.** L. C. MAILLARD and J. ETTORI (*Compt. rend.*, 1936, 202, 1621—1622).—The Ti content of various tissues ranges from 1.5 (kidney) to  $11.0 \times 10^{-6}\%$  (spleen). J. L. D.

**X-Ray structure of animal and plant polysaccharides.** I. F. MAY and L. GRAF (*Z. Biol.*, 1936, 97, 167—172).—Animal polysaccharides, pretreated in various ways, give the same amorphous X-ray pattern whether they are glycogens or galactogens. Plant starches, however, have a cryst. structure, the patterns varying with differences in constitutional hexoses. O. H.

**Chemical constitution of the fat in human subcutaneous connective tissue.** VII. Reichert-Meissl value. G. STOLFI (*Boll. Soc. ital. Biol. sperim.*, 1936, 11, 12—13).—Vals. for the fat of adipose tissue in adults are < in infants. The change occurs in early childhood. In benign and malign

neoplasm and in cancerous cachexy the results of Wacker (A., 1912, ii, 1079) have been confirmed. E. P.

**Ratio of  $\alpha$ - and  $\beta$ -glycerophosphoric acids in human brain-lecithin.** C. ANTONIANI (*Arch. Sci. biol.*, 18, 420—425; *Chem. Zentr.*, 1935, ii, 1902).—The  $\beta$ -acid forms 66—80% of the total. H. N. R.

**Influence of vitamin-D and certain carcinogenic hydrocarbons on the hydrophilic coefficient of lipins.**—See this vol., 935.

**Variations in the nitrogen fractions and water content of rabbit muscle at different stages of growth.** I. Water, residual nitrogen, and pre-formed amino-nitrogen. II. Total and amino-nitrogen in hydrolysed muscle. E. ASMOLOV (*Bull. Biol. Med. Exp. U.R.S.S.*, 1936, 1, 119—120, 121—122).—I. As age increases the  $H_2O$  content of the muscle decreases, and the residual N and  $NH_3$ -N contents increase. The ratio residual N: $NH_3$ -N decreases from 52 to 34. Changes are possibly due to production of polypeptides and cyclic compounds.

II. As age increases total N and  $NH_3$ -N of the hydrolysates increase, whilst the ratios total N:residual N and  $NH_3$ -N:total N remain practically const. W. McC.

**[Constituents of] octopus muscle. Isolation of adenylypyrophosphoric acid and arginine-phosphoric acid and their behaviour.** K. LOHMANN (*Biochem. Z.*, 1936, 286, 28—44).—The isolation of argininephosphoric acid (I) and adenylypyrophosphoric acid (II) from octopus muscle is described. (II) is converted into adenylic acid (III) by the muscle when  $Mg^{++}$  is present and into adenosinediphosphoric acid (IV) when it is absent and (I) is enzymically hydrolysed only when (II) or (IV) is present. The muscle contains zymohexase, converts  $\beta$ - and  $\gamma$ -phosphoglyceric acid and phosphopyruvic acid (V) into  $AcCO_2H$  and  $H_3PO_4$  only if  $Mg^{++}$  and the (III) system are present, and converts  $AcCHO$  into lactic acid (VI) only if glutathione is present. Synthesis of (I) in the muscle from arginine and (V) gives poor yields probably because (VI) production is very small. Deamination of (III) occurs to a moderate extent only in the muscle. W. McC.

**Amino-acids of submaxillary mucoprotein.** C. OLDFELDT (*Z. physiol. Chem.*, 1936, 240, 261—264).—In submaxillary mucoprotein the N distribution is similar to those found in the most acidic proteins. W. McC.

**Biochemistry of the proteins of brain.** V. Alanine content of the proteins in vertebrates. M. K. KARJAGINA (*Bull. Biol. Med. Exp. U.R.S.S.*, 1936, 1, 117—118).—The alanine content varies from 5.05 to 6.7%, vals. being high in birds, frogs, and fish. W. McC.

**Arginine content of proteins of the brain in vertebrates.** A. M. BUDANOVA (*Bull. Biol. Med. Exp. U.R.S.S.*, 1936, 1, 115—116).—The arginine (I) content of the proteins varies from 7.4 (hen) to 10.5% (sheep). In the same animal there is no relation between age and (I) content of brain-proteins. W. McC.

**Determination of glucosamine in proteins.** I. NILSSON (Biochem. Z., 1936, 285, 386—389).—The method of Elson and Morgan (A., 1934, 175) for colorimetric determination of glucosamine (I) and chondrosamine in proteins is shown to be applicable with very slight modification to determination of (I) added to caseinogen and to blood-serum (man, pig, calf). P. W. C.

**Composition of snake venom and comparative action of the globulins and albumins.** F. R. MERCHANTE (Compt. rend. Soc. Biol., 1936, 122, 487—489).—The protein in the venom is chiefly albumin. Analytical data and physiological reactions of the various fractions are given. H. G. R.

**Mucoproteins.** C. OLDFELDT (Z. physiol. Chem., 1936, 240, 249—260; cf. Roche, this vol., 359).—Data of isoelectric points, acid- and base-binding capacities, and titration curves are given. Sub-maxillary mucoprotein has low acid- and high alkali-binding power. Preps. from umbilical cord, cornea, and vitreous humour are also described.

W. McC.

**Properties of a new vitellin from spiders.** M. PARAT and C. JACQUIERT (Compt. rend. Soc. Biol., 1936, 122, 626—629). H. G. R.

**Modifications of the physico-chemical properties of protein solutions with age.** W. DUCE (Boll. Soc. ital. Biol. sperim., 1935, 10, 977—978).—The keeping of aq. solutions of purified caseinogen and of serum- and ov-albumin at reactions near their isoelectric point is accompanied by variations in dynamic and static  $\gamma$  and in  $\kappa$ . F. O. H.

**Titration curve of feather-keratin.** J. B. SPEAKMAN and F. TOWNEND (Trans. Faraday Soc., 1936, 32, 897—902).—Purified seagulls' feather-keratin combines with acids through the basic side-chains of arginine, lysine, and histidine, which probably do not take part in the formation of lateral peptide linkings. The isoelectric range is  $p_{H}$  4.3—6.3, suggesting equivalence between the dicarboxylic acids and the basic  $NH_2$ -acids and amide-N. Determinations of amide-N and dicarboxylic acid content are in agreement. L. J. J.

**Double refraction of chitin.** E. S. CASTLE (J. Gen. Physiol., 1936, 19, 797—805).—Double refraction of crayfish hair is positive with respect to the axis and caused by the arrangement of chitin particles parallel to the axis. H. G. R.

**Adsorption of glucose by albumin.**—See this vol., 933.

**Relation between low-temperature research and colloid chemistry.**—See this vol., 934.

**Stability of lyophilic bio-colloids.**—See this vol., 935.

**Kinetics of muscle-haemoglobin.** G. A. MILLIKAN (Proc. Roy. Soc., 1936, B, 120, 366—388).—The rates of combination of horse heart muscle-haemoglobin with  $O_2$  and CO are several times as fast as the corresponding rates for blood-haemoglobin. The rate of dissociation of the oxygenated pigment is  $<$  that of the corresponding blood compound, but that of the CO complex is much faster. F. A. A.

**Cytochromes. II. Haematinic pigments of *Actinia*: actiniohaematin.** J. ROCHE (Bull. Soc. Chim. biol., 1936, 18, 825—840).—The actiniohaematin of MacMunn is a mixture of cytochrome-*b*, cytochrome-*a* (traces), and a protohaematin which is probably the "free intracellular haematin" of Keilin. Cytochrome-*b* is derived from the same porphyrin as -*c* but differs probably in the N complex, to which the prosthetic group is linked to form a parahematin, and also in the N base on a side-chain of the porphyrin nucleus. H. G. R.

**Constituents of visual purple and its relation to the visual cells.** M. L. VERRIER and R. PANNIER (Compt. rend., 1936, 202, 1614—1616).—Vitamin-A, xanthophyll, albumins, and pigment are extracted by Na tauro- or glyco-cholate. Extracts of the retinae of frogs exposed to light contain the same constituents, although they are yellow as compared with pale rose-coloured controls. J. L. D.

**Pigments of the retina. I. Bull frog.** G. WALD (J. Gen. Physiol., 1936, 19, 781—795).—The interrelations of visual purple, retinene, and vitamin-A (I) and the concn. and distribution of xanthophyll, (I), and flavin have been determined. H. G. R.

**Preparation of protein-free milk-serum in the cold.** W. LEITHE and E. MÜLLER (Z. Unters. Lebensm., 1936, 71, 319—322).—To remove traces of sol. protein, the  $CuSO_4$ - or  $Pb(OAc)_2$ -treated milk is shaken with kaolin and centrifuged.

E. C. S.

**Effect of ingested cottonseed meal on distribution of the constituent fatty acids of goat's milk.** R. W. RIEMENSCHNEIDER and N. R. ELLIS (J. Biol. Chem., 1936, 114, 441—447; cf. A., 1936, 501).—Inclusion of cottonseed meal in the diet of goats increased the proportions of hexoic, lauric, myristic, and stearic acids in the butter-fat at the expense of palmitic and oleic acids. H. D.

**Micro-determination of fats in human milk.** J. M. CLAVERA and F. MORENO MARTÍN (Anal. Fis. Quím., 1935, 33, 815—819).—0.5 or 1 c.c. of milk is treated with HCl and extracted with  $CHCl_3$ , or treated with NaOH and extracted with  $Et_2O$ . The vals. obtained are comparable with those given by macro-methods. F. R. G.

**Precursors in cows' blood of milk fat and other milk constituents.** W. R. GRAHAM, jun., T. S. G. JONES, and H. D. KAY (Proc. Roy. Soc., 1936, B, 120, 330—346).—The fat of cows' milk is derived mainly from the non-phospholipin fatty acids of blood, and, possibly, from fatty acids of cholesterol esters. The P compounds of milk are derived from the blood-inorg. P. Sugar is absorbed from the blood during its passage through the udder. A cow yielding 4 gals. of milk per day may have a blood circulation of about  $1\frac{1}{4}$  gals. per min. through the active mammary gland. F. A. A.

**Differential reactions of human and cow's milk.** M. POLONOVSKI and F. MORENO MARTÍN (Anal. Fis. Quím., 1935, 33, 457—462).—Umikoff's test for human milk is due to reaction between  $NH_3$  and lactose. Cow's milk does not give the coloration owing to its higher buffering power. F. R. G.

**Effect of udder irrigation and milking interval on milk secretion.** E. R. GARRISON and C. W. TURNER (Missouri Agric. Exp. Sta. Res. Bull., 1936, No. 234, 39 pp.).—Irrigation lowers the yield and lactose (I) content of milk and increases the  $p_H$ ,  $Cl'$ , fat, protein, catalase, and leucocyte contents. Fat secretion is inversely  $\propto$  milk yield and is practically independent of other milk constituents. Irrigation with aq.  $CaCl_2$  is more detrimental to milk secretion than is that with aq.  $NaCl$  of the same % concn. Aq. (I) is more injurious than  $H_2O$ . Irrigation with paraffin oil causes as much disturbance as with  $H_2O$  and recovery is slower. Introduction of  $O_2$  into the udder produces results similar to those of liquids. Suspended milking causes smaller changes. Disturbances are attributed to increased permeability of secretory cells to blood constituents caused by direct pressure. The osmotic balance between blood and milk is maintained under these conditions by increased synthesis of (I). A. G. P.

**Effect of thyroxine on milk secretion and on the blood- and milk-phosphatase of the lactating cow.** S. J. FOLLEY and P. WHITE (Proc. Roy. Soc., 1936, B, 120, 346—365).—Daily subcutaneous injections of thyroxine (approx. 0.02 mg. per kg.) into cows in declining lactation cause increases in milk secretion, and in fat and non-fatty solids of milk. An increase in serum-phosphatase and a sharp decline in milk-phosphatase also result. Milk-phosphatase is probably not derived directly from serum-phosphatase. F. A. A.

**Influence of insulin on the lymph-sugar of the silkworm (*Bombyx mori*).** K. WENIG and J. JOACHIM (Biochem. Z., 1936, 30, 98—100).—The total reduction of silkworm lymph amounts to  $106 \pm 5.3$  mg. per 100 ml. (in glucose equiv.) and that due to fermentable sugar (I) to  $22.5 \pm 5.5$  mg. per 100 ml. After injection of insulin (0.1 clinical unit) the (I) completely disappeared in 1 hr., but the total reduction remained unchanged, some non-fermentable reducing substance replacing (I). P. W. C.

**Coloration by mucicarmine and composition of mucin.** M. CHAMBON, P. CROIZAT, P. MALLET-GUY, and A. CHAMBON (Compt. rend. Soc. Biol., 1936, 122, 305—307).—The carminophilic properties of mucin increase with increase in prosthetic group content. The isoelectric point of submaxillary and gastric mucin is  $p_H$  2.4—2.7 and 4, respectively. Histological characteristics are described. F. O. H.

**Protein content of human parotid saliva.** R. G. BRAMKAMP (J. Biol. Chem., 1936, 114, 369—371).—Human parotid saliva, secreted at rates of 0.5 and 2.0 c.c. per min., contained 11 and 58 mg. of protein per 100 c.c., respectively. The protein was chiefly albumin. H. D.

**Excretion of agglutinogens [in the saliva].** G. BRUYNOGHE (Compt. rend. Soc. Biol., 1936, 122, 472—474). H. G. R.

**Composition of biliary mucus.** M. CHAMBON, P. MALLET-GUY, P. CROIZAT, and A. CHAMBON (Compt. rend. Soc. Biol., 1936, 122, 303—305).—Human biliary mucus contains mucin 0.02—0.05, mucoids

0.005—0.15, globulin+nucleoprotein 0.011—0.048, albumin 0.042—0.102, and pseudoglobulin up to 0.103%, the variations occurring according to the site of secretion. F. O. H.

**Biochemical properties of bile-pigments. VI. Insolubility of calcium, barium, and strontium salts of bilirubin and biliverdin. VII. Anticoagulating power *in vitro* of bilirubin, biliverdin, bile, and biliary salts.** A. CLEMENTI (Boll. Soc. ital. Biol. sperim., 1935, 10, 899—900, 900—902; cf. A., 1934, 94).—VI. The loss of agglutinating activity of bilirubin (I) and biliverdin (II) on addition of  $Ca^{++}$ ,  $Ba^{++}$ , or  $Sr^{++}$  is related to the formation of insol. salts on addition of these ions to Na salts of (I) and (II) in aq.  $NaOH$  or  $NH_3$ .

VII. The rate of coagulation of blood *in vitro* is diminished by (I), (II), bile, or Na tauro- or glycocholate. The action is most marked with (I) and (II) and is inhibited by addition of  $Ca^{++}$ . F. O. H.

**Constitution of bile acids. LIV, LV.**—See this vol., 983.

**Detection and approximate determination of acetone in urine with *p*-nitrophenylhydrazine.** W. DEHIO (Z. anal. Chem., 1936, 104, 417—422).—Urine (2 c.c.) is warmed to  $53^\circ$  in a micro-beaker, covered with a glass bearing a drop of *p*-nitrophenylhydrazine in  $AcOH$ . In presence of  $> 0.005\%$  of  $COMe_2$ , a cryst. deposit is obtained within 10 min., the amount and rate of formation being approx.  $\propto [COMe_2]$ . J. S. A.

**Colour reaction for creatinine.** S. R. BENEDICT and J. A. BEHRE (J. Biol. Chem., 1936, 114, 515—532).—Creatinine (I) is determined in dil. urine by addition of 3 : 5-dinitrobenzoic acid in  $EtOH$  and of 6%  $NaOH$ , and colorimetric comparison with a standard. Creatine and glucose do not react and ketones only in concns.  $>$  those found usually in diabetics. The method gives rather lower vals. than the picrate method. With tungstomolybdic acid blood filtrates, the colour produced is different, and it is concluded that the chromogenic substance in blood is not (I). H. D.

**Presence of histidine in human urine.** R. KAPPELLER-ADLER (Biochem. Z., 1936, 285, 123—124).—The paper by Foldes (this vol., 362) is discussed. P. W. C.

**Bile-pigments. II. Test for bilirubin in urine : detection in normal urine.** H. N. NAUMANN (Biochem. J., 1936, 30, 762—764; cf. this vol., 625).—The pigments are adsorbed on talc, and this is treated with a drop of Fouché's reagent or 10%  $HNO_3$ , when the production of blue bilicyanin indicates the presence of bilirubin (I). Normal urine contains approx. 0.3 mg. of (I) per 100 c.c. The limits of detectability of pure (I) dissolved in dil.  $NaOH$ , dil.  $EtOH$ , and urine free from preformed (I) are 0.8, 0.6, and 0.9 p.p.m., respectively. J. N. A.

**Bile-pigments. III. Determination of urobilin and urobilinogen in urine and faeces.** H. N. NAUMANN (Biochem. J., 1936, 30, 1021—1025; cf. preceding abstract).—The optimal conditions for the colorimetric determination of urobilin and urobilinogen

in urine and faeces by the  $p$ -NMe<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>·CHO method are determined and shown to depend chiefly on the mode of reduction of urobilin by Fe(NH<sub>4</sub>)<sub>2</sub>(SO<sub>4</sub>)<sub>2</sub>.

H. D.

**Reticulocyte-stimulating principle for the pigeon in normal human urine.** G. E. WAKERLIN and H. D. BRUNER (Arch. Int. Med., 1936, 57, 1032—1038).—Injection of normal urine before or after heating (100° for 2 hr.) in the absence of air produces an effect similar to that of the erythropoietic substance of liver.

E. D. Y.

**Amibiarsen in the treatment of chronic intestinal amebiasis.** R. N. CHOPRA, B. SEN, and G. SEN (Indian Med. Gaz., 1935, 70, 324—328).—Successful use of amibiarsen (As compound similar to carbosone Lilly; 4-carbamylphenylarsinic acid) is described.

CH. ABS. (p)

**Experimental anæmias and their suitability for the assay of anti-anæmic preparations. II. Collargol-saponin anæmia in rats.** P. GOTTELEBE and W. SKIBBE (Arch. exp. Path. Pharm., 1936, 181, 317—324).—Intravenous or subcutaneous injection of saponin (I) into rats produces a condition simulating pernicious anæmia for 10—15 days, during which time parenteral administration of active liver preps. produces typical increases in erythrocyte and reticulocyte counts. Injection of (I)+collargol produces a more prolonged anæmia suitable for both qual. and quant. tests. The origin of the anæmias is discussed.

F. O. H.

**Dissociation curves of blood-oxygen in anæmia and erythræmia.** N. KORJUEV and BELUSOV (Bull. Biol. Méd. Exp. U.R.S.S., 1936, 1, 139—140).—The positions of the curves are altered in opposite directions in these diseases. Compared with normal blood, anæmic blood appears to have a relatively better, erythræmic blood a relatively worse, respiratory function.

W. McC.

**Glutathione in blood and the organs in experimental anæmia.** G. L. BESOZZI and R. ZANINI (Arch. Sci. biol., 18, 497—505; Chem. Zentr., 1935, ii, 1904).—Glutathione (I) is decreased in the organs and whole blood, but increased in the erythrocytes, of rabbits made anæmic by NHPh·NH<sub>2</sub> or bleeding. All vals. become normal when the anæmia disappears. The increase in (I) in erythrocytes is probably a compensatory reaction of the organism against the loss of oxidative power.

R. N. C.

**Copper and iron in the blood of anæmic infants.** E. LESNÉ, P. ZIZINE, and S. B. BRISKAS (Compt. rend. Soc. Biol., 1936, 122, 532—534).—Fe is decreased and Cu increased.

H. G. R.

**Phthalein test of kidney function in anæmia.** E. M. CHAPMAN (New England J. Med., 1935, 213, 166—167).—Anæmia alone does not affect the excretion of phenolsulphonaphthalein by kidneys.

CH. ABS. (p)

**Dietary production and prevention of anæmia in larval amblystoma.** E. M. PATCH (Science, 1936, 83, 560—561).

L. S. T.

**Influence of cations on fermentation by tumour cells. VI. Calcium and magnesium. II.** A. LASNITZKI (Biochem. Z., 1936, 285, 101—114; cf.

this vol., 243).—K and Ca (1.8× and 3.6×10<sup>-3</sup> mol. of CaCl<sub>2</sub> per litre) acting directly on tumour cells (Jensen sarcoma and Flexner-Jobling carcinoma) increase fermentation (Ca both in presence and absence of K). When, however, K or Ca is added after the cells have undergone a fermentation period in K- or Ca-free Ringer's solution, then K still accelerates fermentation, whereas Ca is inactive. The action of Mg resembles that of Ca, but is smaller. The mechanism is discussed.

P. W. C.

**Chemical composition of the nucleic acid of malignant tissue.** G. KLEIN and J. BECK (Z. Krebsforsch., 1935, 42, 163—177; Chem. Zentr., 1935, ii, 2075).—The acid is identical with thymus-nucleic acid.

R. N. C.

**Demonstration of prolan in tumours.** M. BAUDLER (Arch. Gynakol., 1935, 159, 101—125; Chem. Zentr., 1935, ii, 2080).

R. N. C.

**Tumour tissue. II. Effect of protein on the swelling of normal and tumour cells of mice *in vitro*.** M. J. SHEAR (Amer. J. Cancer, 1935, 23, 771—783).—The swelling of normal and tumour cells in salt solutions is independent of the salt concn. Presence of protein in the salt solution retards and may inhibit swelling. Cells swollen in salt solution shrink when transferred to a protein solution.

CH. ABS. (p)

**Tumour metabolism in the presence of anti-carcinogenic substances.** I. BERENBLUM, L. P. KENDAL, and J. W. ORR (Biochem. J., 1936, 30, 709—715).—(CH<sub>2</sub>Cl·CH<sub>2</sub>)<sub>2</sub>S (mustard gas), (CH<sub>2</sub>Cl·CH<sub>2</sub>)<sub>2</sub>SO<sub>2</sub>, and cantharidin, which inhibit the induction *in vivo* of tar tumours, reduce the glycolysis of minced Jensen sarcoma tissue *in vitro* more than its respiration. (CH<sub>2</sub>Cl·CH<sub>2</sub>)SO, thiodiglycol and croton oil, which have no inhibiting effect on carcinogenesis, do not reduce glycolysis more than respiration. Ethylenebis-β-chloroethyl sulphide, which inhibits the induction of tumours, has no selective action on glycolysis.

P. W. C.

**Immunising characteristics of lipin extracts in cancer.** R. ZDRAZIL (Compt. rend. Soc. Biol., 1936, 122, 417—418).—The "liver-antigen" has an immunising action against Ehrlich's cancer.

H. G. R.

**Fixation of complement in cancer.** R. ZDRAZIL (Compt. rend. Soc. Biol., 1936, 122, 418—420).—The prep. of the "bile-antigen" and the flocculation reactions with cancerous serum are described.

H. G. R.

**Action of fibrin on cancerous serum.** J. KABELIK (Compt. rend. Soc. Biol., 1936, 122, 421—422).—The reaction of Fuchs is not sp. for cancer, but is observed to a smaller extent in syphilis and tuberculosis.

H. G. R.

**Carcinogenic effect of a virus on tarred skin.** P. ROUS and J. G. KIDD (Science, 1936, 83, 468—469).

L. S. T.

**Melanogen and melanin.** H. K. BARRENSCHEEN and H. PRINZ (Biochem. Z., 1936, 285, 130—149).—Et<sub>2</sub>O-sol. and -insol. melanogens were isolated from the urines of 4 cases of melanotic sarcoma without using heavy-metal salts. The Et<sub>2</sub>O-sol. compound

was N- and S-free, acidic, was methylated with  $\text{CH}_2\text{N}_2$ , and did not appear to be a pyrocatechol, but was possibly a quinol derivative. The  $\text{H}_2\text{O}$ -insol. melanogen was not quinonoid, did not contain a free CHO group, gave a N:C ratio of 1.428, and had a small S content (entirely as ethereal sulphate). Red and brown intermediate substances were obtained by acid treatment of the melanogens and a melanin obtained by tryptic digestion of tumour tissue was compared with the acid melanin of the urinary melanogen.

P. W. C.

**Total thyroidectomy in man.** M. T. SCHNITKER, L. H. VAN RAALTE, and E. C. CUTLER (Arch. Int. Med., 1936, 57, 837—886).—Thyroidectomy after cardiac disease causes a fall in the basal metabolic rate and a rise in serum-cholesterol. Serum-Ca, -P, -K, and -I are more variable. Serum-protein is lowered, but -I shows a temporary rise. Thyroidectomy has a beneficial effect in diabetes mellitus.

E. D. Y.

**Blood in cholera: urine analysis.** V. T. LOH and T. Y. TAL (Chinese Med. J., 1936, 50, 651—664).

H. D.

**Physiological significance of unsaturated fatty acids and the iodine-fixing power of the blood.** G. HOLLAND and K. HINSBERG (Z. ges. exp. Med., 1934, 94, 485—494; Chem. Zentr., 1935, ii, 2229).—

Unsaturated fatty acids (I) in the blood of normal men remain const. under different conditions. The I val. is increased in uncompensated circulation disease;  $\text{O}_2$  respiration is apparently without effect. In compensated circulation disease the I val. is < in uncompensated circulation disease, but > normal. It is also increased in liver disease. (I) fall in pernicious anemia. The I val. is increased again on administration of liver diet.

R. N. C.

**Daily variation in sugar content of blood and urine during treatment of diabetes mellitus.** F. L. ROGERS (Arch. Int. Med., 1936, 57, 1027—1031).—The blood-sugar and urinary sugar often rise in the early morning and fall in the afternoon.

E. D. Y.

**Effect of intravenous injections of sodium "ferriscorbon" on acetonuria in spontaneous diabetes of the dog.** F. ARLOING, A. MOREL, A. JOSSERAND, P. COLLET, and A. BADINAND (Compt. rend. Soc. Biol., 1936, 122, 575—577).—Acetonuria is considerably diminished without affecting the glycosuria (cf. A., 1935, 1526).

H. G. R.

**Infantile dehydration.** G. PAISSEAU, BOEGNER, and C. VAILLE (Bull. Soc. Chim. biol., 1936, 18, 645—648).—Infantile dehydration (diarrhoea) is accompanied by increases in blood-N, in the ratio erythrocyte-Cl'/plasma-Cl', and in the vol. of blood-corpuscles, and by a decrease in alkaline reserve.

A. L.

**Organic oxidation in fever. Oxido-reduction (dehydrogenation) and the oxidising enzymes in fibrous tissue-processes.** A. SPINELLI (Arch. ital. Biol., 89, 103—114; Chem. Zentr., 1935, ii, 2544—2545).—In fever the activity is increased.

H. N. R.

**Pressor substance in the blood in malignant hypertension.** R. S. AITKEN and C. WILSON

(Quart. J. Med., 1935, 4, 179—190).—No evidence of pressor activity was found.

CH. ABS. (p)

**Disadvantages of di-iodotyrosine in the treatment of hyperthyroidism.** W. H. BECKHUIS (Nederl. Tijds. Geneesk., 1935, 79, 3963—3971; Chem. Zentr., 1935, ii, 2537).

R. N. C.

**Blood-cholesterol in leprosy.** V. CHORINE and O. CROUGUE (Compt. rend. Soc. Biol., 1936, 122, 621—624).—Leprosy in rats is accompanied by slight hypocholesterolaemia.

H. G. R.

**Total glutathione of leprosy.** R. O. PRUD'HOME (Compt. rend. Soc. Biol., 1936, 122, 739—741).—The decrease in the amount of reduced glutathione (I) in the organs of rats infected with Stefansky's bacillus is not due to the oxidation of (I), since the total (I) is also < normal.

A. L.

**Lipins of leprous granuloma. I. Histochemistry. II. Chemistry.** I. CIACCIO (Boll. Soc. ital. Biol. sperim., 1935, 10, 929—931, 931—933).—I. The distribution of lipins in tissue elements is described.

II. Data of the distribution of phospholipins, free and combined cholesterol, and total  $\text{COMe}_2$ -sol. and free fatty acids are tabulated.

F. O. H.

**Oxidation-reduction processes (glutathione) in diseases of the liver and endocrine glands.** S. S. KAMENETZKI (Platz. Utschen. Med., 1936, 236—249).—In various diseases, the ratio of reduced to oxidised glutathione in the blood deviates from its normal val.

W. O. K.

**Neutral fat content of the blood in liver disease.** J. J. VAN LEEUWEN (Nederl. Tijdschr. Geneesk., 1935, 79, 3983—3987; Chem. Zentr., 1935, ii, 2538).—Addition of carbohydrate to a fat diet increases liver-fat only when liver disease exists.

R. N. C.

**Significance of lower fatty acids normally present in serum in the Takata reaction.** W. GROS (Munch. med. Woch., 1935, 82, 1151—1152; Chem. Zentr., 1935, ii, 1924).—The influence is negligible.

H. N. R.

**Changes in proteins of blood-sera of monkeys infected with malarial plasmodia.** B. N. GHOSH and J. N. SINTON (Rec. Malaria Survey India, 1935, 5, 173—202).—Disturbance of the serum-protein equilibrium after acute parasitic attack is characterised by a decrease in total protein (I) and albumin (II) and an increase in globulin (III). In quiescent intervals between attacks (I) returns towards normal, but the (III)/(II) ratio is frequently abnormally large. Return to normal vals. is accelerated by quinine, atabrin, plasmoquin, or stovarsol.

CH. ABS. (p)

**Activity of melanin, distilled water, and various indicators in Henry's reaction.** F. TRENSZ (Compt. rend. Soc. Biol., 1936, 122, 666—668).—Only melanin and salts containing Fe (e.g., saccharate) are reactive. Indicators and dyes are practically inert, the flocculate formed in the presence of carmine having the characteristics of a "super-flocculation" in  $\text{H}_2\text{O}$  (cf. A., 1935, 1149).

H. G. R.

**Lipin composition of the guinea-pig placenta.** E. M. BOYD (Canad. J. Res., 1936, 14, B, 155—159).—

The lipin composition of the guinea-pig placenta varies with the duration of pregnancy. Between the 20th and 40th days phospholipin and cholesterol increase to a val. which is maintained until term. Neutral fat increases steadily throughout, but cholesterol esters remain unchanged. These changes indicate an alteration of placental lipin metabolism as pregnancy advances, and an increase in physiological activity as early as the 20th day. E. A. H. R.

**Cholesterol content of serum and its cholesterololytic power *in vitro* in skin disease.** H. HRUSZEK (Klin. Woch., 1935, 14, 779—781).—Sera show positive, neutral, or negative cholesterololytic vals. according to the amount of cholesterol (I) dissolved after addition of excess (I). The cholesterololytic val. has no diagnostic importance for skin disease or psoriasis, and does not affect the Wassermann reaction. R. N. C.

**Report of chemistry section.** B. C. ASTON (New Zealand Dept. Agric. Ann. Rept., 1933—1934, 54—58; cf. A., 1935, 1150).—On certain pastures lambs developed a bone disorder resembling rickets, the foreleg bones having low ash, Ca, and P contents and low (50% normal) ash/org. matter ratio. The solubility of limonite in dil. acids and its efficiency in preventing bush sickness were greatly decreased by heating at 500—600°. Air-dried friable limonite gave best results. CH. ABS. (p)

**Variations of serum-protein fractions during an attack of rinderpest.** M. H. FRENCH (Ann. Rept. Dept. Vet. Sci. Tanganyika Territory [1933], 1934, 42—48).—Changes in the % total N, total protein, total globulin, pseudoglobulin, euglobulin (I), and albumin occurring, prior to death of an infected ox, following inoculation, and following vaccination are recorded. The antibody is associated with the (I) fraction. Feeding on poor pasture caused changes in the protein-N fractions, but non-protein-N was unaffected by the plane of nutrition. CH. ABS. (p)

**Pathogenesis of silicotic tissue alterations.** II. Morphological investigation of the retention of quartz-dust in silicotic tissue. III. Nature of asbestosis particles. G. F. KOPPEHÖFER (Arch. Gewerbepath. Gewerbehyg., 1935, 6, 18—37, 38—62; Chem. Zentr., 1935, ii, 1746).—II. The quartz particles undergo partial change into colloidal  $\text{SiO}_2$ , which is the injurious factor.

III. The mechanism of gelatinisation of the asbestos particles is described and factors influencing the process are discussed. H. N. R.

**Non-tropical sprue.** A. M. SNELL (Arch. Int. Med., 1936, 57, 837—856).—Cases show symptoms of gastric anacidity, fatty stools, and lowered serum-Ca, -P, and -protein, sometimes with anæmia and tetany, but respond to liver therapy. E. D. Y.

**Effect of therapy on the behaviour of ether-soluble anti-thyroid protective substances of the blood in thyroid disease.** K. FELLINGER and A. SCHLESINGER (Klin. Woch., 1935, 15, 685—686).—The protective substances are depressed in hyper- and increased in hypo-thyrosis; therapy tends to restore them to normal. R. N. C.

**Experimental hyperglycæmia in rabbits with tubercle (Yersin type) infection.** E. S. PANAYOTOPoulos (Compt. rend. Soc. Biol., 1936, 122, 275—276).—The course of infection (3—4 weeks with fatal termination) is accompanied by an increased hyperglycæmia following ingestion of glucose. F. O. H.

**Tubercle allergy and blood-cholesterol.** V. SPOUJITCH and D. BORITCH (Compt. rend. Soc. Biol., 1936, 122, 340—342).—A definite relationship between allergic reaction and blood-cholesterol could not be established in tubercular patients. F. O. H.

**Biochemistry of pulmonary tuberculosis during aurotherapy.** I. V. BALANESCO, S. OERIU, and V. VARTIC (Bull. Soc. Chim. biol., 1936, 18, 687—702).—In pulmonary tuberculosis the analytical vals. for the blood constituents are closely related to the gravity of the disease. In severe cases there is an increase in sedimentation rate,  $\text{PO}_4'''$ , and creatinine, and a decrease in cholesterol,  $\text{Cl}'$ , total N, hæmoglobin,  $p_H$  val., and  $\text{NH}_2$ - and uric acids. After aurotherapy when the condition of the disease ameliorates, the above vals. approach normal. A. L.

**Sulphur and glutathione content of the blood and tissues in experimental uræmia.** A. A. CHRISTOMANOS (Z. ges. exp. Med., 1934, 94, 504—506; Chem. Zentr., 1935, ii, 2229).—Blood- and tissue-glutathione are decreased. Acid-sol. tissue-N is > residual N of the blood. Neutral S is increased. R. N. C.

**Automatic metabolism apparatus with continuous recording of oxygen consumption for small animals.** H. HÄUSLER (Arch. exp. Path. Pharm., 1936, 181, 345—366). F. O. H.

**Variations in impedance and chemical action during muscular contraction.** M. DUBUISSON (Compt. rend. Soc. Biol., 1936, 122, 817—820).—During contraction, the impedance of frog muscle to an electric current of frequency 2000 cycles per sec. shows two overlapping curves. As fatigue sets in, the first of these falls and the second rises, the latter being affected only by  $\text{CH}_2\text{Br}\cdot\text{CO}_2\text{H}$ . The two curves are related to the decomp. and synthesis of adenylypyrophosphoric acid and phosphagen, respectively. A. L.

**Effect of alimentary disequilibrium on respiratory quotient and basal metabolism of pigeons.** R. LECOQ and J. M. JOLY (Compt. rend., 1936, 202, 1709—1711).—With diets rich in glucose, galactose, or fructose and free from vitamin-B, the R.Q. (normally 0.75—0.82) is diminished and basal metabolism increased. Addition of yeast to the diet tends to inhibit the changes only with the glucose diets (cf. A., 1933, 433, 872; this vol., 368). F. O. H.

**Periodicity in the metabolism of the pancreas of the white mouse during recovery [from pilocarpine injection].** P. B. VAN WEEL (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 278—281).—Variations in R.Q. are repeated after 7 hr. The mechanism of the changes is discussed. A. G. P.

**Changes in reduction-oxidation potential of the cornea of eyes enucleated from cadavers.** Dependence on the length of time after enucle-

ation and conditions of preservation. P. M. KURISCHKIN (Platz. Utschen. Med., 1936, 24—34).—The corneas show a progressive fall in their  $E_h$  vals. during the first 6—8 days after death.

W. O. K.

Method for the study of tissue oxidations. V. R. POTTER and C. A. ELVEHJEM (J. Biol. Chem., 1936, 114, 495—504).—The method consists in the rapid homogenisation of the tissue in buffer solution by a motor-driven pestle and the measurement of the  $O_2$  uptake of the suspension at various dilutions. In rat's liver and brain and chick's liver and kidney,  $Q_{O_2}$  (with and without added substrate) decreases with increasing dilution.

H. D.

Role of erythrocytes in protein metabolism.

III. Distribution of amino-nitrogen between erythrocytes and plasma. I. B. ŚBARSKI. IV. Effect of amino-acids on the respiration of nuclear erythrocytes. S. BICHKOV (Bull. Biol. Med. Exp. U.R.S.S., 1936, 1, 125—127, 123—124).—III. In dogs ingestion of meat results in increase in the  $NH_2-N$  content of the whole blood. The increase occurs in the erythrocytes which transport the  $NH_2$ -acids; plasma- $NH_2-N$  remains nearly const.

IV. The respiration of erythrocytes (pigeon) is decreased by addition of  $NH_2$ -acids (histidine > tryptophan > *d*-alanine > *d*-leucine). The extent to which these  $NH_2$ -acids are adsorbed at the surface of the erythrocytes varies in the same order.

W. McC.

Oxidation and catalysis in the muscles of warm-blooded animals. II. White and red muscles. A. CHARIKOVA and M. TIKHAJA (Bull. Biol. Med. Exp. U.R.S.S., 1936, 1, 111—112).—In the pigeon respiration and oxidase content in breast muscle are > in leg muscle, whilst the reverse is the case in the hen. The difference in the function of the muscles affects the intensity but not the character of the oxidation.

W. McC.

Inhibition of formation of lactic acid in the cell by oxygen. I. A. HAHN and H. NIEMER (Z. Biol., 1936, 97, 195—200).—With 0.04M- $PO_4^{'''}$  extraction of muscle pulp, the inhibitory action of  $O_2$  on lactic acid formation occurs with muscle residue+extract, but not with either component alone or with heated extracts. Pptn. of proteins from the extract by  $COMe_2$  at 0° gives a filtrate which, after removal of  $COMe_2$  is active even after heating. The nature of this heat-stable constituent, which is not an  $O_2$  carrier in lactic acid dehydrogenation, is discussed.

F. O. H.

Effect of diet on the constitution of the organism. R. BERG (Med. Klinik, 1935, 31, 917—920, 947—950; Chem. Zentr., 1935, ii, 2229—2230).

R. N. C.

Composition and calorific value of diets consumed in two [Italian] maritime colonies. A. CARTENI and C. VACCA (Atti R. Accad. Lincei, 1936, [vi], 23, 216—217).—The protein, fat, and carbohydrate contents and calorific val. calc. by Rubner's and Benedict's methods are tabulated.

F. O. H.

Variations in urinary excretion of allantoin in rats on ketogenic and anti-ketogenic diets. G. BERGAMI, P. BAER, and E. BOERI (Atti R. Accad.

Lincei, 1936, [vi], 23, 198—199).—Diets rich in fats (ketogenic) and carbohydrates (anti-ketogenic) respectively decrease and increase excretion of allantoin; excretion of uric acid follows a parallel but less significant course.

F. O. H.

Growth-stimulating properties of grass juice. G. O. KOHLER, C. A. ELVEHJEM, and E. B. HART (Science, 1936, 83, 445).—Addition of fresh, clear, grass juice to a diet of mineralised milk produced on winter rations markedly increased growth in young rats.

L. S. T.

Experimental renal insufficiency produced by partial nephrectomy. IV. Creatine content of hypertensive hypertrophied rat heart after dried meat diet. A. CHANUTIN and S. LUDEWIG (Arch. Int. Med., 1936, 57, 887—892).—Ventricular creatine (I) is independent of dietary (I). (I) per unit wt. is const. (I) per unit surface area increases in hypertension due to increase in muscular tissue.

E. D. Y.

Distribution of the urinary constituents of nitrogen metabolism and its physiological significance. VIII. Fundamental principles for the study of nitrogen catabolism. E. F. TERROINE (Bull. Soc. Chim. biol., 1936, 18, 665—686).—A discussion.

A. L.

Metabolism of glycollic acid in progressive muscular dystrophy. A. T. MILHORAT and V. TOSCANI (J. Biol. Chem., 1936, 114, 461—466).—The possibility that glycollic acid (I) is a precursor of glycine (II) is investigated. Feeding (I) to patients with muscular dystrophy produced a much smaller increase in creatinuria than feeding (II).

H. D.

Decarboxylation of amino-acids by tissues. K. M. ROSANOV (Bull. Biol. Med. Exp. U.R.S.S., 1936, 1, 109—110).—Sliced kidney (guinea-pig) shaken with histidine solutions produces a substance having a pharmacological action similar to that of histamine (I). No such effect is observed with liver and other organs, possibly because the (I) produced is then destroyed.

W. McC.

Role of carbohydrates in protein metabolism in the overheated organism. E. S. NOVAKOVSKAJA (Bull. Biol. Med. Exp. U.R.S.S., 1936, 1, 128—129).—Alterations in the protein and other metabolism produced by overheating are counteracted by giving glucose, which has a sp. dynamic effect and causes restoration of normal conditions.

W. McC.

Phosphoaminolipins of the enteric mucosa and fat absorption. I, II. Qualitative and quantitative variations following administration of iodinated fat. C. ARTOM and G. PERETTI (Boll. Soc. ital. Biol. sperim., 1935, 10, 867—868, 869—871).—I. Following ingestion of iodinated fat (I) (11 g. per kg.) by rabbits, the fraction of the mucosa-lipins insol. in  $COMe_2+MgCl_2$  contains I, the content being max. after 14 hr. and attaining a const. level at 24—72 hr. This I occurs in the purified phosphoaminolipins (II).

II. Ingestion of (I) increases (II), carnitine, and  $COMe_2$ -insol. fatty acids in the mucosa. The data indicate that fat absorption produces increased lipin metabolism of the mucosa.

F. O. H.

**Intestinal absorption of oils of varying degree of unsaturation.** G. PERETTI and L. REALE (Boll. Soc. ital. Biol. sperim., 1935, 10, 871—873).—Variations occur in the rate of absorption in rats of different unsaturated fatty acids, but no parallelism appears to exist between rate of absorption and degree of unsaturation. F. O. H.

**Absorption of oleic acid in the form of mono- and di-olein.** G. PERETTI (Boll. Soc. ital. Biol. sperim., 1935, 10, 873—874).—When expressed as % of oleic acid entering the intestine (rat), oleic acid and mono- and di-olein are absorbed to an extent of 55, 88.4, and 82.7, respectively; thus the last two are absorbed approx. as rapidly as triolein. F. O. H.

**Total fatty acids of the liver after administration of fats of varying degree of unsaturation.** G. PERETTI (Boll. Soc. ital. Biol. sperim., 1935, 10, 875—876).—The increase in liver-fatty acids in rats varies considerably with, but is not related to, the degree of unsaturation of the oil ingested. F. O. H.

**Total fatty acids of the liver after administration of oleic acid and mono- and di-olein.** G. PERETTI and L. REALE (Boll. Soc. ital. Biol. sperim., 1935, 10, 876—877).—The increase in liver-fatty acids following ingestion of oleic acid by rats is > that after ingestion of mono- or di-olein and < that after ingestion of olive oil. F. O. H.

**Lipins of thoracic lymph during absorption of neutral fats.** C. ARTOM and G. PERETTI (Boll. Soc. ital. Biol. sperim., 1935, 10, 877—880).—Following ingestion of horse fat (I) by dogs, the lymph-fat occurs totally as triglycerides, whilst the l val. is > that of (I). The lipin-P (but not specifically phosphatidolipin P) and cholesterol levels tend to increase. F. O. H.

**Effect of iodoacetic acid and of adrenalectomy on fat transport.** L. LASZT and F. VERZAR (Biochem. Z., 1936, 285, 356—367).—The development of fatty liver in rats after P poisoning and on fasting is inhibited by  $\text{CH}_2\text{I}-\text{CO}_2\text{H}$  poisoning and by adrenalectomy. It appears that for transport fat is converted into phosphatides, and that the process is under adrenal hormonal influence in the same way as is fat synthesis in the intestinal mucosa during absorption. P. W. C.

**Fat-sugar metabolism.** I. ABELIN (Z. ges. exp. Med., 1935, 96, 9—17; Chem. Zentr., 1935, ii, 2234).—Rats fed exclusively on fats have a greater glycogen-storing capacity than those fed normally, the liver- and muscle-glycogen being 40—60% > average; oils have a greater effect than semi-solid fats. H. N. R.

**Deuterium as indicator in the study of intermediary metabolism. VI. Synthesis and destruction of fatty acids in the organism.** R. SCHOENHEIMER and D. RITTENBERG (J. Biol. Chem., 1936, 114, 381—395; cf. this vol., 630).—Rats on a carbohydrate diet supplemented with  $\text{D}_2\text{O}$  showed an increased content of D-containing fatty acids reaching a max. in 6—8 days; the increase is shown to be due to synthesis of new acids. Rats fed on a D-containing diet and then transferred to a carbohydrate diet alone showed a destruction of the D-containing fatty acids

approx. as rapid as their synthesis. Azelaic acid isolated from the fat of rats on a D-containing diet contained the same ratio of D : H as the total fatty acids. Injection of 5%  $\text{D}_2\text{O}$  into a developing chick's egg failed to cause D to enter the fatty acid mols. of the embryo. H. D.

**Presence of lactic acid in investigation of the stomach contents, after Ewald and Boas, must be ascertained by a limit-reaction.** G. SANT (Pharm. Tijds. Nederl.-Indie, 1935, 12, 184—187; Chem. Zentr., 1935, ii, 2251).—A suitable reaction is described. H. N. R.

**Lungs and ketone metabolism.** A. I. ODINOV (Biochem. Z., 1936, 286, 101—109).—Pulped dogs' lung at 37—38° produces  $\text{CH}_3\text{Ac}-\text{CO}_2\text{H}$  (optimal at  $p_{\text{H}}$  5.6) and  $\beta$ -hydroxybutyric acid (I) (optimal at  $p_{\text{H}}$  7.0), probably as a result of autooxidation. Production of ketones in the pulp from added  $\text{Pr}^{\text{C}}\text{CO}_2\text{H}$  when the amount of preformed ketones is high is < when it is low. Intravenous administration of  $\text{Pr}^{\text{C}}\text{CO}_2\text{Na}$  usually increases the (I) content of the lungs, but the amount of (I) in the arterial blood is sometimes >, sometimes <, that in the right heart. The lungs probably produce and (especially when the ketone content of the body is high) retain ketones. W. McC.

**Ketogenesis in muscular tissue.** L. M. GOLBER (Platz. Utschen. Med., 1936, 286—299).—Intravenous injection of  $\text{PrCO}_2\text{Na}$  into starving rabbits increases ketonic substances (I) in the derived muscle pulp incubated for 24 hr. at 37°, but no such increase is found with normal rabbits even when the salt is added directly to the pulp. Injection of methylsuccinic acid (II) decreases the formation of (I) in the muscle-pulp, but direct addition of (II) has no significant effect. W. O. K.

**Calcium compounds in dentistry.** A. R. BLISS, jun. (Dental Cosmos, 1935, 77, 763—766).—Ca absorption by mice after administration by stomach tube was determined by the min. dose of  $\text{MgSO}_4$  required to produce narcosis. Rates of Ca absorption were in the (descending) order: Ca lactate, Ca gluconate,  $\text{CaCl}_2$ , Ca inositol hexaphosphate,  $\text{CaHPO}_4$ , Ca glycerophosphate. CH. ABS. (p)

**Phosphorus in the early development of the frog.** M. A. ZIELINSKI (Bull. Acad. Polonaise, 1935, B, 293—304).—Inorg. and labile P were determined in the frog's embryo during development. Inorg. P increased at the expense of the labile; the latter passed through a min. between the 60th and 80th hr. and then increased, the increase being associated with increased powers of muscular contraction. H. D.

**Influence of fasting on the rate of oxidation of ethyl alcohol in rats.** E. LE BRETON (Compt. rend. Soc. Biol., 1936, 122, 330—332).—In rats starved for 1.5—6 days, the rate of oxidation of intraperitoneally injected EtOH diminishes more rapidly than does the basal metabolism. F. O. H.

**Rate of oxidation of ethyl alcohol in homoiotherms during growth.** E. LE BRETON (Compt. rend. Soc. Biol., 1936, 122, 561—564).—In the rat (insensitive to the quantity) the val. decreases with

age, whilst in the cock (sensitive to quantity) little variation occurs.

H. G. R.

Percentage of oxidation due to ethyl alcohol in poikilotherms. E. LE BRETON (Compt. rend. Soc. Biol., 1936, 122, 564—565).—With tortoises and frogs the val. is approx. 90%, the other 10% being due to utilisation of protein.

H. G. R.

Intestinal absorption of castor oil. G. VALETTE and R. SALVANET (Bull. Soc. Chim. biol., 1936, 18, 911—917).—Approx. 68% of the oil administered is recovered in the faeces as fatty acid or as soap while 22% is absorbed. This low val. is not attributed to any anomalous action with the bile or the lipolytic enzymes of the intestines.

H. G. R.

Biochemical and physiological significance of the oxidation of ethyl alcohol in the organism. E. LE BRETON (Compt. rend. Soc. Biol., 1936, 122, 565—568).—A summary of results obtained since 1933.

H. G. R.

Metabolism of polycyclic compounds. III. Anthrhylmecapturic acid. E. BOYLAND and A. A. LEVI (Biochem. J., 1936, 30, 1225—1227; cf. this vol., 234).—Rats and rabbits fed on an anthracene-containing diet excreted 1-anthrhylmecapturic acid, m.p. 193—195°,  $[\alpha]_D^{20}$   $-6^\circ$  to  $-10^\circ$  in EtOH, which on alkaline hydrolysis gave  $\alpha\alpha$ -dianthrhyll disulphide, m.p. 191—193°. Traces of anthraquinone were probably also excreted.

H. D.

Metabolism of normal and tumour tissue. XVII. Action of some derivatives of phenazine, quinoline, and pyridine on the Pasteur reaction. F. DICKENS (Biochem. J., 1936, 30, 1233—1241).—The inhibition of the Pasteur mechanism in normal and tumour tissues by phenosafranine is not due merely to its negative oxidation-reduction potential or to its photosensitising properties, but may be imitated by a group of derivatives of  $C_5H_5N$ , acridine, and quinoline containing  $N^+$  and a conjugated chain terminating in a basic group. The sarcoma-producing styryl 430" of Browning increases the respiration and aerobic and anaerobic glycolysis of rat's liver.

H. D.

Elimination of certain polycyclic hydrocarbons from the animal body. J. G. CHALMERS and P. R. PEACOCK (Biochem. J., 1936, 30, 1242—1248; cf. A., 1934, 1127).—The tissues and excreta of animals fed with hydrocarbons were saponified and the unsaponifiable fraction was treated with digitonin; pigments were removed with fuller's earth and the fluorescence spectrum of the solution was examined. 1:2:5:6-Dibenzanthracene and 1:2-benzpyrene (I) injected intramuscularly into fowls did not appear in the excreta; with the chick embryo (I) was eliminated 90 hr. after injection, but did not appear in the gall-bladder. Injection of (I), methylcholanthrene, and anthracene into mice produced fluorescent substances in the bile after 1—2 hr.

H. D.

Photodynamic sensitisation. Biological action and therapeutic application. A. EIDINOW (Proc. Roy. Soc. Med., 1935, 28, 633—640).—Diseases associated with abnormal reactions of skin to light are due to exogenous photo-biochemical substances which sensitise the skin cells to light. Inborn errors of

metabolism and abnormal production of porphyrin pigments in the excreta cause skin disease.

CH. ABS. (p)

Fast electron beams and their significance in radiation therapeutics. R. GLOCKER (Strahlenther., 1935, 53, 417—423; Chem. Zentr., 1935, ii, 2396—2397).—A review. Tests on the penetration in biological materials are described.

H. J. E.

Destruction of the anterior pituitary by X-rays. I. Destruction of the anterior pituitary and magnesium, calcium, and phosphorus metabolism. L. CANNAVÒ and R. BENINATO (Endokrinol., 1935, 15, 389—404).—Serum-Mg in rabbits falls continuously after X-irradiation of the pituitary, Mg excretion in the urine and faeces decreasing simultaneously. Serum-Ca is unchanged, whilst serum-P oscillates slightly downwards; both Ca and P excretion are almost unaltered.

R. N. C.

Action of ultra-violet irradiation on surface tension of serum-albumin solutions. F. COSSU (Boll. Soc. ital. Biol. sperim., 1935, 10, 973—975).—Aq. serum-albumin at  $p_H$  1.4—8.6 has a min.  $\gamma$  at the isoelectric point; following irradiation,  $\gamma$  is max. at, with a second val. towards the acid side of, the isoelectric point.

F. O. H.

Effect of training on muscle-glycogen of pigeons, rabbits, and hens. V. O. ROZENHARDT (Platz. Utschen. Med., 1936, 280—285).—The increase in glycogen content due to repeated electrical stimulation for 20—28 days varies with different muscles.

W. O. K.

Ammonia production in the non-medullated nerve of the mollusc *Anodonta*. A. V. GOLUBTSOVA and J. L. KAHN (Bull. Biol. Méd. Exp. U.R.S.S., 1936, 1, 130—132).—Electrical stimulation of the nerve in presence of dil.  $H_2SO_4$  results in a 370% increase in  $NH_3$  production. The increased  $O_2$  consumption in the presence of acid is probably due entirely to  $NH_3$  production.

W. McC.

Mitogenetic radiation. H. BARTH (Biochem. Z., 1936, 285, 311—339).—This problem is critically reinvestigated in collaboration with the Gurwitsch school. The results ascribed to mitogenetic radiation are due to the short-wave portion of the radiation, and since in earlier work the sensitivity of the apparatus was not applicable to the range 220—180 m $\mu$ , the negative results do not exclude the possibility of detection of radiation in terms of light-electric properties. Results indicating that similar effects can be obtained by change of moisture and electrostatic field are peculiar to the apparatus used. A method is described which gives statistical results with various protein and inorg. reactions. Absorption spectra of 9 substrates were investigated and striking analogies obtained with published mitogenetic spectra.

P. W. C.

Electrostatic measurements on single motor end-plates and muscle fibres. II. Effect of curare poisoning and radium irradiation. F. BUCHTHAL and J. LINDHARD (Skand. Arch. Physiol., 1935, 72, 35—50; Chem. Zentr., 1935, ii, 2082).

R. N. C.

Does heavy water influence physiological processes? M. F. VON DUNGERN (Z. Biol., 1936,

97, 187—194).—Heavy  $H_2O$  (0.05—10%  $D_2O$ ) has no influence on hydrolysis by ptyalin, pepsin, or trypsin, blood-coagulation, action of thrombin, oxyhaemoglobin spectrum, movement of ciliated epithelial cells, surviving frog's heart, or fatigue and recovery of frog's gastrocnemius muscle. Certain effects ascribed to  $D_2O$  preps. are probably due to impurities.

F. O. H.

**Antagonism between iodine and fluorine in the organism.** W. MAY (Klin. Woch., 1935, 14, 790—792).

R. N. C.

**Diuretic action of organic mercury compounds.** H. U. SIMMERT (Klin. Woch., 1935, 14, 530—532; Chem. Zentr., 1935, ii, 2398).—The action of "novurit" is extra-renal in origin, consisting of an alteration in the tissue-NaCl.

H. N. R.

**Ketogenesis in liver poisoned with phosphorus.** S. LEITES and A. ODINOV (Biochem. Z., 1936, 286, 93—100; cf. this vol., 236).—Production of  $CH_3Ac \cdot CO_2H$  and  $\beta$ -hydroxybutyric acid in rabbits' liver pulp remains unaffected when they are moderately poisoned with P, but decreases if poisoning is severe. Ketogenesis following aseptic autolysis in poisoned liver is  $>$  in healthy liver. Addition of  $Pr^+CO_2Na$  usually has less ketogenic effect when added to poisoned liver pulp than when added to liver pulp from fasting rabbits. Intravenous administration of  $Pr^+CO_2Na$  neither increases the ketone content of the liver nor alters the extent of ketogenesis there, but sometimes increases the ketone content of the lungs.

W. McC.

**Regulation of tissue-nourishing blood-circulation by carbonic acid and cholates.** A. FLEISCH (Arch. int. Physiol., 1935, 40, 385—397; Chem. Zentr., 1935, ii, 1910—1911).—Perfusion of the small intestine with Ringer's solution containing  $H_2CO_3$  or bile acids causes vaso-dilatation.

H. N. R.

**Diet and thyroid function. II. Effect of acetonitrile and potassium iodide on the basal metabolism and histological picture of the thyroid.** F. BRUMAN and A. MILDWURF (Z. ges. exp. Med., 1935, 96, 223—232; Chem. Zentr., 1935, ii, 1738).—The thyroid shows no difference from the normal.

R. N. C.

**Effect of salicyl derivatives on isolated frog and turtle hearts.** R. L. JOHNSON (J. Pharm. Exp. Ther., 1936, 57, 193—197).—Aspirin solution kept for one day is toxic owing to hydrolysis. Other salicylates also reduce the amplitude of heart contractions.

E. D. Y.

**Effect of dinitrophenol on rate of alcohol metabolism.** H. W. NEWMAN and M. L. TAINTER (J. Pharm. Exp. Ther., 1936, 57, 67—73).—The increased loss of EtOH from the blood of dogs, produced by dinitrophenol, is due to the higher rate of respiration and consequent increased loss in the lungs, and not to increased oxidation.

W. O. K.

**Action of various nitro-compounds on metabolism and [body-]temperature.** C. HEYMAKS and H. CASIER (Arch. int. Pharmacodyn. Thér., 1935, 50, 20—64; Chem. Zentr., 1935, ii, 2234—2235).—The effects of many  $NO_2$ -compounds in stimulating metabolism and in raising the body-temp. and their

toxicities are described.  $C_6H_5$  and  $C_{10}H_7$  compounds have equal activities and  $(NO_2)_2$ -compounds are more effective than  $(NO)_1$ - or  $(NO_2)_3$ -, whilst  $(OH)_1$ -compounds are more effective than  $(OH)_2$ -. Etherification of a phenolic OH or introduction of an aliphatic or aromatic group increases the activity. The  $NO_2$  and OH must be in the same ring: introduction of  $SO_3H$ ,  $NH_2$ ,  $CO_2H$ , and further  $NO_2$  lessens the influence on metabolism, but increases the effect on body-temp.

H. N. R.

**Edema and glyoxaline compounds.** M. LOEDER, E. BIOY, M. PERRAULT, and A. VARAY (Presse méd., 1935, 43, 697—699; Chem. Zentr., 1935, ii, 2235).—The hydropigenous action of known tissue-extracts is parallel to their content of glyoxaline compounds. Many synthetic glyoxaline derivatives have a similar activity.

H. N. R.

**Toxicity and effect on blood-sugar of a number of amidine and guanidine derivatives.** W. A. BROOM (J. Pharm. Exp. Ther., 1936, 57, 81—97).—Of various guanidine and amidine compounds (cf. Easson and Pyman, A., 1932, 55), some produced in rabbits an initial hyperglycaemia (I) followed by hypoglycaemia, whilst others caused (I) only. The most active hypoglycaemic compounds were sebac-amidine and *n*-decane-1:10-diamidine, but neither was as active as synthalin. In a homologous series of diamidines  $(CH_2)_n[C(NH) \cdot NH_2]_2$  the toxicity and hypoglycaemic action both increase with *n*, reaching a max. at *n*—8 or 10. The activity of these compounds is chiefly due to their toxic effect on the liver, and not to an insulin-like action. None of the compounds is of clinical value.

W. O. K.

**Influence of bromocholine on gastric secretion.** J. MASEK (Compt. rend. Soc. Biol., 1936, 122, 430—433).—Injection of bromocholine into men increases the gastric acidity; the time to reach a max. is  $>$  that with histamine, but is not accompanied by any ill-effects.

H. G. R.

**Inhibition by fats of the gastric secretion caused by histamine.** B. FIERENS and P. P. DE NAYER (Compt. rend. Soc. Biol., 1936, 122, 805—807).—In dogs with a gastric fistula the secretion of gastric juice produced by histamine is much decreased when arachis oil is administered. This is not in agreement with the findings of Roberts (Quart. J. Med., 1930, 24, 133).

A. L.

**Influence of fatty acids on blood-glycolysis.** G. D'ALESSANDRO and S. PETRUCCI (Biochem. Z., 1936, 285, 72—75).—Addition of castor oil, oleic or more highly unsaturated acids, or of nonoic acid to washed blood corpuscles increases the glycolysing power considerably, the increase varying with the concn. of added acid and being different for the corpuscles of different individuals.

P. W. C.

**Phloridzin and urinary excretion of phosphorus.** A. LAMBRECHTS (Compt. rend. Soc. Biol., 1936, 122, 468—470).—The P threshold is raised and that of glucose lowered by injection of phloridzin into dogs.

H. G. R.

**Dependence of the action of adrenaline on physiological variables.** P. DE LA PEÑA (Biochem. Z., 1936, 286, 77—80).—In rabbits injection of

adrenaline (I) frequently leads to increase in the hæmoglobin concn. of the blood, the magnitude of the effect being dependent also on the temp. of the animals' surroundings and on the activity of the thyroid gland. When the temp. is low (4—6°) the increase in the blood-sugar concn. following (I) injection is < when the temp. is 19—20°. W. McC.

**Specific action of products of intermediate tissue disintegration.** J. A. LAZARIS (Platz. Utschen. Med., 1936, 220—230).—The claim of Mascherpa (A., 1935, 1276) that proteins from organs or tumours injected into an animal result in the preferential deposition of Co in the homologous tissue, is not confirmed. W. O. K.

**Effects of physiological agents on adult tissues *in vitro*.** H. S. SIMMS (Science, 1936, 83, 418—419).—The effects of various agents on the initial growth of adult tissue (mainly chicken aorta) *in vitro* are recorded. Papain and trypsin stimulate growth; the effect of the latter is due to proteolytic digestion of the tissue with apparent removal of an inhibitor. Embryo and spleen extracts have little effect, whilst pituitary growth-hormone is slightly stimulating. Blood-plasma contains a growth stimulant, the "A factor," which is also present in tissues, lymph, urine, and serum, and is essential for growth and for the cells in a resting condition. It is an acid of low mol. wt. and can be pptd. with Ca or Cu with subsequent recovery of activity. The physiological condition of adult tissue cells appears to involve a balance between hormone-like controlling agents, of which there are at least four factors, A, B, C, and D, present in plasma. The rôles of these factors are described. L. S. T.

**Effect of lecithin and cholesterol in combination with insulin on carbohydrate metabolism.** G. CAIZZONE (Biochim. Terap. sperim., 1933, 20, 339—343; Chem. Zentr., 1935, ii, 1907).—A mixture of insulin, lecithin, and cholesterol retained its activity for 1 year. Injection of very large doses may prevent the appearance of hypoglycæmic symptoms. A synergistic action between the components of the mixture is indicated. A. G. P.

**Effect of insulin on the hepatic and renal lipinosis of chloroform narcosis.** B. BARONI (Boll. Soc. ital. Biol. sperim., 1935, 10, 933—936).—Insulin has a transient inhibitory effect on  $\text{CHCl}_3$ -lipinosis in guinea-pigs. F. O. H.

**Some anaesthetic circulatory and respiratory agents.** P. REGNIERS and G. DE VLEESCHOUWER (Arch. int. Pharmacodyn. Thér., 1935, 50, 65—93; Chem. Zentr., 1935, ii, 2237).—The effects of a no. of such agents on anaesthetised dogs are described. H. N. R.

**Anæsthetic power of hydrochloride and phenylpropionate of novocaine on the motor nerves of *Rana esculenta*.** J. RÉGNIER and A. QUEVAUVILLER (Compt. rend. Soc. Biol., 1936, 122, 251—254).—The phenylpropionate is 5—7 times as active as the hydrochloride (cf. this vol., 634). F. O. H.

**Vaso-depressor action of strychnine after ether, alcohol, barbital, and chloral.** H. GOLD and J. TRAVELL (Arch. int. Pharmacodyn. Thér.,

1935, 50, 1—14; Chem. Zentr., 1935, ii, 2235—2236).—Strychnine has a vaso-depressor action on animals under anæsthetic influence. H. N. R.

**Relative hypnotic effects of some aryl- and unsymmetrical alkylaryl-thiocarbamides.**—See this vol., 977.

**Assimilation of fructose during narcosis.** H. FUSS and G. SVEINDAL (Z. ges. exp. Med., 1934, 94, 436—441; Chem. Zentr., 1935, ii, 2236).—During  $\text{Et}_2\text{O}$  narcosis the blood-sugar of rabbits is only transiently affected. H. N. R.

**Extraction and detection of veronal and luminal.** J. H. KREPELKA and V. ŠVARC (Coll. Czech. Chem. Comm., 1936, 9, 191—206).—62% of veronal (I) and 65% of luminal (II) are recovered from flesh by Wasicky's method, 93.5 and 90%, respectively, from urine by Straub and Mihalovits' method. Other methods are less satisfactory. Zwicker's colour reaction is excellent for (I), but may be indistinct for (II). (I) and (II) are best purified by sublimation at 12 mm., for which an apparatus is described. R. S. C.

**Behaviour of blood-sugar in pigeons under the action of poisons of the central nervous system.** R. ALLERS and J. BRILL (Biochem. Z., 1936, 285, 6—10).—A table summarises the effect on the body-temp. and blood-sugar of pigeons of amytal (2 injections), morphia, urethane, chloral (all blood-sugar increasing), and paraldehyde (blood-sugar decreasing). Intramuscular injection of tetrahydro- $\beta$ -naphthylamine causes a fall in body-temp. together with an increase in blood-sugar, the latter effect being greater in the fasting condition. P. W. C.

**Speed of adsorption of medicaments in relation to the osmotic pressures of their solutions.** I. SIMON (Arch. int. Pharmacodyn. Thér., 1935, 50, 180—194; Chem. Zentr., 1935, ii, 1908).—Relations between the velocity of absorption and the osmotic pressure are discussed; no rules of practical significance can be deduced. H. N. R.

**Significance of complex formation and solubility changes for the action of medicines.** J. BUSSEMAKER (Arch. exp. Path. Pharm., 1936, 181, 503—511).—A new method for the detection of complexes in aq. solution is described. Caffeine forms complexes with Na salicylate and with novocaine hydrochloride, and veronal with pyrimidone and antipyrine. The importance of complex formation depends on change in solubility, and this is discussed for various medicinal combinations. J. N. A.

**Antipyretic action of a new antipyrine derivative.** C. L. YI and B. E. READ (Chinese J. Physiol., 1936, 10, 297—302).—1-Phenyl-2-methyl-4-ethylpyrazol-5-one has a much stronger antipyretic action on rabbits than has antipyrine (I): the min. lethal dose for mice is < that of (I). F. A. A.

**Active principles of senna leaves.** W. STRAUB and H. GEBHARDT (Arch. exp. Path. Pharm., 1936, 181, 329—407).—The cathartic principles in Tinivelly senna leaves (D.A.B. VI) (approx. 200 mouse-units per g.) include an anthranol glucoside (which on hydrolysis with acids yields an anthraquinone deriv-

ative, identical with aloe-emodin), a cryst. glucoside (containing 42% of emodin and difficultly hydrolysed by acids), and a glucoside readily hydrolysed even by plant acids in the leaf. F. O. H.

**Cumulative and toxic actions of cardiazol and coramine.** F. ZINNITZ and F. VON BERGMANN (Arch. exp. Path. Pharm., 1936, 181, 335—344).—Continuous administration of small doses (e.g., 5 mg. per kg.) of cardiazol (pentamethylenetetrazole) (I) or coramine (II) into rabbits maintains the blood pressure at 10—15 mm. Hg above normal; larger doses give higher vals. but are rapidly lethal. Individual variations in toxicity occur with (II) but not (I). Narcotics and analeptics are mutually antagonistic. Large doses of (II) are necessary to depress the blood-pressure of spinal cats, whilst (I) is ineffective and less toxic. (II), unlike (I), appears to have a peripheral action. F. O. H.

**Comparative action of cardiazol and coramine in animals.** L. LENDLE (Arch. exp. Path. Pharm., 1936, 181, 408—420).—The action on the respiratory vol. of morphinised rabbits indicates that coramine (I) has a wider range, whilst the dose-effect curve of cardiazol (II) is steeper. With pernocton and avertin narcosis, the effective range of (II) and, to a greater extent, of (I) is increased. With narcotised rats, threefold convulsive doses of (I) prolong narcosis and delay the convulsive and lethal effects. F. O. H.

**Fall in body-temperature in birds after administration of pyrogenic substances.** J. BRILL (Biochem. Z., 1936, 285, 1—5).—Intramuscular injection of tetrahydro- $\beta$ -naphthylamine into hens and pigeons results in a mean fall of body-temp. of 3—3.5° (max. 5.8°), rapid at first, reaching the max. val. in about 1.5 hr. and slowly disappearing. With large doses the temp. may remain subnormal for 2.5 days. The fall in temp. was not strictly  $\propto$  the dose. Cocaine and caffeine also lower the body-temp. P. W. C.

**Action of valerian and a method of assay.** M. KOCHMANN and H. KUNZ (Arch. exp. Path. Pharm., 1936, 181, 421—434).—In sufficiently large doses macerated valerian (I) causes paralysis of the dog's cerebrum; infusions produce paralysis of the mid-brain. Alcoholic and hot and cold H<sub>2</sub>O extracts have approx. the same action. The min. narcotic dose in the white mouse is close to the lethal dose. With rabbits the therapeutic val. of (I) can be determined by its antagonistic action towards the stimulating effect of caffeine. J. N. A.

**Experimental investigation of salvarsan allergy.** P. KALLOS and L. KALLÓS-DEFFNER (Klin. Woch., 1935, 14, 1074—1076; Chem. Zentr., 1935, ii, 1910).—Experiments with guinea-pigs are described. H. N. R.

**Observations on the pharmacological action of ergotamine by experiments on the Pagano-Hering reflex.** E. BECCARI (Arch. int. Pharmacodyn. Ther., 1935, 50, 195—210; Chem. Zentr., 1935, ii, 1908—1909).—Experiments on dogs are described. H. N. R.

**Derivatives of barbituric acid.**—See this vol., 999.

**Toxicity of organic salts of novocaine and morphine. Determination of mean lethal doses.** J. RÉGNIER, S. LAMBIN, and E. SZOLLOSZ (Compt. rend. Soc. Biol., 1936, 122, 759—762).—By subcutaneous injection the toxicities of novocaine phenylpropionate (I) and isobutyrate (II) are equal to, and that of the phenylacetate (III) is slightly >, that of novocaine hydrochloride (IV). (I) and (II) have 1/5—1/6, and (III) has 1/3, the toxicity of cocaine. Intravenously, the three salts have the same toxicity as (IV). Subcutaneously morphine benzoate, cinnamate, and citrate have the same toxicity as the hydrochloride (V), the toxicity of the phenylpropionate being <, and that of the salicylate >, that of (V). A. L.

**Action of cocaine on the respiratory function of the blood.** G. FELLONI (Arch. ital. Biol., 89, 69—75; Chem. Zentr., 1935, ii, 2229).—Absorption of O<sub>2</sub> is restrained. R. N. C.

**Bronchodilator action of sympathomimetic compounds after histamine-induced bronchial spasm.** W. M. CAMERON and M. L. TAINTER (J. Pharm. Exp. Ther., 1936, 57, 152—169).—The order of efficiency was: adrenaline, epinine, 3:4-dihydroxyephedrine > ethyl-norsuprarenin, arterenol, neo-synephrine, cobefrin, atropine > *l*-*m*-hydroxyephedrine, ephedrine, benzedrine, octin > (no activity) ephetonal, propadrin, *m*-hydroxynorephedrine, *p*-hydroxyephedrine. Amines with the pyrocatechol nucleus are the most effective. E. D. Y.

**Ergotocine, ergometrine, ergostetrine, and ergobasine.** K. K. CHEN, E. E. SWANSON, E. C. KLEIDERER, and G. H. A. CLOWES (J. Pharm. Exp. Ther., 1936, 57, 74—80).—Ergotocine, ergometrine, ergostetrine, and ergobasine in the form of maleates have identical effects on the isolated rabbit's uterus, the cock's comb, and the isolated rabbit's intestine. They also give approx. equal colours with *p*-dimethylaminobenzaldehyde, whilst the combustion figures agree closely (cf. Kharasch *et al.*, this vol., 489). W. O. K.

**Influence of pilocarpine on the metabolism of the [salivary] gland and of smooth muscle.** R. VLADESCO and G. NICHITA (Compt. rend., 1936, 202, 1533—1535).—Lactic acid of the blood passes into the saliva, where its content after injection of pilocarpine is > that after stimulation of the chorda tympani nerve, and is parallel to the blood level. The effect of pilocarpine is considered to be due partly to intermediate metabolism of the salivary gland and partly to that of smooth muscle. E. W. W.

**Pharmacology of *Duboisia Hopwoodii* (*d*-nornicotine).** C. S. HICKS, F. T. BRÜCKE, and E. F. HUEBER (Arch. int. Pharmacodyn. Ther., 1935, 57, 335—353).—*d*-Nornicotine present in *D. Hopwoodii* (cf. this vol., 125) is very similar pharmacologically to nicotine, but is 2.5 times as toxic to rats. W. O. K.

**Action of thyroid extracts in experimental lead-poisoning.** R. GARBINI (Arch. int. Pharmacodyn. Ther., 1935, 50, 211—215; Chem. Zentr., 1935, ii, 1911).—In rabbits, injection of thyroid extracts before Pb hastens death, whereas injection after Pb prolongs life. H. N. R.

**Selenium and duck sickness.** A. C. TWOMEY and S. J. TWOMEY (Science, 1936, 83, 470—471).—The poisoning produced in ducks by low concns. of  $\text{Na}_2\text{SeO}_3$  indicates that Se is a contributing factor in duck sickness. L. S. T.

**Chronic carbon monoxide poisoning.** H. BURESCH (Z. Hyg. Infekt., 1935, 117, 153—160; Chem. Zentr., 1935, ii, 1911).—Chronic CO poisoning may be, but is not necessarily, produced by repeated inhalation of small amounts of CO. H. N. R.

**Detoxication of cyanides.** G. AURISICCHIO and G. DE NITO (Boll. Soc. ital. Biol. sperim., 1935, 10, 946—948).—Polemical against Meneghetti (this vol., 377). F. O. H.

**Toxicity of sodium tetrathionate.** E. MENEGHETTI (Boll. Soc. ital. Biol. sperim., 1936, 11, 51—55).—Less than half the dose, stated by Aurisicchio (preceding abstract) to be harmless, is lethal. E. P.

**Urinary sulphate as a measure of exposure to benzene.** W. P. YANT, H. H. SCHRENK, and F. A. PATTY (J. Ind. Hyg., 1936, 18, 349—356).—Exposure of men to  $\text{C}_6\text{H}_6$  vapour decreased urinary  $\text{SO}_4$ . H. D.

**Comparative animal investigations on the action of toluene and xylene on blood.** W. E. ENGELHARDT (Arch. Hyg. Bakt., 1935, 114, 219—233; Chem. Zentr., 1935, ii, 2085).—PhMe and xylene are less injurious to blood than  $\text{C}_6\text{H}_6$ ; it is suggested that they should replace  $\text{C}_6\text{H}_6$  in practice. H. N. R.

**Poisonous vapours of some hydrocarbons and alcohols.** II. C. W. RAADSVELD (Chem. Weekblad, 1936, 33, 288—291).—A review with particular reference to the effects of poisoning by  $\text{C}_6\text{H}_6$  and the lower aliphatic alcohols. S. C.

**Physico-chemical properties of organic poisons and the products derived from them in the animal organism.** N. V. LAZAREV and T. V. STARYZYNA (Bull. Soc. Chim. biol., 1936, 18, 723—740).—A study of the b.p., m.p., *d*, solubility,  $\gamma$ , and  $\epsilon$  of org. poisons and the products of their transformation in the animal organism shows that such products are generally of greater polarity. A. L.

**Activation and inhibition of apodehydrogenases.** H. VON EULER (Biochem. Z., 1936, 286, 72—76).—The activities of the dehydrogenases (lactic, fumaric, malic, succinic acid, EtOH) vary greatly according to the substrate (muscle and brain of pigeon, guinea-pig, rat, rabbit) apparently because of the varying amounts of activators and inhibitors in the substrates, the co-enzyme content of the substrates having an important effect. Activation and inhibition also result from addition of  $\text{NH}_2$ -acids, purines, adrenaline, acetylcholine, glutathione, and other substances. W. McC.

**Optical detection of hydrogenation and dehydrogenation of pyridine in the fermentation co-enzyme.** O. WARBURG and W. CHRISTIAN (Biochem. Z., 1936, 286, 81—82).—The partly hydrogenated (but not the non-hydrogenated) co-enzyme (I) is fluorescent in Hg light (360  $\text{m}\mu$ ). Reduction of (I) by carbohydrate occurs only if sp. colloids are present.  $\text{Na}_2\text{S}_2\text{O}_4$  reduces in absence of colloids. W. McC.

**Laccase of Japanese lac.** II. Reactivity of laccase towards polyhydric phenols and diamines. K. SUMINOKURA (Bull. Chem. Soc. Japan, 1936, 11, 299—309; cf. A., 1930, 1474).—48 substances are examined for aerial oxidation in the presence of laccase from Japanese lac. The order of reactivity is  $p\text{-(NH}_2)_2 > o\text{-(OH)}_2 > o\text{-(NH}_2)_2$ -compounds > compounds with 1 OH and 1 OMe. *m*-Compounds,  $p\text{-C}_6\text{H}_4(\text{OEt})_2$ , various substituted phenols, safrole, aliphatic diamines, alizarin, protocatechuic acid, and dihydroxyphenylalanine are not oxidised; dihydrourosinol only with difficulty. Exceptions are *o*- and *m*- (but not *p*-) cresol, which are slowly oxidised. R. S. C.

**Mechanism of enzyme action.** Decomposition of monoethyl hydrogen peroxide by catalase and of an intermediate enzyme-substrate compound. K. G. STERN (J. Biol. Chem., 1936, 114, 473—494).—The decomp. of  $\text{EtO}_2\text{H}$  (I) by horse liver-catalase, with the formation of  $\text{MeCHO}$ , is unimol. at  $0^\circ$ , the reaction velocity increasing rapidly with rise of temp. The activity- $p_{\text{H}}$  curve has a sharp max. at  $p_{\text{H}}$  10. The catalyst is thermolabile and inhibited by KCN. The ultra-violet absorption spectrum of the reaction mixture indicates the formation of an enzyme-substrate complex with bands at 570 and 534  $\text{m}\mu$  with a reaction rate > that of the decomp. of (I), a low temp. coeff., and no  $p_{\text{H}}$  optimum. H. D.

**Action of aromatic sulphonic acids on carbonylase.** F. AXMACHER and H. LUDWIG (Biochem. Z., 1936, 286, 1—6; cf. this vol., 375; Labes *et al.*, A., 1935, 120).—Amongst aromatic sulphonic acids there is no simple relation between toxicity to carbonylase, mol. wt. (158—1438), and no. of  $\text{SO}_3\text{H}$  groups (1—6). The increase in the toxicity of germanin with increasing concn. is due to adsorption. W. McC.

**Two types of plant-diestase.** G. L. TELLER (J. Biol. Chem., 1936, 114, 425—430).—The existence of two types of diastase, differing in their optimal  $p_{\text{H}}$  and temp., is shown in a no. of plants. One predominates in the flour of sound mature wheat and the other in the bran of germinating cereals. H. D.

**Ascorbic acid and diastase.** P. HOLTZ (Arch. Exp. Path. Pharm., 1936, 181, 514—524).—Merck's diastase (I) but not Merck's pancreatin (II) has a peroxidase activity (reaction with  $\text{H}_2\text{O}_2$  and guaiacum tincture) which is considerably reduced by ascorbic acid (III). (III) also reduces the diastatic activity of (I), but has very little action on that of (II). Cysteine has no effect on either activity of (I). Blood-, saliva-, and pancreas-(I) have their activities diminished by (III). J. N. A.

**Intracellular regulation of enzyme reactions with particular reference to the action of amylase.** S. J. VON PRZYLECKI (Ergebn. Enzymforsch., 1935, 4, 111—146).—Theoretical. R. N. C.

**Characteristics of animal amylases in relation to enzyme source.** W. R. THOMPSON and I. FRIEDMAN (J. Gen. Physiol., 1936, 19, 807—828).—Specificity of the amylases is dependent on species rather than on organ source. The activities of pigs pancreatin, depancreatized dog's serum, and human saliva appear to be due to single chemical substances, that of

saliva being reversibly dissociable. Human and pig's amylases have a common amylolytic radical.

H. G. R.

**Effect of temperature and hydrogen-ion concentration on the  $\alpha$ -amylase of cow's milk.** A. SCHLOEMER (Z. Unters. Lebensm., 1936, 71, 311—318).—The amylase of milk is an  $\alpha$ -amylase (Kuhn, A., 1925, i, 636). The optimum temp. for its activity is approx. 37°, but the optimum and max. temp. for activity and stability vary with the concn. of enzyme, salt, and [H<sup>+</sup>]. The optimum  $p_H$  is 6.3—6.7, but this  $\propto$  the nature of the activators and buffer salts present. Neither dilution nor cold storage affects activity.

E. C. S.

**Activity of amylase solutions in presence of organic salts.** M. E. ALESSANDRINI (Annali Chim. Appl., 1936, 26, 156—162).—The activity of H<sub>2</sub>O-glycerol solutions of malt or fungus amylase is not destroyed by Na lactate (I), citrate (II), or formate (III). If well prepared, the solutions retain their activity indefinitely. In aq. solution the activity is retained longer in the presence of the salts, especially (II) and (III).

L. A. O'N.

**Increase of the amount of active amylase in ungerminated cereals by hydrogen sulphide and papain.** T. CHRZĄSZCZ and J. JANICKI (Biochem. Z., 1936, 285, 47—54).—The amount of active amylase (I) in extracts of ungerminated barley can be increased by H<sub>2</sub>S to an even greater extent than by papain, the effect being reversed by replacing H<sub>2</sub>S by N<sub>2</sub>. The effect is not due to the freeing by H<sub>2</sub>S of (I) bound to protein, but is more probably due to a mobilisation or setting free of activators present in the cereals.

P. W. C.

**Amylase of rye during development and ripening.** T. CHRZĄSZCZ and J. JANICKI (Biochem. Z., 1936, 286, 13—19).—The saccharifying fraction of the amylase suffers partial inactivation as ripening proceeds, whilst the starch-liquefying and dextrin-producing fractions suffer almost complete inactivation because they are progressively adsorbed by sisto-substances which increase in amount as ripening advances. If the stage of development is not too far advanced addition of peptone (as cleuto-substance) counteracts the inactivation. The partial loss of saccharifying power is probably chiefly due to oxidation of the activators which stimulate this power. The views of Purr (A., 1934, 934) and Nordh *et al.* (A., 1932, 303) are contradicted in part.

W. McC.

**Taka-amylase. XI—XIII.** T. KITANO (J. Soc. Chem. Ind. Japan, 1936, 39, 163—165b; cf. this vol., 519).—The adsorption of amylase and maltase from taka-diaxase solutions by Pb and Ca phosphates, ortho-(AlOH)<sub>3</sub>- $\gamma$ , and poly-Al(OH)<sub>3</sub>-A has been determined at various [H<sup>+</sup>]. CaC<sub>2</sub>O<sub>4</sub> does not adsorb the enzymes.

P. G. C.

**Semi-micro-method for iodometric determination of maltose in studies of amylase action.** M. L. CALDWELL, S. E. DOEBBELING, and S. H. MANIAN (Ind. Eng. Chem. [Anal.], 1936, 8, 181—183).—The procedure combines the recommendations of Caldwell *etc.* (cf. this vol., 519) with the micro-method of Linderstrom-Lang and Holter (cf. A., 1933, 864).

E. C. S.

**Specificity of glucosidases.** E. HOFMANN (Biochem. Z., 1936, 285, 429—447).—Tables summarise results of the action of glucosidases of horse kidney, liver, and intestinal mucosa on a variety of  $\beta$ -glucosides and  $\beta$ -galactosides. Differences in  $p_H$  optima, velocity of reaction, *etc.* are so great as to oppose the view that there is only a small no. of sp. glucosidases.

P. W. C.

**Formation of milk sugar. *In-vitro* synthesis of lactose by active mammary gland preparations.** A. P. WEINBACH (J. Gen. Physiol., 1936, 19, 829—841).—Mammary glands of lactating rats, dried in vac. while frozen, yield a non-fermentable reducing substance on incubation with glucose alone or with pig's serum + glucose, galactose, or lactose.

H. G. R.

**Existence of a lipase in fatty tissue.** G. QUAGLIARIELLO and G. SCOZ (Arch. Sci. biol., 1932, 17, 513—529; Chem. Zentr., 1935, ii, 1733).—The lipase (I) content of subcutaneous fatty tissue in dogs is approx. the same as that of the stomach. The (I) is almost equally active towards lower and higher triglycerides, is activated by bile salts, CaCl<sub>2</sub>, quinine (II) (high concns.), and ovalbumin, and inhibited by NaCl, (II) (low concns.), and atoxyl. The glycerol extract of the tissue also contains an enzyme which hydrolyses atoxyl, liberating H<sub>3</sub>AsO<sub>3</sub>.

A. G. P.

**Influence of ketonic substances on serum-lipase.** J. BENEDICT and G. MAYER (Biochem. Z., 1936, 285, 299—305).—Serum-lipase (guinea-pig, man) is not inhibited by COMe<sub>2</sub> *in vitro* in concns. up to 0.35% but is inhibited, especially with guinea-pig lipase, by  $\alpha$ -,  $\beta$ -, and  $\gamma$ -hydroxybutyric acids (most by the  $\gamma$ - and least by the  $\beta$ -acid), inhibition being complete with 0.13—0.16% of acid.

P. W. C.

**Structure and properties of esterases. II. Relationship of ascorbic acid and liver-esterase.** W. VON PANTSCHENKO-JUREWICZ and H. KRAUT (Biochem. Z., 1936, 285, 407—419).—Preps. of liver esterase (I) possess the strong reducing properties characteristic of ascorbic acid (II). The (I) "pheron" or carrier (A., 1935, 251) acquires (I)-activity on adding (II). The blood- and liver-(I) contents of living animals increase on administration of (II). The reaction is not a simple one, however, since the amount of (II) required to reactivate the carrier far exceeds that detectable in (I) preps.

P. W. C.

**Formation of intermediate products during pancreatic digestion of neutral fats.** C. ARTOM and L. REALE (Boll. Soc. ital. Biol. sperim., 1935, 10, 883—884).—Partial hydrolysis (triglyceride hydrolysis, 6—55%) of olive oil by aq. extracts of dog's pancreas yields a product the Ac and sap. vals. of which indicate the presence of mono- and/or di-olein.

F. O. H.

**Products of synthetic action of pancreatic lipase on oleic acid and glycerol.** C. ARTOM and L. REALE (Boll. Soc. ital. Biol. sperim., 1935, 10, 884—886).—Dog's pancreas preps. with oleic acid and glycerol at 38° for 3—10 days produce mainly di- with some mono-olein when the synthesis is 50—55% complete and tri-+di-olein when 55—65% complete.

F. O. H.

**Castor-bean lipase. IX. Enzymic oil synthesis and its activating substance.** E. TAKAMURA (J. Agric. Chem. Soc. Japan, 1936, 12, 401—405).—A substance (not dihydroxystearic acid) exists which activates lipase but, after air oxidation, retards fat synthesis, due to the changed oxidation-reduction potential. P. G. M.

**Action of adrenaline and insulin on proteolytic enzymes of blood.** FERRANTI and MICHELI (Boll. Soc. ital. Biol. sperim., 1935, 10, 956—957).—Injection of insulin (15 units) and adrenaline (1 mg.) into men respectively decreases and increases the blood-proteases. F. O. H.

**Proteolytic enzymes of human embryos at different stages of development.** E. BLUM, A. I. JARMOSCHKEVITSCH, and A. I. JAKOVTSCHUK (Bull. Biol. Med. Exp. U.R.S.S., 1936, 1, 113—114).—The liver, kidney, intestine, and pancreas of the embryos contain dipeptidase from the 2nd month onwards. The intestine and pancreas, from the 5th—6th month, contain protease (I) and carboxypolypeptidase (II). Catheptic (I) [but not catheptic (II)] occurs in liver and kidney from the 3rd month onwards. W. McC.

**Isolation of crystalline pepsinogen from swine gastric mucosæ and its autocatalytic conversion into pepsin.** R. M. HERRIOTT and J. H. NORTHROP (Science, 1936, 83, 469—470).—Details of the isolation of pepsinogen (I) as a colourless protein crystallising in needles from 0.4-saturated  $(\text{NH}_4)_2\text{SO}_4$  at  $p_H$  5.2—5.6 are given. (I) is converted into pepsin at  $p_H$  4.6 by an autocatalytic reaction similar to the conversion of trypsinogen into trypsin; the change probably involves rupture of a peptide linking. L. S. T.

**Ascorbic acid as activator of hepatic cathepsin in presence of ionised or complex-forming metals.** A. BADINAND (Compt. rend., 1936, 202, 1714—1716).—The activation [which does not occur with dehydroascorbic acid (I)] of cathepsin by ascorbic acid (II) is enhanced by  $\text{Ca}^{++}$ ,  $\text{Fe}^{++}$ ,  $\text{Fe}^{+++}$ , or  $\text{Zn}^{++}$ , but not by  $\text{Ba}^{++}$ ,  $\text{Mg}^{++}$ ,  $\text{Pb}^{++}$ , or  $\text{Ti}^{+++}$ , whilst  $\text{Cu}^{++}$  has an inhibitory effect. Complexes containing  $\text{Fe}$ ,  $\text{Zn}$ ,  $\text{Pb}$ ,  $\text{Ti}$ ,  $\text{Ca}$ ,  $\text{Ba}$ ,  $\text{Mg}$ , or  $\text{Cu}$  with (I) or (II) are also active. F. O. H.

**Changes in the activity of the dipeptidases in the regenerating tissues of amphibians.** V. N. ORECHOVITSCH (Biochem. Z., 1936, 286, 91—92; cf. A., 1935, 779).—In the regenerating tails of tadpoles and axolotl, dipeptidase activity on the 2nd day after amputation is 2—2.5 times as great as in ordinary tissue and reaches its max. when regeneration is complete. Subsequently the activity decreases. W. McC.

**Effect of deuterium oxide on action of enzymes.** D. I. MACHT and H. F. BRYAN (J. Amer. Chem. Soc., 1936, 58, 729—731).—Methylene-blue is decolorised more rapidly by suspensions of muscle (I) (rat) and brain in saline containing  $\text{D}_2\text{O}$  (1 in 100—5000) than in aq. saline; a similar acceleration is found for aq.  $\text{D}_2\text{O}$  (1 in 500—2000) extracts of *Lupinus albus* seeds (II) compared with aq. extracts.  $\text{H}_2\text{O}_2$  is decomposed more rapidly by catalase from (I) and

(II) in presence of  $\text{D}_2\text{O}$  (1 in 100). In some cases the more conc. solutions of  $\text{D}_2\text{O}$  cause an initial retardation which is followed by a more marked acceleration. H. B.

**Action of heavy water on fumarase and phosphatase systems.** PEREIRA-FORJAZ and K. P. JACOBSON (Bull. Soc. Chim. biol., 1936, 18, 926—931).—The enzymes are not inhibited by  $\text{D}_2\text{O}$  and it is probable that its action *in vivo* is due to changes in membrane diffusion. H. G. R.

**Fermentation co-enzyme.** O. WARBURG and W. CHRISTIAN (Biochem. Z., 1936, 285, 156—158).—The mixture of phosphoric esters obtained from horse red corpuscles (this vol., 377) contains both  $\text{H}_2$ -transporting co-enzyme (I) and fermentation co-enzyme (II). A method for the separation of (I) and (II) is described. (II) contains 13% N, 8% P [(I) contains 13% P], and on hydrolysis gives adenine and nicotinamide. P. W. C.

(A) **Cozymase.** H. VON EULER, H. ALBERS, and F. SCHLENK. (B) **Pyridine as the active group of dehydrogenating enzymes.** O. WARBURG and W. CHRISTIAN (Biochem. Z., 1936, 286, 140—141, 142).—Polemical and claims to priority. W. McC.

**Glycolysis and phosphate metabolism in cell-free extracts of mammalian brain.** H. VON EULER, G. GÜNTHER, and R. VESTIN (Z. physiol. Chem., 1936, 240, 265—278).—Glycolysis in the extracts (calf, rabbit, rat) requires the presence of  $\text{PO}_4'''$ , although not in the amounts required for glycolysis in muscle. In presence of  $\text{NaF}$ ,  $\text{AcCO}_2\text{H}$  and hexose diphosphate interact in the extracts to produce lactic acid and phosphoglyceric acid as in muscle extracts. The process is activated by cozymase, heat-inactivated cozymase, adenylic acid, and adenosinetriphosphoric acid, but not by glutathione and cysteine. The best substrates for glycolysis by the extracts are glucose and fructose; the extent of degradation of glycogen is smaller and varies considerably. W. McC.

**Salivary phosphatase.** K. V. GIRI (Biochem. Z., 1936, 285, 306—310).—Saliva of adults and children contains a phosphatase, probably identical with urinary phosphatase, which hydrolyses Na glycerophosphate ( $p_H$  optimum 4—5) and more readily Na hexose diphosphate ( $p_H$  optimum 7), which can be dialysed without serious loss of activity and is not activated by  $\text{Mg}^{++}$  at  $p_H$  5. P. W. C.

**Yeast phosphatases.** W. SCHUCHARDT (Biochem. Z., 1936, 285, 448—456).—By selective inactivation by treatment with dil. acid or alkali (this vol., 521) yeast is shown to contain two isodynamic phosphatases, of which that with acid is able to hydrolyse all the investigated phosphoric esters ( $\alpha$ - and  $\beta$ -glycerophosphoric acids, hexose mono- and diphosphate, phosphopyruvic acid, and 3-phosphoglyceric acid), whilst that with alkali using brewery yeast shows considerable relative specificity which, however, is absent using pure cultures of yeast, especially when grown on wort-agar. P. W. C.

**Pyrophosphate of yeast cells. I. Behaviour of the pyrophosphate towards enzymes.** M. M. LEVITOV (Bull. Biol. Méd. Exp. U.R.S.S., 1936, 1,

106—108; cf. this vol., 522).—Adenosine triphosphate comprises < 10% of the total pyrophosphate of yeast. W. McC.

**Balance sheet of sugar fermentation by yeasts.** R. GUILLEMET (Bull. Soc. Chim. biol., 1936, 18, 941—958).—EtOH and CO<sub>2</sub> formed and unutilised sugar were determined during fermentation of glucose, fructose, sucrose, and maltose (I) by various yeasts. With (I), especially in a very dil. medium, the ratio of EtOH formed to reducing sugar utilised sometimes exceeds the theoretical yield of 51%, owing to auto-fermentation. The production of EtOH without CO<sub>2</sub> was also observed in fermentation of (I), particularly with small quantities of yeast. H. G. R.

**Nitrogen assimilation of yeast. VI. Assimilation of formol-titratable nitrogen compounds from beer-wort.** N. NIELSEN and A. LUND (Compt. rend. Trav. Lab. Carlsberg, 1936, 21, No. 13, 239—246).—There is a greater decrease in formol-titratable N (I) than in total N in wort during fermentation, as the former is much more readily assimilated by yeast. If the medium is so diluted that the whole of the assimilable N is taken up, only about 50—70% of (I) is assimilated. Autolysis causes small amounts of (I) to be liberated. E. A. H. R.

**Role of oximinopyruvic and acrylic acids in the synthesis of alanine by yeasts during alcoholic fermentation.** C. FROMAGEOT and P. DESNUELLE (Bull. Soc. Chim. biol., 1936, 18, 820—824).—Neither of these acids is an intermediate in the synthesis of alanine from AcCO<sub>2</sub>H. H. G. R.

**Effect of complex organo-metallic derivatives of vitamin-C on the fermenting power of brewer's yeast.** F. ARLOING, A. MOREL, A. JOSSEAND, L. THÉVENOT, and J. M. PERRET (Compt. rend. Soc. Biol., 1936, 122, 577—579).—Complexes containing Cu have a definite inhibiting action, whilst the accelerating action of other complexes occurs only if the metal is in the complex state (cf. this vol., 626). H. G. R.

**Effect of arsenates on fermentation.** O. MEYERHOF and W. KIESSLING (Naturwiss., 1936, 24, 361—362).—AsO<sub>4</sub><sup>'''</sup> increases the rate of fermentation of phosphopyruvic acid (I) up to the same val. as that of sugar. Fermentation and dephosphorylation of (I) occur only in the presence of a co-enzyme. Mg and the adenyllic acid system have co-enzymic activity, but cozymase is more active. The action of AsO<sub>4</sub><sup>'''</sup> is attributed to an accelerated decomp. of a cozymase pyrophosphate (II). M/500-AsO<sub>4</sub><sup>'''</sup> decomposes sufficient (II) in yeast maceration juice to account for the max. fermentation rate observed in the presence of AsO<sub>4</sub><sup>'''</sup>. (II) is obtained from cozymase by esterification with (I) and may be isolated as the Ba salt. Dephosphorylation of (I) is very rapid and is followed by decarboxylation of AcCO<sub>2</sub>H. The rate of decomp. of (II) determines the rate of fermentation of (I). This is a max. when (a) the PO<sub>4</sub><sup>'''</sup> formed can esterify sugars present, and (b) in the presence of M 500-AsO<sub>4</sub><sup>'''</sup> if sugars are absent. E. A. H. R.

**Incorporation of deuterium into growing organisms. IV.** F. SALZER and K. F. BONHOEFFER (Z. physikal. Chem., 1936, 176, 202—208; cf. this

vol., 639).—Yeast has been grown in culture solutions of sucrose (I) in heavy H<sub>2</sub>O. D was assimilated in a form which could not be washed out and the ratio of the D content of the H of the dry substance of the yeast to that of the H of the H<sub>2</sub>O was approx. 0.42. The D contents of the H of the mixture of amino-acids, the glycogen (II), and the cell-wall hemicelluloses (III) isolated from the yeast were approx. 11, 3, and 15%, respectively. It is inferred that (II) is elaborated from the original (I) in a more direct way than is (III). Only (III) has a D content approx. the same as that of the total dry substance of the yeast. R. C.

**Conjugated action of follicular hormone and mineral catalysts on growth of yeast.** G. BERTRAND and A. P. WEBER (Compt. rend., 1936, 202, 1629—1632).—The increased growth of two species of *Rhodotorula* due to follicular hormone is further enhanced by addition of a mixture of traces of B, I, Cu, Mn, Tl, and Zn; of these catalysts Zn has an outstanding effect. F. O. H.

**Action of follicular hormone on growth of micro-organisms.** A. LUND (Compt. rend. Trav. Lab. Carlsberg, 1936, 21, No. 12, 231—238).—The growth of *Aspergillus niger* and *Saccharomyces cerevisiae* is unaffected by both commercial progynon and pure follicular hormone. E. A. H. R.

**Relation of accessory substances to heavy metals, including molybdenum, in the nutrition of *Aspergillus niger*.** R. A. STEINBERG (J. Agric. Res., 1936, 52, 439—448).—Accessory growth substances are not required by *A. niger*. Decreased growth following the use, in media, of sugar purified by EtOH (to remove bios and co-enzyme R) is due to removal of Mo and Zn in the process. Beneficial effects of yeast, malt extract, etc., usually ascribed to accessory substances, may also be due to heavy metals thus introduced into media. A. G. P.

**Influence of hydrogen acceptors on the fermentation of fucose by *Aspergillus oryzae*.** T. TADOKORO (Bull. Chem. Soc. Japan, 1936, 11, 239—247).—Fermentation of fucose by *A. oryzae* gives kojic, glycollic (I), and lactic (II) acids, a little H<sub>2</sub>C<sub>2</sub>O<sub>4</sub>, a keto-acid (? glycuronic acid), m.p. 155—158°, possibly citric and tartaric acid, and glyceraldehyde. In presence of Me-blue maleic acid is obtained in place of (I) and (II). R. S. C.

**Production of acids from sugar by *Aspergillus niger*. VI. Factors affecting accumulation of citric acid.** K. BERNHAUER and A. IGLAUER (Biochem. Z., 1936, 286, 45—59; cf. A., 1932, 1168).—Best yields of the acid are obtained when the sugar concn. is 17.5—20% (yield 70%) and when the experimental details given are closely followed. Suitable strains of *A. niger* propagated as described must be used. W. McD.

**Conversion of acetic into citric acid by moulds.** T. CHRZĄSZCZ and M. ZAKOMORNY (Biochem. Z., 1936, 285, 340—347).—Strains of *A. niger* grow on Ca(OAc)<sub>2</sub> and convert it chiefly into citric acid (I) or into (I) —H<sub>2</sub>C<sub>2</sub>O<sub>4</sub> (II), addition of small amounts of sugar having a favourable effect on the reaction. Mycelia feebly growing due to unfavourable media and old

mycelia gave little (I) but considerable yields of (II). The view that (I) arises from mycelial substances is incorrect. The formation of aconitic acid as an intermediate was not detected. P. W. C.

**Significance of malic acid in the conversion of acetic to citric acid by moulds.** T. CHRZASZCZ and M. ZAKOMORNY (Biochem. Z., 1936, 285, 348—355).—Addition of *l*-malic acid (I) (Na salt) to a medium containing 4% of  $\text{Ca}(\text{OAc})_2$  (II) led, with strains of *A. niger*, to increased formation of citric acid (III), the effect being almost as great as that on addition of small amounts of sugar (cf. preceding abstract). Free AcOH or (I) is toxic. Addition of 0.5% (I) (Na salt)+0.5% sugar had a better effect on the production of (III) than that of 2% sugar, the amount of (III) formed increasing to 50% of the (II) used. The conversion of sugar into (III) thus requires the simultaneous presence of  $\text{AcOH} + (\text{I})$ . P. W. C.

**Biochemistry of filamentous fungi. IV. Mycelial constituents of *Oospora sulphureo-ochracea*.** I. H. NISHIKAWA (Bull. Agric. Chem. Soc. Japan, 1936, 12, 47—50).—This mould was grown on koji wort of 8° Balling at 20°; 1.2 g. of dried mycelium is obtained per 100 c.c. of medium. Extraction of the powdered mycelium with  $\text{Et}_2\text{O}$  yields three cryst. compounds,  $\text{C}_{17}\text{H}_{16}\text{O}_8$ , needles, m.p. 214° (from EtOH), giving a violet colour with  $\text{FeCl}_3$ -EtOH;  $\text{C}_{10}\text{H}_{10}\text{O}_4$ , pale yellow needles, m.p. 257° (decomp.), from AcOH, sol. in NaOH but insol. in  $\text{NaHCO}_3$ , giving a green colour with  $\text{FeCl}_3$ -EtOH;  $\text{C}_{17}\text{H}_{16}\text{O}_8$ , rhombs, m.p. 200° (with effervescence), from EtOH, giving no colour with  $\text{FeCl}_3$ . A fourth compound, (?)  $\text{C}_{18}\text{H}_{18}\text{O}_8$ , m.p. 190°, is sometimes obtained. P. G. M.

**Content of vitamin- $B_1$  in wheat-germ extracts.** W. H. SCHOPFER and A. JUNG (Compt. rend. Soc. Biol., 1936, 122, 249—251).—The effect of wheat-germ extracts on the growth of *Phycomyces* is partly due to presence of vitamin- $B_1$ . F. O. H.

**Production of vitamins by *Aspergillus oryzae*.** A. SCHEUNERT and M. SCHIEBLICH (Biochem. Z., 1936, 286, 66—71).—*A. oryzae* grown on a mixture free from vitamins produces vitamin- (6 international units from 1 g.) and about twice as much  $-B_2$  as occurs in dry yeast, but no  $-A$ . W. McC.

**Production by moulds and bacteria of substances similar to vitamin-C.** K. BERNHAUER, B. GORLICH, and E. KOCHER (Biochem. Z., 1936, 286, 60—65).—*Aspergillus niger* produces a reducing substance (I) similar to ascorbic acid from sucrose (II), glycerol, sorbitol, and inositol and, in poorer yield, from glucose, mannose, galactose, fructose, sorbose, and lactose. The amount of (I) produced from (II) increases as the (II) concn. increases, the max. yield being attained in 15—25 days. The optimal  $p_H$  for the process is 2.8—3.0. Production of (I) is stimulated by the presence of free acid (citric) and the yield increases as the acid concn. is increased. W. McC.

**Action of *p*-aminophenylsulphamide on moulds.** E. FOURNEAU, J. TREFOUEL, (MME.) J. TRÉFOUEL, F. NITTI, and D. BOVET (Compt. rend. Soc. Biol., 1936, 122, 652—654).—An inhibition of growth

occurs which, in a series of derivatives, runs parallel to the anti-streptococcal activity. H. G. R.

**Invasiveness of skin infections caused by pathogenic fungi and subsurface mycelium.** J. W. WILLIAMS (Science, 1936, 83, 396—397).—The ability of various fungi to invade various solid media with hydrolysed hair or skin as the source of N has been studied and the changes produced are recorded. L. S. T.

**Symbiosis and digestion of cellulose in termites and in mammals.** U. PIERANTONI (Boll. Soc. ital. Biol. sperim., 1935, 10, 944—946).—Utilisation of cellulose due to symbiotic protozoa in the intestines of animals is discussed with special reference to symbiosis of flagellates and termites. F. O. H.

**Blood-iron in experimental *Trypanosoma annamense* infection in rabbits.** L. LAUNOY and H. LAGODSKY (Compt. rend. Soc. Biol., 1936, 122, 633—636).—A diminution in the red cells,  $d$ , and respiratory capacity of the blood was observed. H. G. R.

**Surface electric charge of micro-organisms.** N. CHOUCROUN (Compt. rend., 1936, 202, 1711—1714).—Characteristic variations in the electrophoretic potential of bacteria are discussed. F. O. H.

**Fermentation of dibasic  $C_4$ -acids by *Aerobacter aerogenes*.** H. A. BARKER (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 674—683).—The fermentation of *d*-tartaric (I), *d*-malic, *l*-malic (II), fumaric (III), maleic, and succinic (IV) acids by *A. aerogenes* was investigated. Only (I), (II), and (III) were decomposed. The fermentation appears to proceed by an initial oxidation-reduction between 2 mols. of the substrate, thus accounting for the formation of (IV) in the process. In the decomp. which follows there is no direct splitting of a  $C_4$  mol. into 2  $C_2$  mols.;  $\text{AcCO}_2\text{H}$  is first formed, and this undergoes further decomp. into  $\text{HCO}_2\text{H}$  and AcOH or  $\text{CO}_2$  and MeCHO. Further degradation of  $\text{HCO}_2\text{H}$  may account for the small amounts of  $\text{H}_2$  formed; the presence of EtOH may be due to MeCHO acting as a H-acceptor for the dehydrogenation of (III). E. A. H. R.

**Influence of various sources of carbon on the nitrogen metabolism of *B. perfringens*.** D. GRINEV, D. GORFUNKEL, E. CHAPIRO, and J. GURVITSCH (Bull. Inst. Metchnikoff, 1936, 1, 65—68).—Carbohydrates, alcohols, and salts of org. acids exercise different effects on the N metabolism of *B. perfringens*. W. O. K.

**Hydrogen donators for pneumococcus.** D. BACH (Compt. rend. Soc. Biol., 1936, 122, 558—560).— $\text{AcCO}_2\text{Na}$  added to the culture preserves the activity of glucose-dehydrogenase. H. G. R.

**Nitrogenous nutrition of propionic bacteria.** I. II. Utilisation of ammonia nitrogen. C. FROMAGEOT and P. LAROUX (Bull. Soc. Chim. biol., 1935, 18, 797—811, 812—819).—I. Growth of propionic bacteria in a broth containing decorticated, crushed maize is appreciable only in presence of  $\text{NH}_4$  salts of org. or weak mineral acids.

II. Maize contains a substance enabling propionic bacteria to utilise  $\text{NH}_4\text{-N}$  as a sole source of N.

H. G. R.

**Dehydrogenation in presence of nitrate.** E. AUBEL and F. EGAMI (Compt. rend. Soc. Biol., 1936, 122, 248—249).—The action of various poisons indicates that bacterial dehydrogenation (optimum  $p_{\text{H}}$  9—9.5) of lactic acid in presence of methylene-blue differs from that when  $\text{KNO}_3$  is the  $\text{H}_2$  acceptor; no differentiation is apparent with *l*-alanine as substrate and O and  $\text{KNO}_3$  as  $\text{H}_2$  acceptors. F. O. H.

**Dehydrogenation of lactic acid by staphylococci.** M. G. SEVAG and N. NEUENSCHWANDER-LEMMER (Biochem. Z., 1936, 286, 7—12).—*S. aureus* and *S. albus* convert lactic acid (I) to the extent of 92 and 85% into  $\text{AcCO}_2\text{H}$ , no  $\text{MeCHO}$ ,  $\text{AcOH}$ , or succinic acid being produced. The organisms do not attack  $\text{AcCO}_2\text{H}$  and  $\text{AcOH}$ . With (I), glucose, and glycerol as substrate they consume  $\text{O}_2$  and liberate  $\text{CO}_2$ . W. McC.

**Formation of cadaverine from lysine.** A. I. VIRTANEN and T. LAINE (Suomen Kem., 1936, 9, B, 17—18).—Conversion of lysine (I) into cadaverine (II) by *B. coli* and *B. fluorescens liquefaciens* occurs when (I) is added to media or is acted on by washed bacterial suspensions. (I) is probably excreted from leguminous root nodules and the occurrence of (II) in soil is thus possible. A. G. P.

**Bacterioxanthophyll, the yellow pigment of *Sarcina lutea*.** T. NAKAMURA (Bull. Chem. Soc., Japan, 1936, 11, 176—179).—Evaporation of a  $\text{MeOH}$  extract of *S. lutea* gives a residue, from which a little  $\text{MeOH}$  dissolves the pigment preferentially. Dilution with  $\text{H}_2\text{O}$  (2.3 parts) and extraction with  $\text{Et}_2\text{O}$  gives a crude pigment, shown by colour reactions, solubility, oxidation by  $\text{H}_2\text{O}_2$ , reduction by  $\text{Mg-HCl}$ , absorption spectrum (max. at 490, 460, and 433  $\text{m}\mu$  in  $\text{CS}_2$ ), and saponification to be an ester of xanthophyll type. The pigment is adsorbed on  $\text{Al}_2\text{O}_3$  etc., but is difficult to elute; it gave traces of crystals. R. S. C.

**Lipins of tubercle bacilli. XLV. Isolation of  $\alpha$ - and  $\beta$ -leprosol.** J. A. CROWDER, F. H. STODOLA, and R. J. ANDERSON. XLVI. Phthiocerol, an alcohol from the wax of the human tubercle bacillus. F. H. STODOLA and R. J. ANDERSON (J. Biol. Chem., 1936, 114, 431—439, 467—472; cf. this vol., 899).—XLV. The viscous, unsaponifiable matter from the  $\text{COMe}_2$ -sol. fat from *B. leprae*, when treated with ligroin, gives a mixture, resolved by way of the acetates (prep. by  $\text{C}_5\text{H}_5\text{N-Ac}_2\text{O}$ ) into  $\alpha$ - (I), m.p. 100—101° [acetate, m.p. 69—70°; *Br*-derivative, m.p. 66—67° (resolidifies at 59°, remelts at 73—74°)], and  $\beta$ -leprosol (II),  $\text{OH}\cdot\text{C}_{25}\text{H}_{42}\cdot\text{OMe}$ , m.p. 84—85° (acetate, m.p. 47—48°, resolidifies at 45°, remelts at 51—52°; *Br*-derivative, m.p. 42°, remelts at 45—46°; 3:5-dinitrobenzoate, m.p. 86—87°; urethane, an oil). With HI (I) and (II) give compounds (III),  $\text{C}_{25}\text{H}_{42}(\text{OH})_2$ , m.p. 113—114° and 104—105°, respectively, the latter giving a diacetate, m.p. 48°. (I) and (II) are indifferent to  $\text{CH}_2\text{N}_2$ , but with  $\text{Me}_2\text{SO}_4\text{-KOH}$  in aq.  $\text{EtOH}$  give *Me ethers* (called leprosol *Me*, ethers),  $\text{C}_{25}\text{H}_{42}(\text{OMe})_2$ , m.p. 78—79° (remelts at 80—81°) and 70°, respectively, which are not obtained from (III).

(I) and (II) give no sterol colour reactions, but give a ppt. with digitonin, and are feebly acidic; (I), (II), and (III) give  $\text{FeCl}_3$  and phosphomolybdate reactions. They probably contain a  $\text{C}_6\text{H}_6$  ring carrying the OH and OMe.

XLVI. Hydrolysis of the wax, m.p. 55—56°,  $[\alpha]_D^{25} +0.55^\circ$  in  $\text{CHCl}_3$ , from human tubercle bacilli gives no *d*-eicosan- $\beta$ -ol or *d*-decan- $\beta$ -ol, but affords phthiocerol,  $\text{C}_{34-35}\text{H}_{67-69}(\text{OH})_2\cdot\text{OMe}$ , m.p. 73—74°,  $[\alpha]_D^{25} -4.8^\circ$  in  $\text{CHCl}_3$  (diacetate, m.p. 37—38°; HI gives a hydrocarbon,  $\text{C}_{34}\text{H}_{70}$ , m.p. 58.5—59.5°, stable to Br and giving no colour in the Liebermann-Burchard reaction, probably identical with phytoglycol (A., 1934, 699). R. S. C.

**Phosphorus-containing lipins from human tubercle bacillus.** K. BLOCH (Biochem. Z., 1936, 285, 372—385).—Anderson's A3 phosphatide does not contain an org. N base, the N content being due to impurities, and cannot be any known aminophosphatide or sphingomyelin. By warming with  $\text{COMe}_2$  an unsaponifiable substance AII, m.p. 37°, separates which contains neither P nor N, does not give sterol reactions, and appears to be a wax alcohol. Treatment with dil.  $\text{HCl}$  removes org. bound Mg, and two phosphatides can then be separated: AI, P 3.55%, insol. in  $\text{COMe}_2$ , almost N-free, high m.p. and non-hygroscopic; B, P 2.44%, N < 0.1%, yellow oil, sol. in warm  $\text{COMe}_2$ . Substances AI and B probably are similar in structure excepting that in B the unsaturated and saturated liquid fatty acids predominate. The carbohydrate content of A3 is not chemically bound to the phosphatide. P. W. C.

**Medium for production of a highly active tetanus toxin.** M. GLUSMANN, M. TCHERVIKOV, and G. STAROBINETZ (Bull. Inst. Metchnikoff, 1936, 1, 51—52).—The medium is prepared from a peptone produced by autoclaving meat protein with dil.  $\text{HCl}$  under 2 atm. pressure. W. O. K.

(A) Nitrogen metabolism of *B. tetanus*. (B) Comparisons of strains of different toxicity. D. GRINEV, D. GORFUNKEL, E. CHAPIRO, and J. GURVITSCH (Bull. Inst. Metchnikoff, 1936, 1, 47—48, 49—50).—(A) When *B. tetanus* (I) is grown on peptone media, the changes in various N fractions depend on the type of peptone employed.

(B) The N metabolism of various strains of (I) is the more intense the greater is the activity of the toxins which they produce. W. O. K.

**Chemistry of the somatic antigen of dysentery bacillus.** L. MESROBEANU and G. CALALB (Compt. rend. Soc. Biol., 1936, 122, 496—497).—The fatty acid and sugar contents of various strains are tabulated.

H. G. R.

**Toxicity and specificity of the somatic antigen of dysentery bacillus.** G. CALALB and L. MESROBEANU (Compt. rend. Soc. Biol., 1936, 122, 497—499).—The antigens of the smooth forms have practically the same toxicity. Pptn. reactions with anti-sera at various dilutions are described. H. G. R.

**Staining of bacterial flagella.** S. LEVENSON (Ann. Inst. Pasteur, 1936, 56, 634—643).—Casares-Gil's method is improved by substituting Ag-impreg-

nation by means of aq.  $\text{NH}_3\text{-AgNO}_3$  for treatment with methylene-blue or other basic dye, after mordanting.

P. G. M.

**Luciferin-oxy-luciferin.**—See this vol., 938.

**Inactivation of bacteriophage by ascorbic acid.** I. LOMINSKI (Compt. rend. Soc. Biol., 1932, 122, 766—768).—Ascorbic acid in very low concn. inactivates bacteriophage, the bacteria themselves being less sensitive. Cysteine hydrochloride and pyrogallol have a similar action.

A. L.

**Spontaneous reappearance of lytic activity of bacteriophage inactivated by heat.** I. LOMINSKI (Compt. rend. Soc. Biol., 1936, 122, 769—771).—Bacteriophage heated for 60—90 min. at 60° loses its activity, but reactivation takes place on keeping. The fixation of the bacteriophage by the bacteria is unaffected by the treatment.

A. L.

**Adaptation of bacteriophage to heat.** J. JADIN (Compt. rend. Soc. Biol., 1936, 122, 470—471).—By heating at successively increasing temp. for short periods, the resistance to heat is increased.

H. G. R.

**Ultrafilterability and probable dimensions of bacteriophages.** C. LEVADITI, M. PAIC, J. VOET, and D. KRASSNOFF (Compt. rend. Soc. Biol., 1936, 122, 354—358).—The diameters of various bacteriophages have been determined by ultrafiltration methods.

H. G. R.

**New group of filterable organisms.** P. P. LAIDLAW and W. J. ELFORD (Proc. Roy. Soc., 1936, B, 120, 292—303).—Three strains of a new group of saprophytic organisms have been isolated from sewage; these may be cultivated on artificial media. Each strain shows a marked variation in size, but the organisms are retained by filters of average pore diameter 0.25  $\mu$ . The small forms, which are of about the same size as vaccinia virus, yield cultures containing the large form.

F. A. A.

**Purification of ultra-virus.** V. DEUTSCH (Compt. rend. Soc. Biol., 1936, 122, 529—532).—Vaccinia virus cannot be eluted by Sato and Kodama's method. Ideal purification is not obtained by adsorption and elution, since protein passes into solution with the virus during elution.

H. G. R.

**Antiseptic and bactericidal power of diacetyl.** M. LEVY-BRUHL and Y. CADO (Compt. rend. Soc. Biol., 1936, 122, 373—374).—0.04% is bactericidal for certain pathogenic species.

H. G. R.

**Triethanolamine. [Action on bacteria.]** A. BERTHELOT, G. AMOUREUX, and F. VAN DEINSE (Bull. Soc. Chim. biol., 1936, 18, 652—655).—Technical  $\text{N}(\text{CH}_2\text{-CH}_2\text{-OH})_3$  (I) was without toxic action on a no. of bacteria at 7.3—7.8. In certain cases cultures were obtained when (I) was the only source of C and N.

A. L.

**Natto, or fermented soya bean.** I. Effect of the dipicolinic acid produced. S. UDO (J. Agric. Chem. Soc. Japan, 1936, 12, 386—394).—Accumulation of dipicolinic (pyridine-2:2'-dicarboxylic) acid (I) to a concn. of 1.2—1.5% completely suppresses the growth of *Bacillus natto*, which is also partly inhibited by the viscous substance produced around the soya-

bean grains. The growth of *B. subtilis* and of *Penicillium glaucum* is also inhibited by (I).

P. G. M.

**Chemotherapy of streptococcal infections by derivatives of p-aminophenylsulphonamide.** E. FOURNEAU, J. TRÉFOUËL, (MME.) J. TRÉFOUËL, F. NITTI, and D. BOVET (Compt. rend. Soc. Biol., 1936, 122, 258—259; cf. this vol., 232).—Orientation, replacement, or substitution of the  $\cdot\text{NH}_2$ , substitution of the  $\cdot\text{SO}_2\cdot\text{NH}_2$ , or introduction of a third group generally produces diminished anti-streptococcal activity. Diazotisation and coupling produces active derivatives.

F. O. H.

**Chemotherapeutic efficacy of arsenic compounds of sulphur-rich protein fission products.** W. A. COLLIER and M. KRAUSE (Z. Hyg. Infekt., 1935, 117, 190—195; Chem. Zentr., 1935, ii, 2083).—Condensation products of hydroxy-, amino-, and hydroxylamino-phenylarsine oxides with S-rich keratin fission products of high mol. wt. have been tested. The chemotherapeutic index (mice and rabbits) for the best prep. is 1:120 for trypanosomes and 1:20 for spirochaetes of relapsing fever.

H. N. R.

**Chemotherapeutic action on *Spirillum minus* in mice by certain anil- and styryl-quinoline compounds free from metals or metalloids.** C. H. BROWNING and R. GULBRANSEN (J. Pharm. Exp. Ther., 1936, 57, 56—66).—2-(p-Dimethylaminoanil)-6-acetamidoquinoline methochloride and methosulphate have a marked therapeutic action on *S. minus* infections of mice. Certain related compounds are also active, but to a smaller extent. No obvious relationship was detected between the degree of activity and chemical constitution.

W. O. K.

**Adrenaline binding by different protein substances, lipins, and ground muscular tissue.** J. T. BALABA (Platz. Utschen. Med., 1936, 231—235).—Certain proteins (e.g., caseinogen but not gelatin), peptone, and muscular tissue bind considerable quantities of adrenaline, the effect being increased by lactic acid.

W. O. K.

**Adrenaline secretion in hypophysectomised dogs.** L. KÉPINOV (Compt. rend. Soc. Biol., 1936, 122, 351—354).—After injection of large doses of insulin, the secretion of adrenaline is increased as the blood-sugar falls, the max. coinciding with the appearance of hypoglycæmic convulsions.

H. G. R.

**Adrenaline and the metabolic activity of the warm-blooded heart.** B. WEICKER (Arch. exp. Path. Pharm., 1936, 181, 525—540).—Lactic acid (I) and P fractions were determined in the muscles of the surviving cat's heart after coronary perfusion with adrenaline (II). Under aerobic conditions, therapeutic doses of (II) caused a slight increase of (I) and small changes in the sol. P. Toxic doses of (II) with the unfatigued heart caused cleavage of phosphagen, adenylyl pyrophosphate, and hexose esters with production of  $\text{PO}_4^{''}$ , but performance of work quickly caused resynthesis. There was a similar result under anaerobic conditions, and renewal of the  $\text{O}_2$  supply caused a resynthesis of cleavage products. With hearts poisoned with HCN, (II) increased (I) nearly 500%. The action of strophanthin is very similar to

that of (II), and the differences in degree of their action are discussed. J. N. A.

**Potassium: a basal factor in the syndrome of cortico-adrenal insufficiency.** R. L. ZWEMER and R. TRUSZKOWSKI (*Science*, 1936, **83**, 558—560).—An important function of the adrenal cortex is the regulation of K metabolism and known symptoms of cortico-adrenal insufficiency may be due to a disturbance of cortico-adrenal-K relationships. The beneficial effect of cortin in certain other pathological conditions suggests that the same mechanism is involved. L. S. T.

**Antagonistic action of adrenal cortex hormone towards the fat- and carbohydrate-metabolism hormones of the anterior pituitary gland.** K. J. ANSELMINO, F. HOFFMANN, and E. RHODEN (*Arch. exp. Path. Pharm.*, 1936, **181**, 325—327).—Simultaneous administration of adrenal cortex hormone inhibits the ketogenic (indicated by fall in blood-COMe<sub>2</sub>) and liver-glycogenolytic actions of anterior pituitary fat- and carbohydrate-metabolism hormones (either as crude or purified preps.), respectively. F. O. H.

**Action of the fat metabolism hormone of the anterior pituitary on the saturated and unsaturated fatty acids of the liver.** K. J. ANSELMINO, G. EFFKEMANN, and F. HOFFMANN (*Z. ges. exp. Med.*, 1935, **96**, 209—220; *Chem. Zentr.*, 1935, ii, 1736).—Serum of individuals who have eaten a fat meal, injected into pigeons or rats, causes a rise of unsaturated fatty acids in the liver, which reach a max. in 6 hr. Total fat falls when the initial val. is low, and rises when it is high. Pituitary extracts that contain the fat-metabolism hormone (I) exert the same effects. The active material of the serum is similar to (I) in its ultrafilterability, thermostability, solubility, and response to acids and alkalis; the two are probably identical. R. N. C.

**Liver enlargement following administration of anterior pituitary and organ extracts.** G. EFFKEMANN and L. HEROLD (*Z. ges. exp. Med.*, 1935, **96**, 195—208; *Chem. Zentr.*, 1935, ii, 1736). R. N. C.

**Anterior pituitary hormone and the male genital apparatus: problem of puberty.** G. PIGHINI (*Biochim. Terap. sperim.*, **20**, 161—183; *Chem. Zentr.*, 1935, ii, 1903). R. N. C.

**Action of anterior pituitary sex hormones on different endocrine glands (pancreas, adrenals, pituitary, thyroid) after ligation of the deferentiae.** G. LUCARELLI (*Biochim. Terap. sperim.*, **20**, 10—13; *Chem. Zentr.*, 1935, ii, 1903). R. N. C.

**Thyrotropic hormone of the pituitary gland and iodine metabolism.** B. F. STIMMEL, D. R. McCULLAGH, and V. PICHA (*J. Pharm. Exp. Ther.*, 1936, **57**, 49—55).—Administration of the thyrotropic pituitary hormone (I) to chicks and guinea-pigs lowers the I content of the thyroid. A method for the assay of (I) based on this observation is suggested. (I) is partly inactivated by heating at 100° for 15 min. W. O. K.

**Amount of thyroid-stimulating hormone in the anterior lobe of the pituitary of the thyroid-**

**ectomised rabbit.** G. CHEN and H. B. VAN DYKE (*Chinese J. Physiol.*, 1936, **10**, 285—296).—Thyroidectomy in young female rabbits results, in three months, in an increase in the thyrotropic hormone (I) content of the anterior lobe of the pituitary. No increase in (I) in male rabbits is observed, although hypertrophy of the pituitary is greater. No sexual difference occurs in the total (I) content in normal rabbits. The H<sub>2</sub>O content of hypertrophied is > that of normal pituitary. F. A. A.

**Method for obtaining a preparation of the melanophore hormone of the pituitary gland.** R. L. STEHLE (*J. Pharm. Exp. Ther.*, 1936, **57**, 1—5).—From by-products obtained in the isolation of the pressor and oxytocic principles of the posterior lobe of the pituitary (cf. this vol., 643) a brown hygroscopic powder has been prepared 25 times as potent in its melanophore-dilating action as the standard pituitary powder and having only slight pressor and oxytocic activity. It contains N 14.6, tyrosine 2.9, and cystine 1—2%, and its action is increased by previous treatment with 0.1N-NaOH at 100° (cf. Jores, *Z. ges. exp. Med.*, 1933, **87**, 266). W. O. K.

**Ovarian hormones and carbohydrate metabolism.** E. DE AMILIBIA, M. M. MENDIZABAL, and J. BOTELLA-LLUSIA (*Klin. Woch.*, 1935, **14**, 900—901).—Follicular hormone (I) raises and corpus luteum hormone (II) lowers blood-sugar in young female rabbits after 24 hr.; the effects are abolished by thyroidectomy. Liver-glycogen in rats is lowered by (I) and raised by (II). R. N. C.

**The oestrogenic and gonadotropic hormones in epithelioma of the neck of the uterus.** R. IMBERT, M. MOSINGER, and H. BONToux (*Compt. rend. Soc. Biol.*, 1936, **122**, 692—694).—Hyperfolliculinæmia occurs with ovarian tumours and epitheliomata and is also caused by X-ray or Ra treatment. In cases of epithelioma, an inverse proportionality between prolan-A and folliculin is observed and, despite an increase in prolan-B, no dependence on the oestrogenic hormone was observed. H. G. R.

**Ovarian hormonal antagonism caused by the two crystalline hormones.** R. COURRIER (*Compt. rend. Soc. Biol.*, 1936, **122**, 661—664).—The activity of 1.5 mg. of progesterin is neutralised by approx. 0.04 mg. of dihydrofolliculin. H. G. R.

**Hormones of urine of pregnancy and cholesterolæmia.** L. CIOGLIA (*Boll. Soc. ital. Biol. sperim.*, 1935, **10**, 890—892).—Injection of urine from women during the first 4 months of pregnancy produces hypercholesterolemia in rabbits; during the last 4 months the urine is normally inactive, but after Et<sub>2</sub>O extraction (which tends to increase the activity of the early urine) it is active owing to removal of follicular hormone which, in large doses, produces hypocholesterolemia (cf. A., 1935, 667, 1174). F. O. H.

**Influence of oestrogens on the prostate gland.** S. ZUCKERMAN (*Nature*, 1936, **137**, 1032). L. S. T.

**Synthetic oestrogenic agents without the phenanthrene nucleus.** E. C. DODDS and W. LAWSON (*Nature*, 1936, **137**, 996).—Oestrogenic activities for various org. compounds are tabulated. The phen-

anthrene condensed ring structure is not necessary for this activity, and *p*-(OH)<sub>2</sub>-derivatives of Ph<sub>2</sub> and CH<sub>3</sub>Ph<sub>2</sub> are the only ones so far found to be active.

L. S. T.

Mechanism of the action of sexual (follicular) hormone. III. State of the pituitary. P. HAUPTSTEIN (Klin. Woch., 1935, 14, 1103—1107).

R. N. C.

Products of ultra-violet irradiation of follicular hormone. M. LAPORTA and C. VACCA (Atti R. Accad. Lincei, 1936, [vi], 23, 212—215).—The irradiated hormone retains its oestrogenic activity (the produced oestrus persists for a period > that due to the normal hormone), but completely loses its anti-masculine character and hypercalcaemic action; [ $\alpha$ ] and m.p. are decreased.

F. O. H.

Follicle-stimulating hormone in the urine of vegetative-stigmatised young men with generative disturbance. H. GOLDHAMMER and P. LOEWY (Klin. Woch., 1935, 14, 704—705).

R. N. C.

Action of the male hormone on the sexual characteristics of the crested triton: test for the hormone. A. BEAUNE and R. FALK (Compt. rend. Soc. Biol., 1936, 122, 721—723).—The development of sexual characteristics in the male crested triton (*T. cristatus*), castrated by withdrawal of food, may be used as a test for the male hormone. A. L.

Anti-masculinising action of the male hormone. C. CHAMPY (Compt. rend. Soc. Biol., 1936, 122, 631—632).—Given in large doses (10—12 times the dose of folliculin required to show the same effect) testosterone acetate exhibits an anti-masculinising action in the castrated silver pheasant, which is an ideal species to demonstrate this characteristic.

H. G. R.

Masculinising action on the guinea-pig of water-soluble extracts of ox adrenal. D. HODLER (Compt. rend. Soc. Biol., 1936, 122, 512—514).—Alkaline H<sub>2</sub>O-sol. extracts of adrenal cortex have a masculinising action on females and castrated males.

H. G. R.

Sexual periodicity and the causes which determine it. F. H. A. MARSHALL (Nature, 1936, 137, 1056—1057).

L. S. T.

Sex hormones. XIV, XV.—See this vol., 991.

Intensity of action of insulin in healthy and diseased men. F. MEYTHALER and G. SCHROFF (Klin. Woch., 1935, 14, 893—894).—The disturbance of carbohydrate metabolism by insulin is overcome in 1½ hr. in healthy men. With a disturbed liver function the intensity of action is increased, whilst with pituitary and adrenal disturbances it shows characteristic changes.

R. N. C.

Interpretation of the hypoglycaemia (recovery) curve obtained after injection of insulin in the dog. E. AUBERTIN and R. CASTAGNOU (Compt. rend. Soc. Biol., 1936, 122, 826—829).—The shapes of different types of curves obtained are discussed.

A. L.

Hypoglycaemic action of insulin in partial pancreatectomy in dogs. E. AUBERTIN, A. LACOSTE, R. CASTAGNOU, and R. SARIC (Compt. rend. Soc. Biol., 1936, 122, 830—834).—In partial pan-

createctomy in dogs, the extent of the hypoglycaemic action of injected insulin  $\propto$  the functional val. of the remaining pancreas.

A. L.

Influence of different histolysates administered parenterally and orally on the effect of insulin. V. P. KOMSARENKO (Platz. Utschen. Med., 1936, 56—72).—The action of insulin (I) administered parenterally on the blood-sugar of normal or diabetic dogs is increased when certain tissue lysates are given simultaneously. (I) administered orally with tissue lysates is able to reduce the blood-sugar level, but the order of efficiency of the lysates is not the same as with parenteral administration.

W. O. K.

Anti-hormones and pineal gland. P. ENGEL (Klin. Woch., 1935, 14, 970—971).

R. N. C.

Constituents of blood after injection of thymus extract. C. I. PARHON and G. WERNER (Compt. rend. Soc. Biol., 1936, 122, 710—712).—A diminution in K and inorg. P occurs.

H. G. R.

Biological effects of thymectomy in successive generations of rats. N. H. EINHORN and L. G. ROWNTREE (Science, 1936, 83, 443—445).—Retardation in the rate of growth and a slight delay in the rate of development result.

L. S. T.

Antagonistic effect of the thyroid hormone on the corpus luteum and of the follicular hormone on the pseudo-pregnant uterus. E. ENGELHART (Klin. Woch., 1935, 14, 1068—1070).

R. N. C.

Relation between thyroid and central nervous system. H. VOSS (Klin. Woch., 1935, 14, 881—884).

R. N. C.

Crystallisation of sodium chloride in the serum of guinea-pigs and rabbits during experimental hyperthyroidism and hyperpituitarism. V. BERGAUER (Compt. rend. Soc., Biol., 1936, 122, 426—427).—Crystallisation occurs *in vivo*.

H. G. R.

Thyroid and vitamin-C reserves. E. NESTOR (Compt. rend. Soc. Biol., 1936, 122, 427—430).—The ascorbic acid content of the tissues is reduced by thyroid medication and increased by thyroidectomy.

H. G. R.

Influence of thyroxine on the passage of galactose [into the blood and urine]. N. FRIESINGER and M. NAVILLE (Compt. rend. Soc. Biol., 1936, 122, 637—638).—Administration of thyroxine diminishes galactosuria, whilst prolonged dosage increases it.

H. G. R.

Specificity of the substance inhibiting the hypertensive action of vasopressin in serum of pregnancy. J. A. SCHOCKAERT and J. LAMBILLON (Compt. rend. Soc. Biol., 1936, 122, 481—484).

H. G. R.

Absorption of villikinin by the intestines. E. DE KOKAS and G. DE LUDANY (Compt. rend. Soc. Biol., 1936, 122, 413—416).—Villikinin is active orally, is not inactivated by erepsin, and is absorbed in the duodenum.

H. G. R.

Echinenone as a provitamin-A. E. LEDERER and T. MOORE (Nature, 1936, 137, 996).—Echinenone (A 1935, 1145) can function as a provitamin-A.

L. S. T.

**Distribution of vitamin-A between light petrol and aqueous methyl alcohol.** A. E. GILLAM and B. J. SENIOR (Biochem. J., 1936, 30, 1249—1252).—Vitamin-A distributes itself equally between 90% aq. MeOH and light petroleum (I), whilst with 70% MeOH the concn. is 8 times that in (I). The presence of carotene and temp. variation between 10° and 30° were without influence, whilst cholesterol increased the amount in the (I) phase. H. D.

**Mechanism of elimination of vitamin-A.** A. SANTOS RUIZ (Anal. Fis. Quím., 1935, 33, 820—828).—The observations of Davies and Moore (A., 1935, 261) have been confirmed. The excess vitamin-A is eliminated mainly in the urine as a degradation product giving a considerable increase in I val. F. R. G.

**Synthesis of vitamin-A.** II.—See this vol., 983.

**Ash-manna as a source of vitamins and a cause of alimentary disturbances.** R. LECOQ (Bull. Soc. bot. France, 1934, 81, 782—792).—Manna in large quantities causes disturbances similar to polyneuritis in birds, in spite of the addition of large quantities of vitamin-B. In smaller quantities it does not cause disturbances, and the carbohydrates are utilised by the organism. It contains -B and -D, but neither -A nor -C. It can be used in infantile therapy. R. N. C.

**Vitamin-B<sub>1</sub> content and feeding value of some important [East] Indian foodstuffs. Is katjang idjoe the most suitable means of combating mild cases of beri-beri?** W. F. DONATH and J. P. SPRUYT (Geneesk. Tijds. Nederl.-Indie, 1936, 76, 642—695).—22 native foodstuffs (seeds and beans) were examined for H<sub>2</sub>O, protein, fat, carbohydrate, pentosan, crude fibre, ash, SiO<sub>2</sub>, CaO, MgO, P<sub>2</sub>O<sub>5</sub>, K<sub>2</sub>O, Fe<sub>2</sub>O<sub>3</sub>, and vitamin-B<sub>1</sub> contents. Several, especially "katjang tanah" (*Arachis hypogaea*, L.), contain more -B<sub>1</sub> than does "katjang idjoe" (*Phaseolus radiatus*) (which is unpalatable, and deficient in fat), and are more suitable for combating beri-beri. The -B<sub>1</sub> content should be determined in the finally prepared food and not in the raw material. S. C.

**Growth effect of the residue remaining after alcoholic extraction of yeast.** M. R. RYMER and R. C. LEWIS (J. Biol. Chem., 1936, 114, 361—367).—The growth-promoting effect on rats of yeast residue after alcoholic extraction (A., 1931, 271) may be largely replaced by vitamins-B<sub>1</sub> and -B<sub>2</sub>, so that the postulation of a third factor in yeast is considered unjustifiable. H. D.

**Liver as a source of vitamin-B<sub>12</sub>.** E. R. BECKER and N. F. MOREHOUSE (Science, 1936, 83, 530—531). L. S. T.

**Vitamin-C metabolism in the foetus. I. Resorption of ascorbic acid from the placenta. II. Storage of vitamin-C in the adrenals.** W. NEUWEILER (Klin. Woch., 1935, 14, 1040—1041; Chem. Zentr., 1935, ii, 1907).—The foetus probably obtains vitamin-C from the placenta and stores it in the adrenals. A. G. P.

**Resistance of capillaries in experimental C-avitaminosis of animals and men. Use of the phenomenon of the fall in resistance of capillaries for rapid determination of vitamin-C**

**activity of foods.** I. I. MATUSIS (Platz. Utschen. Med., 1936, 139—154).—The resistance to negative pressure of the capillaries of guinea-pigs on a scorbutic diet rapidly decreases within 2—3 days. Administration of vitamin-C results in the capillaries returning to their normal condition. In man the fall in resistance is slower, becoming evident in 8—10 days, and -C effects only a relatively slow cure. W. O. K.

**Renal and hepatic elimination of ascorbic acid.** M. LOEPER, E. CHABROL, J. COTTET, and A. LESURE (Compt. rend. Soc. Biol., 1936, 122, 404—406).—Increased elimination in the bile and, to a greater extent, in the urine follows intravenous injections of ascorbic acid. H. G. R.

**Ascorbic acid in the liver during hepatitis.** M. LOEPER, J. COTTET, and A. LESURE (Compt. rend. Soc. Biol., 1936, 122, 388—390).—In cases of cirrhosis the ascorbic acid (I) content of the liver is low. Guinea-pigs with acute P hepatitis have increased (I) in the liver. H. G. R.

**Relation between the antiscorbutic activity and mode of administration of ascorbic acid.** H. C. HOU (Chinese J. Physiol., 1936, 10, 213—220).—The min. protective dose of ascorbic acid (I) given orally to guinea-pigs is twice that given subcutaneously. Rectal administration is ineffective. Subminimal protective doses given twice daily are not more effective than four times the dose given once every two days. The (I) content of different organs varies little with degree of protection, except that with the higher doses there is an increased content in the adrenals. F. A. A.

**Behaviour of d-araboascorbic acid and vitamin-C towards ferrous salts.** K. MAURER and B. SCHIEDT (Biochem. Z., 1936, 285, 67—71).—The blue complex substance (I) formed when ascorbic acid (II) or iso-(II) is neutralised and Fe<sup>II</sup> salt added in presence of air can be isolated by addition of excess of EtOH. COMe<sub>2</sub>, or dioxan. An aq. solution of (I) slowly on keeping, more quickly on adding H<sub>2</sub>O<sub>2</sub>, deposits 0.4—0.5 mol. of FeC<sub>2</sub>O<sub>4</sub>. P. W. C.

**Glutathione and ascorbic acid.** H. BORSOOK and C. E. P. JEFFREYS (Science, 1936, 83, 397—398).—The antiscorbutic potency of a solution of oxidised ascorbic acid (I) is equal to the quantity of oxidised (I) which can be converted into the reduced form by H<sub>2</sub>S in acid solution. At  $p_H < 5.5$  and 37° the reversibly oxidised form undergoes an irreversible change, losing its antiscorbutic potency and its reducibility by H<sub>2</sub>S. The change proceeds as quickly in a vac. as in air and is rapid at  $p_H 7.4$ . The reversibly oxidised form is protected from this change *in vivo* by reduction. Glutathione (II) (0.1—0.2%) rapidly effects the reduction. Previous failures to observe this action of (II) are ascribed to the use of insufficient (II) and too low a  $p_H$ . L. S. T.

**Effect of light on the oxidation-reduction potential of ascorbic acid.** E. MARTINI (Biochim. Terap. sperim., 20, 505—517; Chem. Zentr., 1935, ii, 1907).—In PO<sub>4</sub>'''-buffer solutions, the redox potential of ascorbic acid (I) is lowered by exposure to light. Fluorescent substances [methylene-blue (II), eosin] intensify this effect. Glucose in the presence of (II)

behaves similarly. Rapid decolorisation of (II) by milk in light is probably due to (I). A. G. P.

**Occurrence of vitamin-C in cerebrospinal fluid and aqueous humour.** M. TATSUMI, Y. NAGAO, K. OKAMURA, and J. GAMO (Klin. Woch., 1935, 14, 1007).—Ascorbic acid increases the vitamin-C content of the aq. humour of a dog, but not that of the cerebrospinal fluid of a dog or a scorbutic child.

R. N. C.

**Ascorbic acid content of animals in C-avitaminosis.** A. GIROUD, A. S. RUIZ, C. P. LEBLOND, and A. R. RATSIMAMANGA (Bull. Soc. Chim. biol., 1936, 18, 750—756).—The amount of ascorbic acid in the livers and kidneys of guinea-pigs deprived of dietary vitamin-C decreases progressively for about 10 days, when a steady val. is reached. A. L.

**Isolation of crystalline vitamin-C from lombok (*Capsicum annuum*, L.).** J. P. SPRUYT and A. G. VAN VEEN (Geneesk. Tijds. Nederl.-Indie, 1936, 76, 1065—1071).—Cryst. ascorbic acid (0.1 g.) was isolated from 500 g. of lombok by a slight modification of the Banga-Gyorgyi Pb(OAc)<sub>2</sub> method. S. C.

**Chemical composition and vitamin-C content of liang-hsu (*Dioscorea cirrosa*, Lour.?).** D. Y. LIU and C. S. YANG (Chinese J. Physiol., 1936, 10, 355—358).—This tuber contains about 11% of total solids, mainly sugar and starch, and is a good source of vitamin-C (92 mg. ascorbic acid per kg.). F. A. A.

**Combined ascorbic acid in foodstuffs.** B. C. GUHA and J. C. PAL (Nature, 1936, 137, 946).—Extracts of cabbage and of the bel (*Aegle marmelos*), but not mangoes, with EtOH or Et<sub>2</sub>O give much greater vitamin-C vals. on heating. This increase is ascribed to the liberation of combined -C in the foodstuff and not to inactivation of -C oxidase by heat (cf. A., 1935, 1176). L. S. T.

**Ultra-violet spectra of tissue extracts and their ascorbic acid content.** J. A. DE LOUREIRO (Bull. Soc. Chim. biol., 1936, 18, 757—768).—A spectrographic examination of the extract of brain-tissue after deproteinisation with COMe<sub>2</sub> followed by pptn. with phosphotungstic acid and Hg(OAc)<sub>2</sub> at *p*<sub>H</sub> 5.6 shows that the reducing power of the extract determined by the Tillmans' method is due mainly to ascorbic acid. A. L.

**Changes in the ascorbic acid and glutathione contents of stored and sprouting potatoes.** L. B. PETT (Biochem. J., 1936, 30, 1228—1232).—The ascorbic acid (I) and glutathione (II) contents of potatoes is at a max. at maturity; the decrease which occurs on storage increases with rise of temp. Forced sprouting at any stage of the decline resulted in a rapid rise in the (I) and (II) contents followed by a rapid fall. H. D.

**Naturally occurring chicken provitamin-D.** A. G. BOER, E. H. REERINK, A. VAN WIJK, and J. VAN NIEKERK (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 622—632).—Pure provitamin-D acetate (I), m.p. 129—130°,  $[\alpha]_D^{20}$  -85.3°, was obtained from a crude cholesteryl acetate containing 4.5% of provitamin-D (II) by fractional adsorption and elution followed by recrystallisation from MeOH. Hydrolysis of (I) by EtOH-KOH gives (II), m.p. 150°,

$[\alpha]_D$  -127° (3:5-dinitrobenzoate, m.p. 205—206° (decomp.)). (II) undergoes the same photochemical change on irradiation as ergosterol. The activity for chickens of irradiated (II) is the same as that of cod-

The suggested structure for (II) is supported by its taking up only 1 mol. of H<sub>2</sub> on hydrogenation, as one of the con-

jugated double linkings is difficult to hydrogenate. Ozonisation confirms the absence of a double linking in the side-chain. Differences between the m.p. and biological activity of (II) and the prep. of Windaus *et al.* (A., 1935, 1363) are due to impurities in the earlier prep. The identity of 7-dehydrocholesterol with (II) is established. E. A. H. R.

**Absorption spectra of sterols from natural sources with particular reference to ergosterol and other vitamin-D precursors.** A. E. GILLAM and I. M. HEILBRON (Biochem. J., 1936, 30, 1253—1256).—Sterols from *Arenicola marina*, sea anemones, and oysters have absorption bands identical with those of ergosterol. *A. marina* sterols, like dehydroergosterol, have max. also at 346, 328, and 316 mμ.

H. D.

**Antirachitic effectiveness of vitamin-D from various sources.** R. W. HAMAN and H. STEENBOCK (J. Biol. Chem., 1936, 114, 505—514).—Heated and irradiated purified cholesterol (I) has absorption bands in the ultra-violet and vitamin-D activity similar to those of irradiated crude (I). The antirachitic activity of some fish oils was not increased by irradiation. The solvent in which ergosterol or (I) was dissolved during irradiation had no influence on the resultant -D activity. H. D.

**Antirachitic irradiation product of 7-dihydrocholesterol.**—See this vol., 982.

**7-Dehydrositosterol and 7-dehydrostigma-sterol.**—See this vol., 982.

**Mutual reactions between plant extracts and heteroplasmic graft components, and their immunological and genetic significance.** D. KOSTOV (Bull. Acad. Sci. U.R.S.S., 1935, 1177—1216).—Polemical, against Chester and Silberschmidt (cf. A., 1934, 1273). R. T.

**Phytoserology.** E. G. DANKERT (Anal. Asoc. Quim. Argentina, 1935, 23, 153—161).—Preliminary experiments on Mez' blood-serum method for diagnosing the relationships of plants are described. Attention is directed to the necessity for studying the protein content of the vegetable extracts and the *p*<sub>H</sub> and lipin content of the solutions. F. R. G.

**Assimilation methods of various types of *Chlorella*.** H. GAFFRON and K. WOHL (Naturwiss., 1936, 24, 412).—Calculation of the quantum efficiency for the assimilation process of *Chlorella* from the data due to Emerson gives a val. only 1/12 that of Warburg *et al.* This discrepancy, originally attributed to an error in measurement of light intensity, is now ascribed to the fact that Warburg used *C. pyrenoidosa*, whereas

Emerson used *C. vulgaris*, the two varieties having very different assimilation capacities. A. J. M.

**Variations in the composition of the birch (*Betula alba*, L.) during the year.** A. Sosa and C. Sosa-Bourdoul (Bull. Soc. Chim. biol., 1936, 18, 918—925).—Reducing sugar, sucrose, and betuloside were determined in the various portions of the birch; all show an increase in the bark during autumn. Betulin, very conc. in the epidermis, is not present in other portions of the bark. H. G. R.

**Cultivation of an alga in concentrated heavy water.** H. MEYER (Naturwiss., 1936, 24, 346).—*Chlorella vulgaris* grew on a medium containing  $\text{MgSO}_4$  0.001,  $\text{K}_3\text{PO}_4$  0.001,  $\text{KNO}_3$  0.07, and  $\text{FeCl}_3$  0.0001% in heavy  $\text{H}_2\text{O}$  (> 96%  $\text{D}_2\text{O}$ ) as well as in a control medium with  $\text{H}_2\text{O}$  in place of  $\text{D}_2\text{O}$ . W. O. K.

**Light, temperature, and the reproduction of plants.** V. H. BLACKMAN (Nature, 1936, 137, 931—934, 971—973).—A lecture. L. S. T.

**Rubber content of golden-rod (*Solidago*) leaves affected by light.** J. T. PRESLEY (Science, 1936, 83, 436).—Exposure to light reduces the rubber content of these leaves after harvesting. L. S. T.

**Chemotropism of plant roots. I. Chemotropic stimulation by mineral salts.** B. NIKLEWSKI and J. DUDA. II. Stimulation by colloids. B. NIKLEWSKI, H. BRODOWSKA, M. DYDO, and M. KAHL (Biochem. Z., 1936, 286, 110—119, 120—127).—I. The chemotropic effect of substances contained in an agar block placed on one side of the root tip of *Sinapis alba* seedlings was always positive (curvature towards the block) in healthy seedlings. Negative curvature was due to pathological causes. The most powerful effects were produced by  $\text{PO}_4'''$ ,  $\text{K}'$ ,  $\text{Hg}''$ ,  $\text{Al}'''$ ,  $\text{Fe}'''$ ,  $\text{UO}_2''$ , eosin, and Me-violet. Substances which restricted growth had more powerful action than those which did not. No reversal of direction of curvature resulted from altering the concn. of the substance.

II. Chemotropic effects are produced by colloidal solutions of Au, Ag,  $\text{Fe}(\text{OH})_3$ , Cu,  $\text{As}_2\text{S}_3$ , resins, gums, and humus pptd. from extracts of farmyard manure with HCl, but not by those of proteins, starch,  $\text{NH}_3$ -acids, or by suspension of quartz. The effects appear to depend on the particle size of the colloids.

W. McC.

**Photosynthetic unit'' in the assimilation process of green plants.** J. WEISS (Nature, 1936, 137, 997; cf. Kohn, this vol., 907).—It is assumed that for every chlorophyll mol. on the surface of the lipid phase reducing  $\text{CO}_2$  there are approx. 500 mols. in the interior which provide the surface mol. with the necessary 4 quanta of energy. L. S. T.

**Effect of potassium on carbon assimilation in plants.** G. RÖHDE (Z. Pflanz. Dung., 1936, 44, A, 1—24).—A review. A. G. P.

**Carbon dioxide storage. IX. Germination of lettuce seeds at high temperatures in light and in darkness.** N. C. THORNTON (Contr. Boyce Thompson Inst., 1936, 8, 25—40; cf. A., 1935, 1177).—Germination of lettuce was effected at 20—26° in an atm. containing 5—10% of  $\text{CO}_2$  and 20% of  $\text{O}_2$

within 17 hr. either in light or darkness. At 35°, 40—80% of  $\text{CO}_2$  and a period of 65 hr. were necessary. Seeds made dormant by moist storage at 35° in the absence of  $\text{CO}_2$  germinated at this temp. during and after exposure to the higher  $[\text{CO}_2]$ . Seedlings produced by these treatments subsequently grow well in air. A. G. P.

**Induced changes in respiration rates and time relations in the changes in internal factors.** L. P. MILLER, J. D. GUTHRIE, and F. E. DENNY (Contr. Boyce Thompson Inst., 1936, 8, 41—61).—Treatment of potato tubers with the vapour of chemicals which increase their  $\text{CO}_2$  output produced an increase in sugar content and in catalase (I) and peroxidase (II) activity, but not until the peak of respiratory activity had passed. EtOH decreased the  $\text{CO}_2$  output and (II) activity, but increased (I). Enhanced capacity to reduce methylene-blue resulting from treatment with  $\text{CH}_2\text{Cl}\cdot\text{CH}_2\cdot\text{OH}$  (III) or Bu halides began after the rise in respiration rate. The citric acid (IV) content of treated tubers declined and the  $p_H$  increased simultaneously with the increase in respiration. Additional  $\text{CO}_2$  produced was probably derived, to a large extent, from (IV). (III) increased the glutathione (V) and decreased the  $\text{SO}_4''$  content of tubers at a period later than the action on respiration. Bu halides lowered the (V) content. A. G. P.

**Chemical allometry in plant growth.** P. MEUNIER (Bull. Soc. Chim. biol., 1936, 18, 636—644).—The equation  $y = bx^a$ , where  $y$  is the total wt. of one constituent,  $x$  the total wt. of the organism, and  $b$  and  $a$  consts. for a particular constituent, previously applied to animal growth also applies to plant growth. A. L.

**Growth-accelerating and -inhibiting action of fluorescein on plants.**—See B., 1936, 612.

**Action of adrenaline and extracts of adrenal cortex on the growth of *Hyacinthus orientalis*.** L. DESOLE (Boll. Soc. ital. Biol. sperim., 1935, 10, 980—981).—A growth-promoting action was observed. F. O. H.

**Modifications in the root (especially root-tip) of *Hyacinthus orientalis* grown in solutions of adrenaline and adrenal cortex extracts.** L. DESOLE (Boll. Soc. ital. Biol. sperim., 1935, 10, 982—983).—The roots partly darken in colour, those tissues affected giving a positive Viale reaction for adrenaline. F. O. H.

**Follicular hormone and the time of blooming of chrysanthemums.** I. STORMER (Biochem. Z., 1936, 285, 29—35).—The development of buds and blooms and the plant length of the chrysanthemum "Majestic" were unaffected by commercial progynon or by the pure hormone or its Na salt. P. W. C.

**Esters as plant hormones.** P. W. ZIMMERMAN, A. E. HITCHCOCK, and F. WILCOXON (Contr. Boyce Thompson Inst., 1936, 8, 105—112; cf. A., 1935, 1548).—Plant responses, characteristic of growth-substances, were induced by Me and Et naphthylacetate, Me, Et,  $\text{Bu}^a$ , and  $\text{Bu}^b$  phenylacetate, Me  $\beta$ -indolylacetate (I), and Me  $\beta$ -indolylpropionate. (I) was more effective than hetero-auxin. Me esters of indole compounds were more, and those of the

$C_{10}H_7$  and Ph compounds less, active in inducing bending responses than were the corresponding free acids. The activity of corresponding esters was in the order  $Me > Et > Bu$ . Plants absorbed the esters through the roots (from soil) and transported them to aerial organs. A. G. P.

**Effect of growth substances on the rooting response of cuttings.** A. E. HITCHCOCK and P. W. ZIMMERMAN (Contr. Boyce Thompson Inst., 1936, 8, 63—79).—Treatment of various cuttings with indolyl-acetic, -propionic, and -butyric or naphthylacetic acid induced earlier rooting and an increased no. of roots which emerged over a greater stem area than in untreated controls. Aq. solutions of the growth substances were 100—500 times as effective, in many cases, as lanoline preps. of similar concn. Effects of the duration of treatment with various concns. were examined. Substances stimulating rooting also retarded the growth of non-dormant buds. A. G. P.

(A) Influence of  $Cl^-$  and  $SO_4^{--}$  on growth of white ramie (*Boehmeria nivea*) rhizomes. (B) Effect of external factors on the activity of the rhizosphere. A. A. ISAKOVA (Bull. Acad. Sci. U.R.S.S., 1935, 1143—1146, 1147—1162).—(A) Concns.  $> 0.17M$ -NaCl or  $0.15M$ - $Na_2SO_4$  separately, or  $0.085M$ -NaCl and  $0.075M$ - $Na_2SO_4$  together, are lethal to the rhizomes.

(B) Addition of NaCl and  $Na_2SO_4$  to cultures of soil micro-organisms promotes or inhibits decomp. of peptone, glycine, glucose (I), sucrose (II), cellulose, NaOBz, or  $Na_2C_2O_4$ , according to the type of organisms present, and to the concn. of the salts. In the rhizosphere,  $Cl^-$  intensifies ammonification and the decomp. of (II), but inhibits decomp. of (I) and of org. acids; the opposite effects are produced by  $SO_4^{--}$ . R. T.

**Phytochemical problems.** T. WEEVERS (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 757—761).—The phytochemical characteristic of a species, genus, or family of plants is due to a combination of several chemical compounds. Similar compounds occurring in unrelated families always originate by way of simple reactions from products of metabolism of general occurrence. This is discussed in reference to cineole in Labiatae, Myrtaceae, and Zingiberaceae, alkaloids in Papaveraceae, Fumaroidaceae, and Papaveroidae, heart aglucones, nicotinic acid, and trigonelline. It is suggested that a co-enzyme, probably identical with that of Warburg, is present in all higher plants. P. G. C.

**Dissolved carbon dioxide and the ripening of tomatoes.**—See B., 1936, 617.

**Occurrence in pears of metabolic gases other than carbon dioxide.** E. HANSEN and H. HARTMAN (Oregon Agric. Exp. Sta. Bull., 1935, No. 342, 10 pp.).—Emanations (probably  $C_2H_4$ ) from ripe pears at room temp. and from unripe pears in cold storage caused epinasty in tomato plants, retarded germination of certain seeds, and accelerated the ripening of newly picked fruit. After cold-storage for a short period fruit did not respond to the emanations. A. G. P.

**Gravity-position of tomato stems and their production of the emanation causing leaf epinasty.** F. E. DENNY (Contr. Boyce Thompson Inst., 1936, 8, 99—104; cf. A., 1935, 1179, 1548).—Emanations from tomato plants causing epinasty in potato leaves similar to that caused by  $C_2H_4$ , are more effective when tomato stems are horizontal than when vertical. A. G. P.

**Spectrum analysis of some woods from Spain and Fernando Po.** S. PINA DE RUBIES and L. LEMMEL (Anal. Fis. Quim., 1935, 33, 492—499).—A more detailed account of work already published (A., 1935, 1289). F. R. G.

(A) Microcrystalline structure of thorns. S. PIENKOWSKI and Z. KULESZANKA. (B) X-Ray examination of resin in wood. S. PIENKOWSKI and L. JURKIEWICZ (Acta phys. polon., 1934, 3, 393—400, 435—446; Chem. Zentr., 1935, ii, 1733—1734).—Structures are examined by X-ray methods. A. G. P.

**Tables for the calculation of the osmotic value of expressed plant juices, sugar solutions, and some salt solutions.** H. WALTER (Ber. deut. bot. Ges., 1936, 54, 328—339).—A compilation of f.p. depression and osmotic data for glucose, sucrose, NaCl,  $Na_2SO_4$ , and  $MgSO_4$ , for use in calculating the composition of plant saps etc. F. A. A.

[Constituents of] *Polygonum hydropiper*. C. MASINO (Boll. Chim. farm., 1936, 75, 242—248).—The air-dried root contains 0.42—0.64% of Fe. Traces of anthraquinone glucosides occur in the roots, but not leaves or stems. The whole plant (40 kg.) yields an essential oil (9 g.), tannin, and, on hydrolysis, a keto-hexose. F. O. H.

**Composition and uses of the fruit of the giant cactus (*Carnegiea gigantea*) and its products.** R. A. GREENE (J. Chem. Educ., 1936, 13, 309—312). L. S. T.

**Determination of calcium, magnesium, potassium, and sodium in plants by extraction with hydrochloric acid.** F. TERLIKOWSKI and S. SOZANSKI (Rocz. Nauk. roln. leśn., 1935, 34, 143—148; Chem. Zentr., 1935, ii, 2095).— $< 10$  g. of the finely-divided material are shaken for 1 hr. with 500 c.c. of  $N$ -HCl; the filtrate is analysed by standard methods. H. N. R.

**Ratio of iron soluble in cold water to total iron in the leaves of healthy and injured plants.** A. HELLER (Kl. Mitt. Ver. Wasser-, Boden-, Lufthvg., 1935, 11, 43—47; Chem. Zentr., 1935, ii, 2834).—The determination of the two forms of Fe in the leaves does not constitute a test for smoke injury, and the time required does not make it practicable in leaf analysis. R. N. C.

**Distribution of manganese and iron in Quebec pines.** P. RIOU, G. DELORME, and HORMISDAS (Compt. rend., 1936, 202, 1811—1812).—The ash, Fe, and Mn contents of *P. strobus*, *P. resinosa*, and *P. banksiana* are determined. Higher vals. for Fe are accompanied by lower vals. for Mn. J. L. D.

**Rarer elements in the ash of *Polyporus fomentarius* and its host trees.** B. NEMEC (Ber. deut. bot. Ges., 1936, 54, 276—278).—The ash of

*P. fomentarius* contains relatively more Cu, Zn, Al, and Mn, and less Ti, Si, Fe, Ca, and Mg than does that of beechwood (*Fagus silvatica* and *Carpinus betulus*). Au, Cr, and V are also present in traces. F. A. A.

Phosphorus content of citrus.—See B., 1936, 612.

Biological role of hydroxylamine. II. Reaction for hydroxylamine. III. Hydroxylamine in the leaves of higher plants. M. LEMOIGNE, P. MONGUILLON, and R. DESVEAUX (Bull. Soc. Chim. biol., 1936, 18, 841–867, 868–876).—II. Blom's reaction (A., 1928, 674) is modified to increase the specificity and the reaction with related substances is studied.

III.  $\text{NH}_2\text{OH}$  is obtained by autolysis of green leaves, but is also present in the fresh leaves, whence it is obtained by hydrolysis from both volatile and non-volatile constituents. H. G. R.

Relations between the natural system of plants and their chemical structure. P. KLASON (Svensk Pappers-Tidn., 1935, 38, 450–454; Chem. Zentr., 1935, ii, 2835).—The higher N content of marine algæ is the result of their marine life. North Sea algæ contain about 27% of lignin, which, unlike that of higher plants, contains an alcohol complex. R. N. C.

Carbohydrates of the fruits of *Rosa rugosa*. E. VOTOČEK and L. SGARZI (Coll. Czech. Chem. Comm., 1936, 8, 185–190).—The fruits of *R. rugosa*, preserved in EtOH, yield to hot EtOH a syrup,  $[\alpha]_D +27.8^\circ$ , which contains fructose and glucose. Dried fruits yield a little sucrose. They contain a hygroscopic, amorphous "gum," sol. in  $\text{H}_2\text{O}$ , insol. in EtOH, which gives mannose and the reactions of pentoses when hydrolysed. Hydrolysis of the EtOH-insol. portions with 5%  $\text{H}_2\text{SO}_4$  yields galactose; the product gives pentose reactions and with  $\text{HNO}_3$  yields mucic acid. The residual insol. material yields glucose when heated first with 80% and then with 6%  $\text{H}_2\text{SO}_4$ . R. S. C.

Reserve polysaccharides of plants and their significance in the animal economy. I. *d*-Galacto-*d*-mannan of lucerne (*Medicago*, L.). F. MAX and A. S. SCHULZ (Z. Biol., 1936, 97, 201–217).—The occurrence of galactans in animal and plant tissues is discussed. Extracts (aq. KOH) of lucerne seeds are pptd. by EtOH and the ppt. is redissolved in  $\text{H}_2\text{O}$  and successively pptd. from KOH, HCl, and aq. solution by EtOH to yield 8.6% of a polysaccharide mixture (bound galactose, 36.7%). Purification by digestion with human saliva followed by pptn. with alkaline Cu reagent, regeneration of the Cu compound by HCl, and pptn. by EtOH affords a *d*-galacto-*d*-mannan,  $[\alpha]_D^{20} +93.74^\circ$  in  $\text{H}_2\text{O}$ , hydrolysed by acids to galactose and mannose (1:1). F. O. H.

Acidic character of cellulose. Oxidation processes in membranes. M. LUDTKE (Biochem. Z., 1936, 285, 78–97).—Crude cellulosic material always has a higher acid val. than the cellular material obtained from it, the acidic cuticular substances not being removable by treatment with neutral extraction agents, e.g.,  $\text{C}_6\text{H}_6$ -EtOH. Both unripe material and material attacked by moulds and bacteria show higher acid vals. than ripe and healthy material. During the

bleaching of cotton-wool by dil.  $\text{Cl}_2$ - $\text{H}_2\text{O}$  and aq.  $\text{NH}_3$ , the acid val. decreased during the first 6 days from 15 to 2 and then slowly increased in the following 22 days to 6. The rapid initial fall corresponds with the oxidative removal of cuticular substance. Crit. examination indicates that the residual acidity is due to contaminating substances and their degradation products and is not a natural property of cellulose nor the result of oxidation of the terminal groups of the cellulose chains to  $\text{CO}_2\text{H}$ . P. W. C.

Composition of the plant cell wall. R. S. HILPERT [with W. ROSSÉE and R. WAGNER] (Ber., 1936, 69, [B], 1509–1514).—The C content of the cell walls of seedlings is considerably > that of cellulose (I) and treatment with NaOH or  $\text{NaHSO}_3$  leaves a residue with the approx. composition of a (I) anhydride. The hypothesis that (I) is the sole primary product between the fibres of which new substances, including lignin, are subsequently deposited must therefore be abandoned. The C content of stems in the initial stages is < that of seedlings, but increases during growth. During the whole growth the % of lignin increases. The % OMe increases almost regularly, and it appears that the carbohydrates are partly methylated, particularly those which give insol. products with acids. The primary seedling has a low OMe no., but elimination of  $\text{H}_2\text{O}$  has already proceeded considerably. During the formation of the stem a new skeleton substance appears which in course of ripening loses  $\text{H}_2\text{O}$  and becomes methylated. The max. of both processes is reached in the ripe plant. During ripening small amounts of non-carbohydrate material appear to be produced. H. W.

Lignin from oat straw.—See this vol., 994.

Colorimetric and mol. wt. determination of digitalis glucosides. W. NEUMANN (Z. physiol. Chem., 1936, 240, 241–248).—The method is similar to that of Hauschild (A., 1935, 1531). Solutions must be maintained at 18–22° and readings made after 10 and 20 min. W. McC.

Glucoside from blueberry leaf. N. K. EDGARS (J. Amer. Pharm. Assoc., 1936, 25, 288–291).—Acid-MeOH extracts of dried leaves (approx. constitution determined) of *Vaccinium corymbosum* freed from wax, resin, and chlorophyll yield 2% of a galloylmethoxy-glucose, *neomyrtillin*,  $\text{C}_{24}\text{H}_{36}\text{O}_{16}$ , m.p.  $57^\circ$ ,  $[\alpha]_D -0.7^\circ$  (0.1% aq. solution), which diminishes alimentary hyperglycaemia in piqued rabbits. F. O. H.

Japanese sago plant. III. Enzyme chemistry of a constituent containing formaldehyde. I. K. NISHIDA and A. YAMADA (J. Agric. Chem. Soc. Japan, 1935, 11, 357–364).—The distillate from seeds crushed in  $\text{H}_2\text{O}$  contained  $\text{CH}_2\text{O}$ . None was obtained from fresh seed boiled with  $\text{H}_2\text{O}$  for 30 hr. The  $\text{H}_2\text{O}$  extract of crushed seed yielded with AcOH and subsequently EtOH a ppt. having the action of emulsin which liberated  $\text{CH}_2\text{O}$  when added to the boiled seed.  $\text{CH}_2\text{O}$  probably occurs as a glucoside in the seed. The enzyme action was optimum at  $p_H$  3.3 and 42–45°. CH. ABS. (p)

Flavone compounds of *Polygonum hydropiper*, L. H. P. KRYNSKA (Wiadom. farm., 1935, 62, 215–216; Chem. Zentr., 1935, ii, 2696).—Extraction of the

powdered drug with  $\text{COMe}_2$  affords 0.11% of a cryst. substance, apparently rhamnazin. H. N. R.

**New hesperidin.**—See this vol., 970.

**Nucleic acid of ergot of rye.** II. M. GATTY-KOSTYAL and J. TESARZ (Bull. Acad. Polonaise, 1936, B, 1—32; cf. A., 1934, 709).—Hydrolysis of the nucleic acid (I) from ergot gave 10 atoms of purine-N to 4 of P; the purines were pptd. with  $\text{Ag}+\text{aq. NH}_3$  and the ppt. was decomposed with  $\text{H}_2\text{S}$ . After concn., guanine (II) was pptd. quantitatively with 1% aq.  $\text{NH}_3$  or  $\text{AcOH}$  and adenine (III) from the filtrate with dil.  $\text{H}_2\text{SO}_4$  and  $\text{CuSO}_4+\text{NaHSO}_3$ . (I) contained (II) and (III) in equimol. proportions and a pentose. Uracil and cytosine were isolated from (I) after hydrolysis at 150—160°. The data indicate a structure similar to that of yeast-nucleic acid. H. D.

**Synthesis of djenkolic acid.**—See this vol., 973.

**Constitution of the azulenes.**—See this vol., 993.

**Volatile oil from western yarrow.** R. L. McMURRAY (J. Amer. Pharm. Assoc., 1936, 25, 304—306).—The oil from the flowers of *Achillea millefolium lanulosa*, Piper,  $d_{25}^{20}$  0.8995,  $[\alpha]_{25}^{20}$  —8.98°,  $n_{25}^{20}$  1.4657, acid val. 1.82, sap. val. 26.75, ester val. 24.93, differs from the oil from eastern yarrow (*A. millefolium*, L.).

F. O. H.

**Crystalline diterpene, sciadopitene, from the oil of leaves and twigs of *Sciadopitys verticillata*, S. and Z. II. Derivative of sciadopitene and the reduction of the two isomerides.** K. NISHIDA and H. UOTA (J. Agric. Chem. Soc. Japan, 1936, 12, 308—312; cf. this vol., 207).—isoSciadopitene prepared by heating the diterpene with dil.  $\text{H}_2\text{SO}_4$  has m.p. 108—109°,  $[\alpha]_{\text{D}}^{20}$  +22.13° in  $\text{CHCl}_3$ , and forms a monohydrochloride, m.p. 106—108°,  $[\alpha]_{\text{D}}^{20}$  +3.96° in  $\text{CHCl}_3$ .

Catalytic reduction (Pt-black in  $\text{COMe}_2$ ) of the diterpene or of the isomeride yields dihydrosciadopitene, m.p. 71—72°,  $[\alpha]_{\text{D}}^{20}$  +22.8° in  $\text{CHCl}_3$ .

A. G. P.

**Isolation from cottonseed oil of an alcohol resembling  $\alpha$ -tocopherol from wheat-germ oil.**—See this vol., 963.

**Occurrence of quebrachitol in stems of *Haplophyton cinicidum*.** E. P. CLARK (J. Amer. Chem. Soc., 1936, 58, 1009—1010).—Quebrachitol (I), m.p. 192—193° (corr.) (lit. 186—187°),  $[\alpha]_{\text{D}}^{20}$  —81.2° in  $\text{H}_2\text{O}$ , is isolated in about 0.7% yield. (I) is demethylated by  $\text{HI}$  ( $d$  1.7) to *l*-inositol, m.p. 242—243° (sinters at 195°) (lit. 238°),  $[\alpha]_{\text{D}}^{20}$  —64.7° in  $\text{H}_2\text{O}$  [hexabenzoate, m.p. 247° (lit. 252°)]. Crystallographic data are given. H. B.

**Solubility of tannins of chestnut wood.** M. QUENDIAC (Compt. rend., 1936, 202, 1697—1700).—Pre-treatment of chestnut wood with  $\text{COMe}_2$  increases the amount of tannin extractable by  $\text{EtOH}$ . The bearing of extraction data on the nature of the tannins is discussed. F. O. H.

**Grayanotoxins, active constituents of *Leucothoe grayana*.**—See this vol., 995.

**Carotenoids and their physiological importance.** L. ZECHMEISTER (Chem.-Ztg., 1936, 60, 505—508).—A review.

**Petroleum-soluble fluorescent constituents of leaves.** H. H. STRAIN (Nature, 1936, 137, 946—947).—Two fluorescent substances have been isolated from the leaves of many plants, and from etiolated maize and barley seedlings, by chromatographic adsorption (light petroleum-MgO). By their fluorescence and activation these materials may affect many processes such as photosynthesis, pigment formation, etc. L. S. T.

**Determination of chlorophyll.**—See this vol., 1006.

**Purification and fluorescence spectrum of chlorophyll-*b*.**—See this vol., 923.

**Physostigmine-like drug.** F. W. FREISE (Pharm. Zentr., 1936, 77, 378—379).—Characteristics of the seeds [alkaloids (identical with physostigmine), 1.58—2.85% (mainly in testa); oil, 6—9%] of certain species of *Dioclea* (resembling *Physostigma venenosum* and found in S. America) are described. F. O. H.

***Atropa betica*.** E. GÓMEZ MÚGICA (Anal. Fis. Quim., 1936, 34, 100—102).—*A. betica* contains 0.58% of hyoscyamine and 0.18% of atropine. F. R. G.

**Drugs from Bolivia.** L. KOON (Arch. Pharm., 1936, 274, 343—369).—Steam-distillation of the rhizomes and roots of *Dorstenia brasiliensis* gives a neutral substance,  $\text{C}_{34}\text{H}_{18}\text{O}_{10}$ , m.p. 151°, present partly as ester; ligroin extracts the same ester, and hydrolysis of the extract gives also a volatile, pungent substance and an acid,  $\text{C}_{37}\text{H}_{23}\text{O}_{10}$ , m.p. 139°. Further general chemical characteristics of this and other plants are given. R. S. C.

**Pharmacognosy of peyotl. II. Microscopy and chemistry.** E. BECCARI (Arch. Farm. speriment., 1936, 61, 161—185).—The characteristics of preps. of the dried testa of *Echinocactus Williamsi*, Lem. (mezcal buttons; cf. Kauder, A., 1899, i, 650), and of common adulterants are described. Analytical data for contents of ash, waxes, resins, and  $\text{CHCl}_3$ - and  $\text{EtOH}$ -sol. fractions and for total alkaloids and their distribution are given. F. O. H.

**Proteins of wheat bran.** I. S. JAITSCHNIKOV and T. V. SCHVEDOVA (J. Gen. Chem. Russ., 1936, 6, 584—587).—The content of  $\text{H}_2\text{O}$ -, aq.  $\text{NaCl}$ -, and aq.  $\text{NaOH}$ -sol. proteins is determined. R. T.

(A) "Proto-acid" of the field nut. V. A. DALMATOV. (B) "Proto-acid" of fibrin. S. S. PEROV. (C) Identity of racemisation curves of some "proto-acids." I. LEONTEV and K. MARKOVA. (D) "Proto-acid" of soya bean. S. S. PEROV, P. DJATSCHENKO, and K. SCHELPAKOVA. (E) "Proto-acid" of lupin. S. S. PEROV, P. DJATSCHENKO, and K. SOVETINOVA. (F) "Proto-acid" of ovalbumin. S. S. PEROV. (G) Transformation of globulin into "proto-acid." P. DJATSCHENKO (Trud. Lab. Izuch. Belka Belkovogo Obmen. Organ., 1933, No. 4, 50—53; No. 5, 39—54; 1935, No. 7, 17—25, 39—51, 52—54, 55—61, 67—75).—(A) The proto-acid (I) extracted with  $\text{NaOH}$  from the fat-free nut has the same acidity, N content, electrical conductivity,  $\eta$ , surface tension, and  $n$  (in 1% solution) as casein (II).

(B) Blood contains a (I) similar to (II). Differ-

ences in blood-proteins are ascribed to complexes consisting of (I) combined as a salt or ester with other compounds.

(c) Every protein dissolved in dil. alkali exhibits a definite rate of racemisation. The (I) of egg-white, fibrin, (II), soya beans, and peas shows the same racemisation curve.

(d) The (I) of soya bean (prep. described) has the same composition and physical consts. as (II), including coagulation by rennin.

(e) The (I) is physically identical with (II), which it can replace in the manufacture of glue and plastics.

(f) Prep. of the (I) is described. It is indistinguishable from (II).

(g) Conversion of glycinin (from soya bean) into (I) is described. The (I) is identical with (II).

CH. ABS. (p)

**Casein** ("caseinic acid"). S. S. PEROV (Trud. Belkovo Lab. Sborn., 1931, 82 pp.).—The separation, purification, and titration of casein are examined and the cryst. product is prepared. Milk contains only a single protein, lactalbumin, lactoprotein, etc. being merely physical modifications of casein.

CH. ABS. (p)

**Vegetable "proto-acid."** S. S. PEROV and M. LISITZUIN (Trud. Belkovo Lab. Sborn., 1932, 69 pp.).—The prep. and properties of proto-acid from beans, oats, peas, and wheat are described. All yield the same acid, which is similar to "caseinic acid" (see preceding abstract).

CH. ABS. (p)

**Structure of protein phases in plant substrata.** S. S. PEROV (Trud. Lab. Izuch. Belka Belkovogo Obmen. Organ., 1932, No. 3, 32—50).—The classification of proteins into globulins, albumins, etc. is criticised. Globulin from peas is an impure proto-acid.

CH. ABS. (p)

**Physicochemical and immunological properties of the protein from seeds of *Phaseolus aureus*,** R. I. LEONTEV (Trud. Lab. Izuch. Belka Belkovogo Obmen. Organ., 1933, No. 5, 62—67).—The purified proto-acid has the same physical consts. as has casein and produces no anaphylactic shock in guinea-pigs. Geographical, meteorological, and soil conditions prevailing during the growth of a plant have no effect on the chemical and physiological structure of the protein in the seed. CH. ABS. (p)

**Preparation of pure proto-acid from peas on a semi-plant scale.** V. A. DALMATOV (Trud. Lab. Izuch. Belka Belkovogo Obmen. Organ., 1935, No. 7, 76—94).—Yields of 17% of proto-acid and 42% of starch are obtained from ground peas. CH. ABS. (p)

**Interferometer for biological work.** R. JONNARD (Compt. rend. Soc. Biol., 1936, 122, 396—398). H. G. R.

**Electron microscopic photographs of chitin objects.**—See this vol., 955.

**Micro-electrode for determining  $p_H$ .** V. A. DORFMAN (Bull. Biol. Med. Exp. U.R.S.S., 1936, 1, 133—134).—Apparatus is described. Determinations are made in  $H_2$  and an agar block containing 0.1N-KCl is used instead of a solution. Strictly anaerobic determinations cannot be made. W. McC.

**Resistance for determination of redox potentials in biological fluids.** M. E. FREEMAN (Science, 1936, 83, 562). L. S. T.

**Potentiometric adaptation of the Shaffer-Hartmann sugar method.** L. F. NEY and E. S. WEST (J. Biol. Chem., 1936, 114, 547—550).—The sugar solution, Fe or Zn blood filtrate, or  $Fe_2(SO_4)_3$ -Lloyd's reagent urine filtrate is heated with Shaffer-Somogyi reagent (A., 1933, 699), a  $K_3Fe(CN)_6$ -citrate solution is added, and the potential against a blank, similarly treated, is determined. H. D.

**Use of ceric salts in the micro-determination of glucose.**—See this vol., 968.

**Micro-determination of mol. wt. in exaltone.**—See this vol., 956.

**Micro-method for accurate determination of  $D_2O$  in water.**—See this vol., 949.

**Determination of total base in blood and other biological fluids by the electro dialysis method of Adair and Keys.** A. KEYS [with W. V. CONSOLEZIO] (J. Biol. Chem., 1936, 114, 449—459).—The application of the method (A., 1935, 52) to biological fluids is described. An average error of 1% with samples of 0.2 ml. was obtained. H. D.

**Determination of total creatine.** C. CIACCIO and I. CIACCIO (Boll. Soc. ital. Biol. sperim., 1935, 10, 927—928).—The tissue is deproteinised by means of  $CCl_3CO_2H$ , the extract is conc. in presence of HCl, neutralised, pptd. by  $ZnSO_4-NaOH$ , and creatine in the resulting filtrate is determined by  $NaOH$ -picric acid reagent. F. O. H.

**Photo-electric micro-determination of copper.** B. EISLER, K. G. ROSDAHL, and H. THEORELL (Biochem. Z., 1936, 285, 76—77).—The method permits the determination of  $0.5 \times 10^{-6}$  g. of Cu in biological material in presence of Fe. P. W. C.

**Determination of chlorides in biological fluids by use of adsorption indicators.** Use of diphenylamine-blue for volumetric micro-determination of chlorides in urine and blood-filtrates. A. SAIFER and M. KORNBLUM (J. Biol. Chem., 1936, 114, 551—555).— $Cl^-$  is determined by acidification, addition of octyl alcohol, and titration with  $AgNO_3$  with  $NHPh_2$ -blue as indicator. H. D.

**Micro-determination of fluorine in plant and animal matter.** A. MAYRHOFER and A. WASITSKY [with W. KORN] (Mikrochem., 1936, 20, 29—48).—The material is mixed with glass powder and  $H_2SO_4$ , the F being distilled off as  $SiF_4$  and absorbed in NaOH. The Si is determined colorimetrically with  $NH_4$  molybdate, quinol, and a mixture of  $Na_2CO_3$  and  $Na_2SO_3$ , comparison being made with a synthetic solution (aq.  $CuSO_4$  with  $NH_3$  and traces of picric acid) standardised against aq.  $Na_2SiO_3$ . Natural products are ashed and the F in the sol. portion of the ash is pptd. with  $La(OAc)_3$  and ignited gently, this product being combined with the insol. ash for the determination. J. W. S.

# BRITISH CHEMICAL ABSTRACTS

## A.—PURE CHEMISTRY

SEPTEMBER, 1936.

### General, Physical, and Inorganic Chemistry.

**Atomic hydrogen and the disappearance of hydrogen in discharge tubes.** R. DELAPLACE (Compt. rend., 1936, 202, 1986—1987).—If traces of  $\text{H}_2\text{O}$  vapour and Hg are excluded from the discharge, no fall in pressure occurs and no CO and  $\text{CH}_4$  are formed. In absence of  $\text{H}_2\text{O}$  vapour the formation of at. H is restricted. Heating the glass liberates traces of  $\text{CO}_2$ , CO, and  $\text{H}_2$ . H. J. E.

**Intensities in the principal series of lithium.** S. WEINTROUB (Proc. Physical Soc., 1936, 48, 535—548).—The effect of using orthogonal wave functions in the calculation of the optical terms and oscillator strengths ( $f$  nos.) of the first three lines of the principal series of Li has been investigated. Good agreement with observed vals. is obtained for the optical terms; the agreement for the  $f$  nos. is not so good, but is better than that obtained using non-orthogonal wave functions. W. R. A.

**Spectra Be III and Be IV.** H. A. ROBINSON (Physical Rev., 1936 [ii], 50, 99).—New determinations of the  $\lambda\lambda$  of the  $1s^21S_0-1s.np^1P_1$  series of Be III and the  $1s^2S-np^2P$  series of Be IV are recorded. A. J. M.

**Absorption coefficients of the 4774, 5770, and 6290 A. oxygen bands.** L. HERMAN and (MME.) R. HERMAN-MONTAGNE (Compt. rend., 1936, 202, 2064—2066).—Data are recorded. The absorption  $\propto$  the square of the pressure (4—12 kg. per sq. cm.). H. J. E.

**Influence of carbon monoxide, adsorbed by a platinum electrode, on the current-potential relations of the electrical discharge in oxygen.** V. SIHVONEN (Z. Elektrochem., 1936, 42, 538—544).—In streaming  $\text{O}_2$  at low pressure CO is produced at a C anode and is oxidised to  $\text{CO}_2$  by  $\text{O}_2$  adsorbed by a Pt cathode. When C is the cathode,  $\text{CO}$  is strongly adsorbed by the Pt anode and prevents emission of ions until removed by the streaming  $\text{O}_2$ , when the current momentarily passes. E. S. H.

**Stark effect in neon.** N. RYDE (Z. Physik, 1936, 100, 771—773).—Polemical, against Steubing and Kindler (this vol., 653). A. B. D. C.

[Stark effect in neon.] W. STEUBING and H. KINDLER (Z. Physik, 1936, 100, 773).—A reply to Ryde (see above). A. B. D. C.

**Transparency of sodium and potassium films in the Schumann region.** W. H. WATSON and D. G. HURST (Nature, 1936, 138, 124).—A Na film on fluorite is an ideal filter to remove all visible and ultra-violet light of  $\lambda > 2100$  A., and to pass the entire Schumann region. The results for Na and K

do not support the existing theory of the optical properties of metals. L. S. T.

**Isotope shift in the resonance line of magnesium.** D. A. JACKSON and H. KUHN (Proc. Roy. Soc., 1936, A, 154, 679—683).—The singlet resonance line 2852 A. of Mg is shown by the at. beam method to possess two components at a separation of 0.033  $\text{cm}^{-1}$ , the component of longer  $\lambda$  being much stronger than the other. The splitting of the line is ascribed to an isotope shift, the stronger line being due to the abundant isotope 24 and one of the other two, and the weaker line to the third isotope. L. L. B.

**Band spectrum of sulphur.** A. CHRISTY (Physical Rev., 1935, [ii], 47, 251).—A reply to criticism (this vol., 397). L. S. T.

**Optical L spectra of chlorine, Cl VIII, Cl IX, Cl X, and Cl XI.** B. EDLÉN (Z. Physik, 1936, 100, 726—733). A. B. D. C.

**Nuclear spin and magnetic moment of potassium (41).** J. H. MANLEY (Physical Rev., 1936, [ii], 49, 921—924; cf. Fox, this vol., 1).—The spin of the  $^{41}\text{K}$  nucleus and the hyperfine structure separation of the  $^2S_1$  normal state were measured by the method of zero moments, the high resolution for separating the two isotopes being obtained by passing a beam of neutral K atoms through a weak inhomogeneous magnetic field 153 cm. long. The spin was  $3/2$ , and the hyperfine structure separation and magnetic moments  $0.554 \pm 0.2\%$  of those of  $^{39}\text{K}$ , the vals. of which give for  $^{41}\text{K}$  0.22 nuclear Bohr magneton and  $0.00853 \pm 0.0001 \text{ cm}^{-1}$  for magnetic moment and separation, respectively. The abundance ratio  $^{39}\text{K}/^{41}\text{K}$  is  $13.4 \pm 0.5$ . N. M. B.

**Narrow continuous band of potassium in the extreme red.** T. OKUDA (Nature, 1936, 138, 168).—A broadening of the resonance lines in the extreme red absorption spectrum of K vapour in  $\text{H}_2$ , and the appearance, at higher temp., of a narrow, continuous band at approx. 7220 A. has been observed. L. S. T.

**Use of the reflexion echelon for interferometric wave-length comparisons extending into the Schumann region.** D. L. MACADAM (Physical Rev., 1936, [ii], 50, 185).—Measurements of eight  $\lambda\lambda < 2100$  A. for Cu II agree to  $< 0.004$  A. with calc. vals. Difficulties of the method are discussed. N. M. B.

**Emission spectrum of diatomic arsenic.** G. M. ALMY and G. D. KINZER (Physical Rev., 1935, [ii], 47, 199).—The mol. spectrum of As in emission

consists of an extensive group of bands between 2250 and 3750 Å. and a weak group near 4200 Å.

L. S. T.

**Structure of bromine III.** K. R. RAO (Nature, 1936, 138, 168).—An extension of previous work (A., 1935, 423).

L. S. T.

**Hyperfine structure of the cadmium resonance line.** A. G. SHENSTONE (Physical Rev., 1935, [ii], 47, 317).

L. S. T.

**Fluorescence spectra of antimony vapour excited by cadmium, zinc, and magnesium sparks.** R. SIKSNA (Acta phys. polon., 1933, 2, 253—265; Chem. Zentr., 1935, ii, 3062).—Data for the line and band fluorescence are given.

H. J. E.

**Fluctuation bands of the vapour of diatomic tellurium.** M. DESIRANT and A. MINNE (Bull. Acad. roy. Belg., 1936, [v], 22, 646—658).—A series of wide and symmetrical bands showing fluctuations in intensity have been observed in the spectrum of the vapour of  $\text{Te}_2$ . The bands are composed of numerous fine bands degraded towards the red. Two systems may be recognised, one extending from the last bands of the principal system to 6000 Å., the other from 6000 Å. into the red. The heat of dissociation for the normal state of  $\text{Te}_2$  is calc. to be 2.3 volts.

A. J. M.

**First spark spectrum of caesium as excited by electron impact.** R. R. SULLIVAN (Physical Rev., 1936, [ii], 49, 912—916).—An apparatus for the study of the controlled excitation of spectra of volatile metals is described. Certain aspects of the optical excitation functions for several Cs II lines are given. Onset potentials are compared with those predicted by existing energy level schemes, and possible transitions are suggested for the unclassified lines  $\lambda\lambda$  4264.7 and 4763.6.

N. M. B.

**Resonance radiation of mercury 2536.7 Å. line, avoiding Doppler broadening.** S. YEN (Helv. phys. Acta, 1935, 8, 225—246; Chem. Zentr., 1935, ii, 2782).—The Doppler broadening is avoided by exciting the resonance line in a beam of Hg at. rays. Zeeman resolution of the line is observable with very low magnetic fields, revealing a new magnetic effect.

J. S. A.

**Paschen-Back effect of hyperfine structure. III. Separation of  $^{199}\text{Hg}$ .** J. B. GREEN (Physical Rev., 1936, [ii], 50, 126—128; cf. A., 1935, 137).—The magnetic components due to  $^{199}\text{Hg}$  have been separated. The lines studied were  $\lambda\lambda$  3125, 5461, 4358, and 4047. An almost complete Paschen-Back effect is observed, each ordinary Zeeman component being accompanied by two satellites due to the nuclear spin  $i = \frac{1}{2}$ . Results agree closely with theory.

N. M. B.

**Afterglow in electrically excited mercury vapour.** K. NARKIEWICZ-JODKO (Acta phys. polon., 1933, 2, 311—333; Chem. Zentr., 1935, ii, 3064).—Measurements at  $100\text{—}300^\circ/2.6\text{—}87\text{ mm.}$  are recorded. The mm. pressure for the afterglow was 2 mm. The effective diameter of excited Hg was  $6 \times 10^{-8}\text{ cm.}$ , assuming a life of  $10^{-7}\text{ sec.}$

H. J. E.

**Distribution of atomic nuclear spins.** S. TOLANSKY (Nature, 1936, 137, 1071; A., 1935, 676).—Diagrams showing the distribution of nuclear spins in atoms of odd at. wt. are given. The preponderance of spin of val.  $\frac{1}{2}$  in the case of nuclei with an odd nuclear neutron indicates that neutron spin and orbital moments tend to oppose each other.

L. S. T.

**Electrical discharge between rotating copper electrodes.** A. KOTECKI (Acta phys. polon., 1934, 3, 105—114; Chem. Zentr., 1935, ii, 3209).—The voltage drop across a 10-mm. arc in air at atm. pressure does not vary with the speed of rotation of the electrodes (Cu or Al).

H. J. E.

**Second sheath near the [oxide-coated] cathode of an arc discharge [in rare gases].** N. WARMOLTZ (Nature, 1936, 138, 36).

L. S. T.

**Ultra-violet stellar spectra with aluminium-coated reflectors. IV. Spectrum of  $\alpha$  Boötis.** R. W. SHAW (Astrophys. J., 1936, 83, 225—237).—Lines between 3150 and 3950 Å. are tabulated. Al, Cr, Cu, Fe, Ni, Na, Ti, and V, and the NH mol. spectrum have been identified.

L. S. T.

**Effect of oxygen on the auroral afterglow.** J. KAPLAN (Nature, 1936, 138, 35).

L. S. T.

**Absorption-line intensities in B-type stars.** E. G. WILLIAMS (Astrophys. J., 1936, 83, 279—304).

L. S. T.

**Connexion between emission intensity and violet displacement of the absorption lines in the spectrum of P. Cygni.** T. ARAKI and M. KURIHARA (Proc. Imp. Acad. Tokyo, 1936, 12, 125—127).

A. J. M.

**X-Ray wave-length scales.** A. E. RUARK (Physical Rev., 1935, [ii], 47, 316; cf. A., 1934, 333).—When  $4.806 \pm 0.003 \times 10^{-10}\text{ e.s.u.}$  is used for  $e$  and  $1.7579 \times 10^7\text{ e.m.u./g.}$  for  $e/m$ , the discrepancy between measured photo-electron energies and those calc. from X-ray  $\lambda\lambda$  is explained.

L. S. T.

**Absorption of X-rays of wave-length 50 to 150 Å. by elements of low atomic number.** T. R. CUYKENDALL (Physical Rev., 1936, [ii], 50, 105—109).—Mass absorption coeffs. accurate to 2% were determined for C, Na, Al, S, K, Ni, and Cu for the range 50—209 Å. Vals. of the electronic scattering coeff. by the Klein-Nishina formula are in good agreement with experiment for C in the range 40—100 X. The photo-electric absorption in Cu is  $\propto \lambda^2$ .

N. M. B.

**Absorption of ultra-short X-rays by elements of high atomic number.** M. T. JONES (Physical Rev., 1936, [ii], 50, 110—114; cf. preceding abstract).—Mass absorption coeffs. accurate to 0.8% were measured for Pb, Ta, Sn, Ag, Mo, and Nb for the range 30—185 Å. Photo-electric absorption is calc. and discussed in relation to at. no. and the Klein-Nishina formula.

N. M. B.

**Structure of the extremely soft X-ray absorption of solids.** H. M. O'BRYAN (Physical Rev., 1936, [ii], 49, 944).—The absorption of Li and Mg on celluloid and of Li and Na halides in the range 170—500 Å. shows, for Li, an additional band at 196 and a faint edge at 225 Å.; LiCl gives very sharp bands

at 204 and 192 Å., the other Li halides give similar bands, but the Na halides only one prominent band at 372 Å. Mg halides show a band near 235 Å. Mg gives a stronger edge at 237 than at 250 Å. The bands for the halides are due to the alkali ion of the crystal. There must be two sets of lattice levels. Results are in poor agreement with calculations.

N. M. B.

**Shape of the Compton lines.** A. SOMMERFELD (Physical Rev., 1936, [ii], 50, 38—40).—The continuous Compton band observed for bound electrons must have a definite limit on the short-wave side. Beyond this limit, and up to the unmodified Rayleigh line, there should be a no. of discrete lines, which may be termed Raman lines. There is no discontinuity in the intensity. The experimental conditions for observing these lines are discussed and it is suggested that lines observed by Ray in the spectrum of X-rays which have passed through thin films (A., 1930, 833) might thus be explained.

A. J. M.

**Correlation between scattering and recoil in the Compton effect.** J. C. JACOBSEN (Nature, 1936, 138, 25).—Experiments with  $\gamma$ -rays from Ra-Th confirm the usual theory of the Compton effect (cf. this vol., 265).

L. S. T.

**Relative and absolute values of atomic levels.** A. E. SANDSTROM (Phil. Mag., 1936, [vii], 22, 171—180).—A discussion of data obtained from X-ray absorption spectra and from the magnetic deflection of secondary electrons.

H. J. E.

**Natural width of the  $K\alpha$  lines.** H. MARGENAU (Physical Rev., 1935, [ii], 47, 89—90).

L. S. T.

**K Radiation of boron.** J. SERPE (Compt. rend., 1936, 202, 1979—1981).—The K radiation of powdered B is a single continuous band. The effect of temp. on its structure is discussed.

H. J. E.

**K Radiation of crystallised boron.** A. HAUTOT (Compt. rend., 1936, 202, 2138—2140).—The increase of conductivity and the variation in the K radiation bands with rise of temp. for cryst. B prepared by reducing  $\text{BCl}_3$  with  $\text{H}_2$  in a condensed high-frequency spark are explained on the supposition that the valency electrons are held in the crystal lattice at low temp. ( $600^\circ$ ), and are liberated at high temp. ( $1530^\circ$ ).

C. R. H.

**$K\alpha$  Satellite lines.** L. G. PARRATT (Physical Rev., 1936, [ii], 50, 1—15).—The  $K\alpha_{3,4}$  group of X-ray satellite lines has been recorded for the elements from S (at. no. 16) to Ge (32). For elements of at. no. between 16 and 28 there are five components of the satellite lines, and for those between 29 and 32 there are four. The widths, indices of asymmetry, and overlapping factors of the  $K\alpha_{1,2}$  lines were also determined. The effect of chemical linking, determined by using targets of various Ca compounds, was negligible.

A. J. M.

**$L\alpha$  Satellites for the elements 72, 73, 75, 83, 90, and 92.** (MLLE.) Y. CAUCHOIS (Compt. rend., 1936, 202, 2068—2069; cf. this vol., 3).—Data are summarised and discussed.

H. J. E.

**Formation of a potassium film on silver.** J. J. BRADY (Physical Rev., 1935, [ii], 47, 197).—The

photo-electric properties of K films deposited on a freshly evaporated Ag surface have been investigated with special reference to the saturation of the photo-current.

L. S. T.

**Use of the image potential for the surface photo-electric effect.** R. D. MYERS (Physical Rev., 1936, [ii], 49, 938—939).—The calc. surface photo-electric effect, taking account of the image force between electron and metal, shows an increased no. of slow electrons and a somewhat steeper max. of the effect as a function of the illuminating frequency.

N. M. B.

**Photo-electric effect of the deuteron.** G. BREIT and E. U. CONDON (Physical Rev., 1936, [ii], 49, 904—911).—Theoretical cross-sections for the dissociation of the deuteron by absorption of  $\gamma$ -rays (the Chadwick-Goldhaber effect) are calc., and curves of cross-section as a function of energy for various assumed widths are given and discussed.

N. M. B.

**Thermionic emission from platinum in bromine and chlorine vapour.** S. KALANDYK (Acta phys. polon., 1934, 3, 165—178; Chem. Zentr., 1935, ii, 3209—3210).—The negative emission from Pt is increased by the presence of Br and occurs at a relatively low temp. ( $160^\circ$  for 0.235 mm. Br pressure). The effect increases with the Br pressure. It is attributed to a chemical reaction. The + emission is unchanged. At very high temp. the normal emission from Pt is observed. Similar results were obtained for Cl<sub>2</sub> and I.

H. J. E.

**Ionisation of gases by collisions of their own accelerated atoms.** R. N. VARNEY (Physical Rev., 1936, [ii], 50, 159—161).—Neutral atom beams of rare gases of energies 20—400 volts were produced by accelerating ionised atoms and then neutralising the charges. The min. energies needed by these neutral atoms to ionise gas atoms by collision were determined. Ne, Ar, Kr, and Xe ionised their own gases at energies about three times the actual ionisation potentials.

N. M. B.

**Total ionisation of nitrogen by electron collisions.** (MISS) G. A. ANSLOW and (MISS) M. DE B. WATSON (Physical Rev., 1936, [ii], 50, 162—169).—The total ionisation by beams of electrons of homogeneous velocity and energies  $> 1500$  volts increases rapidly up to 75 volts, then less rapidly but linearly to 375 volts, for which there is a break in the ionisation curve, indicating the onset of K electron ionisation; the ionisation again increases rapidly near 750 volts and less rapidly but linearly after 1200 volts. The mean effective ranges and electron energies nearly obey the relation  $R_0 = 0.07 + 1.88 \times 10^{-6} V^2$  cm. at 1 mm. pressure. The average total ionisation per cm. of absorbing gas layer shows a max. above 100 volts in the primary ionisation region and a second max. at 750 volts, twice the ionisation potential of the K electrons of N, these characteristics being similar to those for air.

N. M. B.

**Secondary electron emission from a hot nickel target due to bombardment by hydrogen ions.** (MISS) M. HEALEA and E. L. CHAFFEE (Physical Rev., 1936 [ii], 49, 925—930).—Consistent vals. were

obtained after keeping the target hot for 6 weeks. The no. of electrons emitted from the target per positive ion varied from 0.046 at 303 e.v. to 0.223 at 1539 e.v. ion energy. N. M. B.

(A) Inelastic scattering of electrons from solids. E. RUDBERG. (B) Theory of inelastic scattering of electrons from solids. E. RUDBERG and J. C. SLATER (Physical Rev., 1936, [ii], 50, 138—150, 150—158).—(A) The energy distribution of electrons scattered inelastically from Cu, Ag, and Au surfaces deposited in vac. was investigated for the energy range 50—400 volts. For certain vals. of the energy loss suffered by the scattered electron the curves show max. characteristic of the material and independent of the primary voltage. Each metal has two max. below 10 volts, and these appear to correspond roughly with regions of high optical absorption. The penetration depth of the scattered electron, estimated from energy distribution measurements on films of Ca, CaO, Ba, and BaO of known thickness deposited on Ag, shows that inelastic scattering is determined by the first few at. layers near the surface. The Ca and Ba deposits show a high rate of oxidation, even at  $< 10^{-7}$  mm. pressure. The distribution curves for the oxides differ entirely from those for the metal.

(B) Mathematical. A detailed calculation is given for Cu. The distribution curve and its two max. are in good agreement with experiment. N. M. B.

Anomalies in the charging of gas molecules by slow ions. F. WOLF (Naturwiss., 1936, 24, 447—448).—An earlier method (this vol., 539) has been improved, and the form of the charge transference cross-section against ionic velocity studied for  $H_2^+ \rightarrow N_2$ ,  $H^+ \rightarrow A$ , and  $H^+ \rightarrow H_2$  for low ionic velocities. There is a more or less definite secondary max. or min. in the curves at low velocities.

A. J. M.

Production of radiation and ionisation from helium atoms by potassium positive ions. (Miss) A. C. DAVIES (Proc. Roy. Soc., 1936, A, 155, 123—141).—The excitation and ionisation of neutral He atoms by a beam of  $K^+$  ions of controlled energy has been investigated. The beginning of measurable ionisation plus radiation effects occurs at about 450 volts. The no. of electrons produced per K ion per cm. of path at a 1 mm. pressure by 750-volt ions is estimated as  $8.7 \times 10^{-3}$ , and by 3000-volt ions as  $2.3 \times 10^{-1}$ . Possible causes of the discrepancies in results of previous investigators are discussed.

L. L. B.

Preparation and investigation of a new alkali ion source. J. KOCH (Z. Physik, 1936, 100, 669—684).—An alkali chloride mixed with degassed W powder is a very pure source of Cs, Rb, and K ions.

A. B. D. C.

Incidence of positive caesium ions on a degassed tungsten surface. J. KOCH (Z. Physik, 1936, 100, 685—701).—Cs ions incident on a W surface are largely reflected, and the saturation Cs layer is  $< 0.1$  monat.

A. B. D. C.

New process of negative ion formation. F. L. ARNOT (Nature, 1936, 138, 162).—The majority of negative ions formed by the passage of a stream

of electrons through Hg vapour,  $H_2$ ,  $N_2$ ,  $O_2$ , and  $CO_2$  do not arise by the attachment of an electron to an atom. They are formed from positive ions which extract two electrons from any negatively charged electrode, including the filament, to which they are driven. Occasionally the positive ion is dissociated by its collision with the surface and the negative ion then formed is one of the products of dissociation; e.g., the negative ions detected in  $CO_2$  are  $CO_2^-$ ,  $CO^-$ ,  $O_2^-$ ,  $O^-$ , and  $C^-$ . In  $O_2$ , both  $O_2^-$  and  $O^-$  are found, but Hg vapour,  $H_2$ , and  $N_2$  give only the at. negative ion. The probability of conversion of positive into negative ions on a Ni surface in each gas increases as the energy of the positive ion is increased, and data for the conversion of a 180-volt positive ion are recorded. L. S. T.

Fundamental at. wts. Ratio of silver nitrate to silver chloride. O. HONIGSCHMID and R. SCHLEE (Angew. Chem., 1936, 49, 464—466).—The mean of eight determinations yields a val. of 1.185241 for the ratio  $AgNO_3 : AgCl$ . Combining with the vals. 1.57479 and 4.042592 for the ratios  $AgNO_3 : Ag$  and  $AgCl : Cl$ , respectively, the at. wts. of Ag, Cl, and N are 107.8812, 35.4562, and 14.0088, respectively.

J. W. S.

Calculation of at. wts. from nuclear reaction energies. H. A. WILSON (Proc. Roy. Soc., 1936, A, 154, 560—563; cf. A., 1935, 1443).—It is shown that at. wts. with  $^{16}O = 16$  can be calc. from nuclear reaction energies without making use of at. wts. determined by other methods. Vals. obtained for 18 light elements in this way are in agreement with those of Bethe and of Oliphant, Kempton, and Rutherford from mass spectrograph results (cf. A., 1935, 910).

L. L. B.

Masses of  $^9Be$ ,  $^{10}Be$ , and  $^{11}B$  as determined from transmutation data. H. R. CRANE and C. C. LAURITSEN (Physical Rev., 1935, [ii], 47, 420).—Vals. deduced are  $^9Be$  8.0059,  $^{11}B$  11.0095 or 11.0093,  $^{10}Be$  9.0125 (approx.  $2 \alpha$ -particles + 1 neutron).

L. S. T.

Differences in the isotopic composition of atmospheric and aqueous oxygen and the electrolytic separation factor of oxygen isotopes. N. MORITA and T. TITANI (Bull. Chem. Soc. Japan, 1936, 11, 414—418).—The  $d$  of light  $H_2O$  prepared by combination of  $D_2$ -free  $H_2$  and atm.  $O_2$  indicates that atm.  $O_2$  is 0.0007% heavier than  $O_2$  from  $H_2O$ , and that the electrolytic separation factor for  $O_2$  isotopes is  $1.01 \pm 0.01$ .

C. R. H.

Influence of density differences between atmospheric and aqueous oxygen on data for oxygen and hydrogen isotopes. N. MORITA and T. TITANI (Bull. Chem. Soc. Japan, 1936, 11, 419—424).—Contemporary vals. for the ratio  $D : H$  and for the electrolytic separation factor for O isotopes are compared and discussed.

C. R. H.

Isotopes in induced radioactivity. T. R. WILKINS and L. S. SHNIDMAN (Physical Rev., 1935, [ii], 47, 251).—The final stable products of nuclear transformations resulting from  $\alpha$ -ray bombardment, viz.,  $^{30}Si$ ,  $^{13}C$ ,  $^{27}Al$ , etc., are all isotopes of rarest occurrence according to mass spectrum data. In

transformations from neutron bombardment the resulting stable atoms such as  $^{16}\text{O}$ ,  $^{24}\text{Mg}$ ,  $^{32}\text{S}$ , etc. are the most frequently occurring isotopes. Transformations occurring in nature thus appear to be more frequently of the neutron type. L. S. T.

**Isotopic constitution of iron and nickel.** A. J. DEMPSTER (Physical Rev., 1936, [ii], 50, 98).—The mass spectrum of Fe obtained by sparking between pure electrolytic Fe electrodes indicates the existence of isotopes of Fe of mass 54, 56, 57, and 58, the last being the weakest. The mass spectrum of Ni obtained by fractionating  $\text{Ni}(\text{CO})_4$  showed the presence of isotopes of mass 58, 60, 61, 62, and 64. A. J. M.

**Mass spectrograph analysis of bromine.** J. P. BLEWETT (Physical Rev., 1936, 49, 900—903).—Attempts to observe a third isotope to explain the three periods of artificial radioactivity induced by slow neutrons show that an isotope 77 or 83 cannot be present to more than 1 in 3000. The abundance ratio  $81/79$  was  $0.975 \pm 0.025$ , giving the at. wt. of Br  $79.92 \pm 0.02$  on Aston's scale or  $79.90 \pm 0.02$  on the at. wt. scale. The processes of formation of positive and negative Br ions by slow electrons were studied, giving heat of dissociation of  $\text{Br}_2$   $1.9 \pm 0.5$  volts, and electron affinity of Br  $3.8 \pm 0.2$  volts. N. M. B.

**Isotopic constitution of barium and cerium.** A. J. DEMPSTER (Physical Rev., 1936, [ii], 49, 947; cf. Blewett, this vol., 772).—Mass spectra photographs of Ba ions formed in a high-frequency spark between Ba electrodes show very faint isotopes at 130 and 132; Ce gives similar results at 136 and 138. On a neutron-proton plot of the isotopes  $^{130}\text{Ba}$  and  $^{136}\text{Ce}$  fall on the straight line indicating the lower mass limit for nuclear stability. N. M. B.

**Isotopic constitution of strontium and tellurium.** A. J. DEMPSTER (Physical Rev., 1936, [ii], 50, 186).— $^{84}\text{Sr}$  is confirmed (cf. Blewett, this vol., 772). Mass spectra of the charged atoms from a spark between Te and Pd electrodes show a new faint  $^{120}\text{Te}$ , but no trace of  $^{127}\text{Te}$  indicated by Bainbridge (cf. A., 1933, 1099). N. M. B.

**Mass equivalent of the energy in radioactive transformations.** A. J. DEMPSTER (Nature, 1936, 138, 201).—A spark between electrodes of Pb and Pd or Pt-Rh forms doubly-charged Pb ions which give close doublets in the mass spectrograph with the singly-charged Rh and Pd ions at 102, 103, and 104. The at. masses deduced for the Pb isotopes are  $206.00 \pm 0.01$  and  $208.00 \pm 0.01$ . These vals. agree with those obtained for U-Pb and Th-Pb from the radioactive transformations of U and Th, provided that an allowance is made for the mass equivs. of the energy emitted in these processes. L. S. T.

**Isotopic constitution of lead from hyperfine structure.** J. L. ROSE and R. K. STRANATHAN (Physical Rev., 1936, [ii], 49, 916—920; cf. A., 1935, 270).—The % relative abundances of the Pb isotopes, determined from intensity measurements of the hyperfine structure components of the spark line  $\lambda = 2203$ , were 51.5, 26.3, 21.4, and 0.8 for isotopes 208, 206, 207, and 204, respectively. For integral

masses of the isotopes the mean mass no. is  $207.22_8$ , giving 207.20 on the at. wt. scale, assuming a packing factor of +1. N. M. B.

**Atomic masses of uranium and thorium.** A. J. DEMPSTER (Nature, 1936, 138, 120).—Doublets obtained in the mass spectrograph with  $\text{Th}^{++}$  and  $^{116}\text{Sn}$ , and  $\text{U}^{++}$  and  $^{119}\text{Sn}$  give 232.070 and 238.088 ( $\text{O} = 16.000$ ) for the at. masses of Th and U, respectively. Doubly-charged ions of  $^{235}\text{U}$ , mass 235.084  $\pm 0.01$ , also appeared. Reduced to the chemical scale, the at. wts. become 232.024 for Th and 238.028 for the mean of the two U isotopes, compared with the accepted vals. of 232.12 and 238.14, respectively. Electrodes prepared from heated  $\text{UO}_2(\text{NO}_3)_2$  and Na uranyl acetate also gave  $^{235}\text{U}$ , which is regarded as isomeric with the short-lived isotope formed by neutron bombardment of U (this vol., 773). These isotopes have the same mass and charge, but differ in nuclear properties. L. S. T.

**Mechanism of isotopic exchange reactions.** E. OGAWA (Bull. Chem. Soc. Japan, 1936, 11, 425—427).—Theoretical. Polarisation of atoms probably plays the most important part, an element being richer in the heavier isotope when it is in the more positively polarised state. C. R. H.

**Arrangement of chemical elements in teaching.** E. WIBERG (Angew. Chem., 1936, 49, 480—481).—A new layout of the periodic table is described, in which the sub-groups and transition elements are introduced between the Ti and Ge sections of group II. J. W. S.

**Anchoring of radium emanation on nuclei.** G. ALIVERTI and G. ROSA (Atti R. Accad. Sci. Torino, 1934—1935, 70, I, 266—271; Chem. Zentr., 1935, ii, 2847).—The binding of Rn on nuclei in measurements of atm. radioactivity is improbable; the effect is probably due to Th-Em. J. S. A.

**Disintegration constant of thorium and branching ratio of thorium-C.** A. F. KOVARIK and N. I. ADAMS, jun. (Physical Rev., 1936, [ii], 50, 99).—By means of a mechanical counter to determine the rate of emission of  $\alpha$ -particles from  $\text{ThO}_2$  and its products, the  $\text{ThO}_2$  being covered with celluloid to prevent escape of Th-Em, the val. of the disintegration const.  $\lambda$  was found to be  $5.17 \times 10^{-11}$  years $^{-1}$ , the half val. period being  $1.34 \times 10^{10}$  years. The branching ratio of Th-C is 0.660. A. J. M.

**Materialisation of the energy of  $\beta$ -rays from radium-C.** A. M. DA SILVA (Compt. rend., 1936, 202, 2070—2072).—Data are recorded for the no. of positrons observed in a Wilson chamber with varying thicknesses of Pb surrounding the source. The effects due to the source and to  $\gamma$ - and  $\beta$ -rays are separated. Preliminary experiments with Al screens are described. H. J. E.

**$\gamma$ -Radiation from Po + Be.** G. BERNARDINI and L. EMO (Ric. sci. Prog. tec., 1935, II, 6, 17—23; Chem. Zentr., 1935, ii, 2924).—The max. energy of secondary electrons from Po+Be, measured by absorption in Al, is  $3.5 \times 10^6$  e.v. corresponding with  $\gamma$ -rays of  $3.7 \times 10^6$  e.v. J. S. A.

**Photon theory and Compton effect.** W. BOTHE and H. M. LEIBNITZ (Physical Rev., 1936, [ii], 50, 187).—Investigations showed that the Compton effect for Ra-C  $\gamma$ -rays is in agreement with the photon theory, and Shankland's anomalous results (cf. this vol., 265) are not supported but were probably due to inhomogeneity of the  $\gamma$ -rays. N. M. B.

**Experimental proof of the diffraction of neutrons.** H. VON HALBAN and P. PREISWERK (Compt. rend., 1936, 203, 73—75).—Data for the angular distribution of neutrons after diffraction through Fe powder at 90° and 300° abs. show that at lower temp. the intensity diminishes and increases for small and large deviations, respectively. C. R. H.

**Quantum energy of  $\gamma$ -rays excited by slow neutrons.** S. KIKUCHI, K. HUSIMI, and H. AOKI (Nature, 1936, 137, 992—993).—The absorption curves of the secondary electrons due to  $\gamma$ -rays emitted from 24 elements under bombardment by slow neutrons are discussed. L. S. T.

**Neutron.** H. A. SHADDUCK (J. Chem. Educ., 1936, 13, 303—308).—A summary of recent work. L. S. T.

**Neutrality of the neutron.** P. B. MOON (Proc. Physical Soc., 1936, 48, 658).—From the lack of influence of an electric field on neutrons of thermal velocities it is shown that the neutron has no electric charge as great as  $10^{-7}$  of the electronic charge. W. R. A.

**Experiments with neutrons having thermal energies.** J. R. TILLMAN (Proc. Physical Soc., 1936, 48, 642—647).—Different views regarding the influence of temp. on the properties of neutrons are discussed. W. R. A.

**Slowing down of neutrons by thin layers of paraffin.** S. NISHIKAWA, S. NAKAGAWA, and I. SUMOTO (Proc. Imp. Acad. Tokyo, 1936, 12, 128—130).—An analysis of neutron groups was made by passing neutrons through layers of paraffin of various thicknesses and measuring the  $\beta$ -activity induced by the neutrons in Ag and I. Cd filters were also used. A. J. M.

**Passage of neutrons through paraffin wax.** P. B. MOON (Proc. Physical Soc., 1936, 48, 648—657).—The velocity distribution of neutrons passing through paraffin wax is investigated on the assumption that the collisions made before thermal velocity has been reached are elastic collisions with protons. The no. of neutrons crossing unit area is investigated and the ratio of the flux of thermal neutrons in the interior to that at the surface is calc. W. R. A.

**Diffusion and absorption of neutrons in paraffin spheres.** D. M. YOST and R. G. DICKINSON (Physical Rev., 1936, [ii], 50, 128—132).—Measurements were made of the activities imparted to Ag and In detectors in paraffin spheres of various sizes with a Ra-Be source of neutrons at the centre. Results are in fair agreement with theory for distances from the source  $> 8$  cm. The mean free path of the neutrons in paraffin is 0.53 cm., and the ratio of the sp. absorption rate const. to the diffusion const. 0.026 cm.<sup>-2</sup> N. M. B.

**Cross-section measurements with slow neutrons of different velocities.** P. PREISWERK and H. VON HALBAN, jun. (Nature, 1936, 138, 163).—A correction (this vol., 772). L. S. T.

**Photo-neutrons.** D. P. MITCHELL, F. RASETTI, G. A. FINK, and G. B. PEGRAM (Physical Rev., 1936, [ii], 50, 189).—The slowing by H<sub>2</sub>O of neutrons obtained from the photo-disintegration of Be by Rn  $\gamma$ -rays was investigated, and the growth in no. was compared with that of neutrons from a Rn-Be source. The mean free paths of the Rn  $\gamma$ -Be photo-neutrons and Rn  $\alpha$ -Be neutrons were approx. 5 and 9 cm., respectively. The relative no. of photo-neutrons and  $\alpha$ -particle neutrons was 0.2 : 1. Similar experiments were made with the Rn bulb in the centre of a 200-c.c. sphere of pure D<sub>2</sub>O; the photo-neutrons were much slower, and their no. was 2% of the no. of neutrons from Rn-Be. N. M. B.

**Action of neutrons on heavy water.** W. F. LIBBY, E. A. LONG, and W. M. LATIMER (Physical Rev., 1935, [ii], 47, 424—425).—Interposition of D<sub>2</sub>O between target and source (Rn+Be) results in a large decrease in induced radioactivity. L. S. T.

**Scattering of slow neutrons. II.** A. C. G. MITCHELL, E. J. MURPHY, and M. D. WHITAKER (Physical Rev., 1936, [ii], 50, 133—137; cf. A., 1935, 1441; this vol., 541).—Scattering curves are given for neutrons from Fe, Ni, Ag, Cu, and C with various detectors, and the scattering cross-sections for a number of elements are tabulated. Differences in the curves for the Fermi groups are most marked when the scatterer is itself a good absorber of one of the groups. The temp. effect on the neutrons which activate In has been investigated. N. M. B.

**Possibility of selective phenomena for fast neutrons.** G. GAMOW (Physical Rev., 1936, [ii], 49, 946).—In nuclear transformations due to collisions with fast neutrons, resonance phenomena in the region of semi-light nuclei are predicted, with an indication of fast neutron energy for which resonance disintegration should be observed. The reactions discussed are:  ${}^{27}_{13}\text{Al} + {}^4_2\text{He} \rightarrow {}^{30}_{15}\text{P} \rightarrow {}^{30}_{15}\text{Si} + {}^1_1\text{H}$ ;  ${}^{24}_{12}\text{Mg} + {}^4_2\text{He} \rightarrow {}^{28}_{14}\text{Si} \rightarrow {}^{28}_{13}\text{Al} + {}^1_1\text{H}$ ; and  ${}^{28}_{14}\text{Si} + {}^1_0\text{n} \rightarrow {}^{29}_{14}\text{Si} \rightarrow {}^{28}_{13}\text{Al} + {}^1_1\text{H}$ . N. M. B.

**Capture, stability, and radioactive emission of neutrons.** J. R. DUNNING, G. B. PEGRAM, and G. A. FINK (Physical Rev., 1935, [ii], 47, 325).—The no. of neutrons detected in an ionisation chamber 25 cm. distant when a Rn+Be source is placed in the centre of solid spheres of diameters up to 25.7 cm. have been measured for H<sub>2</sub>O, C (coal), Al, sand, Cu and Pb shot. The probability of capture indicated is  $> 25\%$  per collision and may be  $< 10\%$  for most cases. The disappearance of neutrons is apparently  $>$  that required by capture in the production of artificial radioactive atoms, by transfer of momentum on impact and by loss of energy in excitation, without supposing the neutron itself to be disintegrated by nuclear impact. L. S. T.

**Mass spectrographic determination of the mass difference  ${}^{14}\text{N} + {}^1\text{H} - {}^{15}\text{N}$  and the nitrogen disintegration reactions.** E. B. JORDAN and K. T.

BAINBRIDGE (Physical Rev., 1936, [ii], 50, 98).—The isotopic ion  $^{15}\text{N}^+$  was matched in intensity with the mol. ion  $(^{14}\text{N}^1\text{H})^+$ . The doublet separations gave the mass difference  $^{14}\text{N}^1\text{H} - ^{15}\text{N} = 0.01074 \pm 0.0002$  mass units. The use of this val. together with the previously determined mass difference for  $^3\text{H} - ^2\text{D}$ , gives  $8.57 \pm 0.2$  m.e.v. for the energy release in the N deuteron disintegration  $^{14}\text{N} + ^2\text{D} \rightarrow ^{15}\text{N} + ^1\text{H}$ . The mass differences in the production of radio-O and in other N disintegration reactions are also calc.

A. J. M.

Proton emission resulting from  $\alpha$ -ray bombardment of boron and phosphorus. R. F. PATON (Physical Rev., 1935, [ii], 47, 197).—When bombarded with  $\alpha$ -particles from Th-C' the protons emitted from B consist of  $\approx$  four groups with characteristic velocities and energies, the vals. for three of which agree with those obtained using Po  $\alpha$ -particles. With P, new proton groups are emitted.

L. S. T.

Selection rules for the  $\beta$ -disintegration. G. GAMOW and E. TELLER (Physical Rev., 1936, [ii], 49, 895—989).—The rules are stated on the basis of Fermi's neutrino theory.

N. M. B.

Decomposition of beryllium under influence of  $\gamma$ -rays. G. BERNARDINI and M. MANDÒ (Ric. sci. Prog. tec., 1935, 6, II, 38—41; Chem. Zentr., 1935, ii, 2627).—If a Be isotope  $^9\text{Be}$  + a neutron are formed by the  $\gamma$ -ray disintegration of  $^9\text{Be}$ , the isotope must either be stable, or else emit  $\alpha$ -rays of range  $\approx 2.5$  mm.

J. S. A.

Fermi proton effect. A. VON GROSSE and M. S. AGRUSS (Physical Rev., 1935, [ii], 47, 91).—Filling a Ag cup with  $\text{H}_2\text{O}$  increases the activity produced in the Ag by irradiation with neutrons from Be+Rn. Surrounding the cup with  $\text{H}_2\text{O}$  increases the activity still further.  $n\text{-C}_5\text{H}_{12}$  has a similar effect, but not  $\text{CCl}_4$  or  $\text{CS}_2$ . The addition of 5% of  $\text{UO}_2(\text{NO}_3)_2$  or  $\text{H}_3\text{BO}_3$  to the  $\text{H}_2\text{O}$  reduces the effect. The protons of the  $\text{H}_2\text{O}$  absorb the energy of the neutrons by elastic collisions, and the neutrons are then more easily captured with the production of stable or radioactive isotopes.

L. S. T.

$\gamma$ -Ray neutrons and the Fermi proton effect. A. VON GROSSE and M. S. AGRUSS (Physical Rev., 1935, [ii], 47, 93).—Neutrons emitted by  $\gamma$ -rays from Be show the Fermi proton effect. Irradiation of I by Be+ $\gamma$ -rays from Ra gives a product with a half-period of 24 min. Surrounding the source with  $\text{H}_2\text{O}$  increases the induced radioactivity five-fold (cf. preceding abstract).

L. S. T.

Disintegration of beryllium by photons and its possible bearing on the mass of  $^9\text{Be}$ . L. N. RIDENOUR, K. SHINOHARA, and D. M. YOST (Physical Rev., 1935, [ii], 47, 318).—Bombardment of Be with X-rays at 50 cycle a.c. at 0.9 m.e.v. gives results which indicate that the mass of  $^9\text{Be}$  is too high. A val. of 9.0114 is calc.

L. S. T.

Evidence from efficiency curves for the nature of the disintegration process for boron. J. H. WILLIAMS and W. H. WELLS (Physical Rev., 1936, [i], 50, 186—187).—Efficiency curves for the production of  $\alpha$ -particles by bombarding a  $\text{B}_2\text{O}_3$  thick target

with protons of 120—240 kv. are given and discussed. The suggested reaction  $^1\text{H} + ^{11}\text{B} \rightarrow ^9\text{Be} + ^4\text{He}$  is probably a case of resonance disintegration. N. M. B.

Ranges of particles emitted in the disintegration of boron and lithium by slow neutrons. J. ROTBLAT (Nature, 1936, 138, 202).—The ranges of particles emitted during disintegration of  $^{10}\text{B}$  and  $^6\text{Li}$  by slow neutrons from a Po-Be source, using a B- or Li-coated ionisation chamber, have been determined, and the energies calc. An additional release of energy from B, possibly related to  $\gamma$ -rays, is indicated. The cross-section of the B nucleus for capture of a slow neutron is 8 times that of the Li nucleus.

L. S. T.

Absorption and scattering of neutrons. W. F. LIBBY and W. M. LATIMER (Physical Rev., 1935, [ii], 47, 193).—Interposition of  $\text{H}_2\text{O}$  between a Ag target and the neutron source (Be+Rn) markedly increases the activation induced.  $\text{H}_3\text{BO}_3$  decreases the activation of Ag and Cu, as do KCl, NaCl,  $\text{CCl}_4$ , and  $\text{BiONO}_3$  with Cu. Absorption with NaF, NaI, BeO, and CuO is negligible, and  $\text{NH}_4\text{NO}_3$  and S produce small increases in activation.

L. S. T.

Bifurcation in the transmutation of aluminium by the action of fast neutrons. P. DE LA CIERVA (Anal. Fis. Quim., 1936, 34, 541—548).—The no. of atoms of Al transformed into  $^{27}\text{Mg}$  to every atom transformed into  $^{24}\text{Na}$ , on bombardment with neutrons from different sources, is as follows: Be+Rn source, 2:1; Be+Ra, 3:2; Be+Ra, with Pb between Al and neutrons, 3:23; Be+Ra, with paraffin interposed, 3:09 (also forms  $^{28}\text{Al}$ ); Li+Rn, no  $^{27}\text{Mg}$  or  $^{24}\text{Na}$ , but  $^{28}\text{Al}$ ; Mg+Rn, only  $^{27}\text{Mg}$ .

L. A. O'N.

Artificial radioelements. M. E. NAHMIAS and R. J. WALEN (Compt. rend., 1936, 203, 71—73).—Evidence has been obtained for the formation of  $^{20}\text{F}$ ,  $^{19}\text{O}$ , and  $^{16}\text{N}$  from F, and  $^{20}\text{F}$  and  $^{23}\text{Ne}$  from Na, as a result of neutron bombardment. With periods of the order of 1 sec. the results are inconclusive, but the activation of Be is confirmed,  $^9\text{Li}$  probably being formed.

C. R. H.

Disruption of atoms by neutrons. E. MATZNER (Sitzungsber. Akad. Wiss. Wien, 1934, 143, 579—590; Chem. Zentr., 1935, ii, 2628).—The yields obtained by the neutron disintegration of C, Al, S, Fe, Co, Ni, Cu, Zn, Ga, Mo, Ag, Cd, Sn, Pt, and Pb have been measured by scintillation and Wilson chamber methods.

J. S. A.

Disruptibility of light elements investigated with the double-tube electrometer. J. SCHINTLMEISTER and G. STETTER (Sitzungsber. Akad. Wiss. Wien, 1934, 143, 597—617; Chem. Zentr., 1935, ii, 2629).—The disintegration yield of the light elements up to Cl shows an exponential fall from a max. in the case of N, on which is superposed a periodic function giving a uniformly higher yield from "odd" elements than from "even." J. S. A.

Radioactive isotope of iron. E. B. ANDERSEN (Nature, 1936, 138, 76—77).—Active Fe, probably  $^{56}\text{Fe}$ , decaying with a period of approx. 72 hr. has been isolated from Co irradiated by neutrons.

L. S. T.

**Artificial activation of thorium by neutrons.** E. RONA and E. NEUNINGER (Naturwiss., 1936, **24**, 491).—By bombardment of pure ThCl<sub>4</sub> with slow and rapid neutrons, products were obtained with half-life periods of 25 min. (isotope of Th), 3.5 hr. (isotope of Ac), and 42 hr. (isotope of Ac). The most probable scheme of disintegration is  $^{232}_{90}\text{Th} + ^1_0\text{n} = ^{229}_{88}\text{Ra} + ^4_2\alpha$ ;  $^{229}_{88}\text{Ra} \xrightarrow{\beta} ^{229}_{89}\text{Ac} \xrightarrow{\beta} ^{229}_{90}\text{Th} \xrightarrow{\alpha} ^{225}_{86}\text{Ra} \xrightarrow{\beta} ^{225}_{87}\text{Ac}$ . A. J. M.

**Energy of cosmic rays. I. Electro-magnet and cloud chamber.** P. M. S. BLACKETT. **II. Curvature measurements and the energy spectrum.** P. M. S. BLACKETT and R. B. BRODE (Proc. Roy. Soc., 1936, **A**, 154, 564–573, 573–587).—I. Details are given of a large cloud chamber in a strong magnetic field, for measuring high-energy cosmic ray tracks.

**II.** The sources of error are considered, and a preliminary determination of the energy spectrum of 188 vertical cosmic rays is made. L. L. B.

**Frequency of secondary phenomena of the radiation penetrating lead.** A. DRIGO (Ric. sci. Prog. tec., 1935, **I**, 6, 529–534; Chem. Zentr., 1935, **ii**, 2925).—Measurements of the dependence of the no. of particles on the thickness of the absorbing screens do not support Rossi's views (A., 1935, 804). J. S. A.

**Origin of the hardening of cosmic rays in passing through matter.** W. F. G. SWANN (Physical Rev., 1935, [ii], 47, 250). L. S. T.

**Production of cosmic-ray showers.** W. H. PICKERING (Physical Rev., 1935, [ii], 47, 423). L. S. T.

**Bursts of cosmic radiation.** A. R. HOGG (Nature, 1936, **138**, 77–78). L. S. T.

**Critique of daily course of cosmic radiation.** A. WAGNER (Sitzungsber. Akad. Wiss. Wien, 1934, **143**, 533–561; Chem. Zentr., 1935, **ii**, 2629–2630).—Data recorded previously are analysed. J. S. A.

**Electrostatic deflexion of cosmic radiation.** W. E. DANFORTH and W. F. G. SWANN (Physical Rev., 1935, [ii], 47, 421). L. S. T.

**Influence of earth's magnetic field on penetrating radiation in geographical latitude of Florence.** G. BERNARDINI and D. BOCCIARELLI (Ric. sci. Prog. tec., 1935, **6**, II, 36–37; Chem. Zentr., 1935, **ii**, 2630). J. S. A.

**Form of nuclear levels [of rhodium].** P. PREISWERK and H. VON HALBAN, jun. (Nature, 1936, **138**, 163). L. S. T.

**Self-consistent field, with exchange, for beryllium. II. The (2s)(2p)<sup>3</sup>P and <sup>1</sup>P excited states.** D. R. HARTREE and W. HARTREE (Proc. Roy. Soc. 1936, **A**, 154, 588–607; cf. A., 1935, 912).—Fock's equations for the self-consistent field, including exchange terms, have been obtained and solved numerically for the (2s)(2p)<sup>3</sup>P and <sup>1</sup>P terms of neutral Be. The calc. energy vals. are in agreement with observation. L. L. B.

**Present state of the neutrino hypothesis.** G. BECK (Physical Rev., 1935, [ii], 47, 202).—A discussion. The hypothesis does not remove difficulties arising from experimental evidence. L. S. T.

**Mass and energy.** K. WAGNER (Physikal. Z., 1936, **37**, 522–523).—It is not necessary to regard the relationship between mass and energy as a relativistic conception. It follows from Maxwell's work on the pressure of light. A. J. M.

**Nuclear structure and isotope systems.** T. I. EFREMENKO (Ukrain. Chem. J., 1936, **11**, 103–118).—Theoretical. R. T.

**Nomenclature of elementary corpuscles.** P. GRUNER (Helv. phys. Acta, 1935, **8**, 326–327; Chem. Zentr., 1935, **ii**, 2923).—For the electrical particles (electrons) the names positon, negaton, and nulliton (uncharged) are proposed. Material particles (materions) are termed neutrons, protons, deutons, tritons, etc., with neproton as a negative particle of mass 1. J. S. A.

**Extended Thomas-Fermi method for atomic nuclei.** F. S. WANG (Z. Physik, 1936, **100**, 734–741). A. B. D. C.

**Nuclear radius.** A. K. SOLOMON (Physical Rev., 1935, [ii], 47, 249).—For both light and heavy nuclei, the nuclear radius  $\propto$  the cube root of the at. wt. of the product nucleus. The slopes of the lines for heavy and light elements are parallel. When the nuclear radius is plotted against at. no. a random distribution of radioactive nuclei is obtained. L. S. T.

**Value of the electronic charge.** R. T. BURGE and E. McMILLAN (Physical Rev., 1935, [ii], 47, 320; cf. this vol., 133, 404).—A discussion and recalculation of Schopper's val. (A., 1935, 279). L. S. T.

**Conservation laws in quantum theory.** N. BOHR (Nature, 1936, **138**, 25–26).—Doubts concerning the validity of conservation of energy and momentum in at. phenomena are now largely removed. The root of the still unsolved difficulties of quantum electrodynamics lies in the atomistic nature of electricity. L. S. T.

**Atomic collisions and radiation from meteors.** E. ÖRIK (Acta Univ. Tartuensis, 1934, **26**, A, No. 2, 37 pp.; Chem. Zentr., 1935, **ii**, 2798).—Theoretical. J. S. A.

**Absorption spectra of iodine solutions. II. Influence of iodide.** A. V. PANFILOV and R. V. TEIS (J. Gen. Chem. Russ., 1936, **6**, 588–605).—Progressive dilution of I in KI solutions with aq. KI leads to a shift in the position of the absorption bands and to diminution in intensity of coloration; these changes are reversed by further addition of aq. KI. Similar effects are obtained in presence of starch. Beer's law is followed more closely when the solution is diluted with H<sub>2</sub>O than with aq. KI. The effects are ascribed to the existence of a series of equilibria between I, KI, KI<sub>3</sub>, and H<sub>2</sub>O. R. T.

**Induced pre-dissociation and energy exchange in nitric oxide.** E. KONDRATEEVA and V. KONDRATEEV (Acta Physicochim. U.R.S.S., 1935, **3**, 1–10).—

The ratio of intensities of the  $\beta$ - and  $\gamma$ -bands in the emission spectrum of NO alone and when mixed with A has been determined. In the spectrum of pure NO the  $\gamma$ -bands are much more intense than the  $\beta$ -bands, but in that of the mixture they are of approx. equal intensity. The phenomena can be explained on the hypothesis of induced pre-dissociation in the  $^2\Sigma$  state. The probability of the transfer of a quantum of vibrational energy of an excited NO mol. into kinetic energy on collision with an A atom is calc. to be approx. 1. A. J. M.

**Band spectra of boron and aluminium halides.** E. MIESCHER (Helv. phys. Acta, 1935, 8, 279—308; Chem. Zentr., 1935, ii, 2633).—Emission spectra from  $\text{BCl}_3$  vapour between 2600 and 2900 Å. and from  $\text{BBr}_3$  vapour between 2850 and 3100 Å. are analysed and referred to  $^1\Pi \rightarrow ^1\Sigma$  transitions. Similar  $^3\Pi \rightarrow ^1\Sigma$  bands excited in  $\text{AlBr}_3$  and  $\text{AlI}_3$  are described. Dissociation energies are calc. J. S. A.

**Ultra-violet band systems of SiCl.** W. JEVONS (Proc. Physical Soc., 1936, 48, 563—573).—The emission spectrum of SiCl, produced from  $\text{SiCl}_4$  vapour, has three systems of doublet bands degraded towards the further ultra-violet. The bands are discussed and compared with the data of Datta. W. R. A.

**Absorption spectrum of tellurium dichloride vapour.** J. LARIONOV (Acta Physicochim. U.R.S.S., 1935, 3, 11—22).—The absorption spectrum of  $\text{TeCl}_2$  has been investigated in the visible and ultra-violet. The bands in the visible may be classified into three sequences, the spectrum being made up of broad diffuse bands without heads with a superimposed continuous absorption. There is a further continuous absorption in the ultra-violet. The first continuous absorption in the visible may be due to  $\text{TeCl}_2 + h\nu \rightarrow \text{TeCl} + \text{Cl}$ ;  $\text{TeCl}_2 + h\nu \rightarrow \text{TeCl} + \text{Cl}'$ ; or  $\text{TeCl}_2 + h\nu \rightarrow \text{Te} + \text{Cl}_2$ . The corresponding heats of dissociation for these processes are 54, 56, and 51 kg.-cal., respectively. A. J. M.

**Emission spectrum of bismuth fluoride.** H. G. HOWELL (Proc. Roy. Soc., 1936, A, 155, 141—150).—An emission spectrum attributed to BiF has been excited by means of a high-frequency discharge in the vapour of  $\text{BiF}_3$ . The bands lie in the region 4150—5100 Å. and are degraded to the red. A vibrational analysis has been made. The vibrational consts. are nearly equal to those of  $\text{PbF}$ . L. L. B.

**Change in the absorption spectrum of cobalt chloride in aqueous hydrochloric acid solution with change of temperature.** O. R. HOWELL and A. JACKSON (Proc. Roy. Soc., 1936, A, 155, 33—41).—The absorption spectra of several aq. solutions containing a fixed amount of  $\text{CoCl}_2$  and varying amounts of HCl have been measured at a series of temp. The extinction coeffs. at the max. of the two principal bands, 695 m $\mu$  and 666 m $\mu$ , have been plotted against temp. For a given [HCl], the extent of the transformation from red to blue over a wide range of temp. is small compared with the total change observed on increasing [HCl] at const. temp. The results are explained in terms of the theory previously advanced (A., 1934, 7). L. L. B.

**New absorption band in potassium bromide crystals.** E. REXER (Physikal. Z., 1936, 37, 523).—Electron migration in a KBr crystal may produce absorption bands which do not give rise to photochemical processes. A KBr crystal, heated for some time in air, gives an absorption band due to electron migration with a max. at 302 m $\mu$ . Absorption in this band does not give rise to photochemical colouring, but to the emission of fluorescence with a max. at 453 m $\mu$ . A. J. M.

**Band spectrum of FeH.** A. HEIMER (Naturwiss., 1936, 24, 491—492).—The strongest band in the spectrum of FeH is the 0—0 band at 4288 Å. It is degraded towards the red, and consists of single P and R branches. It arises from a  $^1\Sigma \rightarrow ^1\Sigma$  transition. A. J. M.

**The 2530 Å. band of NH.** R. W. LUNT, R. W. B. PEARSE, and E. C. W. SMITH (Proc. Roy. Soc., 1936, A, 155, 173—182).—The 2530 band of NH has been excited by a hollow-cathode discharge in streaming  $\text{NH}_3$  with sufficient intensity to photograph under high dispersion. The band corresponds with a  $^1\Pi$  transition, and the  $^1\Pi$  state is the same as that already known as the initial state concerned in the emission of the 3240 and 4502 bands. The rotational consts. for the six electronic states now known for NH are tabulated. L. L. B.

**Absorption of light by some gases in the far ultra-violet.** G. RATHENAU (Physica, 1936, 3, 727—728).— $\text{NH}_3$ ,  $\text{N}_2$ ,  $\text{N}_2\text{O}$ ,  $\text{CO}_2$ , and  $\text{C}_6\text{H}_6$  show continuous absorption in the region 150—270 Å. O. D. S.

**Band spectrum of  $\text{OH}^+$ .** M. KOVNER (Physical Rev., 1936, [ii], 50, 188; cf. Loomis, this vol., 267).—Term differences and multiplet splitting consts. are evaluated. N. M. B.

**Band spectrum of arsenic oxide ( $\text{AsO}$ ) and lead oxide ( $\text{PbO}$ ).** F. MORGAN and E. N. SHAWHAN (Physical Rev., 1935, [ii], 47, 192—199).—The band spectrum of  $\text{AsO}$  has been studied in emission and absorption and that of  $\text{PbO}$  in absorption. L. S. T.

**Absorption spectra and photodissociation of some inorganic molecules.** M. JAN-KHAN and R. SAMUEL (Proc. Physical Soc., 1936, 48, 626—641).—The regions of absorption in  $\text{PCl}_3$ ,  $\text{PBr}_3$ ,  $\text{PCl}_5$ ,  $\text{PBr}_5$ ,  $\text{POCl}_3$ ,  $\text{P}_2\text{O}_5$ ,  $\text{AsCl}_3$ ,  $\text{SbCl}_3$ ,  $\text{SbOCl}$ , and  $\text{BiCl}_3$  are correlated with certain photodissociation processes. A comparison with the mean bond energies calc. from thermochemical data allows certain conclusions to be reached as to the structure of these mols. W. R. A.

**Absorbing and reflecting powers of sulphuric acid solutions in the far infra-red.** C. H. CARTWRIGHT (J. Chem. Physics, 1936, 4, 413—417).—Measurements are recorded with 2—37.4N- $\text{H}_2\text{SO}_4$  for  $\lambda$  52—152  $\mu$  monochromatic. A broad absorption band at approx. 60  $\mu$ , similar to the 60  $\mu$  band of  $\text{H}_2\text{O}$ , was observed in dil. and conc.  $\text{H}_2\text{SO}_4$ . This appears to be of interat. origin. The reflecting and absorbing powers of aq.  $\text{H}_2\text{SO}_4$  are those of  $\text{H}_2\text{O}$  or  $\text{H}_2\text{SO}_4$ . It is suggested that with < 5% of  $\text{H}_2\text{O}$  in  $\text{H}_2\text{SO}_4$ ,  $\text{SO}_4^{--}$  and  $\text{OH}_4^{--}$  ions may be formed.

On further dilution  $H^+$  and  $H_3SO_4^+$  are formed. In dil. solutions  $H^+$  and  $SO_4^{2-}$  are present. H. J. E.

**Far ultra-violet absorption spectrum of methyl iodide.** W. C. PRICE (Physical Rev., 1935, [ii], 47, 419).—Analysis of this spectrum at low pressures in the region 2000—1200 Å. gives two ionisations potentials, viz., 9.489 and 10.113 volts ( $\pm 0.003$  volt).

L. S. T.

**Absorption spectrum of alkyl iodides in extreme quartz ultra-violet. I. Experimental.** G. MILAZZO (Z. physikal. Chem., 1936, B, 33, 109—119).—The v.p. and absorption spectra of the saturated vapours of  $PrI$ ,  $BuI$ ,  $Pr^iI$ , and  $Bu^iI$  have been measured at various temp. as far as 1960 Å.

R. C.

**Electronic state of radicals in polyatomic molecules.** V. HENRI (Compt. rend., 1936, 203, 67—69).—The CN group in cyanides and thiocyanates is in the normal inactive state  $X(^2\Sigma)$  and in halogen derivatives and carbylamines it is in the active state  $B(^2\Sigma)$ . In nitriles it appears to be in a higher state than those known, the frequency being approx.  $2250\text{ cm}^{-1}$ . The groups  $C\equiv C$ ,  $N\equiv N$ , and  $NO$  are, respectively, in the states  $A(^3\Pi)$ ,  $C(^3\Pi)$ , and  $X(^2\Pi)$ .

C. R. H.

**Tetramethylethylene and the influence of the double linking.** J. ERRERA, P. MOLLET, and (MILE.) M. L. SHERRILL (Compt. rend., 1936, 203, 66).—The positions of the spectral absorption bands for  $C_2Me_4$  are discussed in relation to the band positions of saturated and ethylenic hydrocarbons (cf. this vol., 1049).

C. R. H.

**Ultra-violet absorption of some aromatic hydrocarbons. IV. Constitution of hexahydropyrene.** M. PESTEMER and F. MANCHEN (Monatsh., 1936, 68, 92—100).—The absorption spectrum of hexahydropyrene (I) (2500—4500 Å.) resembles those of  $C_{10}H_8$  and its alkyl derivatives. It is concluded that (I) contains an intact  $C_{10}H_8$  ring system and that hydrogenation occurs symmetrically in the two remaining rings in the mol. The partly hydrogenated products obtained by the action of nascent H have absorption spectra corresponding with mixtures of (I) and pyrene.

H. J. E.

**Variations in the ultra-violet spectrum of phenol as a function of  $p_H$ .** M. GEX (Compt. rend., 1936, 202, 2145—2147).—The ultra-violet absorption of PhOH solutions of varying  $p_H$  indicates that on passing from PhOH to phenoxide an intermediate modification of PhOH exists between  $p_H$  7 and 9.

C. R. H.

**Ultra-violet absorption by liquids.** L. A. GINSEL (Physica, 1936, 3, 578—584).—Preliminary. Qual. diagrams of the ultra-violet absorption bands of *o*- and *m*- $C_6H_4Cl\cdot OH$  and  $PhNO_2$  are given.

O. D. S.

**Absorption spectra of hydroxyanthraquinones in different solvents.** K. LAUER and M. HORIO (J. pr. Chem., 1936, [ii], 145, 273—280).—Absorption spectra of 1- (I) and 2-hydroxy- and 1:8-, 1:3-, 1:6-, 2:3-, 2:6-, and 2:7-dihydroxy-anthraquinone in  $C_6H_6$ , cyclohexane, EtOH, conc.  $H_2SO_4$ , and aq. NaOH are detailed. The OH gives a band with max. about 4000 Å., shifted for all compounds except (I)

by  $H_2SO_4$  and NaOH to about 5000 Å. or higher  $\lambda$ ; with (I) only NaOH causes this shift. The absorption max. of 1- and 2-aminoanthraquinone move to higher  $\lambda$  with increasing  $\epsilon$  of the solvent, in contradiction to Scheibe's rule. R. S. C.

**Behaviour of the absorption band of uranine solution under high pressure.** W. J. LYONS (Physical Rev., 1935, [ii], 47, 198).—For pressures up to 915 kg. per sq. cm., the absorption band max. of a dil. sq. solution of uranine did not show the expected shift to regions of longer  $\lambda$ .

L. S. T.

**Substitution and absorption-band displacement. VII. Anthracene and naphthalene derivatives.** H. CONRAD-BILLROTH (Z. physikal. Chem., 1936, B, 33, 133—144; cf. A., 1935, 913).—The application of the rule previously described (A., 1933, 445) to the above compounds is examined. The absorption bands consist of two groups, the position of which in the unsubstituted mols. is characterised by a zero point common to both ring systems and by two "ring-fusion influence vectors" which in substitution are included in the geometrical addition. These lie in the plane of the mol. and in the axis of symmetry. The direction of the substituent "influence vectors" is towards the centre of the ring system, not the centre of single rings. With these modifications the rule is valid. R. C.

**Spectroscopic studies of the simpler porphyrins. I. Absorption spectra of porphin, *ms*-methyl-, -ethyl-, -propyl-, and -phenylporphin.** V. M. ALBERS and H. V. KNORR (J. Chem. Physics, 1936, 4, 422—425).—Curves for the mol. absorption coeffs. of  $Et_2O$  solutions for 3700—7000 Å. are recorded. There is a very strong band at 3900 Å. in porphin, at 4130 Å. in all the aliphatic-substituted mesoporphins (I), and at 4140 Å. in *ms*-phenylporphin. For (I) the absorption coeff. for this band decreases as the length of the C chain increases. Beer's law holds. H. J. E.

**Fluorescence of the porphyrins. III.** A. STERN and M. DEŽELIĆ (Z. physikal. Chem., 1936, 347—357).—The fluorescence spectrum of solutions of octaethylporphin (I) varies little with the solvent, the band max. being shifted towards the blue compared with those of solid (I). The spectrum of adsorbed (I) has its max. in approx. the same position as that of a HCl solution, indicating that adsorption involves primarily the N atoms of the pyrrolenine nuclei, and these in a similar way to salt formation. Hen- and duck-egg shells give similar spectra, showing the same porphyrin, ooporphyrin (II), to be present in each. The (II) is present in the shell in mol. solid solution, not in the adsorbed state, for the spectra resemble that of protoporphyrin in neutral solution.

R. C.

**Absorption spectrum of bilirubin.** J. HENRY-CORNET and L. A. M. HENRY (Bull. Acad. roy. Belg., 1936, [v], 22, 553—559).—There is a max. in the absorption spectrum of bilirubin between 2300 and 3800 Å., made up of a no. of max. and min. The absorption spectrum is characteristic and may be used to identify the substance. Deter-

mination of the extinction const. may be used to measure the concn. of bilirubin in serum.

A. J. M.

**Conditions for excitation of fluorescence of proteins.** F. VLÈS (Compt. rend., 1936, 202, 2184—2186).—The fluorescence of certain proteins and  $\text{NH}_2$ -acids when subjected to ultra-violet light is described.

C. R. H.

**Influence of van der Waals forces on energy states of molecules on basis of luminescence of solidified gases.** L. VEGARD (Avh. norsk. Vid.-Akad. Oslo, 1935, No. 2, 14 pp.; Chem. Zentr., 1935, ii, 2783; cf. A., 1935, 147).—The fluorescence bands of solid  $\text{N}_2$ -inert gas mixtures are broadened towards longer  $\lambda$  by van der Waals forces. Electronic terms are affected to a greater extent than vibrational terms.

J. S. A.

**Photographic infra-red absorption spectrum of gaseous ammonia.** S. H. CHAO (Physical Rev., 1936, [ii], 50, 27—37).—The absorption bands of  $\text{NH}_3$  at 10,000, 7920, and 6470 Å. have been re-investigated using apparatus with greater dispersion and resolving power. Some difficulty was experienced in analysing the bands, the complexity of structure being probably due to the fact that the bands are made up of several parallel-type and perpendicular-type bands. The effect of pressure on the width of the lines is considerable, but in mixtures of  $\text{NH}_3$  and air, increase of air pressure produced only slight broadening. The broadening with increase of pressure may be due to the intermol. Stark effect connected with the dipole moments of the mols.

A. J. M.

**Near infra-red spectrum of  $\text{MgO}$ .** R. B. BARNES and R. R. BRATTAIN (Physical Rev., 1935, [ii], 47, 416).

L. S. T.

**Infra-red spectrum of heavy acid solutions.** D. WILLIAMS and E. K. PLYLER (J. Chem. Physics, 1936, 4, 460).— $\text{D}_2\text{O}$  solutions of  $\text{DCl}$ ,  $\text{D}_2\text{SO}_4$ , and  $\text{D}_3\text{PO}_4$  have absorption bands at 5.7 and 3.4  $\mu$ .

H. J. E.

**Infra-red spectra and organic chemistry.** R. B. BARNES (Rev. Sci. Instr., 1936, [ii], 7, 265—271).—A general survey of applications to deuterio-chemistry, polymerisation, isomerism, tautomerism, detection of H linkings, qual. analysis, and determination of particle size.

N. M. B.

**Effect of association on the infra-red absorption spectrum of acetic acid.** R. H. GILLETTE and F. DANIELS (J. Amer. Chem. Soc., 1936, 58, 1139—1142).—The infra-red absorption spectrum has been obtained at 25° and 172°, corresponding with single and associated mols., respectively. Three of the fundamental frequencies are the same in both mols., and two are shifted. Modes of vibration of the two mols. are suggested. The association of carboxylic acids to dimers probably occurs through the formation of H linkings leading to ring structure, which gives rise to different absorption frequencies.

E. S. H.

**Effect of substitution on the infra-red absorption spectrum of acetic acid.** R. H. GILLETTE (J. Amer. Chem. Soc., 1936, 58, 1143—1144).—Uniform shifts in the infra-red absorption spectra of  $\text{AcOH}$

and mono-, di-, and tri-chloro-, mono-bromo- and -iodo-, di-, and tri-methyl-, and diethyl-acetic acid have been determined.

E. S. H.

**[Absorption] spectra in the near infra-red. Methane and its chloro- and nitro-derivatives.** C. CORIN (J. Chim. phys., 1936, 33, 448—475).—Absorption bands between 0.8 and 2.7  $\mu$  are listed for  $\text{Pr}^n\text{OH}$ ,  $\text{Pr}^n\text{OH}$ , allyl alcohol, glycerol,  $\text{EtCHO}$ ,  $\text{C}_6\text{H}_5\text{CHO}$ ,  $\text{COMe}_2$ ,  $\text{EtCO}_2\text{H}$ ,  $\text{C}_2\text{H}_5\text{CO}_2\text{H}$ ,  $\text{AcCO}_2\text{H}$ ,  $\text{NEt}_3$ ,  $\text{NH}_2\text{Et}$ ,  $\text{NH}_2\text{Et}$ , nitrosodipropylamine, and  $\text{EtONO}$ . Liquid  $\text{CH}_4$  has a band at 2.0  $\mu$  not present in the vapour. The absorption of the Cl-derivatives of  $\text{CH}_4$  diminishes as the no. of C-H linkings decreases.  $\text{CCl}_3\text{NO}_2$  has 7 bands at 1.40—2.59  $\mu$  at  $\lambda$  identical with those of  $\text{C(NO}_2)_4$ . Frequencies are allocated to the CH, NO, C-NO<sub>2</sub>, and NO<sub>2</sub> groupings.

J. G. A. G.

**Photometric and spectrophotometric studies. XI. Absorption spectra of hydrocarbons and halogen derivatives in the near infra-red.** E. TRABERT and K. SCHAUM (Z. wiss. Phot., 1936, 35, 153—170).—The absorption spectra in the near infra-red of the following compounds are recorded: the normal paraffins,  $\text{C}_n\text{H}_{2n+2}$  ( $n=5-9$ ),  $\text{EtBr}$ ,  $\text{EtI}$ ,  $\text{Pr}^n\text{Cl}$ ,  $\text{Pr}^n\text{Cl}$ ,  $\text{Pr}^n\text{Br}$ ,  $\text{Pr}^n\text{Br}$ ,  $\text{Bu}^n\text{Cl}$ ,  $\text{Bu}^n\text{Br}$ ,  $\text{Bu}^n\text{Cl}$ ,  $\text{Bu}^n\text{Br}$ ,  $\text{CHCl}_3$ ,  $\text{CHBr}_3$ ,  $\text{C}_6\text{H}_6$ ,  $\text{C}_{10}\text{H}_8$ , phenanthrene, Ph.,  $\text{CH}_2\text{Ph}_2$ ,  $\text{CHPh}_3$ , cyclo-hexane and -hexene, tetra- and deca-hydronaphthalene, PhMe, *m*-xylene, 1 : 3 : 5- $\text{C}_6\text{H}_3\text{Me}_3$ .

A. J. M.

**Infra-red absorption of liquid hydrocarbons. Influence of the double linking.** J. ERRERA, P. MOLLET, and (MLLE.) M. L. SHERRILL (Compt. rend., 1936, 202, 2141—2142).—Variations in infra-red absorption of saturated and unsaturated aliphatic hydrocarbons are described.

C. R. H.

**Infra-red absorption of rubber and related hydrocarbons.** D. WILLIAMS (J. Chem. Physics, 1936, 4, 460).—Very thin films of styrene, isoprene, and cymene all show intense absorption bands at 3.4, 6.2, and 7.0  $\mu$  and weaker bands between 7  $\mu$  and 9  $\mu$ . Pure gum rubber gave a band at 5.8  $\mu$  and in a low-S vulcanised rubber the corresponding absorption was at 6.0  $\mu$ . At all other  $\lambda$  from 2.5 to 9.0  $\mu$  the absorption spectrum of rubber resembles that of isoprene. Polymerised butadiene gave strong bands at 5.5 and 6.0  $\mu$  and less intense bands beyond 7  $\mu$ . Rubber hydrochloride gave a very intense band at 8.4  $\mu$ , which was not characteristic of the other hydrocarbons studied.

H. J. E.

**Evidence from Raman effect for a slight asymmetry of the carbon atom.** R. T. DUFFORD (Physical Rev., 1935, [ii], 47, 199).—The Raman spectra of many simple C compounds afford evidence of two slightly different strengths of linking. Similar but less extensive evidence exists for O and N.

L. S. T.

**Raman spectra of  $\text{N}_3^-$ ,  $\text{NCS}^-$ , and  $\text{CO}_2$ .** A. LANGSETH and J. R. NIELSEN (Physical Rev., 1935, [ii], 47, 198).—A further study (cf. A., 1935, 145) and application to the constitution of  $\text{N}_3^-$  and  $\text{CNS}^-$ . New measurements of the depolarisations and relative intensities of the principal Raman bands of  $\text{CO}_2$  have been made.

L. S. T.

**Raman effect of water vapour.** D. BENDER (Physical Rev., 1935, [ii], 47, 252).—H<sub>2</sub>O vapour at 135° excited by Hg 2536 Å. gives only one Raman band 3654.5 cm.<sup>-1</sup> and extending approx. 5 cm.<sup>-1</sup> on both sides of its centre. There is no indication that the line is double (cf. A., 1934, 1155). No pure rotation band was found. L. S. T.

**Raman spectra. III. Deuterium-substituted acetic acids.** W. R. ANGUS, A. H. LECKIE, and C. L. WILSON (Proc. Roy. Soc., 1936, A, 155, 183—194).—The Raman spectra of Ac<sub>2</sub>O, AcOH, AcOD, and CD<sub>3</sub>·CO<sub>2</sub>D have been studied. Ac<sub>2</sub>O exhibits some lines not found in the spectra of the acetic acids. The lines of the acids are divisible into three categories: those unmodified on D substitution, those showing a progressive modification as the D content is increased, and those modified in CD<sub>3</sub>·CO<sub>2</sub>D only. This classification leads to the assignment of the most prominent frequencies. That corresponding with the symmetrical C-D vibration is 2111 cm.<sup>-1</sup>, and with the CD<sub>2</sub> group 1100 cm.<sup>-1</sup> L. L. B.

**Raman spectra of the deuteromethanes.** G. E. MACWOOD and H. C. UREY (J. Chem. Physics, 1936, 4, 402—406).—MeD, CH<sub>2</sub>D<sub>2</sub>, CHD<sub>3</sub>, and CD<sub>4</sub> were prepared by the interaction of MeI, CH<sub>2</sub>I<sub>2</sub>, and CHBr<sub>3</sub> with D<sub>2</sub>O with a Al-Hg couple and by interaction of CO<sub>2</sub> and D<sub>2</sub> with a supported Ni catalyst at 310°, respectively. The first three substances were studied at a pressure of 2 atm., and the last-named at 5 atm. 20 lines were measured and analysed. Rotational structure of CD<sub>4</sub> was observed. H. J. E.

**Raman spectrum of cyclopropane.** R. ANANTHAKRISHNAN (Nature, 1936, 138, 123).—Data for the liquid and vapour are compared and discussed; those for the liquid include new frequencies at 736, 1503, 2852, and 2952 cm.<sup>-1</sup> L. S. T.

**Raman spectra of some substituted epoxy-cyclohexanes.** E. CANALS, M. MOUSSERON, L. SOUCHE, and P. PEYROT (Compt. rend., 1936, 202, 2084—2086).—Data are recorded for epoxycyclohexane and various alkyl and aryl derivatives. They are compared with corresponding vals. for cyclohexane. H. J. E.

**Raman spectrum of some substituted epoxy-cyclopentanes.** E. CANALS, M. MOUSSERON, L. SOUCHE, and P. PEYROT (Compt. rend., 1936, 202, 1989—1992).—Data for a series of derivatives are recorded and discussed. H. J. E.

**Raman spectrum of indole.** G. B. BONINO and R. MANZONI-ANSIDEI (Ric. sci. Prog. tecn., 1935, 6, I, 579—580; Chem. Zentr., 1935, ii, 3082).—The spectrum contains the lines of a C-disubstituted pyrrole and of an o-disubstituted C<sub>6</sub>H<sub>6</sub>, confirming the chemical formulation as a pyrrole ring fused to a C<sub>6</sub>H<sub>6</sub> ring. H. N. R.

**Raman spectrum of divinyl sulphide.** G. B. BONINO, R. MANZONI-ANSIDEI, and D. DINELLI (Ric. sci. Prog. tecn., 1935, 6, I, 505—506; Chem. Zentr., 1935, ii, 3081—3082).—The spectrum is compared with those of thiophen and diallyl sulphide. Conjugation of the S with the C:C linking shifts the C:C line from 1630—1650 cm.<sup>-1</sup> to 1580—1590 cm.<sup>-1</sup> The absence of such a line in thiophen points to the

absence of C:C linkings. A similar shift in compounds containing a C:C conjugated with a C<sub>6</sub>H<sub>6</sub> ring cannot be taken as evidence for the validity of the Kekule structure. H. N. R.

**Raman spectrum of pyrrole and its derivatives.** G. B. BONINO (Gazzetta, 1936, 66, 316—336).—Theoretical; a recent paper by Stern and Thalmayer (this vol., 546) is discussed and criticised. E. W. W.

**Electrical resistance of cadmium films.** E. TOWNES and D. ROLLER (Physical Rev., 1935, [ii], 47, 197).—Cd films deposited on a glass plate cooled by liquid air or solid CO<sub>2</sub> in a mol. beam apparatus become conducting at a thickness of 2—7 × 10<sup>-7</sup> cm. and have a crit. thickness of 6—8 × 10<sup>-7</sup> cm., at which the resistivity is approx. 15 times that of the bulk metal. The bearing of these results on photo-electric phenomena in metal films and on theories of film structure is discussed. L. S. T.

**Electrical properties of anodically oxidised aluminium.** J. W. HOLST (Tids. Kjem., 1936, 16, 73—76; cf. this vol., 565).—The dry Al<sub>2</sub>O<sub>3</sub> layer has low electrical conductivity, only slightly unidirectional, probably due to presence of Al(OH)<sub>3</sub>. It is concluded that the rectifying properties of the oxidised Al electrode cannot be due to a pure electron flow through the oxide layer. M. H. M. A.

**Crystal photo-effect and rectifying action in the bulk of the crystal.** G. GROETZINGER and J. LICHTSCHNEIN (Nature, 1936, 138, 163—164).—Illumination of a cuprite crystal in contact with two electrodes through which an a.c. is passing produces an additional direct voltage. Curves showing the variation of this voltage with the a.c. and its relation to the crystal photo-electric effect are given. The additional current is probably connected with events occurring in the interior of the crystal (bulk rectification). L. S. T.

**Contact potential differences between single crystal surfaces of different orientations.** I. H. KURZKE and J. RORTGARDT (Z. Physik, 1936, 100, 718—725).—The contact p.d. between the (111) and the (111) planes of a single Bi crystal is +0.36 volt. A. B. D. C.

**Influence of atmospheric gases on the electrical conductivity of cuprous oxide.** L. DUBAR (Compt. rend., 1936, 203, 46—48).—The influence of dry O<sub>2</sub>, dry N<sub>2</sub> (O<sub>2</sub>-free), and H<sub>2</sub>O vapour on the surface κ of Cu<sub>2</sub>O, which has been heated in vac., has been studied. N<sub>2</sub> and H<sub>2</sub>O vapour have little effect, but O<sub>2</sub> increases κ. Subsequent treatment with N<sub>2</sub> or H<sub>2</sub>O reduces κ to its original val. C. R. H.

**Recent investigations of semi-conductors.** A. SCHULZE (Chem.-Ztg., 1936, 60, 545—547).—A review of literature concerning Si, C, Ti, Zr, Hf, Th, B, As, and Te. T. G. P.

**Theory of non-independent flow of electricity in gases.** H. MACHE (Elektrotech. u. Maschinenbau, 1935, 53, 253—258, 269—273; Chem. Zentr., 1935, ii, 2784).—Theoretical. An approx. theory is developed and applied to the calculation of the discharge characteristics of condensers with nonhomogeneous ionisation. J. S. A.

**Dielectric losses in a high-frequency alternating field and molecular dimensions.** J. HENRION (Compt. rend., 1936, 203, 52—54).—Data for high-frequency dielectric losses for polar mols. in a non-polar solvent, at  $\lambda$  7 m., have been applied to the calculation of mol. dimensions, using the formula  $t = 4\pi\eta^3/kT$  ( $t$ =time of relaxation in sec.,  $k$ =Boltzmann const.,  $\eta$ =viscosity,  $T$ =abs. temp.,  $r$ =radius of mol. supposed spherical). For non-spherical mols.  $r^3$  can be replaced by the product of 3 radii along 3 orthogonal axes, one of which is in the same direction as the electric moment, and passing through the centre of gravity of the mol. C. R. H.

**Absorption of various alcohols at high frequencies.** R. ZOUCKERMANN and R. FREYMAN (Compt. rend., 1936, 202, 2079—2081).—No narrow bands were observed in the absorption by 7 primary alcohols of waves of 3—12 m. length. In a homologous series with a fixed  $\lambda$ , the conductivity increases rapidly at first, and tends to a const. val. for mols. with  $> 5$  C. H. J. E.

**Dipole ortho-effect.** L. TIGANIK (Keem. Teated, 1935, 2, 88—106; Chem. Zentr., 1935, ii, 2936).—On the view that the ortho-effect is due to electron displacements, not to deflexion of valency angles, a theory is developed on classical electrostatic lines, and applied to  $C_6H_6$  and its substitution products. Vals. for dipole moments so calc. agree with experimental vals. It is considered, however, that in  $C_6H_6$ , the H atoms are displaced from the plane of the ring. J. S. A.

**Electric dipole moments of nitrophenols.** H. O. JENKINS (J.C.S., 1936, 1049).—The dipole moment of  $o$ -NO<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>·OH in C<sub>6</sub>H<sub>6</sub> solution at 25° has been redetermined and its relatively low val. confirmed. The moments of substituted phenols are discussed briefly. D. C. J.

**Index of refraction of water and paraffin at high frequencies.** L. S. SKAGGS and R. T. DUFFORD (Physical Rev., 1935, [ii], 47, 201—202).—Measurements at  $\lambda\lambda$  of approx. 10 cm. agree with classical electromagnetic theory. L. S. T.

**Effect of pressure on the refractive index of carbon disulphide.** F. E. POINDEXTER (Physical Rev., 1935, [ii], 47, 202).—Vals. of  $n$  for CS<sub>2</sub> for each of the Hg lines 5790, 5460, and 4360 Å. are recorded for pressures from 1 to 1880 kg. per sq. cm. Dispersion increases over the whole range of pressure, the increase being more rapid at lower pressures. L. S. T.

**Influence of dilution on the molecular refractivities of complex cyanides and cobaltammines.** A. K. BHATTACHARYA (J. Indian Chem. Soc., 1936, 13, 284—293).—The  $R_L$  of complex cyanides at 21° and of cobaltammines at 30° were measured at concns. up to 0.1 mol. For the more stable cyanides  $R_L$  decreases with dilution, but for the less stable cyanides and for most of the cobaltammines  $R_L$  increases with dilution. This latter effect is ascribed to the decomposition of the complex ions into simpler ions. C. R. H.

**Utilisation of molecular refraction for determining constitution and configuration of sugars.**—See this vol., 1094.

**Refractivity of  $\alpha$ -chloronitriles.** J. VANDEWIJER (Bull. Soc. chim. Belg., 1936, 45, 251—269).—The prep.,  $d$ , and  $n$  for the  $H_a$ ,  $H_\beta$ ,  $H_\gamma$ , and  $D$  lines at 15° and 30° of the first 10 members of the homologous series commencing CH<sub>2</sub>Cl·CN are recorded. The  $n$  of the series is minimal at C<sub>3</sub> and a periodicity persists to C<sub>7</sub>. From the mol. refractivities at 20°, the sp. refractivity of Cl less that of H is  $H_a$  5.059,  $D$  5.083,  $H_\beta$  5.155,  $H_\gamma$  5.201, from which data for H (A., 1934, 132) give the sp. refractivities of Cl  $H_a$  6.086 and  $D$  6.120. J. G. A. G.

**Liquids of high refractive index.** B. W. ANDERSON and C. J. PAYNE (Nature, 1936, 138, 168).—A correction (cf. A., 1934, 163) and an acknowledgment of priority. L. S. T.

**Optical polarisation ellipsoids of the hydrogen halide gases.** C. H. D. CLARK (Nature, 1936, 138, 126).—These ellipsoids constitute similar solid figures. The four H halides have equal optical anisotropies and the optical polarisability perpendicular to the internuclear axis of symmetry is approx. 75% of that along this axis. This latter val. is equal to the polarisability of the halogen ion X<sup>-</sup>. L. S. T.

**Optical rotation of tartaric acid in presence of titanium ion.** M. SCHENK (Helv. Chim. Acta, 1936, 19, 639—645).—The val. of  $[\alpha]$  of Ti<sup>IV</sup> tartrate depends on [H<sup>+</sup>], and shows max. in both acid and alkaline solutions separated by a sharp min. Aq. tartaric acid in presence of Ti<sup>IV</sup> oxalate (contrary to the sulphate) shows mutarotation during neutralisation with KOH, due to slow hydrolysis of the tartrate. T. G. P.

**Rotatory power of methyl tartrate.**—See this vol., 1093.

**Analysis of rotatory dispersions of configurationally related halides.** P. A. LEVENE, A. ROTHEN, and R. E. MARKER (J. Chem. Physics, 1936, 4, 442—449).—Rotatory dispersion curves of halides of the type CHMeR·[CH<sub>2</sub>] <sub>$n$</sub> ·X (X=halogen, R=alkyl) have been analysed in the visible and ultra-violet regions. Changes due to variations of X and R and the val. of  $n$  (1—4) are discussed. H. J. E.

**Variation with temperature of the magnetic birefringence of nitric oxide and oxygen under pressure.** H. BIZETTE and B. TSAI (Compt. rend., 1936, 202, 2143—2145).—Previous work (this vol., 140) has been extended to temp. —80° to 20°. C. R. H.

**Old and new chemistry of radicals.** P. H. HERMANS (Chem. Weekblad, 1936, 33, 442—450).—A lecture. S. C.

**Valency and molecular structure.** J. DEVRIES (J. Chem. Educ., 1936, 13, 320—324). L. S. T.

**Nature of the hydrogen bond. I. Association in carboxylic acids.** R. H. GILLETTE and A. SHERMAN (J. Amer. Chem. Soc., 1936, 10, 1135—1139).—Theoretical. The wave function should include polar and homopolar terms. The H linking consists of at least the states X·H·X<sup>-</sup>, X·HX, and XH·X. E. S. H.

**Chemical linking.** A. E. VAN ARKEL (Chem. Weekblad, 1936, 33, 454—457).—A lecture dealing

principally with the quantum mechanics of simple mols. S. C.

Relations between functions of cohesion forces of liquids and their chemical function at the b.p. under constant pressure. G. DUCH (Compt. rend., 1936, 202, 1977—1979).—Theoretical.

H. J. E.

Dissociation energy of diatomic sulphur, selenium, and tellurium vapours. P. GOLDFINGER, W. JEUNEHOMME, and B. ROSEN (Nature, 1936, 138, 205—206).—Vals. deduced from spectroscopic and thermochemical data are discussed.

L. S. T.

Relation between internuclear distance and group number for diatomic hydrides. H. C. CORBEN (Phil. Mag., 1936, [vii], 22, 144—145).—The equilibrium internuclear distance for the ground state ( $r_e$ ) is related to the no. of electrons outside closed shells ( $n$ ) by the expression  $r_e n - a + bn - c(n-1)^3$ , where  $a$  and  $c$  are consts. and  $b$  depends on the mol. period. The following vals. of  $r_e$  are predicted: SH 1.362, SeH 1.90, TiH 1.81, VH 1.72, CrH 1.64, MnH 1.55 Å.

H. J. E.

Distribution of energies of electrons. J. S. E. TOWNSEND (Phil. Mag., 1936, [vii], 22, 145—171).

H. J. E.

Nuclear separation of the  $S_8$  molecule by electron diffraction. L. R. MAXWELL, V. M. MOSLEY, and S. B. HENDRICKS (Physical Rev., 1936, [ii], 50, 41—45).—The nuclear separation of the  $S_8$  mol. from  $S_8$  vapour at 800° was  $1.92 \pm 0.03$  Å. The electron diffraction pattern of the vapour changes considerably at temp.  $< 800^\circ$  owing to the formation of  $S_{2+n}$  mols. The S—S—S angle in the higher mol. forms is about  $100^\circ$ , and the S—S distance between neighbouring atoms, 2.1 Å. These vals. are in agreement with those found by Warren *et al.* (A., 1935, 285) for the symmetrical puckered  $S_8$  ring in the rhombic form.

A. J. M.

Atomic forces of solid states, I, II. W. WEN-PO (Phil. Mag., 1936, [vii], 22, 49—68).—Theoretical. A method of calculating at. radii and thermal expansion is described.

H. J. E.

Ground state vibrational frequencies. H. G. HOWELL (Nature, 1936, 138, 36).—The arithmetic mean of the vibrational frequencies of two mols.  $A_2$  and  $B_2$  belonging to the same periodic group approx. equals the frequency of the mol. AB. PN and AsN do not conform to this rule.

L. S. T.

Determination of van der Waals forces. H. S. W. MASSEY and R. A. BUCKINGHAM (Nature, 1936, 138, 77).—Vals. of the van der Waals energy const.  $C$  calc. from data (A., 1935, 1295) on the collision of rare gas with alkali atoms agree with those derived from the polarisabilities of the atoms, suggesting that the free path method serves for the determination of these forces.

L. S. T.

Van der Waals potential and the lattice energy of a  $n\text{-CH}_3$  chain molecule in a paraffin crystal. A. MULLER (Proc. Roy. Soc., 1936, A, 154, 624—639).—The van der Waals potential of a  $\text{CH}_3$  group in a paraffin crystal is calc. by applying London's theory (A., 1930, 525). The mol. must be subdivided for the

purpose of calculation, but it is found that for different modes of subdivision the final val. of the potential is the same.

L. L. B.

Molecular energy of alkali halides. E. J. W. VERWEY and J. H. DE BOER (Rec. trav. chim., 1936, 55, 431—443).—More correct vals. of the lattice and mol. energies (cf. A., 1932, 564) have been calc., which give the following vals. of the electron affinity:  $F'$  92.2,  $Cl'$  83.0,  $Br'$  77.2, and  $I'$  69.9 kg.-cal. Mol. energy vals. for the alkali halide vapours are calc. for different mol. models, and the effect of the polarisation forces is also considered. The mols. of the alkali halides are perfect ionic mols.

O. J. W.

Energy and structure of the molecules of the alkaline-earth oxides. J. H. DE BOER and E. J. W. VERWEY (Rec. trav. chim., 1936, 55, 443—450; cf. preceding abstract).—The lattice energies of  $\text{BeO}$ ,  $\text{MgO}$ ,  $\text{CaO}$ ,  $\text{SrO}$ , and  $\text{BaO}$  have been calc. The calc. val. of the electron affinity of O ( $\text{O} \rightarrow \text{O}'$ ) is  $-173$  kg.-cal. The vals. of the mol. energy calc. for these mols. are considerably  $<$  those derived from the lattice and sublimation energies. It is probable that the vapours of these oxides, which have ionic lattices in the solid state, consist mainly of homopolar mols.

O. J. W.

Physical chemistry of homologous series. E. M. BRUINS (Rec. trav. chim., 1936, 55, 419—420).—Formulae are derived for the electrostatic potential in a homologous series surrounding a single charge and a dipole.

O. J. W.

Determination of linking moments in polyatomic molecules. R. MECKE (Z. physikal. Chem., 1936, B, 33, 156—162).—Theoretical. The previously described method (this vol., 268) of calculating for characteristic valency vibrations, where the energy is largely localised in a linking, the linking moment,  $u$ , from the intensities of the overtones has been simplified. By plotting the transition moments derived from the total absorption of the individual bands against  $v$  and extrapolating to  $v=0$   $\mu$  is obtained. An examination of the conditions for this extrapolation indicates that it would be possible to derive abs. partial dipole moments from suitable absorption measurements.

R. C.

Characteristic periods of vibrations of ionised gases in a magnetic field. T. V. IONESCU (Compt. rend., 1936, 203, 57—59).—Mathematical.

C. R. H.

Electron affinity of free radicals. X. Potentiometric method for determining  $\Delta F$  for the addition of sodium to an organic compound. H. E. BENT and N. B. KEEVIL (J. Amer. Chem. Soc., 1936, 58, 1228—1233; A., 1935, 1188).—Apparatus and procedure are described. Didiphenylenediphenylethane has an abnormally high electron affinity, which is related to the strength of phenylfluorene as an acid.

E. S. H.

Collisions of the second kind and electron affinity. L. GOLDSTEIN (Compt. rend., 1936, 202, 2057—2059; cf. this vol., 656).—Negative ions cannot be produced directly in pure  $\text{O}_2$ ,  $\text{SF}_6$ , or  $\text{CF}_4$ . In presence of 1% of A, Kr, or Xe, metastable atoms of the rare gas are produced by electronic collisions,

and these dissociate  $O_2$ ,  $SF_6$ , or  $CF_4$  by collisions of the second kind. The resulting electronegative atoms can form negative ions.

H. J. E.

**Functional space in quantum mechanics.** L. CHADENSON (Compt. rend., 1936, 202, 1974—1977).

H. J. E.

Some lattice sums involved in the calculation of elastic constants. M. GOEPFERT-MAYER and A. MAY (Physical Rev., 1936, [ii], 50, 99).—The method of calculation of the electrostatic part of the consts.  $C_{11}$  and  $C_{12}$  for crystals of the CsCl type is given.

A. J. M.

**Rotation of dipole molecules in solid bodies.** J. FRENKEL (Acta Physicochim. U.R.S.S., 1935, 3, 23—36).—Fowler's theory of the rotation of mols. in solids (A., 1935, 683) is compared with the Pauli method of determining the orientation of mols. in a polar gas on application of an external field. The theory is extended to the case where the orienting field acting on any given mol. of the crystal depends on the neighbouring mols. and has not a const. val. An expression is obtained for the transition temp. of a solid, this expression being similar to that for the Curie temp. of a ferromagnetic solid.

A. J. M.

**Surface tension of mercury in presence of gases.** I. Dry air. M. KERNAGHAN (Physical Rev., 1935, [ii], 47, 202; cf. A., 1931, 788).— $\gamma$  falls rapidly from 464 dynes per cm. in a vac. until an apparently crit. pressure of 7 mm. of dry air is reached. At higher pressures  $\gamma$  remains approx. const.

L. S. T.

(A) Increments of parachor of polymethylenic rings. (B) Multiple linkings in molecules of carbon compounds, and the structural constants of molecular refraction. V. S. GUTIRIA (J. Gen. Chem. Russ., 1936, 6, 340—349, 455—459).—(A) Experimental vals. of increments in parachors of homologous series of cyclic polymethylenic hydrocarbons differ considerably from those calc. from Mumford and Phillips' formulæ (A., 1929, 1219), or from other formulæ derived by Gutiria.

(B) The structural consts. of mol. refraction,  $MR$ , of  $C-C$ ,  $C=C$ , and  $C\equiv C$  compounds are derived from  $K - am \sin \alpha + b$ , where  $m$  represents the no. of linkings between C atoms,  $\alpha$  is the angle subtended by the lines of valency, and  $a$  and  $b$  are consts., depending on the  $\lambda$  of the light used. The vals. calc. for  $MR$  are in satisfactory agreement with those calc. by the usual formula, and with experiment, for a no. of hydrocarbons.

R. T.

**Temperature function of X-ray reflexion in the neighbourhood of the m.p. of a crystal.** R. B. JACOBS and A. GOETZ (Physical Rev., 1935, [ii], 47, 94—95).—Deviations from the Debye-Waller function near the m.p. of Bi crystals are described.

L. S. T.

**Effect of temperature on the reflexion of X-rays by crystals.** III. High temperatures. Allotropic crystals. C. ZENER and S. BILINSKY (Physical Rev. 1936, [ii], 50, 101—104; cf. this vol., 273).—The former discrepancy at high temp. disappears when account is taken of the variation of the characteristic temp. with temp. A relationship is found

between the temp. factors for two allotropic forms of the same element.

N. M. B.

**Absolute atomic factors of sulphur and lead.** P. DE LA CIERVA and J. PALACIOS (Anal. Fis. Quím., 1935, 33, 34—38).—The intensity of the (220) reflexion of PbS has been compared with that of the (200) reflexion of NaCl, whence from the data of James *et al.* (A., 1928, 225) the val. of the  $F$  factor for PbS is 63.15 for  $\sin \theta/2 = 0.238$ , which, combined with the authors' curves (A, 1935, 908) for Pb and S, gives the abs. curves of the  $F$  factors.

F. R. G.

**New and unexplained effects in Laue X-ray reflexion in calcite.** J. W. M. DUMOND and V. L. BOLLMAN (Physical Rev., 1936, [ii], 50, 97).—Incomplete blackening was observed where complete blackening of the plate would be expected in the Laue X-ray reflexion through thin cleaved plates of calcite. It was found that emergent beams which should be parallel were slightly convergent. Along the lengths of paired spectral lines there were marked fluctuations of intensity not due to interference.

A. J. M.

**Mathematical modulus derived from X-ray data for evaluation of residual distortion in crystals.** G. L. CLARK and M. M. BECKWITH (Physical Rev., 1935, [ii], 47, 200; cf. A., 1935, 1193).

L. S. T.

**Scattering of X-rays by gases.** E. O. WOLLAN (Physical Rev., 1935, [ii], 47, 201).

L. S. T.

**Diffuse scattering of X-rays by crystals.** G. E. M. JAUNCEY (Physical Rev., 1935, [ii], 47, 201).

L. S. T.

**Recrystallisation and crystal growth in aluminium.** A. VON ZEERLEDER (Schweiz. Arch. angew. Wiss. Tech., 1935, 1, 148—151; Chem. Zentr., 1935, ii, 2873).—Crystal growth in deformed Al at 550° is discussed.

J. S. A.

**Crystallisation of supercooled dielectric liquids in an electric field.** R. SWINNE (Wiss. Veroff. Siemens-Werken, 1936, 15, 124—128).—Polar substances ( $PhNO_2$ , fenchone, and  $PhCN$ ) were crystallised from the supercooled liquids with and without the application of an electric field (up to 5 kv. per cm.). Without a field, crystals did not usually appear between the electrodes, but when the field was applied crystallisation between them was more marked than elsewhere. With non-polar substances ( $C_6H_6$ ) the field caused no difference in the crystallisation.

A. J. M.

**Structure of radicals in crystals.** W. H. ZACHARIASEN (Physical Rev., 1935, [ii], 47, 201).

L. S. T.

**Nature of viscid fluid threads.** (Sir) J. LARMOR (Nature, 1936, 138, 74).

L. S. T.

**Orientation of molecules on the surface of solids and liquids.** F. KOROSI (Tech. Kurir, 1936, 7, No. 7, 2—4).—A review.

E. P.

**Crystal structure of carbon.** U. HOFMANN and D. WILM [with E. CSALAN] (Z. Elektrochem., 1936, 42, 504—522).—X-Ray determinations for coarsely-cryst. graphite give  $a$  4.252,  $c$  6.69 Å. As the crystal size diminishes, lattice distortion appears, reaching a max. in active C. There is a continuous

gradation of structure from graphite to active C; distortion is already detectable in Ceylon and Acheson graphite. Crystal growth begins at 1400°. The alteration of the structure by oxidation has been studied. E. S. H.

**Composition and crystal structure of trigonal chromium and manganese carbides.** A. WESTGREN (Jernkont. Ann., 1935, 118, 231—240).—The cell dimensions are: Cr carbide,  $a$  13.98,  $c$  4.523 Å.; Mn carbide  $a$  13.87,  $c$  4.53 Å. On rotation photographs of the latter about the axis (001) the only prism reflexions ( $hko$ ) visible are those with  $h$  and  $k$  even. The no. of atoms in the unit cell must be a multiple of 4. The formula  $Mn_7C_3$  (80 atoms per unit cell) is supported. CH. ABS. (c)

**Structure of potassium tetroxide.** V. KASSATOKHIN and V. KOTOV (J. Chem. Physics, 1936, 4, 458).— $KO_2$  forms a tetragonal face-centred lattice of the  $CaC_2$  type ( $a$  5.70,  $c$  6.72 Å.; 4 mols. in unit cell; space-group  $D_{4h}^{17}-F4/mmm$ ). The distance between adjacent O nuclei is  $1.28 \pm 0.07$  Å. The formula  $KO_2$  is supported. H. J. E.

**Fourier analysis of X-ray patterns of vitreous  $SiO_2$  and  $B_2O_3$ .** B. E. WARREN, H. KRUTTER, and O. MORNINGSTAR (J. Amer. Ceram. Soc., 1936, 19, 202—206).—Analysis of the patterns obtained in vac. with monochromatic Mo and Cu radiations showed that  $SiO_2$  is a tetrahedral Si—O network and that  $B_2O_3$  is a triangular co-ordination of B atoms surrounded by shared O atoms. The results agree with the Zachariasen prediction of the structure of oxide glasses. The glass-forming tendency of these two oxides is due to the complex irregular aggregate structures which require much rearrangement during cooling to assume a symmetrical (cryst.) structure and to the flexibility (i.e., stability) of the linking between an O and two cations. J. A. S.

**Crystal structure and colloid-chemical properties of vanadium pentoxide.** J. A. A. KETELAAR (Natuurwetensch. Tijds., 1936, 18, 80).—A brief discussion (cf. this vol., 274). D. R. D.

**Cation arrangement in a few oxides with crystal structures of the spinel type.** E. J. W. VERWEY and J. H. DE BOER (Rec. trav. chim., 1936, 55, 531—540).—The electrical conductivity of  $Fe_3O_4$ , with a cubic spinel lattice, is  $10^8$  times that of  $Mn_3O_4$  and  $Co_3O_4$  with a closely related tetragonal lattice. This difference is to be explained by differences in the valency state of the cations, and in the arrangement of the cations among the lattice points of the spinel unit cell. The high conductivity of  $Fe_3O_4$  may be explained on the conception that the oxide is  $FeO.Fe_2O_3$ . The crystal contains equal amounts of  $Fe^{++}$  and  $Fe^{+++}$  in the equiv. lattice points. The low conductivity of  $Co_3O_4$  together with considerations of energy, and study of X-ray structure, leads to the conclusion that it is made up of  $Co^{++}$  and  $Co^{+++}$ .  $Mn_3O_4$  has a structure similar to  $Co_3O_4$ , but the cell is distorted tetragonally. Both  $Mn_3O_4$  and  $Co_3O_4$  are true spinels. The X-ray diagram of  $\gamma\text{-Fe}_2O_3$ , having crystal structure closely related to spinel, shows that there are a no. of vacant cationic positions. The  $Mn_2O_3.H_2O$  obtained by Dubois (A., 1935, 181,

946) may be regarded as  $\gamma\text{-Mn}_2O_3$ . It has a face-centred tetragonal cell, similar to the  $\gamma\text{-Fe}_2O_3$  cell, but distorted. A. J. M.

**Structure of metal hydroxides with the emanating power 1.00.** O. ERBACHER (Z. physikal. Chem., 1936, B, 33, 47—53).— $Fe(OH)_3$  preps. of this type (cf. A., 1926, 332) give an amorphous X-ray diagram. Their radioactive emanating power shows them to have an exceptionally open internal structure. R. C.

**Morphology of pigments. III. X-Ray study of litharge.** E. G. IVANTSHEVA (J. Gen. Chem. Russ., 1936, 6, 621—625).— $PbO$  prepared by the Barton process crystallises in the rhombic system, whilst oven  $PbO$  consists of tetragonal crystals.  $Pb_2O_3$  gives a characteristic X-ray spectrum, indicating that it is not a mixture of  $PbO$  and  $PbO_2$ . R. T.

**Structure of silver azide.** M. BASSIÈRE (Bull. Soc. franç. Min., 1935, 58, 333—340; cf. this vol., 16). L. S. T.

**Monohydrated sulphates of the magnesium series.** F. HAMMEL (Compt. rend., 1936, 202, 2147—2149).—The dimensions of the unit cells of monohydrated Mg, Mn, Fe, Co, Ni, Cu, and Zn sulphates have been calc. (cf. this vol., 413). C. R. H.

**Calcium sulphate hemihydrate and the anhydrites. I. Crystallography.** W. A. CASPARI (Proc. Roy. Soc., 1936, A, 155, 41—48).—The prep., properties, and morphology of single crystals of  $CaSO_4.0.5H_2O$  (I) are described. X-Ray analysis gives the probable space-group as  $D_{2d}^{13}$  or  $D_{2d}^{14}$ , 3 mols. per unit cell,  $d$  2.60. The arrangement of ions in the lattice is discussed. The suggested structure leaves channels between  $Ca^{++}$  and  $SO_4^{--}$  ions, along which  $H_2O$  mols. can circulate. Dehydration of (I) under conditions short of conversion into anhydrite (II) causes slight mechanical changes in the crystal, but leaves the lattice unaltered. From the fact that the dihydrate and (I) yield the same substance under these conditions, it is concluded that there is only one crystal species intermediate between (II) and dihydrate. Sol. (I) has crystals belonging to the trigonal system,  $a$  6.82,  $c$  6.24 Å.,  $d$  2.70. L. L. B.

**Crystalline form and optical properties of calcium iodate.** J. MÉLON (Bull. Soc. franç. Min., 1935, 58, 343—349).— $Ca(IO_3)_2.6H_2O$  is not truly dimorphous. Crystals obtained in presence of  $HNO_3$  and of  $CaCrO_4$  show only facial differences.  $n_D$  1.686,  $n$  1.644, and  $n_p$  1.604. L. S. T.

**Crystallography of caesium molybdotellurates.** J. D. H. DONNAY and J. MÉLON (Amer. Min., 1936, 21, 299—311).—Cs molybdotellurate crystallises in two types, (i) equant, biaxial positive, and (ii) tabular, biaxial negative, both being triclinic and apparently holohedral. (i) has  $a:b:c=0.9498:1:0.6059$ ,  $\alpha$   $96^\circ 41'$ ,  $\beta$   $102^\circ 1'$ ,  $\gamma$   $101^\circ 31'$ ,  $n_a$  1.709,  $n_\beta$  1.716,  $n_\gamma$  1.797. (ii) has  $a:b:c=0.9365:1:0.7989$ ,  $\alpha$   $93^\circ 45'$ ,  $\beta$   $94^\circ 8'$ ,  $\gamma$   $88^\circ 21'$ ,  $n_a$  1.669,  $n_\beta$  1.734,  $n_\gamma$  1.738. L. S. T.

**Crystal structure of metaldehyde.** L. PAULING and D. C. CARPENTER (J. Amer. Chem. Soc., 1936, 58,

1274—1278).—X-Ray data indicate a body-centred unit, having  $a_0$  10.40,  $c_0$  4.11 Å., containing two mols. of  $(\text{MeCHO})_4$ . The space-group is  $C_4^2-I_4$ ; parameter vals. have been determined. The mol. consists of an 8-membered  $-\text{O}-\text{C}-\text{O}-\text{C}-$  ring with H and Me attached to each C. The interat. distances and linking angles are the same as in  $(\text{MeCHO})_3$ .

E. S. H.

**Crystallographic study of tartaric acid derivatives.** J. WYART and Y. KI-HENG (Compt. rend., 1936, 203, 95—97).—The vals. of  $a$ ,  $b$ , and  $c$ , respectively for the following compounds are: tartramide, 10.0, 12.2, 4.90; tartramic acid 12.30, 7.96, 6.00; Me tartrate, 18.50, 10.00, 8.45; K borotartrate, 4.88, 18.00, 7.65 Å.

C. R. H.

**Diffraction of X-rays by the higher polyethylene glycols and by polymerised ethylene oxides.** W. H. BARNES and S. ROSS (J. Amer. Chem. Soc., 1936, 58, 1129—1131).—The X-ray diagrams show no essential difference between the higher polyethylene glycols and polymerised ethylene oxides.

E. S. H.

**Change of lattice of fibroin when completely dried in a vacuum.** V. MATSUNAGA (Naturwiss., 1936, 24, 446—447).—The lattice const. of ordinary fibroin (containing some  $\text{H}_2\text{O}$ ) is the same as that of the substance which has taken up as much  $\text{H}_2\text{O}$  as possible, and  $>$  that of completely dried fibroin.

A. J. M.

**X-Ray analysis of keratins.**—See this vol., 1138.

**Crystal orientation in tooth-enamel.**—See this vol., 1010, 1011.

**Formation and crystallisation of vitreous media.** W. T. RICHARDS (J. Chem. Physics, 1936, 4, 449—457).—A discussion. It is shown to be unnecessary to postulate a vitreous state of aggregation, since all the properties of glasses appear to be those of undercooled liquids of high  $\eta$ .

H. J. E.

**Electron-optical reproduction with electrons liberated photo-electrically.** H. MAHL and J. POHL (Z. tech. Phys., 1935, 16, 219—221; Chem. Zentr., 1935, ii, 2626; cf. A., 1935, 139).

J. S. A.

**Kikuchi lines from etched copper crystal.** W. COCHRANE (Nature, 1936, 138, 202—203).—An etched single crystal of Cu, protected from distortion, gives Kikuchi lines, in addition to the cross-grating pattern of spots, by diffraction of a fast electron beam. These lines form a criterion of perfection of the crystal lattice.

L. S. T.

**Oxide layer on a polished copper surface.** S. DOBINSKI (Nature, 1936, 138, 31).—The electron diffraction pattern usually attributed to polished Cu is due to  $\text{Cu}_2\text{O}$ . Polishing in absence of air gives haloes of different size corresponding with spacings of 1.91 and 1.16 Å.

L. S. T.

**Anomalous values of lattice spacings obtained by electron diffraction.** E. PICKUP (Nature, 1936, 137, 1072).—Attention is directed to discrepancies in lattice spacings calc. from electron diffraction patterns. These anomalies may invalidate the results of electron-wave methods for measuring at. consts.

L. S. T.

3 z

**Analytic method of interpretation of electron diffraction photographs of gases.** S. H. BAUER (J. Chem. Physics, 1936, 4, 406—412).—A simplified method of calculating interat. distances and valency angles is described. Published data for  $\text{CH}_2\text{Cl}_2$ ,  $\text{CHCl}_3$ , and  $\text{COCl}_2$  are recalcd. and modified. New measurements on  $\text{C}_3\text{H}_8$  are recorded.

H. J. E.

**Electron-diffraction study of paraldehyde.** D. C. CARPENTER and L. O. BROCKWAY (J. Amer. Chem. Soc., 1936, 58, 1270—1273).— $(\text{MeCHO})_3$  consists of a staggered, 6-membered ring of alternate C and O atoms, having a C—O distance of  $1.43 \pm 0.02$  Å. The linking angles are tetrahedral and the Me groups are placed symmetrically about the mol. in nearly the same plane as the ring, with the possibility that only one Me may be above the plane of the ring. The C of the Me groups are attached to the C of the ring by linkings having a length of  $1.54 \pm 0.02$  Å.

E. S. H.

**Study of the nature of liquids by means of X-ray diffraction.** G. W. STEWART (Physical Rev., 1935, [ii], 47, 201).

L. S. T.

**Theory of the piezo-resistive effect.** J. W. COOKSON (Physical Rev., 1935, [ii], 47, 194—195).—The change in electrical resistance which a homogeneous body undergoes when subjected to mechanical stress is discussed for a Bi crystal.

L. S. T.

**Dependence of dielectric properties of Seignette salt crystals on mechanical factors.** R. DAVID (Helv. phys. Acta, 1935, 8, 431—484; Chem. Zentr., 1935, ii, 3207—3208).—The effect of pressure on the hysteresis and polarisation phenomena was studied.

H. J. E.

**Magnetic properties of manganese heated in nitrogen.** L. F. BATES, R. E. GIBBS, and D. V. REDDI-PANTULU (Proc. Physical Soc., 1936, 48, 665—671).—The combination of amorphous Mn with  $\text{N}_2$  has been studied between  $300^\circ$  and  $1000^\circ$ . Ferromagnetic compounds are formed at temp. much  $<$  previously reported. The magnetic hysteresis phenomena, the ferromagnetic Curie points, and an X-ray study of the compounds are described. The ferromagnetism can be associated with the  $\gamma$ -phase of Mn with a slightly enlarged lattice const.; the function of the  $\text{N}_2$  is not understood.

W. R. A.

**Ferromagnetism of nickel. II. Temperature effects.** J. C. SLATER (Physical Rev., 1936, [ii], 49, 931—937; cf. this vol., 671).—With the help of Fermi statistics and the model previously proposed, the free energy is calc. as a function of temp. and magnetic moment. The val. of the latter for which the free energy is a min. decreases with rise of temp. to zero at the Curie point, and, with the free energy val. at the min., as a function of temp., agrees with experiment. At abs. zero not all the spins are parallel, and this effect probably becomes more pronounced on approaching Fe in the ferromagnetic series, explaining the fact that alloys of Fe and Co show the highest saturation moments, the moment decreasing in Fe and in its alloys with lighter elements.

N. M. B.

**Magnetisation of nickel under compressive stresses and the production of magnetic dis-**

continuities. C. W. HEAPS (Physical Rev., 1936, [ii], 50, 176—179).—Hysteresis curves for stresses up to the elastic limit have been obtained. The existence of contiguous compressed and stretched regions appears necessary for the production of large Barkhausen discontinuities. N. M. B.

Behaviour of some solidified gases in polarised light. E. POHLAND (Angew. Chem., 1936, 49, 482—483).—Optical examination in polarised light between crossed nicols shows that solid HCN, NO, and SO<sub>2</sub> are double refracting, and that SbH<sub>3</sub> is dimorphous, the cubic form being the stable one. J. W. S.

Cryolite. Index of refraction, birefringence, and crystalline forms. G. CESARO and J. MELON (Bull. Acad. roy. Belg., 1936, [v], 22, 362—372).—*n* for cryolite is 1.343 at 6620 Å. and 1.319 at 4770 Å. The vals. obtained at other  $\lambda$  agree with those calc. from the Cauchy formula. The birefringence for various faces, and the angles between the faces, are calc. A. J. M.

Allotropy of very pure calcium. A. SCHULZE (Z. Metallk., 1936, 28, 55—57).—The ordinary face-centred cubic ( $\alpha$ ) form of Ca is converted into a body-centred ( $\beta$ ) form at 300° and into a close-packed hexagonal ( $\gamma$ ) form at 450°. The  $\beta$ - $\gamma$  change is accompanied by a heat evolution of 5.3 g.-cal per g. These results have been established by thermal, dilatometric, X-ray, and electrical resistance methods. A. R. P.

Highly polymerised compounds. CXLI. Osmotic mol. wt. determinations with polymer-homologous series of substances of high mol. wt. G. V. SCHULZ (Z. physikal. Chem., 1936, 176, 317—337).—Mol. wts. of cellulose nitrates, polyethylene oxides, and polystyrenes have been deduced from osmotic pressure measurements by means of the equation previously suggested (this vol., 146). Mol. wts. up to 10<sup>6</sup> may be determined by this method. A convenient osmometer is described. R. C.

$\alpha$ - $\beta$  Transition with mechanically treated and with untreated zirconium. J. H. DE BOER, P. CLAUSING, and J. D. FAST (Rec. trav. chim., 1936, 55, 450—458).—Measurements of the electrical resistance of Zr rods, which had been subjected to varying preliminary treatment, show that the indefinite character of the  $\alpha$ - $\beta$  transition is not due to the transition itself, but to the heating of the rods in air during the mechanical working. The  $\alpha$ - $\beta$  transition temp. is 865±10° (cf. A., 1932, 219). O. J. W.

Influence of oxygen and nitrogen on the  $\alpha$ - $\beta$  transition of zirconium. J. H. DE BOER and J. D. FAST (Rec. trav. chim., 1936, 55, 459—467; cf. preceding abstract).—Zr can take up homogeneously < 10 at.-% of O and of N, and in presence of these gases the  $\alpha$ - $\beta$  transition is no longer sharp, but extends over a temp. range. With 10 at.-% O the transition commences below 910° and extends to >1550°. In this temp. range the  $\beta$ -phase is in equilibrium with an  $\alpha$ -phase which is richer in O. The resistance curves are scarcely influenced by the addition of Al. O. J. W.

High-temperature properties of niobium. A. L. REIMANN and C. K. GRANT (Phil. Mag., 1936, [vii], 22, 34—38).—Measurements of the sp. resistance, total thermal radiation, electron emission, and rate of evaporation at 1800—2400° abs. are recorded. The m.p. was 2770° abs. H. J. E.

Electrical resistivity of bismuth single crystals. A. B. FOCKE and J. R. HILL (Physical Rev., 1936, [ii], 50, 179—184).—Measurements in the temp. range —185° to 100° on Bi crystals containing Pb, Sn, Sb, or Te showed, in general, that falling temp. results in greater effectiveness of the impurity except when the impurity concn. allows phase separation at low temp. Less than 0.03% of all impurities cause a sharp increase in the resistance. The effect of larger amounts depends on the nature of the impurity; Pb and Sn increase the resistance; Te lowers it below the val. for pure Bi; Sb causes the initial rise to fall off and then to be slowly re-established; >0.03% Sn and >0.2% Pb result in a negative temp. coeff. for resistance parallel to the principal axis. N. M. B.

Electrical resistance of bismuth alloys. N. THOMPSON (Proc. Roy. Soc., 1936, A, 155, 111—123).—The electrical resistance of single crystals of Bi containing traces of Pb, Sn, Ge, Se, Te, and other elements has been measured from 14° to 400° abs. Pb, Sn, and Ge dissolves in the Bi lattice, giving an alloy with a high negative temp. coeff. of resistance parallel to the principal axis of the crystal, and a similar, but smaller, effect perpendicular to the axis. Se and Te dissolve in Bi, but there is no negative temp. coeff.; the addition of the first trace of the impurity lowers the sp. resistance, both parallel and perpendicular to the axis, except at low temp. The results are discussed in the light of Jones' theory of Bi (A., 1935, 153). L. L. B.

Time effects in superconductors. K. MENDELSSOHN and R. B. PONTIUS (Nature, 1936, 138, 29—30). L. S. T.

Carrier electrons in superconduction. R. FORRER (Compt. rend., 1936, 202, 2059—2061).—The electrons which are responsible for superconduction are the *s* electrons of incomplete shells. H. J. E.

Electrostatic behaviour of superconductors. H. LONDON (Proc. Roy. Soc., 1936, A, 155, 102—110; cf. A., 1935, 689).—It follows from measurements of the capacity of a superconducting condenser that no electrostatic fields exist in a pure superconductor, and that in all stationary cases the surface of a superconductor is equipotential. L. L. B.

Conductivity of *p*-axoxyanisole. M. JEZEWSKI and M. MIESOWICZ (Acta phys. polon., 1934, 3, 279—283; Chem. Zentr., 1935, ii, 5052).—Conductivity data are recorded at 121° for d.c. and a.c., and with longitudinal and transverse magnetic fields of 4000 gauss. H. J. E.

Magnetic measurements in chemistry. J. S. ANDERSON (Chem. and Ind., 1936, 555—559).—The application of magnetic susceptibility measurements to chemical problems is reviewed. J. S. A.

**Collective electron specific heat and spin paramagnetism in metals.** E. C. STONER (Proc. Roy. Soc., 1936, A, 154, 656—678).—General expressions are obtained which show how the sp. heat and spin paramagnetism, and their temp. variation, depend on the band form. Only the low temp. range is considered. A method of determining the effect of interchange interaction is developed. Positive interchange interaction does not necessarily result in ferromagnetism, even at the lowest temp. The magnetic properties of the elements of the first two columns of the periodic table and of the transition elements and rare earths are considered on the basis of the theoretical treatment. L. L. B.

**Magnetic properties of the plasma of gas discharges.** M. STEENBECK (Wiss. Veroff. Siemens-Werken, 1936, 15, 1—17).—The plasma of a gas discharge may be treated as a metal with freely moving, non-degenerate electron gas. The diamagnetic susceptibility and magnetic moment induced in the plasma are determined. The susceptibility is > that of any other diamagnetic substance. A. J. M.

**Preparation of lithium alum.** J. F. SPENCER and G. T. ODDIE (Nature, 1936, 138, 169).—Concn. and cooling in an ice-NaCl freezing mixture of an aq. solution of  $\text{Li}_2\text{SO}_4 \cdot \text{H}_2\text{O}$  and  $\text{Al}_2(\text{SO}_4)_3 \cdot 18\text{H}_2\text{O}$  (1:1) yields isotropic crystals, a combination of cube and octahedron, of Li alum. At room temp. the crystals decompose; at  $200^\circ$ , all  $\text{H}_2\text{O}$  is lost and a bulky, friable mass remains. The mass susceptibility is  $-0.541 \times 10^{-6}$ . L. S. T.

**Magne-crystalline action. IV. Magnetic behaviour of paramagnetic ions in the S-state in crystals.** K. S. KRISHNAN and S. BANERJEE (Phil Trans., 1936, A, 235, 343—366; cf. A., 1935, 924).—Special technique for the measurement of feeble anisotropies, and data for 10 paramagnetic single crystals of  $\text{Mn}^{++}$  and  $\text{Fe}^{+++}$  salts, 13 isomorphous diamagnetic crystals obtained by replacing Mn by Mg or Zn, and Fe by Al, and abs. susceptibilities of the 10 first-mentioned are given. Causes discussed contributing to the anisotropy are: diamagnetism of the crystal, mutual influence of the magnetic moments and their non-cubic arrangement in the crystal lattice, and the Stark splitting of the  $^6\text{S}$  levels under the influence of the cryst. electric fields. A method for calculating the magnitude of the Stark separation from the anisotropy and the "characteristic temp." is described. The part played by Stark splitting in various low-temp. phenomena is reviewed; the entropy-temp. and sp. heat-temp. curves of the crystals around  $0.1^\circ$  abs. can be predicted from magnetic measurements at room temp. Data for some mixed crystals are given. N. M. B.

**Optical method for the measurement of paramagnetic susceptibilities. Application to the ethyl sulphates of the rare earths in the direction of the optic axis.** J. BECQUEREL (Physica, 1936, 3, 705—723; cf. Van Vleck and Hebb, A., 1934, 944).—Vals. of the magnetic susceptibilities of the hydrated Et sulphates of Pr, Nd, Ds, and Er parallel to the optic axis are deduced from measurements of the magnetic rotatory power at temp.

between  $1.45^\circ$  abs. and room temp. Those for Ds are in agreement with direct measurements and all are compatible with the theory of paramagnetism.

O. D. S.

**Magnetic properties of some compounds of the rare elements.** S. VELAYOS (Anal. Fis. Quim., 1935, 33, 5—33; cf. A., 1934, 586).— $\chi$  for  $\text{Er}_2\text{O}_3$ ,  $\text{Dy}_2\text{O}_3$ ,  $\text{Gd}_2\text{O}_3$ ,  $\text{Gd}_2(\text{SO}_4)_3$ ,  $\text{Pr}_2\text{O}_3$ , and  $\text{Nd}_2\text{O}_3$  has been measured over the range  $80$ — $720^\circ$  abs., whence the magneton nos. are 52.0, 46.8, 38.97, 39.1, 17.5, and 16.4.  $\text{Pr}_2\text{O}_3$  and  $\text{Nd}_2\text{O}_3$  do not obey the Weiss-Curie law but obey the modification proposed by Cabrera *et al.* (A., 1925, ii, 755),  $(\chi + k)(T + \Delta) = C$ . The magneton nos. of  $\text{Pr}_2\text{O}_3$  and  $\text{Nd}_2\text{O}_3$  agree more closely with the theoretical vals. of Hund than those of Van Vleck and Frank. F. R. G.

**Critical examination of Pascal's value for the magnetic susceptibility of the  $\text{CH}_3$  group.** S. S. BHATNAGAR and N. G. MITRA (J. Indian Chem. Soc., 1936, 13, 329—334).—Recalculation of Pascal's val. for  $\chi$  of the  $\text{CH}_3$  group, using modern vals. for at. wts. and correcting for the new val. for  $\text{H}_2\text{O}$ , gives, as an average of 50 vals.,  $-11.68 \times 10^{-6}$  (cf. Pascal's val.  $-12.35 \times 10^{-6}$ ). C. R. H.

**Search for a photomagnetic effect.** R. M. EMBERSON and R. T. DUFFORD (Physical Rev., 1935, [ii], 47, 202).—Measurements of the magnetic susceptibilities of >60 substances, including Grignard solutions giving the photovoltaic effect, failed to reveal a change in susceptibility due to illumination. L. S. T.

**Dispersion of sound in oxygen.** L. S. SINNESS and W. E. ROSEVEARE (J. Chem. Physics, 1936, 4, 427—431).—The velocity of a 1000-cycle sound wave in  $\text{O}_2$  of various degrees of humidity at  $26.5^\circ$  was measured. The velocity was a min. for  $p_{\text{H}_2\text{O}} = 1$ —3 mm. The change in velocity due to dispersion was 0.16%. The  $\text{H}_2\text{O}$  mols. are effective in bringing the heat capacity of the first vibrational state of  $\text{O}_2$  into equilibrium with the sound wave. H. J. E.

**Acoustic experiments for the investigation of molecular collisions.** H. O. KNESER (Sitzungsber. Ges. Naturwiss. Marburg, 1935, 69, 189—194; Chem. Zentr., 1935, ii, 3213).—The absorption of sound waves by air or  $\text{O}_2$  is small for high or low frequencies, and is a max. for moderate frequencies. Addition of 1% of  $\text{H}_2$  at EtOH increases the absorption considerably.  $\text{N}_2$ , CO, or He does not change it. H. J. E.

**Molecular absorption of sound in gases.** H. O. KNESER (Z. tech. Phys., 1935, 16, 213—219; Chem. Zentr., 1935, ii, 3213; cf. preceding abstract).—Measurements with air,  $\text{O}_2$ , and  $\text{CO}_2$  agree with the theory of mol. absorption. Foreign gases increase the absorption coeff. H. J. E.

**Direct calorimetric determination of  $C_p$  of the hydrogen isotope in the solid and liquid state.** E. BARTHOLOME and A. EUCKEN (Z. Elektrochem., 1936, 42, 547—551).—Apparatus and technique are described and results reported for solid  $\text{H}_2$  (11.20—17.75° abs.), solid  $\text{D}_2$  (11.60—21.23° abs.), liquid  $\text{H}_2$  (15.33—23.13° abs.), and liquid  $\text{D}_2$  (19.62—23.49° abs.). The determinations of  $C_p$

are discussed. Vals. of  $\theta$  are 105 for  $H_2$  and 97 for  $D_2$ . E. S. H.

**Specific heat, entropy, and dissociation of technical gases and vapours.** E. JUSTI and H. LUDER (Forsch. Ingenieur. Ausg., 1935, 6, A, 209—216; Chem. Zentr., 1935, ii, 2789—2790).—Data given previously (A., 1935, 289) are supplemented by data for  $H_2$ ,  $D_2$ ,  $N_2$ ,  $O_2$ , HD, OH, CO, NO,  $H_2O$ ,  $D_2O$ ,  $CO_2$ ,  $SO_2$ ,  $CH_4$ ,  $C_2H_4$ ,  $C_2H_2$ , and air. The variations of  $C_p$  and  $C_p$  with pressure are discussed, and data are given for the dissociation of  $H_2$ ,  $N_2$ ,  $O_2$ , NO,  $H_2O$ ,  $CO_2$ ,  $N_2O$ ,  $SO_2$ ,  $C_2H_6$ , and for the water-gas reactions. J. S. A.

**Mean specific heats of gases, for use in fuel technical calculations.** W. GUMZ (Feuerungstechn., 1935, 23, 85—86; Chem. Zentr., 1935, ii, 2789).—Mean sp. heats between  $0^\circ$  and  $3500^\circ$  are given for  $CO_2$ ,  $SO_2$ ,  $H_2O$ ,  $N_2$ ,  $O_2$ , A, CO,  $CH_4$ ,  $H_2$ , and air. J. S. A.

**Entropy of water and the third law of thermodynamics.** Heat capacity of ice from  $15^\circ$  to  $273^\circ$  abs. W. F. GIAUQUE and J. W. STOUT (J. Amer. Chem. Soc., 1936, 58, 1144—1150).—The discrepancy between the spectroscopic val. of the entropy and the  $\int_0^T C_p/dT$  for  $H_2O$  has been evaluated as 0.82 g.-cal./degree/mol. Heat capacity data for ice are recorded. No difference in thermal properties was observed whether the ice was cooled slowly or rapidly to low temp. or kept for a long time at low temp. E. S. H.

**Specific heat of nickel.** E. C. STONER (Phil. Mag., 1936, [vii], 22, 81—106).—An analysis of the sp. heat of Ni is made in terms of the lattice vibration term, the dilatation term, and the electronic and magnetic sp. heats. H. J. E.

**Electronic specific heat in palladium.** G. L. PICKARD (Nature, 1936, 138, 123).—Determinations of the sp. heat of Pd between  $2.5^\circ$  and  $22^\circ$  abs. give  $C = 0.0000224T^3 + 0.0031T$  g.-cal. per degree for the at. heat. The first term represents the component due to the lattice vibrations, and the second the sp. heat of the free electrons or positive holes (unfilled quantum states). As predicted by Mott, the val. of the electronic sp. heat is  $>$  that for normal metals and is even  $>$  that of Ni. L. S. T.

**Exact determination of specific heats at high temperatures. VIII. Additive law for the atomic heats of metals in their binary compounds.** F. M. JAEGER and T. J. POPPEMA (Rec. trav. chim., 1936, 55, 492—517; cf. A., 1934, 354).—Further measurements of  $C_p$  for Sb and Pd and for the binary compounds  $MgZn_2$ ,  $PtSb_2$ ,  $PdSb$ ,  $PdSb_2$ ,  $PdSb$ ,  $PdCu$ , and  $PdCu_3$  are recorded. The observed mol. heat differs in general from that calc. from the component at. heats, and the differences increase with the temp. Some X-ray data for  $\beta$ - $Pd_3Sb$  are given. O. J. W.

**Specific heats of solid substances at high temperatures. XI. Specific heats, electrical resistance, and thermo-electric behaviour of titanium in their dependence on temperature.** F. M. JAEGER, E. ROSENBOHM, and R. FONTEYNE (Rec. trav. chim., 1936, 55, 615—654).—Ti exists in

an  $\alpha$ -form with hexagonal symmetry, stable below  $\sim 905^\circ$ , and a body-centred cubic  $\beta$ -form stable above  $880$ — $905^\circ$ . Measurements of the heat given out in cooling, the resistance,  $R$ , at  $250$ — $940^\circ$ , and the thermo-e.m.f.,  $E$ , at  $50$ — $1020^\circ$  show that transition occurs very slowly. The true at. heat,  $C_p$ , rises from 6.507 at  $200^\circ$  to 8.901 at  $817^\circ$ . From  $817^\circ$  onwards it rises very rapidly, then drops abruptly to 7.525, which is the val. for the  $\beta$ -form and does not vary with temp. Apparently  $817$ — $905^\circ$  is a transition interval. A series of "minor transition points" have also been observed. At these, peculiar hysteresis effects occur on cooling; some, at least, of these points are partly due to the presence of traces of O and N and the production within the metal of oxide films and their partial reduction by the excess of Ti at various temp. These gases also affect the transition  $\beta$ -Ti. The modification of the Saladin-Le Chatelier method for the precise measurement of the variation of  $E$  and  $R$  with temp. in a high vac. is described. R. C.

**Isotherms of methane between  $0^\circ$  and  $150^\circ$  for densities up to 225 Amagat. Calculated specific heat, energy, and entropy in the same region.** A. MICHELS and G. W. NEDERBRAGT (Physica, 1936, 3, 569—577; cf. this vol., 20).—Isotherms of  $CH_4$  have been determined at  $25^\circ$  intervals between  $0^\circ$  and  $150^\circ$  and are represented by an empirical formula. Calc. vals. of the sp. heat, internal and free energies, and entropy are tabulated. O. D. S.

**Specific heat of formic acid and its aqueous solutions.** A. A. GLAGOLEVA and S. I. TSCHERBOV (J. Gen. Chem. Russ., 1936, 6, 685—690).—Sp. heat data are recorded for the range  $25$ — $80^\circ$ . R. T.

**Amorphous and crystalline forms of rubber hydrocarbon.** G. S. PARKS (J. Chem. Physics, 1936, 4, 459).—It is suggested that the cryst. rubber hydrocarbon described by Bekkedahl and Matheson (this vol. 417) was in reality a mixture of cryst. material with approx. 70% of amorphous material. The heat of fusion of the pure cryst. material was recalcd. as 17.4 g.-cal. per g., which is of the same order of magnitude as the val. for other hydrocarbons of m.p.  $> 200^\circ$  abs. H. J. E.

**M.p. and b.p. in series of homopolar substances.** J. F. DURAND (Bull. Soc. chim., 1936, [v], 3, 1382—1388).—When the b.p. (abs. temp.) of A, Kr, and Xe are plotted as abscissæ and those of the corresponding substances  $PCl_3$ ,  $AsBr_3$ , and  $SbI_3$  as ordinates, the three points lie on a straight line. The same holds for  $SiCl_4$ ,  $GeBr_4$ , and  $SnI_4$ . Similarly, when the b.p. of He, Ne, A, Kr, and Xe are plotted against those of  $H_2$ ,  $F_2$ ,  $Cl_2$ , Br, and I, the five points lie on a straight line, but when the m.p. are plotted only the vals. for  $Cl_2$ , Br, and I are in alignment. By extrapolation, the halogen at. no. 85 should have b.p. about  $684^\circ$  and m.p. about  $572^\circ$  abs. E. S. H.

**Determination of physico-chemical constants.** M. WOJCIECHOWSKI and E. R. SMITH (Nature, 1936, 138, 30).—The difference between the b.p. and condensation temp. enables the consts. for the pure substance or azeotropic mixture to be calc. The

b.p. of *iso*-C<sub>5</sub>H<sub>11</sub>·OH and *d*<sup>25</sup> for Pr<sup>o</sup>OAc thus obtained are 131·806° and 0·88299(3) g. per c.c., respectively.

L. S. T.

**Vapour pressure of barium.** J. A. M. VAN LIEMPT (Rec. trav. chim., 1936, 55, 468—470; cf. A., 1935, 1454).—The following expression for the v.p. is obtained:  $\log p = -9727/T + 7·83$  (*p* in mm.), and the following data for Ba are calc.: heat of evaporation 44,450 g.-cal. per g.-atom, b.p. 1696°, Trouton's const. 22·6.

O. J. W.

**Vapour pressure of deuterium water from 20° to 230°.** F. T. MILES and A. W. C. MENZIES (J. Amer. Chem. Soc., 1936, 58, 1067—1069).—V.p. are recorded for D<sub>2</sub>O and the differences of latent heat of vaporisation for D<sub>2</sub>O and H<sub>2</sub>O calc. The v.p. of D<sub>2</sub>O and H<sub>2</sub>O are identical at about 224°.

E. S. H.

**Vapour pressure, b.p., and heat of vaporisation of HDO and H<sub>2</sub>O<sup>18</sup>.** E. H. RIESENFELD and T. L. CHANG (Z. physikal. Chem., 1936, B, 33, 127—132).—The v.p. of HDO at 100° and of H<sub>2</sub>O<sup>18</sup> at 65—100° have been calc. from the increased concn. of these in the residue after partial distillation of H<sub>2</sub>O (cf. A., 1935, 1064). The empirical equations  $p_{\text{D}_2\text{O}}/p_{\text{H}_2\text{O}} = 1·35e^{-259/RT}$  and  $p_{\text{H}_2\text{O}^{18}}/p_{\text{H}_2\text{O}} = 1·013e^{-13/RT}$  have been obtained. The b.p. of HDO and H<sub>2</sub>O<sup>18</sup> are calc. to be 100·7° and 100·1°, and the mol. heats of vaporisation  $\lambda_{\text{H}_2\text{O}} + 130$  and  $\lambda_{\text{H}_2\text{O}} + 13$  g.-cal., respectively.

R. C.

**Vapour pressure and heat of vaporisation of heavy water.** E. H. RIESENFELD and T. L. CHANG (Z. physikal. Chem., 1936, B, 33, 120—126).—The excess of the v.p. of H<sub>2</sub>O over that of D<sub>2</sub>O has been measured at 20—230°. With rising temp. it passes through a max., 82·6 mm., at 170°, and is zero at 225° and negative above. The excess of the heat of vaporisation of D<sub>2</sub>O over that of H<sub>2</sub>O falls with rising temp., but is always positive.

R. C.

**Vapour pressure of ethyl alcohol and toluene as a criterion of purity.** F. SCHOUTEDEN and J. DEVEUX (Natuurwetensch. Tijds., 1936, 18, 242—247).—The v.p.-temp. curve of the liquid is determined in a closed space (e.g., in a glass-spring manometer) under such conditions that (1) the vol. of the vapour phase is negligible, (2) the vol. of the liquid phase is negligible compared with that of the vapour. For a pure substance, the two curves are coincident. Curves are recorded for pure EtOH and PhMe. A method of calculating the heat of mixing from v.p. data is obtained thermodynamically.

D. R. D.

(A) Isotherms of nitrogen between 200 and 300 atm. and 0° and 150°. (B) Calculation of thermodynamic properties of nitrogen up to 3000 atm. between 0° and 150°. A. MICHELS, H. WOUTERS, and J. DE BOER (Physica, 1936, 3, 585—589, 597—604; cf., A., 1934, 355, 837).—(A) Earlier measurements are extended to higher densities (up to 578 Amagat). The results are not accurately represented by either of the empirical formulae tried.

(B) From the isotherm data the change in internal energy, sp. heat, entropy, and free energy on compression have been calc.

O. D. S.

**Determination of coefficient of equilibrium for condensed (gas) systems.** S. M. LEVINSON (Chimstr., 1935, 7, 262—264).—Coeffs. for CH<sub>4</sub>, C<sub>2</sub>H<sub>4</sub>, C<sub>3</sub>H<sub>6</sub>, C<sub>4</sub>H<sub>8</sub>, and C<sub>5</sub>H<sub>10</sub> have been derived for the range -90° to 30° and 0 to 50 atm. CH. Abs. (e)

**Thermodynamical researches.** N. A. DE KOLOSOVSKI (Acta Univ. Asiae Med., 1934, [vi], 1, No. 7, 3—91).—A thermodynamical treatment of the properties of liquids and vapours.

E. S. H.

**Volume energy of real gases (He, Ne, H<sub>2</sub>).** V. JACYNA (Acta phys. polon., 1934, 3, 15—32; Chem. Zentr., 1935, ii, 3212).—Data are recorded, and deviations from the ideal gas laws are discussed.

H. J. E.

**Röntgenographic measurements of expansion of crystalline masses.** W. BUSSEM [with M. BLUTH and G. GROCHTMANN] (Ber. deut. keram. Ges., 1935, 16, 381—392; Chem. Zentr., 1935, ii, 2848).—X-Ray measurements of lattice parameters are given for MgO, cristobalite, corundum, sillimanite, and SiC from -182° to 1400°.

J. S. A.

**Heat conduction by rarefied gases. I. Thermal accommodation coefficient of helium, hydrogen, neon, and nitrogen on glass at 0°.** W. H. KEESOM and G. SCHMIDT (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 716; cf. A., 1911, ii, 253; 1933, 1).—The accommodation coeffs. of He (0·336), H<sub>2</sub> (0·283), Ne (0·670), and N<sub>2</sub> (0·855) on glass at 0° have been measured by Schleiermacher's method.

J. L. D.

**Heat conductivity of tungsten and cooling effects of leads on filaments at low temperatures.** I. LANGMUIR and J. B. TAYLOR (Physical Rev., 1936, [ii], 50, 68—87).—The theory of the effect of the temp. of the leads to a W wire in an evacuated vessel on the temp. distribution and resistance is given, and general equations are given for W filaments up to 600° abs. It is shown that the heat conductivity,  $\lambda$ , may be calc. from determinations of temp. or resistance resulting from the passage of a current through the filament. For low temp. (<600° abs.) it is more convenient to use the resistance.  $\lambda$  at 273° abs. is 1·66 watts per cm. per degree and decreases with rising temp. according to  $\log \lambda = 0·951 - 80·30 \log T$ .

A. J. M.

**Heat losses from a tungsten wire in helium.** W. C. MICHELS and G. WHITE (Physical Rev., 1935, [ii], 47, 197).—The accommodation coeff. found is 0·092, which becomes 0·069 when corr. for thermal etching produced in cleaning the wire.

L. S. T.

(A) Conduction of heat by some metals at low temperatures. H. BREMMER and W. J. DE HAAS. (B) Determination of the heat-resistance of mercury at the temperatures obtainable with liquid helium. W. J. DE HAAS and H. BREMMER. (C) Heat conductivity of superconductive alloys. H. BREMMER and W. J. DE HAAS (Physica, 1936, 3, 672—686, 687—691, 692—704).—(A) The heat-resistance ( $R_h$ ) of Pb has been measured between 2·5° and 77° abs. and of Cu and W between 14° and 22° abs. Below the threshold of superconductivity of Pb  $R_h$  has different vals.,  $W_n$  and  $W_s$ , in the presence or absence of a magnetic field of strength sufficient to

destroy the superconductivity.  $W_n < W_s$ . Both pass through min. vals. at about  $5^\circ$  and  $8^\circ$  abs., respectively. The "ideal resistance,"  $R_i$ , of Pb also passes through a min.  $R_i$  of Cu is still decreasing at  $14.5^\circ$  abs.  $R_i$  of W appears to tend to a min. at low temp.

(n) Relative vals. of  $R_h$  of Hg between  $2.5^\circ$  and  $4^\circ$  abs. are given.  $W_s$  and  $W_n$  both show a min. val. at about  $3.5^\circ$  abs.

(c)  $R_h$  has been measured for alloys of the following compositions: Pb 56, Sn 44 wt.-%,  $15-70^\circ$  abs.: Bi 50, Pb 25, Sn 25 wt.-%, eutectic mixture,  $2.6-276^\circ$  abs.: In-Pb alloys containing 8.6, 50, and 99 wt.-% Pb,  $2.5-278^\circ$  abs. In all cases  $R_h$  increases rapidly at low temps. but more slowly than is predicted by theory. O. D. S.

**Viscosity of halogen compounds of the elements of group V of the periodic system.** (MLLE.) A. I. LICHATSCHEVA and G. P. LUTSCHINSKI (J. Chim. phys., 1936, 33, 488-491).—The variations with temp. of the viscosities of  $\text{PCl}_3$ ,  $\text{AsCl}_3$ ,  $\text{SbCl}_3$ ,  $\text{PBr}_3$ ,  $\text{AsBr}_3$ , and  $\text{SbBr}_3$  follow Batschinski's formula (cf. A., 1935, 438). The limiting vals.,  $\omega$ , of the chlorides are  $>$  those of the bromides, and the  $\omega$  of the group V elements decrease with increase of at. wt.

J. G. A. G.

**Viscosity of air and the electronic charge.** G. KELLSTROM (Physical Rev., 1936, [ii], 50, 190; cf. A., 1935, 1455).—Improved apparatus gave the result  $\eta_{20^\circ} = (18201 \pm 27) \times 10^{-8}$  or  $\eta_{23^\circ} = (18349 \pm 27) \times 10^{-8}$ ; this, with Millikan's data, gives  $e = (4.818 \pm 0.011) \times 10^{-10}$  e.s.u. N. M. B.

**Measurements of the viscosity of water and water vapour up to the critical region.** K. SIGWART (Forsch. Geb. Ingenieurw., 1936, 7, 125-140).—A flow method for the determination of  $\eta$  of  $\text{H}_2\text{O}$  and  $\text{H}_2\text{O}$  vapour at high pressure and temp. is described. The  $\eta$  of  $\text{H}_2\text{O}$  depends on its  $d$ , that of the vapour on both its  $d$  and temp. The slope of the isotherms of  $\eta$  against pressure for  $\text{H}_2\text{O}$  vapour remains practically const. up to the saturation pressure, where an increase occurs. Below  $275^\circ$  the increase in  $\eta$  is small, amounting to only 5% for a pressure increase of 100 atm. The  $\eta$  of  $\text{H}_2\text{O}$  at the crit. point was found to be  $3.85 \times 10^{-6}$  kg. sec. per sq. m.

R. B. C.

**Relationship between the constitution and viscosity characteristics of hydrocarbons.** W. R. WIGGINS (J. Inst. Petroleum Tech., 1936, 22, 305-327).—The viscosity ( $\eta$ ) of hydrocarbons in relation to their constitution is considered in the light of published data. It is shown that the fractional  $\eta$ -temp. coeff.  $(1/\eta)(\Delta\eta/\Delta t)$  has a linear relationship with  $\log \tau$ , i.e.,  $(\Delta\eta/\Delta t)(1/\eta \log \eta) = \text{const.}$  This function is approx. const. for the same hydrocarbon, varying from 0.03 to 0.04 for aliphatic hydrocarbons and those of simple cyclic structure, whilst branched and polycyclic hydrocarbons give higher vals. The corresponding expression in kinematic units is regarded as a simple index for classifying viscous hydrocarbons. C. C.

**Density of mixtures of some molten electrolytes.** V. P. MASCHOVETZ and Z. F. LUNDINA (Coll. Trans. 1st U.S.S.R. Conf. Non-aq. Solutions, Kiev,

1935, 191-212).—The  $d$  of  $\text{MgCl}_2$ ,  $\text{NaCl}$ , and  $\text{KCl}$  falls linearly with rise of temp. from  $100^\circ$  to  $1000^\circ$ . The  $d$ -composition curves of the systems  $\text{MgCl}_2$ - $\text{NaCl}$  and  $\text{KCl}$ ,  $\text{KCl}$ - $\text{BaCl}_2$ , and  $\text{MgCl}_2$ - $\text{KCl}$ - $\text{NaCl}$  have been determined. R. T.

**Fused salts.** V. A. IZBEKOV (Coll. Trans. 1st U.S.S.R. Conf. Non-aq. Solutions, Kiev, 1935, 142-152).—A lecture. R. T.

**Viscosity of butyric acid-water mixtures.** C. R. BURY and J. GRINDLEY (J.C.S., 1936, 1003-1004).—The  $\eta$ -composition curves at  $-3^\circ$  to  $35^\circ$  afford no evidence for micelle formation, although anomalous in the crit. solution region is apparent at  $-3^\circ$ . The max. at approx. 70% acid are not accepted as evidence for compound formation.

C. R. H.

**Dielectric constant of dioxan-water mixtures between  $0^\circ$  and  $80^\circ$ .** G. ÅKERLOF and O. A. SHORT (J. Amer. Chem. Soc., 1936, 58, 1241-1243).—Data have been obtained for  $\lambda = 150$  m., using a resonance method. E. S. H.

**Solid solutions of methane and krypton.** M. VON STACKELBERG, F. QUATRAM, and H. J. ANTWEILER (Z. Elektrochem., 1936, 42, 552-557).—Thermal analysis and v.-p. determinations show that  $\text{CH}_4$  and Kr form an unbroken series of solid solutions. The f.p. and b.p. of all mixtures lie between those of the components. E. S. H.

**Aggregative states. II. Connexion between composition and properties in eutectics of binary systems of type I.** E. I. ACHUMOV (J. Gen. Chem. Russ., 1936, 6, 559-575; cf. this vol., 21).—Mathematical. R. T.

**Piezometric researches. III. Effect of high pressures on the melting curve of binary mixtures.** L. DEFFET (Bull. Soc. chim. Belg., 1936, 45, 213-250; cf. A., 1935, 688).—Data are recorded for the binary mixtures  $\text{C}_6\text{H}_6$ - $\text{C}_{10}\text{H}_8$  and  $\text{C}_6\text{H}_6$ -urethane over a wide range of composition. The composition of the  $\text{C}_6\text{H}_6$ - $\text{C}_{10}\text{H}_8$  eutectic varies only slightly with pressure, and, in general, with increase of pressure, the eutectic is enriched with respect to that component which has the smaller val. of  $\delta$  (*loc. cit.*). The influence of pressure on the solubility of  $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$  has also been examined. J. G. A. G.

**Two eutectic cycles with diphenyl.** A. M. VASILIEV (J. Gen. Chem. Russ., 1936, 6, 555-558).—The eutectics in the systems  $\text{Ph}_2$ - $\text{COPh}$ ,  $\text{Ph}_2$ - $\text{NHPh}$ ,  $\text{NHPh}_2$ - $\text{COPh}$ , and  $(\text{CH}_2\text{Ph})_2$ - $\text{Ph}_2$ - $\text{C}_{10}\text{H}_8$ , as determined by Lee and Warner (A., 1933, 228; 1935, 448), agree closely in composition with the requirements of Flavitzki's formula (A., 1906, ii, 152). R. T.

**Chemical composition and optical properties of solutions. II. Optical properties of solutions in the quaternary system  $\text{NH}_4\text{Cl}$ - $\text{NaCl}$ - $\text{KCl}$ - $\text{H}_2\text{O}$  at  $15^\circ$ .** E. I. ACHUMOV and M. P. GOLOVKOV (J. Gen. Chem. Russ., 1936, 6, 542-548; cf. this vol., 22).— $n$ -composition diagrams are recorded.

R. T.

**System nickel-zinc.** W. HEIKE, J. SCHRAMM, and O. VAUPEL (Metallwirts., 1936, 15, 655-662).—Alloys containing 22-29 and 45-52% Ni have been

re-examined by thermal methods. From the results and a detailed consideration of other work, a revised diagram is presented. C. E. H.

**Copper-tin alloys.** C. HAASE and F. PAVLEK (Z. Metallk., 1936, 28, 73—80).—The accepted solid solubility of Sn in Cu is 14% at temp. up to 400°, this val. being obtained with annealed alloys, prolonged ageing of which at  $\geq 400^\circ$  fails to decompose the solid solution. If, however, such alloys are cold-rolled after annealing and then aged at 300°, pptn. of a Sn-rich phase occurs. From sp. resistance and hardness measurements and from micrographic and X-ray analysis of cold-worked alloys after various methods of ageing, it is shown that the true solid solubility of Sn in Cu is 13.5% at 400°, 10.9% at 350°, 5.5% at 300°, 2.8% at 250°, and about 1.2% at 200°. The pptd. phase is  $\text{Cu}_3\text{Sn}$  at  $< 370^\circ$  and  $\text{Cu}_3\text{Sn}_\delta$  ( $\delta$ ) at  $> 370^\circ$ .  $\text{Cu}_3\text{Sn}$  pptd. at 300° is hexagonal,  $a$  2.7523 Å,  $c/a$  1.5697. The min. amount of cold-work required to produce pptn. is the lower the higher is the degree of supersaturation, and the rate of pptn. is the greater and the period of induction the shorter the higher is the degree of reduction above the min. The rate of pptn. is retarded by crystal recovery and recrystallisation phenomena above 300°. Pptn. is a continuous single-phase process which produces little hardening, but a characteristic change in the micro-structure. A. R. P.

**Reflecting power of the binary mixed crystal series copper-nickel.** P. BERGMANN and W. GUERTLER (Z. tech. Phys., 1935, 16, 235—236; Chem. Zentr., 1935, ii, 2634).—The selective reflective power of Cu in texturally homogenised Cu-Ni alloys disappears completely with  $> 25\%$  Ni. J. S. A.

**X-Ray investigation of the transformations in aluminium-silver alloys.** W. HOEFMANN and K. E. VOLK (Metallwirts., 1936, 15, 699—701).—The work of Ageev and Shoyket (A., 1933, 1110) is confirmed. The  $\beta$ -phase has a body-centred cubic structure, and at 700°,  $a=3.24$  Å. C. E. H.

**Transformations in eutectoidal copper-aluminium alloys.** V. GRIDNEV and G. KURDJUMOV (Tech. Phys. U.S.S.R., 1936, 3, 135—141).—The transformations in the  $\beta$ -phase of Cu alloys with (a) 12% Al and (b) 12% Al and 2% Ni have been studied by thermal and dilatometric analysis. The change from the disordered  $\beta$  lattice to the ordered  $\beta_1$  lattice is accompanied by a small decrease in vol., whereas the martensitic-like transformation  $\beta_1 \rightarrow \beta'$  shows a slight increase in vol. On rapid heating of quenched specimens the  $\beta'$ -phase is converted directly into  $\beta$ ; to convert  $\beta'$  into  $\beta_1$  the quenched alloy must be tempered at 400°, but at 430° the  $\beta_1$ -phase breaks down into eutectoidal  $\alpha + \gamma$ . When  $\beta_1$  is reheated at 190° it is reconverted into  $\beta'$ , which then passes back to  $\beta_1$  at 225° without internal diffusion, and hence the diffusion-less lattice change of the metastable  $\beta$ - into  $\beta'$  is reversible after tempering. A. R. P.

**Magnetic investigations of the [precipitation-] hardening of beryllium-nickel alloys.** W. GERLACH (Z. Metallk., 1936, 28, 80—83).—During pptn.-hardening of quenched 2% Be-Ni alloy the  $d$ , magnet-

isation, remanence, coercivity, and magnetic transformation point all increase parallel with the hardness; the magnetic hardness produced by pptn. increases with the degree of supersaturation of the original solid solution. These results are explained thus: during pptn. treatment the Be atoms leave the solid solution lattice, which then contracts and being richer in Ni acquires a higher magnetic transformation point. The pptn. temp. is insufficiently high to allow diffusion to fill the lattice gaps by Ni atoms, and hence magnetic hardness is increased. The Ni-Be compound which is pptd. during ageing stabilises the incomplete Ni lattice and renders the increased magnetic hardness relatively insensitive to changes of temp. A. R. P.

**X-Ray analysis of the homogenous phase in the system Mg-Ni.** F. BACHMETEV (Acta Physico-chim. U.R.S.S., 1935, 3, 531).—A correction. The no. of mols. in the unit cell of the compound  $\text{MgNi}_2$  is 8 and not 16 as previously stated (cf. this vol., 152). O. D. S.

**System manganese-carbon and the carburising of manganese alloys.** R. SCHENCK, N. G. SCHMAHL, and O. RUETZ (Z. Elektrochem., 1936, 42, 569).—Cementation of Mn in  $\text{CH}_4$  at 700—900° has been studied.  $\text{Mn}_3\text{C}$  dissolves 0.5% of C at 800—900°. Higher carbides were not found. In cementing Mn-Fe alloys,  $\text{Mn}_3\text{C}$  stabilises an equiv. amount of  $\text{Fe}_3\text{C}$ ; above 900° excess of C is taken into solution. Cementation of Mn is reduced by adding Cu. E. S. H.

**Constitution and structure of alloys.** A. PORTEVIN (Bull. Soc. chim., 1936, [v], 3, 1189—1237).—A lecture.

**X-Ray investigations on the ternary system nickel-copper-zinc.** J. SCHRAMM and O. VAUPEL (Metallwirts., 1936, 15, 723—726).—Previous thermal and micrographic work by Schramm (Diss., Freiberg, 1934) is extended to the examination of the phases which occur at room temp. C. E. H.

**Alloys of iron, manganese, and carbon. XV. Ternary diagram and general summary.** F. M. WALTERS, jun., and C. WELLS (Trans. Amer. Soc. Met., 1936, 24, 359—374).—Previous work is summarised. W. P. R.

**X-Ray investigation of the iron-chromium-silicon phase diagram.** A. G. H. ANDERSEN and E. R. JETTE (Trans. Amer. Soc. Met., 1936, 24, 375—419).—The Fe-rich portion of the ternary diagram Fe-Cr-Si has been studied by X-ray methods. The parametric surface of Fe-rich solid solutions has been developed with considerable accuracy, and the range for which the  $\alpha$ -Fe phase is homogeneous at 600°, 800°, and 1000° has been determined. The boundary consists of three sections characterised by (a) the  $(\text{Fe,Cr})_3\text{Si}_2$  phase, (b) the  $\text{Cr}_3\text{Si}$  phase, and (c) the solid solution phase which dissolves up to 10% Si. This phase is formed by pptn. from the binary and ternary  $\alpha$ -solid solutions. W. P. R.

**Transformation in 18:8 [chromium-nickel] austenitic steel. I. Magnetic investigation of the  $\gamma \rightarrow \alpha$  transformation.** G. AKIMOV and L. PEVSNER. II. Investigation of the transformation by thermoelectric method. G. AKIMOV and

N. TOMASHOV. III. Thermal expansion of cold-worked 18:8 steels. IV. The  $\gamma \rightarrow \alpha$  transformation in 18:8 austenitic steel deformed by twisting at different temperatures. G. AKIMOV and J. FRIEDMANN. V. Thermal analysis of deformed and hardened stainless steel. G. AKIMOV and N. TOMASHOV (Tech. Phys. U.S.S.R., 1936, 3, 142—148, 149—154, 155—157, 158—164, 165—175).—I. When austenitic 18:8 stainless steel is cold-rolled, transformation of  $\gamma$  into  $\alpha$  starts along the grain boundaries and slip planes and reaches 45% after a reduction of 80% in thickness. On subsequent heating of the cold-worked metal the amount of  $\alpha$  begins to increase at 250° and the rate of transformation increases with the degree of reduction, a definite relation between  $\alpha$  and  $\gamma$  being established for a definite temp. and a definite degree of reduction. At 445° reconversion of  $\alpha$  into  $\gamma$  begins irrespective of the degree of reduction, but above 475° there is a definite equilibrium between the  $\alpha$  and  $\gamma$  for each temp., and this varies with degree of reduction up to about 600°, above which it again becomes independent of degree of reduction, since at this temp.  $\alpha$  has practically disappeared.

II. Measurements of the e.m.f. between deformed and undeformed 18:8 steel show a sudden change at 485—700° due to the  $\alpha \rightarrow \gamma$  transformation. Increase in degree of reduction from 48 to 71% lowers the temp. at which carbide pptn. occurs from 730° to 705°. The thermoelectric power-temp. curve for deformed steel resembles closely the magnetic saturation-temp. curve above 450°.

III. Dilatometric curves for cold-worked 18:8 steel show that a contraction occurs at 500° due to the  $\alpha \rightarrow \gamma$  change which is not affected by degree of reduction and an inflexion at 650° probably due to carbide pptn.

IV. The degree of work-hardening of 18:8 steel produced by twisting varies only slightly between 20° and 470°; as the deformation temp. is raised to 150° the magnetic saturation decreases sharply and at higher temp. approaches zero asymptotically, indicating that transformation of  $\gamma$  into magnetic  $\alpha$  practically ceases at 150°. Twisting at room temp. produces a more fine-grained structure, but tends to rupture the grains, whereas twisting at 450—470° produces no deformation of the microstructure and no refinement of the grain structure.

V. Thermal analysis of cold-worked 18:8 steel shows a heat effect due to removal of elastic stress starting at 490° and reaching a max. at 540°, a second effect due to carbide pptn. starting at 650° and reaching a max. at 695°, and a third effect due to the beginning of recrystallisation at 800°. On reheating the steel after quenching from 1200° heat effects occur at 435° and 540° due to stress removal and at 700° due to carbide pptn. A. R. P.

Low-temperature diffusion of solid aluminium into iron. L. G. HALL (Physical Rev., 1935, [ii], 47, 418—419).—A review of data relating to the diffusion of Al into Fe. L. S. T.

Diffusion in solid metals and its relation to other properties. W. SEITH and E. A. PERETTI (Z. Elektrochem., 1936, 42, 570—579).—The diffusion

velocities of Cu, Cd, In, Sn, and Sb in Ag at 650—895° have been determined by spectrum analysis. The results confirm those reported for diffusion in Pb (A., 1935, 158). E. S. H.

Diffusion of gases through metals. III. Degassing of nickel and diffusion of carbon monoxide through nickel. C. J. SMITHELLS and C. E. RANSLEY (Proc. Roy. Soc., 1936, A, 155, 195—212).—The gas evolved by heating commercial Ni in a vac. or in  $H_2$  is mainly CO. The measured rate of diffusion of CO through Ni is too small to account for the rate at which gas is evolved in the degassing process; it is therefore suggested that the CO is generated from C and  $O_2$  contained in the Ni. Measurements have also been made of the diffusion of C and  $O_2$  through Ni. The rate of diffusion of  $O_2$  is much < that of C, but it would seem that the rate of diffusion of C is the controlling factor in the rate at which CO is evolved. L. L. B.

Diffusion of sucrose in highly concentrated solutions. A. MERTENS (Bull. Ass. anc. Étud. Louvain, 1935, 35, 107—110; Chem. Zentr., 1935, ii, 3311).—The diffusion coeff. is tabulated from 18.5° to 160°. H. N. R.

Vaporisation of boric acid in the cold with the vapours of the lower homologues of primary alcohols. M. ARQUET (Bull. Soc. chim., 1936, [v], 3, 1422—1424).— $H_3BO_3$  vaporises rapidly from solutions in MeOH at room temp.; in EtOH solutions the loss of  $H_3BO_3$  is less. When coal gas, containing the vapour of MeOH, EtOH, or  $Pr^iOH$ , is passed over cryst.  $H_3BO_3$ , the latter is volatilised, the gas burning subsequently with a green flame. E. S. H.

Volatility and dehydration of boric acid. M. VON STACKELBERG and F. QUATRAM (Z. Elektrochem., 1936, 42, 551).—The influence of temp. (110—170°) and  $H_2O$ -v.p. (100—760 mm.) on the volatilisation of  $H_3BO_3$  in  $H_2O$  vapour has been determined.  $H_3BO_3$  vaporises as such and has a definite "solubility" in  $H_2O$  vapour, which is independent of the pressure. The main influence of  $H_2O$  is to prevent dehydration to  $HBO_2$ , which is non-volatile. E. S. H.

Solubility of slightly soluble electrolytes. M. HAÏSSINSKI (Acta Physicochim. U.R.S.S., 1935, 3, 517—528).—Methods used in the measurement of the solubilities of the hydroxides and sulphates of the heavy metals are criticised. The results of different methods are so discordant that the measured vals. cannot be regarded as characteristic consts. O. D. S.

Solubility of alkaline-earth fluorides in acids. I. TANANAEV and S. TSCHRELASCHVILI (J. Gen. Chem. Russ., 1936, 6, 606—611).—The solubility of  $CaF_2$ ,  $SrF_2$ , and  $MgF_2$  is given by  $S = [L[H^+]^2/4K^2 + 1]^{1/3} - M/1000$ , where  $S$  is g. of fluoride of mol. wt.  $M$  in 1 ml. of solution,  $L$  is the solubility product, and  $K$  the dissociation coeff. of HF. The formula does not apply to  $BaF_2$ . Formulae for deriving the vals. of  $L$  and  $K$  at different  $p_H$  are given. R. T.

Solubility of precipitates in acids. A. K. BABKO (Bull. Sci. Univ. Kiev, 1935, 1, 155—161).—Expressions are derived, whereby the solubility of

sparingly sol. salts ( $\text{BaC}_2\text{O}_4$ ,  $\text{CaC}_2\text{O}_4$ ) in presence of excess of cation or precipitant may be calc. Experimental results agree with theory in presence of excess of  $\text{H}_2\text{C}_2\text{O}_4$ , but not of  $\text{Ba}^{++}$  or  $\text{Ca}^{++}$ . R. T.

[Solubility of] nitrates of group II metals in liquid ammonia. M. A. PORTNOV (Coll. Trans. 1st U.S.S.R. Conf. Non-aq. Solutions, Kiev, 1935, 93—104).—The solubility of  $\text{Ca}(\text{NO}_3)_2 \cdot 4\text{H}_2\text{O}$  in liquid  $\text{NH}_3$  increases between  $-70^\circ$  and  $70^\circ$  and shows a break at  $-46^\circ$ , corresponding with the transition to  $\text{Ca}(\text{NO}_3)_2 \cdot 4\text{NH}_3$ ; at  $25^\circ$  the solid phase is  $\text{Ca}(\text{NO}_3)_2 \cdot 6 \cdot 5\text{NH}_3$ . Solubility data are also recorded for  $\text{Sr}(\text{NO}_3)_2$  and  $\text{Ba}(\text{NO}_3)_2$ ; the solubilities are in the order  $\text{Ca} > \text{Sr} > \text{Ba}$  at  $-50^\circ$ , and in the inverse order at  $50^\circ$ . Sr and Ba nitrates do not combine with  $\text{NH}_3$  at  $0^\circ$ ; they combine with 2.5 and  $4\text{NH}_3$ , respectively, at  $-12^\circ$ , and with  $8\text{NH}_3$  at  $-25^\circ$ . Curves connecting solubility with conductivity are recorded. R. T.

Solubility of organic compounds in water. A. E. VAN ARKEL and S. E. VLES (Rec. trav. chim., 1936, 55, 407—411).—Data are recorded for 9 chloroethanes and for  $s\text{-C}_2\text{H}_4\text{Br}_2$  in  $\text{H}_2\text{O}$  at  $0$ — $50^\circ$ . The results are discussed in reference to the dipole moments of the solutes and the formula (cf. A., 1934, 1064) expressing the relation between the heat of mixing and the cohesion energies of the two components. O. J. W.

Salting out. Influence of ammonium salts on solubility of nicotine. B. V. J. CUVELIER (Z. anal. Chem., 1936, 105, 325—328).— $(\text{NH}_4)_2\text{SO}_4$  has the largest salting out effect. J. S. A.

Equilibria in salt systems with deuterium water. F. T. MILES, R. W. SHEARMAN, and A. W. C. MENZIES (Nature, 1936, 138, 121).—When referred to the same no. of mols. of solvent the solubility of KCl in  $\text{D}_2\text{O}$  is  $<$  that in  $\text{H}_2\text{O}$  by approx. 7% at  $30^\circ$ , 3.6% at  $100^\circ$ , and 1.5% at  $180^\circ$ . At  $10^\circ$ ,  $\text{CuSO}_4 \cdot 5\text{D}_2\text{O}$  is approx. 12% less sol. in  $\text{D}_2\text{O}$  than is  $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$  in  $\text{H}_2\text{O}$ , and approx. 1.2% at  $96^\circ$ , where both salts are transformed into the triquo-forms. The relations between the solubility curves for  $\text{SrCl}_2 \cdot 6\text{H}_2\text{O}$ ,  $\text{SrCl}_2 \cdot 6\text{D}_2\text{O}$ ,  $\text{SrCl}_2 \cdot 2\text{H}_2\text{O}$ , and  $\text{SrCl}_2 \cdot 2\text{D}_2\text{O}$  are also described. L. S. T.

Connexion between separate and reciprocal solubility of components in systems involving double decomposition. E. I. ACHUMOV (J. Gen. Chem. Russ., 1936, 6, 691—696).—Theoretical. R. T.

Dissolution of elements in molten  $\text{AlCl}_3$ -NaCl. V. A. PLOTNIKOV and N. S. FORTUNATOV (Mem. Inst. Chem. Ukrain. Acad. Sci., 1936, 3, 123—128).—The solubility of Hg, P, Mn, W, Mo, Cu, Si, and S in molten 1:1  $\text{AlCl}_3$ -NaCl has been measured at  $150$ — $370^\circ$ . Except in the case of S, chemical reaction does not take place between the solutes and the solvent. R. T.

Formation and growth of a new phase in relation to the influence of vectorial properties of a substance, and of external factors. IV. Influence of solvent and of admixtures on the form of the crystals separating. V. Influence of an electric field on the linear velocity of

crystallisation in supercooled liquids. S. S. URAZOVSKI and J. S. ROZUM (Ukrain. Chem. J., 1936, 11, 127—135, 136—142).—IV. The size and shape of crystals separating from supersaturated solutions of NaCl in  $\text{H}_2\text{O}$  or EtOH,  $\text{CdI}_2$  in  $\text{H}_2\text{O}$ , MeOH, EtOH, PrOH, BuOH,  $\text{Et}_2\text{O}$ ,  $\text{COMe}_2$ ,  $\text{CHCl}_3$ , or PhMe, and of  $\text{CO}(\text{NH}_2)_2$  in  $\text{H}_2\text{O}$ , EtOH, PrOH, BuOH,  $\text{Et}_2\text{O}$ , MeCHO,  $\text{CCl}_4$ ,  $\text{C}_6\text{H}_6$ , PhEt, or  $\text{PhNO}_2$  vary according to the nature of the solvent, and of other substances ( $\text{PhOH}$  and  $\text{Bu}^n\text{CO}_2\text{H}$ ) present. The phenomena are interpreted on the basis of selective adsorption on different crystal edges.

V. The rate of crystallisation of salol, but not of  $\text{COPh}_2$ , is reduced in an electric field; the effect is ascribed to differences in the relative proportions of the different polymorphs of salol present. R. T.

Partition coefficient of iodine between water and carbon tetrachloride. G. HERRERO (Anal. Fis. Quim., 1936, 34, 549—552).—The partition coeff. increases from 75.07 to 84.7 as the [I] in the  $\text{CCl}_4$  layer increases from 1.27 to 15.45 g. per litre. L. A. O'N.

Distribution of nicotine between water and organic solvents. N. A. DE KOLOSOVSKI and F. S. KULIKOV (Acta Univ. Asiae Med., 1935, [vi], 1, No. 8, 1—28).—Distribution coeffs. for nicotine between  $\text{H}_2\text{O}$  and  $\text{C}_6\text{H}_6$ , xylene, decalin, light petroleum,  $\text{CCl}_4$ ,  $\text{CHCl}_3$ ,  $\text{CHBr}_3$ ,  $\text{C}_2\text{H}_4\text{Br}_2$ , PhBr,  $\text{PhNO}_2$ ,  $\text{Et}_2\text{O}$ , isoamyl ether, iso- $\text{C}_5\text{H}_{11}\text{OH}$ ,  $\text{CH}_2\text{PhOH}$ , *m*-cresol, cyclohexanone, and  $\text{CS}_2$ , respectively, and between glycerol and  $\text{CS}_2$  at  $25^\circ$ , have been determined. The results are discussed. E. S. H.

Adsorption of argon and nitrogen from the lowest to the highest pressures by active carbon. A. VON ANTROPOFF [with F. STEINBERG, F. KALTHOF, L. SCHMITZ, and R. SCHAELEN] (Z. Elektrochem., 1936, 42, 544—547).—Adsorption has been determined from  $-160^\circ$  to  $200^\circ$  and from 0.005 to 200 atm. Adsorption increases linearly with increasing pressure at low pressures; at higher pressures and low temp. a max. is reached, whereas at still higher pressures adsorption decreases and eventually almost reaches zero. The apparent contradiction to Langmuir's equation is discussed. E. S. H.

Adsorption of radium emanation at low temperatures. L. WERTENSTEIN (Acta phys. polon., 1934, 3, 469—484; Chem. Zentr., 1935, ii, 3058—3059).—The life period of the absorbed material and the dependence of the adsorption equilibrium on the temp. have been determined. H. J. E.

Influence of platinum on the adsorption characteristics of charcoal in solutions of electrolytes. S. LEVINA, A. FRUMKIN, and A. LUNEV (Acta. Physicochim. U.R.S.S., 1935, 3, 397—412).—The effects which result from platinising can be reproduced by the mechanical mixing of Pt with the charcoal. It is suggested that the action of the Pt is purely electrochemical; the potential of the Pt, acting as a H<sub>2</sub> electrode, is communicated to the charcoal and determines its adsorption capacity. O. D. S.

Measurements of adsorption at the air-water interface by the microtome method. J. W. MCBAIN and R. C. SWAIN (Proc. Roy. Soc., 1936,

A., 154, 608—623).—The microtome method (A., 1932, 331) is shown to give reproducible quant. measurements of the abs. amount of adsorption in the air-H<sub>2</sub>O interface for all types of solutions. The results for positive adsorption of PhOH and of CH<sub>2</sub>Ph·CH<sub>2</sub>·CO<sub>2</sub>H, and for negative adsorption of NaCl agree closely with the predictions of the Gibbs theorem. L. L. B.

**Adsorbent properties of barium sulphate.** I. M. KOLTHOFF (Bull. Soc. chim. Belg., 1936, 45, 270—278).—The data and conclusions of de Brouckere (cf. this vol., 423) are disputed. J. G. A. G.

**Adsorbent properties of barium sulphate.** (MLLE.) L. DE BROUCKERE (Bull. Soc. chim. Belg., 1936, 45, 279—285).—A reply to Kolthoff (cf. preceding abstract). J. G. A. G.

**Adsorption of organic substances at crystal surfaces.** IV. Adsorption of sodium oleate and nonoate by cinnabar. N. A. HELD and I. A. CHAINSKI (Kolloid-Z., 1936, 76, 26—33; cf. A., 1935, 1069).—Potentiometric titrations show that a bimol. layer of the soap is adsorbed at the surface of cinnabar. E. S. H.

**Adsorption of dyes on glass.** J. LENOIR (Document. sci., 1935, 4, 193—199; Chem. Zentr., 1935, ii, 2933).—With very dil. solutions, the amount of dye adsorbed rises steeply with increasing concn., reaching a const. max. val. at fairly low dye concn. With Me-violet a bimol. adsorbed layer is formed. J. S. A.

**Sorption of vapours by gels of hydrates of the oxides of aluminium, iron, and titanium.** I, II. E. V. ALEXEEVSKI and G. M. BELOTZERKOVSKI (J. Gen. Chem. Russ., 1936, 6, 370—381, 382—389).—I. Max. sorptive capacity for CCl<sub>3</sub>·NO<sub>2</sub> and C<sub>6</sub>H<sub>6</sub> vapours is obtained by drying Fe(OH)<sub>3</sub> gel at 100—200°, Al(OH)<sub>3</sub> gel at 120—240°, and TiO<sub>2</sub> gel at 200°.

II. The sorptive power of Al(OH)<sub>3</sub> gel for C<sub>6</sub>H<sub>6</sub> vapour is > that of Fe(OH)<sub>3</sub> gel, and for H<sub>2</sub>O vapour is > that of CaCl<sub>2</sub>, P<sub>2</sub>O<sub>5</sub>, and SiO<sub>2</sub> gel. Adsorption of H<sub>2</sub>O proceeds according to the Langmuir equation. R. T.

**Periodic phenomena in diffusion and adsorption.** II. Experiments without membranes. H. WAELSCH and S. KITTEL (Kolloid-Z., 1936, 76, 19—26; cf. this vol., 284).—The concn. of aq. NaCl or CaCl<sub>2</sub> undergoes periodic changes with time after addition of BaSO<sub>4</sub>. This behaviour is traced to periodic adsorption of the electrolyte by the ppt. The periodic effect is destroyed by addition of NaNO<sub>3</sub>, NaOH, or H<sub>2</sub>S, but not by HCl or H<sub>2</sub>SO<sub>4</sub>; it depends also on the method of prep. of BaSO<sub>4</sub>, and on the relation of the amount of adsorbent to the electrolyte concn. E. S. H.

**Constitution of the surface of active carbon.** E. O. K. VERSTRAETE (Natuurwetensch. Tijds., 1936, 18, 107—113).—Diamond sols are negatively charged and do not become positive even after long activation in CO<sub>2</sub> at 1050°. The results are in accordance with Kruyt's theory of electron shift for positive C. S. C.

**Surface oxide films.** E. J. W. VERWEY and J. H. DE BOER (Rec. trav. chim., 1936, 55, 675—687).

—Theoretical. In the oxides formed by adsorption of O on alkaline-earth metals the surface oxide mols. are at. rather than ionic, yet the linking is sufficiently polar to produce a double layer, with the negative coating outside. There is an activation energy, *E*, because the O<sub>2</sub> mol. must be dissociated and the reacting atoms brought into an excited state. For C this is > for metals owing to the O atoms each being bound by two C atoms and C—C distance in the graphite lattice being small. The positive charge of outgassed C in contact with air and H<sub>2</sub>O is attributable to its adsorbing O and behaving as an O electrode. A negative ζ-potential combined with a positive Nernst (air) potential on C and on noble metals can be explained by the presence of a surface oxide layer with a large positive potential drop (cf. A., 1935, 1069). R. C.

**Thermomechanics of the surface film.** I. General; pure substances. II. Adsorption formula. III. Mixed phases. J. E. VERSCHAFFELT (Bull. Acad. roy. Belg., 1936, [v], 22, 373—389, 390—401, 402—411).—Theoretical. A. J. M.

**Surface development of active zinc oxide.** G. GRAUE and R. KOPPEN (Z. anorg. Chem., 1936, 228, 49—56).—Changes in the surface of ZnO with various thermal treatments have been followed by the Hahn emanation method (A., 1935, 32). The emanation evolved increases rapidly after heating to 300°, decreases with pretreatment at 350—1000°, and rises somewhat after the specimen has been heated to >1000°. This agrees with the observed optimum catalytic activity of ZnO after heating to 300°. The adsorption of indigotin from C<sub>6</sub>H<sub>6</sub> solution is also a max. for ZnO previously heated at 300°. X-Ray photographs are given for specimens of ZnO after various heat-treatments. The adsorption of emanation by ZnO is diminished by long heating. It is a max. after heating at 300°. H. J. E.

**Stability of a surface of contact between two phases.** Concept of epiphases in mutual equilibrium. New enunciation of the phase rule. L. GAY (J. Chim. phys., 1936, 33, 476—487).—Theoretical. When a surface of contact between two phases becomes unstable, two or more epiphases in mutual equilibrium appear, and the variance, *V*, of the system of *n* components, *φ* phases, *φ'* epiphases, and *s* surfaces of contact is *V* = *n* - *φ* - *φ'* + *s* + 2. The theory is of general application to singular points in interfacial tension curves (cf. A., 1926, 348; 1932, 1200; 1935, 1071). J. G. A. G.

**Relations between the adhesion of particles of microscopic size and the activity coefficients of the electrolytes.** A. VON BUZAGH (Kolloid-Z., 1936, 76, 2—9).—The adhesion of quartz particles of 14.2 μ diameter to a wall of polished quartz has been determined in solutions of different electrolytes by the tilting-plate method. With neutral salts containing uni- and bi-valent cations the adhesion decreases with increasing activity coeff.; solutions of ter-, quadri-, and sexa-valent cations reverse the charge on the quartz particles, and the curve connecting adhesion with activity coeff. shows a max. and a

min. With salts of multivalent cations the relations are complicated by the effects of hydrolysis.

E. S. H.

**Permeability of membranes. I. Theory of ionic permeability. II. Experiments with artificial selective membranes.** K. H. MEYER and J. F. SIEVERS (Helv. Chim. Acta, 1936, 19, 649—664, 665—677).—I. A quant. theory of the ionic selectivity of membranes is given, in which the membrane is regarded as a network of chains carrying laterally fixed ionised groups. The permeability depends on (a) the concn. of the fixed ions, (b) the mesh of the network, (c) the external concn. of the electrolyte, and (d) the solubility of the ions in the membrane.

II. Methods are described for preparing neutral, acidic, basic, and amphoteric membranes, which have been studied. The results are interpreted in the light of the authors' theory. The selectivity of biological membranes and their powers of absorbing certain dyes have been correlated.

T. G. P.

**Cryoscopic constants.** J. F. DURAND and L. WAI-HSUN (Bull. Soc. chim., 1936, [v], 3, 1389—1391).—The relation  $K' = 0.0015MT'$ , where  $K'$  is the cryoscopic const.,  $M$  the mol. wt., and  $T'$  the abs. m.p., is deduced theoretically and confirmed experimentally for several org. substances. Exceptions are traced to association or other anomalies.

E. S. H.

**Nature of some dilute and concentrated non-electrolytes.** B. H. VAN RUYVEN (Rec. trav. chim., 1936, 55, 471—491).—F.p., b.p., and osmotic pressure data for aq. solutions of MeOH, sucrose, glucose, mannitol,  $\alpha$ -methylglucoside, and dulcitol are discussed. In many cases the depression of the f.p. ( $\Delta_f$ ) and the elevation of the b.p. ( $\Delta_b$ ) are given, even for conc. solutions, by  $\Delta_f = 1.85N_w$  and  $\Delta_b = 0.52N_w$ , where  $N_w$  = g.-mols. solute per 1000 g. H<sub>2</sub>O. The osmotic pressure is given by  $P = 22.41N_w \times T/273$ . Deviations from these equations are due mainly either to formation of complexes of solute mols. or to hydration of the solute mols.

O. J. W.

**Non-aqueous solutions.** I. A. KABLUKOV (Coll. Trans. 1st U.S.S.R. Conf. Non-aq. Solutions, Kiev, 1935, 13—28).—A lecture.

R. T.

**Non-aqueous solutions. I. Ternary systems.** V. A. PLOTNIKOV (Coll. Trans. 1st U.S.S.R. Conf. Non-aq. Solutions, Kiev, 1935, 29—45).—A review.

R. T.

**Specific heat of non-electrolytes in solution, and the effect of the dielectric constant of the solvent on the vibrational state of their molecules.** K. BENNEWITZ and L. KRATZ (Physikal. Z., 1936, 37, 496—511).—Results obtained by Heydweiller's method for CsCl and LiCl agree with those obtained by other methods. The sp. heats of aq. solutions of CO(NH<sub>2</sub>)<sub>2</sub>, glycerol, quinol, dioxan, glucose, lactose, sucrose, and solutions of some of these substances in other solvents of known dielectric const. have been determined. The solute usually has a larger mol. heat in solution than in the pure state. In explanation it is assumed that the dielectric const. of the solvent affects the directional forces of the oscillators in the solute mols. Calculation

of the mol. heat from the lowering of frequency due to the dielectric effect and the existence of dispersion gives satisfactory results for glucose and sucrose. This lowering of frequency could be demonstrated by an examination of the Raman lines of the solutions, which should show a displacement.

A. J. M.

**Dielectric constants of extremely dilute solutions.** F. E. HOECKER (J. Chem. Physics, 1936, 4, 431—434; cf. A., 1935, 1318).—Measurements by the heterodyne beat method are recorded for C<sub>6</sub>H<sub>6</sub> and CCl<sub>4</sub> solutions of EtOH at mol. fraction vals. from 0.01 to 0.00007. Effects of association are absent in this concn. range. Derived vals. of the mol. polarisation of EtOH at 24.5° agree with measurements made on EtOH vapour. The electric moments of EtOH in C<sub>6</sub>H<sub>6</sub> and CCl<sub>4</sub> solution are  $1.700 \pm 0.006 \times 10^{-18}$  and  $1.674 \pm 0.005 \times 10^{-18}$ , respectively. Vals. of  $d$  for dil. solutions of EtOH in C<sub>6</sub>H<sub>6</sub>, CCl<sub>4</sub>, and CS<sub>2</sub> are recorded.

H. J. E.

**Dipole moments of molecules in solution.** S. H. BAUER (J. Chem. Physics, 1936, 4, 458—459).—Fluctuation for polar mols. dissolved in a non-polar solvent is discussed.

H. J. E.

(A) **Optical rotation of alkaline solutions of sucrose.** (B)  $p_H$  of solutions of calcium hydroxide in water and aqueous sucrose. K. SMOLEŃSKI (Rocz. Chem., 1936, 16, 270—280, 281—287).—(A) [with W. KOZŁOWSKI]. The fall in  $[\alpha]_M$  with increasing  $p_H$  is due to formation of uni- and bi-valent anions of sucrose, of  $[\alpha]_M$  20.6° and 18.4°; the vals. found agree with the view that sucrose is a dibasic acid, with  $k_1 = 3 \times 10^{-13}$  and  $k_2 = 3 \times 10^{-14}$ .

(B) [with S. POREJKO]. The  $p_H$  vals. found are in conformity with the above view.

R. T.

**Behaviour of methyl-red in alcohol-water solution.** F. REIMERS (Z. anorg. Chem., 1936, 228, 33—43).—The absorption curves of Me-red in acid, alkali, and buffered EtOH-H<sub>2</sub>O solutions (20—85% EtOH) have been measured spectrophotometrically. Absorption coeffs. for the isoelectric form (I) and indicator exponents for Me-red in 20—85% EtOH solution are calc. The change of indicator exponent with [EtOH] suggests that (I) is an uncharged mol.

H. J. E.

**Refraction of solutions of electrolytes, and ionic association.** A. I. BRODSKI, N. S. FILIPPOVA, and G. M. SCHERSCHEVER (Coll. Trans. 1st U.S.S.R. Conf. Non-aq. Solutions, Kiev, 1935, 72—79).—Refraction data for 0—0.12N-KCl and -NaCl support the theory of complete ionisation.

R. T.

**Nature of electrolytes in non-aqueous solutions.** M. I. USANOVITSCH (Coll. Trans. 1st U.S.S.R. Conf. Non-aq. Solutions, Kiev, 1935, 46—49).—Conductivity is associated with compound formation.

**Solvation in non-aqueous solutions.** V. S. FINKELSCHTEIN (Coll. Trans. 1st U.S.S.R. Conf. Non-aq. Solutions, Kiev, 1935, 50—53; cf. preceding abstract).—Usanovitsch's results are compatible with solvation rather than with compound formation.

R. T.

**Optical behaviour of dissolved ions and its significance for the structure of solutions of**

electrolytes. III. Optical absorption of sodium eosinate. G. KORTUM (Z. physikal. Chem., 1936, B, 33, 1—22; cf. this vol., 425).—The extinction coeffs.,  $\epsilon$ , for the various absorption bands rise rapidly with the concn.,  $c$ , except when this is very small, when they remain const. This effect is apparently connected with the decrease in fluorescence with rise in  $c$ . The effect of foreign salts on  $\epsilon$  indicates that the above variation of  $\epsilon$  is due, not to deformation of the eosin anions (I) in the Coulomb field of the ionic atm. nor to ionic association of (I) with cations, but to association of (I) with each other under the influence of van der Waals forces. This association is detectable at concns. as low as  $3 \times 10^{-6} M$ . R. C.

Dielectric constants of amphoteric electrolytes. G. HALBEDEL (Z. physikal. Chem., 1936, B, 33, 83—108).—Dielectric consts.,  $\epsilon$ , have been measured at 20—50° by a resonance method with a frequency of  $\sim 10^8$  hertz. For aq. solutions of antipyrine,  $p\text{-NH}_2\text{-C}_6\text{H}_4\text{-CO}_2\text{H}$ , theobromine, caffeine, 7-methylpurine, and pyocyanine  $\epsilon$  is  $>$  for pure  $\text{H}_2\text{O}$ ; the possibility of a zwitterion structure for the first two substances thus seems improbable. For solutions of  $\text{NH}_2$ -acids and betaines in  $\text{H}_2\text{O}$  and  $\text{EtOH}$   $\epsilon$  is  $>$  that of the solvent by an amount  $\Delta\epsilon$  which increases linearly with the concn. up to a crit. concn.,  $c$ , at which mutual interaction of the mols. becomes effective;  $c$  depends on the length and dipole moment of the zwitterion.  $\Delta\epsilon$  per mol. of solute is approx.  $\propto$  the no. of members in the chain between the positive and negative charge. The technique of measuring  $\epsilon$  is discussed. R. C.

Complex aquo-phosphate ions with several [solvent molecule] shells. H. BRINTZINGER and C. RATANARAT (Z. anorg. Chem., 1936, 228, 61—64; cf. A., 1935, 824).—Determinations of the ionic wt. of  $\text{PO}_4'''$  by the dialysis method are recorded for  $p_{\text{H}}$  2.0—14.2, using  $\text{S}_2\text{O}_3''$  as the reference ion. Vals. corresponding with  $[\text{H}_2\text{PO}_4(\text{H}_2\text{O})_4]'$  at  $p_{\text{H}}$  2 and  $[\text{PO}_4(\text{H}_2\text{O})_{18}]'''$  at  $p_{\text{H}}$  14.2 have been obtained. The constitution of these ions is discussed. H. J. E.

Methods of dialysis. IV. Independence of ionic weight determination on the  $p_{\text{H}}$  of the solution to be dialysed. H. BRINTZINGER, C. RATANARAT, and W. ECKARDT (Z. anorg. Chem., 1936, 228, 77—82; cf. A., 1935, 579).—It is shown by measurements on various ions (e.g.,  $[\text{Fe}(\text{CN})_6]'''$ ,  $[\text{Co}(\text{NH}_3)_4\text{SO}_4]'$ ) that the ionic wt. is independent of the reference ion used and is the same whether the medium is alkaline, neutral, or acid. H. J. E.

Formation of aerosols. I. Technique. Sulphuric acid clouds. N. FUCHS and N. OSCHMAN (Acta Physicochim. U.R.S.S., 1935, 3, 61—78).—A method for preparing aerosols with reproducible particle concn. and particle size consists in rapidly mixing two air streams containing substances which will react to give the desired aerosol, followed by rapid expansion. In this way coagulation is almost entirely avoided. The production of  $\text{H}_2\text{SO}_4$  clouds by mixing air streams containing  $\text{SO}_3$  and  $\text{H}_2\text{O}$  is described. The radius of the particles was 1.2— $1.5 \times 10^{-6}$  cm. A. J. M.

Preparation of colloidal gold, and its detection in very small quantities. D. C. DALMAS and E. C. STATHIS (Praktika, 1935, 10, 106—110; Chem. Zentr., 1935, ii, 2644).— $\text{AuCl}$  is reduced by alcoholic phenolphthalein at 35—40° to a violet Au sol. The reaction may be used for the detection of Au.

J. S. A.

Synthesis of hydrosols of sparingly soluble metal salts by electrolysis. III. Copper arsenate and arsenite hydrosols. B. G. SAPROMETOV and S. P. KAMSOLOVO (Kolloid-Z., 1936, 76, 46—54; cf. A., 1934, 1305).—The prep. of negatively-charged  $\text{Cu}_3(\text{AsO}_4)_2$  and  $\text{Cu}_3(\text{AsO}_3)_2$  sols by electrolysis of  $\text{Na}_3\text{AsO}_4$  or  $\text{Na}_3\text{AsO}_3$  with a Cu anode and Pt cathode under fixed conditions of c.d., concn., and temp. is described. Positively-charged sols of  $\text{Cu}_3(\text{AsO}_4)_2$  have been prepared from  $\text{Zn}_3(\text{AsO}_4)_2$  and very dil. solutions of Cu salts. The  $\zeta$ -potential and the resistance to coagulation by KCl have been determined. Tests on the use of these sols as insecticides have been carried out.

E. S. H.

$\text{TiO}_2$  hydrosols. R. WINTGEN and K. LINS (Angew. Chem., 1936, 49, 489—492).—Dialysis of 1—3%  $\text{TiCl}_4$  solution yields sols more conc. than those prepared by Graham's method and of finer particle size than the method of grinding and suspending. Relatively clear sols are also obtained by pptg.  $\text{TiO}_2$  from aq.  $\text{TiCl}_4$  with  $\text{NH}_3$  and peptising the ppt. with  $\text{NaOH}$ . The sp. conductivities of the sols prepared in different ways have been measured and the average no. of  $\text{TiO}_2$ ,  $\text{Cl}'$ , and  $\text{H}_2\text{O}$  mols. per micelle are calc.

J. W. S.

Nature of cellulose ester solutions. S. GLÜCKMANN (Kolloid-Z., 1936, 76, 84—95).—Benzylcellulose has been fractionated by adding excess of  $\text{EtOH}$  to solutions in  $\text{C}_6\text{H}_6\text{-EtOH}$ . The viscosity and solubility of the fractions have been determined, and little difference in composition and properties is observed. The crit. amounts of excess of  $\text{C}_6\text{H}_6$  or  $\text{EtOH}$  required to coagulate the solutions at different temp. and the influence of variation in the proportions of  $\text{C}_6\text{H}_6$  and  $\text{EtOH}$  on the viscosity and vol. of the solution have been determined. The results are discussed in relation to adsorption and solvation phenomena.

E. S. H.

Viscosity of suspensions and solutions. VII. Viscosity of sphere suspensions. R. SIMHA (Kolloid-Z., 1936, 76, 16—19; cf. this vol., 679).—Mathematical.

E. S. H.

Pressure viscosimetry of kaolin suspensions. G. FUCHS (Acta Physicochim. U.R.S.S., 1935, 3, 137—146).—A new form of capillary viscosimeter is described. The relation between the viscosity,  $\eta$ , of suspensions of kaolin and structure formation has been examined.  $\eta$  at first increases with time and then decreases. This is attributed to aggregation, which may be supposed to occur in two stages. The primary aggregates cease to be formed after a time, and then a looser secondary aggregation occurs, accounting for the decrease in  $\eta$ . The greater is the initial degree of dispersion the more intensive is the structure formation. Dilution causes the destruction of the suspension. Addition of dehydrating agents

(EtOH) encourages structure formation and produces an increase in  $\eta$ . A. J. M.

**Refraction of light by colloidal solutions. I. Arsenic and antimony trisulphide sols.** A. S. MENON (Kolloid-Z., 1936, 76, 9—15).—Light refracted by freshly-prepared  $\text{As}_2\text{S}_3$  sols is almost completely plane-polarised. The degree of polarisation for long  $\lambda$  is  $>$  for short  $\lambda$ . Rayleigh's law has been confirmed for sols of particle size between 23 and 108 m $\mu$ . After keeping the sol for about 14 days, the refracted light contains about 10% of unpolarised light.  $\text{Sb}_2\text{S}_3$  sols show a weak, unpolarised component in the refracted light. E. S. H.

**Viscosimetric investigations of structure formation in ferric hydroxide sols. III. Destruction of ferric hydroxide sols on dilution.** G. FUCHS and Z. KAMSOLOVA (Acta Physicochim. U.R.S.S., 1935, 3, 127—136).—The destruction of young and aged conc.  $\text{Fe}(\text{OH})_3$  sols and gels on dilution has been studied. The effect of adding  $\text{FeCl}_3$  was also examined. The viscosity data indicate the existence of structures of different ages and solidity in the sol particles, which may be termed primary and secondary structures. The mechanism of destruction consists in the breakdown of secondary structures and displacement of the adsorption equilibrium with dilution. A. J. M.

**Effect of dilution of ferric hydroxide sols.** K. JABECZYNSKI and B. SAWONIAK (Rocz. Chem., 1936, 16, 301—305).—The velocity of coagulation of  $\text{Fe}(\text{OH})_3$  sols is given by  $k \times 10^{-3} = 63.3c^{1.5}$ , where  $c$  is the concn. of  $\text{Fe}(\text{OH})_3$ . The charge and dimensions of the particles are not affected by dilution. R. T.

**Electrochemistry of platinum sols. I. Preparation of the sols.** N. BACH and N. BALASCHOVA (Acta Physicochim. U.R.S.S., 1935, 3, 79—96).—Pt sols have been prepared by the arc method with  $\text{O}_2$ ,  $\text{H}_2$ , and air, respectively, above the  $\text{H}_2\text{O}$  in which dispersion takes place. The  $\text{O}_2$ -Pt sol is brown, and the conductivity of the sol is  $>$  that of the  $\text{H}_2\text{O}$  in which it is dispersed. The  $\text{H}_2$ -Pt sol is moderately stable and is grey. The conductivity of a  $\text{H}_2$ -Pt sol decreases when saturated with  $\text{O}_2$ ; that of an  $\text{O}_2$ -Pt sol increases when saturated with  $\text{H}_2$ . The conductivity of an air-Pt sol is about 15 times that of the  $\text{H}_2\text{O}$  in which it is dispersed, indicating the formation of foreign electrolytes, and not only  $\text{H}_2\text{Pt}(\text{OH})_6$ . When  $\text{H}_2\text{SO}_4$  was added to the  $\text{H}_2$ -Pt sol, which was then saturated with  $\text{O}_2$ , conductivity measurements show that the adsorption is essentially similar to that at platinised Pt electrodes, each particle of sol acting as a small gas electrode. Cataphoresis experiments show that the particles of the  $\text{H}_2$ -Pt sol are negatively charged, the cataphoretic velocity being 3—4  $\mu$  per sec. per volt per cm. A. J. M.

**Electrochemical properties of highly purified silica sols.** A. I. BAIBAEV and V. A. KARGIN (Acta Physicochim. U.R.S.S., 1935, 3, 97—118).— $\text{SiO}_2$  sols obtained by hydrolysis of  $\text{SiCl}_4$  cannot be prepared in the pure state by electrodialysis through a carefully purified parchment-paper membrane. The acidic properties of "pure"  $\text{SiO}_2$  sols are due to acid (usually  $\text{HCl}$ ) in the intermicellar liquid of the sol.  $\text{SiO}_2$

sols obtained by oxidation of  $\text{SiH}_4$  by  $\text{O}_3$  in aq. solution possess no acidic properties, and only a very small quantity of compensating ions in the outer shell of the double layer. The stability of such pure  $\text{SiO}_2$  sols is maintained solely by the lyophilic properties of  $\text{H}_2\text{SiO}_3$ , but  $\text{HCl}$  exerts a stabilising action. The cataphoretic velocity and the  $\zeta$ -potential are small, and are dependent to a high degree on the purity of the sol. A. J. M.

**Effect of supersonic waves on the viscosity of colloids.** O. KIMURA (J. Chem. Soc. Japan, 1935, 56, 842—851).—The viscosities of gum acacia and gelatin sols and of aq. Na stearate are diminished by the action of supersonic waves. This is attributed to a change in the micellar structure or in the degree of hydration. CH. ABS. (e)

**Electric double layer and the stability of lyophobic colloids.** E. J. W. VERWEY (Chem. Rev., 1935, 16, 363—415).—A review. CH. ABS. (e)

**Coagulation of sols of mercuric sulphide in alcohol.** K. VOLKOV and J. GLASMAN (Bull. Sci. Univ. Kiev, 1935, 1, 85—94).—The particles have a negative charge, the magnitude of which is characteristic of lyophobic colloids. The sol is irreversibly coagulated by  $\text{AgNO}_3$  or  $\text{CuCl}_2$ , probably due to formation of a surface layer of insol., undissociated mols. Progressive addition of  $\text{AlCl}_3$  or  $\text{FeCl}_3$  causes coagulation, followed by peptisation, which is ascribed to the adsorption of solvated mols.; the optimum coagulative concns. of undissociated salts ( $\text{HgCl}_2$ ,  $\text{HgI}_2$ ) cannot, however, be explained in this manner. R. T.

**Electrolytic coagulation of Prussian-blue sols.** E. L. LEDERER (Kolloid-Z., 1936, 76, 54—60).—The coagulation of Prussian-blue sols by a wide range of electrolytes, including uni-, bi-, and ter-valent ions, is in accordance with Ostwald's rule. The sols also conform to the requirements of Burton's rule. E. S. H.

**Dynamics of colloidal sols.** H. R. KRUYT (Natuurwetensch. Tijds., 1936, 18, 87—88).—A brief review. D. R. D.

**Dielectric constant of lyophilic colloids.** J. T. G. OVERBEEK (Natuurwetensch. Tijds., 1936, 18, 113—117).— $\epsilon$  has been determined (with  $\nu = 3.5 \times 10^8$ ) for starch, agar, arabinates, gelatin, and ovalbumin sols and gels. It is practically unchanged by gelation, alterations in  $p_H$ , or the addition of luteo- $\text{CoCl}_2$ . It falls slightly on coacervation and shows an unexplained slight increase over the calc. val. at higher temp. (43°). S. C.

**Effect of electrolytes on negatively charged silver iodide sols considered in conjunction with micro-cataphoresis [experiments].** F. BOSCH and H. HAEMERS (Natuurwetensch. Tijds., 1936, 18, 90—103).—Flocculation and cataphoresis experiments with  $\text{HNO}_3$ ,  $\text{KNO}_3$ ,  $\text{Ba}(\text{NO}_3)_2$ ,  $\text{Al}(\text{NO}_3)_3$ ,  $\text{Th}(\text{NO}_3)_4$ , and mixtures of these electrolytes are described. The results do not show whether discharge by  $\text{Th}(\text{NO}_3)_4$  is due to  $\text{Th}^{IV}$  or  $\text{Th}(\text{OH})_4$ . S. C.

**Velocity of cataphoresis and electrical conductivity of colloids.** A. J. RUTGERS and J. T. G.

OVERBEEK (Natuurwetensch. Tijds., 1936, 18, 88—89).—The differences in the charge on colloid particles as measured by cataphoresis and conductivity measurements are explained by assuming that the particle consists of a central nucleus with a charge  $(n+n')e$ , surrounded by a firmly attached  $H_2O$  layer (Smoluchowski), charge  $-n'e$ , in which the ions move freely with regard to the  $H_2O$ , and a diffuse layer, charge  $-ne$ . S. C.

**Sensitisation and protective action of starch on negative sols.** M. DE SMET (Natuurwetensch. Tijds., 1936, 18, 118—122).—In order to explain the clarification of coal-washing liquors by adding starch (I), NaOH, and  $Ca(OH)_2$ , the action of (I) and electrolytes on negative C and AgI sols has been studied. Small amounts ( $<10^{-4}\%$ ) of a hydrophilic colloid make a negatively charged hydrophobic colloid much more sensitive to electrolytes, but larger amounts have a stabilising effect. This adequately explains the action of (I) and  $Ca(OH)_2$ , but the action of NaOH is still obscure. No theoretical explanation of the phenomena is forthcoming. S. C.

**Composition and ionic exchange of ferric silicates and phosphates.** A. J. PUGH and M. S. DU TOIT (Soil Sci., 1936, 41, 417—431).—The composition and exchange reactions have been examined in relation to  $p_H$ . The colloidal condition of these complexes is attained by a continuous process of polymerisation with formation of covalent compounds, until the unit forms a micelle of colloidal dimensions. The dissociation of the complex forms the basis of exchange reactions, the mechanism of which is discussed. A. G. P.

**Chemical activity of silicic acid.** V. N. KRESTINSKAJA and O. S. MOLTSCHANOVA (Kolloid-Z., 1936, 76, 60—72).—When  $CuSO_4$  is added to sols of  $SiO_2$  or  $Na_2SiO_3$  solutions, Cu and Na are exchanged in equiv. amounts; with  $SiO_2$  sols the action of  $CuSO_4$  depends on the  $Na^+$  content of the sol. Potentiometric titration curves of  $SiO_2$  sols and  $Na_2SiO_3$  solutions with  $H_2SO_4$  are discussed. E. S. H.

**Gels of aluminium bromide with nitromethane.** J. P. MESHENNI (Mem. Inst. Chem. Ukrain. Acad. Sci., 1936, 3, 85—87).— $MeNO_2$  and  $AlBr_3$  yield a gel, which gradually liquefies when exposed to the air, and decomposes to yield an emulsion of  $MeNO_2$  when immersed in  $H_2O$ . R. T.

**Gelatinised emulsions. II. Influence of electrolytes on the emulsifying power of alkali soaps.** L. KREMNEV and T. PAPKOVA-KVITZEL (Acta Physicochim. U.R.S.S., 1935, 3, 451—464; cf. this vol., 158).—The emulsifying power of alkali soaps is increased by the addition of small concns. of electrolytes. This is ascribed to the influence of the latter on the hydrolysis of the soaps, and is not observed on the addition of glucose. High concns. of electrolytes cause a marked decrease in emulsifying power, which is correlated with the degree of hydration of the added ions. Addition of glucose causes a decrease in emulsifying power. O. D. S.

**Emeraldin sols. II. Mechanism of stabilising effect of gelatin in the production of sols.** V. PTSHELIN (Kolloid-Z., 1936, 76, 72—81; cf. A., 1935, 580).—A min. amount of gelatin is required for the stabilisation of emeraldin sols, the amount depending on the conditions of prep. of the sol. When an incompletely protected sol is coagulated, all the gelatin is found in the ppt. The mechanism of stabilisation and protection is discussed. E. S. H.

**Influence of hydrogen-ion concentration on gelatin.** R. REIGER and S. BACH (Kolloid-Z., 1936, 76, 82—83).—The time of gelation of gelatin is uninfluenced by  $[H^+]$  between  $p_H$  4.05 and 7.8. E. S. H.

**Thixotropic gelation. I. Mechanism of thixotropic gelation.** J. L. RUSSELL and E. K. RIDEAL. II. Coagulation of clay suspensions. J. L. RUSSELL (Proc. Roy. Soc., 1936, A, 154, 540—549, 550—560).—I. Small amounts of  $Al_2O_3$  added to  $SiO_2$  suspensions produce thixotropic gels. Gelation is caused by as little as 1 part of  $Al_2O_3$  to 4000 parts of relatively coarse quartz particles. The increase in vol. of the gel  $\propto$  the wt. of  $Al_2O_3$  added with larger wts. of  $Al_2O_3$ . The results support the theory that thixotropic gelation is due to the oriented coagulation of the colloid.

II. Moderately conc. clay suspensions show three types of coagulation, depending on the electrolyte concn.; at low concn. there is a partial flocculation of a lyophobic nature, at medium concn. a thixotropic gelation, and at high concn. a complete flocculation of a hydrophilic nature. The properties of the suspensions show that the clay consists partly of a highly disperse gel-forming material, and partly of a coarser material with no capacity for gelation. The apparent viscosity of the thixotropic clay gels varies inversely as the cube of the applied stress. The gels show a well-defined breaking point when stretched beyond a certain limit, and no permanent rigidity at low stresses. L. L. B.

**Mechanism of the movement of ions of chlorine and hydrogen in the presence of gelatin.** S. A. SCHTSCHUKAREV and V. M. VDOVENKO (J. Phys. Chem. U.S.S.R., 1934, 5, 512—520).—Vals. for the sp. conductivity, relative  $\eta$ , and transport nos. of  $H^+$  and  $Cl^-$  for 0.1N-HCl in 0—10% gelatin at 40° are recorded. The mobility of  $Cl^-$  passes through a max. with increasing gelatin concn., whereas that of  $H^+$  falls continuously. A loose linking between  $H^+$  and gelatin is assumed, which reduces the effective  $[H^+]$ . The gelatin also increases  $\eta$  and so decreases the mobility of both  $Cl^-$  and  $H^+$ . CH. ABS. (e)

**Electrokinetic phenomena. XII. Electroosmotic and electrophoretic mobilities of protein surfaces in dilute salt solutions.** L. S. MOYER and H. A. ABRAMSON (J. Gen. Physiol., 1936, 19, 727—738).—The ratio of the two mobilities of protein-coated surfaces (quartz, Pyrex, or paraffin coated with gelatin) is approx. 1.0. H. G. R.

**Effect of denaturation on the colloidal behaviour of ovalbumin.** P. KOETS and J. SCHOOF (Natuurwetensch. Tijds., 1936, 18, 103—106).—Observations on the coacervation and flocculation

of normal and denatured ovalbumin (I) on the addition of Na arabinatesols, as well as measurements of electrocataphoresis, show that during the denaturing process (heating to 100°) no change takes place in the density of the charge on (I) but that the sol changes in character from hydrophilic to hydrophobic.

S. C.

**Thermodynamic equations at the absolute zero.** V. A. PLOTNIKOV (Mem. Inst. Chem. Ukrain. Acad. Sci., 1936, 3, 37—44).—Theoretical. R. T.

**Inner thermodynamics. II.** V. NJEGOVAN (Acta phys. polon., 1934, 3, 213—214; Chem. Zentr., 1935, ii, 2930).—Theoretical. J. S. A.

**Thermodynamics of intermediate reactions.** H. SCHMID (Z. Elektrochem., 1936, 42, 579).—Theoretical. E. S. H.

**Inversion of the ammonia equilibrium.** E. N. EREMIN and N. I. KOBOSEV (Acta Physicochim. U.R.S.S., 1935, 3, 151—160).—The inversion of the  $N_2 + 3H_2 \rightleftharpoons 2NH_3$  equilibrium at high temp. noted by Maxted is connected with the thermal dissociation of  $H_2$ . The inversion temp. corresponds with that at which the dissociation of  $H_2$  becomes marked. At. H combines readily with  $N_2$  at 1000—1500° abs. The problem is treated quantitatively and the results agree well with experiment. A. J. M.

**Nomogram for the formation of ammonia in the equilibrium reaction  $2NH_3 \rightleftharpoons 3H_2 + N_2$ .** P. MONTAGNE (Bull. Soc. chim., 1936, [v], 3, 1424—1427). E. S. H.

**Limiting high-temperature rotational partition function of non-rigid molecules. IV.** Ethylene, propylene,  $\Delta^a$ -butene, *cis*- and *trans*- $\Delta^2$ -butene, isobutene, trimethylethylene, tetramethylethylene, and butadiene. V. Equilibrium constants for reactions of paraffins, olefines, and hydrogen. L. S. KASSEL (J. Chem. Physics, 1936, 4, 435—441; cf. this vol., 673).—IV. Data are calc. and compared with experimental vals.

V. Equilibrium consts. for the dehydrogenation of  $C_2H_6$ ,  $C_3H_8$ , and *n*- and *iso*- $C_4H_{10}$  are calc. on the basis of vibrational frequency data, and compared with experimental vals. The discrepancies are discussed. Equilibrium consts. for the reactions  $2C_2H_4 \rightleftharpoons C_4H_8$ ,  $CH_4 + C_2H_4 \rightleftharpoons C_3H_8$ ,  $CH_4 + C_3H_8 \rightleftharpoons C_4H_{10}$ , and  $C_2H_6 + C_2H_4 \rightleftharpoons C_4H_{10}$  are also calc. H. J. E.

**Dissociation relations of the water HOD.** I. H. ERLÉNMEYER and A. EPPRECHT (Helv. Chim. Acta, 1936, 19, 677—680).—From previous data  $[H^+]$  and  $[D^+]$  in pure HOD are calc. to be  $0.564$  and  $0.111 \times 10^{-7}$ , respectively. T. G. P.

**Extremely weak acids.** W. K. McEWEN (J. Amer. Chem. Soc., 1936, 58, 1124—1129).—The acidity of 30 compounds (arylated hydrocarbons, alcohols, enols, amines) is determined by three different methods: (i) colorimetric; essentially that of Conant and Wheland (A., 1932, 572); (ii) spectroscopic; the compound is titrated with  $CNaPh_3$  in an inert atm. using aetioporphyrin I as indicator; (iii) polarimetric; the compound is treated with Na *l*-menthoxide and the position of equilibrium determined. The  $pK$  vals. are tabulated. *tert*.-Butyl-fluorene, m.p. 61°,

is obtained by reduction (red P, HI, AcOH) of the -fluorenol. H. B.

**Relation between the dissociation constants of substituted aliphatic acids and the distance between the dissociating and the substituted groups.** J. P. GREENSTEIN (J. Amer. Chem. Soc., 1936, 58, 1314—1316).—An inverse linear relation exists between  $pK$  and  $l^2$  (the square of the distance, in A., from the centre of the dipole group to the carboxyl centre on the assumption of an extended chain), when  $l^2$  is substituted for  $d$  in MacInnes' equation (A., 1928, 1326). For  $\alpha\beta$  substitution  $l^2$  is about twice, and for a  $\gamma$  substitution about three times, that for an  $\alpha$  substitution. E. S. H.

**Dissociation constants of ascorbic acid and its iodine oxidation product.** G. CARPÉNI (Compt. rend., 1936, 203, 75—78).—Dissociation consts. of ascorbic acid obtained electrometrically are  $2 \times 10^{-5}$  and  $6.3 \times 10^{-13}$  at 1°, and  $6.76 \times 10^{-5}$  and  $2.75 \times 10^{-12}$  at 20°. If the oxidation product, oxyascorbic acid, is titrated rapidly with NaOH, without waiting for equilibrium to be attained, the const. obtained is  $2.4 \times 10^{-9}$  at 20°, but a return titration with HCl gives a new curve indicating two consts.,  $8.9 \times 10^{-4}$  and  $1.6 \times 10^{-5}$ . Slow titration with NaOH indicates three consts.,  $6 \times 10^{-4}$ ,  $1.2 \times 10^{-8}$ , and  $5.1 \times 10^{-11}$ , whilst the return titration indicates  $1.8 \times 10^{-3}$ ,  $7.1 \times 10^{-5}$ , and  $3.2 \times 10^{-9}$ . C. R. H.

**Activity coefficients of ions.** (MLLE.) M. QUINTIN (J. Chim. phys., 1936, 33, 433—447).—Full details are given of work previously reported (this vol., 289). From e.m.f. data for  $CuSO_4$ , the calc. radii (Debye  $a$ ) of  $Cu^{+}$  and  $SO_4^{--}$  are  $3.5 \pm 0.2$  and  $1.3$  A., respectively. J. G. A. G.

**Thermodynamics of liquid-vapour equilibrium in system nitrogen-oxygen.** I. R. KRITSCHESVSKI and N. S. TOROTSCHESCHNIKOV (Z. physikal. Chem., 1936, 176, 338—346).—The fugacity,  $f$ , of  $N_2$  has been calc. at 100—125° abs. and 2.5—32 atm. from  $p$ - $v$ - $T$  and from thermal data; the two methods yield concordant results. For  $N_2$  in the vapour in equilibrium with a liquid  $N_2$ - $O_2$  mixture  $f$  is equal to the product of the mol. fraction of  $N_2$  in the liquid and the fugacity of pure  $N_2$  under a pressure equal to the total v.p. of the mixture.  $f$  for the  $O_2$  must obey a similar law. R. C.

**Vapour pressure measurements of the system calcium chloride-water.** A. LANNUNG (Z. anorg. Chem., 1936, 228, 1—18).—Measurements made with a hot-wire manometer (cf. A., 1934, 1170) at 0—50° are recorded. The dihydrate exists in two forms. Basset's observations on the tetrahydrate are confirmed (cf. A., 1933, 352). Heats of linking of the separate  $H_2O$  mols. in the hydrates are calc. H. J. E.

**Vapour pressures of saturated aqueous solutions. Mono- and di-ammonium hydrogen phosphates.** E. J. ROEHL (J. Amer. Chem. Soc., 1936, 58, 1291—1292).—For  $NH_4H_2PO_4$  at 19—90° the results are given by  $\log P = -2240/T + 8.862$ , and for  $(NH_4)_2HPO_4$  at 19—55° by  $\log P = -2240/T + 8.807$  with mean deviations of 0.8% and 0.4%, respectively. These and previous data

for other saturated aq. solutions show a linear relation between  $\log P$  and  $1/T$ , which when plotted gives lines parallel to that for  $H_2O$ . E. S. H.

**Heavy water of crystallisation.** J. R. PARTINGTON and K. STRATTON (*Nature*, 1936, **137**, 1075—1076).—The dissociation pressure of  $CuSO_4 \cdot 5D_2O$  is 6.655 mm. at  $25^\circ$  and 9.285 mm. at  $30^\circ$ . If the reaction is  $CuSO_4 \cdot 5D_2O \rightleftharpoons CuSO_4 \cdot 3D_2O + 2D_2O$ , this gives 4437 g.-cal. for the heat of combination of  $2D_2O_{liq.}$ , the corresponding val. for  $2H_2O$  being 5560 g.-cal. L. S. T.

**System albite-fayalite.** N. L. BOWEN and J. F. SCHAIRER (*Proc. Nat. Acad. Sci.*, 1936, **22**, 345—350).—F.p. and m.p. are recorded for the entire range of mixtures. The eutectic, m.p.  $1050^\circ \pm 5^\circ$ , contains 84% of albite (I), and the liquidus of (I) is a straight line. J. G. A. G.

**Representation of ternary systems.** E. SCHEIL (*Arch. Eisenhüttenw.*, 1935—6, **9**, 571—573).—To assist in understanding ternary diagrams it is recommended that the interrelationships of the 3- and 4-phase equilibria be summarised in a tabular form; examples of these are given for numerous Fe systems. A. R. P.

**Ternary systems  $KI-K_2SO_4-H_2O$  and  $NaI-Na_2SO_4-H_2O$ .** J. E. RICCI (*J. Amer. Chem. Soc.*, 1936, **58**, 1077—1079).—Equilibrium data are given for  $KI-K_2SO_4-H_2O$  at  $25^\circ$  and for  $NaI-Na_2SO_4-H_2O$  at  $15^\circ$ ,  $25^\circ$ , and  $45^\circ$ . No double salts or solid solutions are formed. E. S. H.

**Phase-rule study of the calcium arsenates.** G. W. PEARCE and L. B. NORTON (*J. Amer. Chem. Soc.*, 1936, **58**, 1104—1108).—Study of the system  $CaO-As_2O_5-H_2O$  at  $90^\circ$  shows the existence of  $CaHAsO_4$ ,  $Ca_5H_2(AsO_4)_4$ ,  $Ca_3(AsO_4)_2$ , and  $3Ca_3(AsO_4)_2 \cdot Ca(OH)_2$ . E. S. H.

**Equilibria in the system  $Li_2O-SiO_2-CO_2$ .** C. KROGER and E. FINGAS (*Festschr. Tech. Hochschule Breslau*, 1935, 296—306; *Chem. Zentr.*, 1935, ii, 2793; cf. A., 1933, 916).—The equilibrium state resulting from the action of  $SiO_2$  on  $Li_2CO_3$  has been studied. J. S. A.

**Equilibrium diagrams of salts for salt baths.** V. **System  $BaCl_2-CaCl_2-KCl$ .** T. SATO and T. AMANO (*Kinz-no-Kenk.*, 1934, **11**, 549—560; cf. A., 1935, 303).—In the system  $CaCl_2-KCl$  the compound  $CaCl_2 \cdot KCl$  (m.p.  $760^\circ$ ) is formed. This forms eutectics with  $KCl$  and  $CaCl_2$  at  $655^\circ$  (25 mol.-%  $KCl$ ) and  $615^\circ$  (76 mol.-%  $KCl$ ), respectively. The ternary eutectics are at  $543^\circ$ ,  $553^\circ$ , and  $552^\circ$  ( $BaCl_2$  23, 26, 21,  $CaCl_2$  58, 18, 17,  $KCl$  19, 56, 62 mol.-%, respectively). CH. ABS. (e)

**Systems zirconium oxalate-alkali oxalates-water.** (MLLE.) J. BOULANGER (*Compt. rend.*, 1936, **203**, 87—90).—The following solid phases were obtained:  $3Na_2X \cdot 2ZrOX \cdot H_2X \cdot 8H_2O$ ;  $2Na_2X \cdot ZrOX \cdot H_2X \cdot 2H_2O$ ;  $2(NH_4)_2X \cdot ZrOX \cdot H_2X \cdot 2H_2O$ ;  $2Li_2X \cdot ZrOX \cdot H_2X \cdot 7H_2O$  ( $X = C_2O_4$ ). C. R. H.

**Equilibrium in the reaction of hydrogen with ferrous oxide in liquid iron at  $1600^\circ$ .** M. G. FONTANA and J. CHIPMAN (*Trans. Amer. Soc. Metals*, 1936, **24**, 313—332).—An error in previous work is shown to be due to concn. gradients in the gas

caused by temp. gradients. The present work shows that the equilibrium const.  $K$  is 4.75 and is independent of  $[O]$ , and the activity of  $FeO$  dissolved in liquid  $Fe$   $\propto$  its wt.-%. The free energy of formation of  $FeO$  in 1% solution is  $-34,740$  g.-cal. at  $1600^\circ$ . The val. of  $K$  for the  $C + FeO \rightleftharpoons Fe + CO$  reaction is calc. to be 0.006, in good agreement with the experimental val. 0.010 previously obtained. W. P. R.

**Equilibrium between iron and nickel and their silicates saturated with silicic acid.** P. BARDENHEUER and E. BRAUNS (*Mitt. Kaiser-Wilh.-Inst. Eisenforsch.*, 1935, **17**, 127—132; *Chem. Zentr.*, 1935, ii, 2872).—Equilibrium data at  $1600^\circ$  are recorded. H. J. E.

**Equilibrium between niobium pentoxide, sodium carbonate, and carbon dioxide.** P. SUE (*Compt. rend.*, 1936, **203**, 90—92).—The reactions  $Nb_2O_5 + Na_2CO_3$  and  $NaNbO_3 + Na_2CO_3$  have been studied by measuring the equilibrium pressure of  $CO_2$  liberated. The heats of reaction are, respectively, 25 and 91.5 kg.-cal. C. R. H.

**Systems  $CaO-Al_2O_3-CaCl_2-H_2O$  and  $CaO-SiO_2-CaCl_2-H_2O$ .** R. NACKEN and R. MOSEBACH (*Z. anorg. Chem.*, 1936, **228**, 19—27; cf. B., 1935, 1096).—Aq.  $CaCl_2$  reacts fairly rapidly with  $3CaO \cdot Al_2O_3$  at  $30^\circ$ , forming the compound  $3CaO \cdot Al_2O_3 \cdot CaCl_2 \cdot 10H_2O$ . Solubility data are given. This reaction controls the influence of  $CaCl_2$  on the setting of Portland cement. No corresponding compound is formed from  $3CaO \cdot SiO_2$  and aq.  $CaCl_2$ . The  $CaCl_2$  retards the reaction between  $3CaO \cdot SiO_2$  and  $H_2O$ . H. J. E.

**Thermal equilibrium in ternary systems.** XIII. **Tetramorphism of ammonium nitrate in the ternary system with carbamide and resorcinol.** K. HRYNAKOWSKI and M. SZMYTÓWNA (*Rocz. Chem.*, 1936, **16**, 181—186).—The fusion diagram has been constructed. The transition points for the various polymorphs of  $NH_4NO_3$  are the same as for the pure salt. R. T.

**Free energy of dissociation of hydrogen.** E. N. EREMIN (*Acta Physicochim. U.R.S.S.*, 1935, **3**, 147—150).—The spectroscopic val. for the heat capacity of  $H_2$  and the experimental vals. of the heat of dissociation are used in deriving an equation for the free energy of dissociation of  $H_2$ . The equilibrium consts. of the dissociation calc. from the equation for different temp. are in good agreement with the vals. obtained by Giaque. A. J. M.

**Determination of heats of dissolution [of silicates] in acids of various concentration.** H. E. SCHWIETE and A. PRANSCHKE (*Zement*, 1935, **24**, 593—598; *Chem. Zentr.*, 1935, ii, 2931).—With a large excess of acid, the heat of dissolution changes only by an amount which corresponds with the heat of dilution of the acid. The heat of hydration of  $CaO$  is determined as 15 kg.-cal. per mol. J. S. A.

**Molecular conductivity of strong electrolytes in concentrated solutions.** S. KANEKO (*J. Chem. Soc. Japan*, 1935, **56**, 793—795).—A formula is derived for the mol. conductivity of binary salts of equal ionic valency. For  $KCl$  it is valid up to 1*N*.

CH. ABS. (e)

**Electric conductivity and viscosity of salts dissolved in solutions of carbohydrates and glycerol.** J. DĚDEK and J. DYKÝJ (Coll. Czech. Chem. Comm., 1936, 8, 261—287).—The data refer to aq. solutions at 20—50° containing 0—88 g. of sucrose, glucose, and glycerol per 100 c.c. of solution and 0.001—1.0*N* concns. of electrolyte. The relation  $1/\Lambda_v\eta = ax + b$ , where  $\Lambda_v$  is the equiv. conductivity at dilution  $v$  and  $\eta$  is the viscosity of the aq. non-electrolyte ( $x$  g. per 100 c.c. of solution) and  $a$  and  $b$  are const., applies, in general, when  $x$  is  $>30$ , and, in some cases when  $x$  is  $>0$ . With Cl' as anion,  $a$  and  $b$  increase for the cations in the order  $H^+ < K^+ < Na^+ < Li^+$ . With const. [KCl], the order of the vals. of  $a$  and  $b$  is glycerol < glucose < sucrose, but with rise of temp.,  $a$  decreases (becomes less negative) and  $b$  increases.  $a$  and  $b$  decrease as  $v$  increases. The relation of these results to the rules of Walden and Johnston is discussed. J. G. A. G.

**Influence of pressure on conductivity of solutions.** P. Z. FISCHER (Mem. Inst. Chem. Ukrain. Acad. Sci., 1935, 2, 303—307).—A review.

R. T.

**Effect of non-electrolytes on the conductivity of electrolyte solutions.** V. A. PLOTNIKOV, P. Z. FISCHER, and V. P. BARABANOV (Mem. Inst. Chem. Ukrain. Acad. Sci., 1935, 2, 211—226).—The sp. conductivity of 0.33—3.83*N*-KCl, 0.5—2.5*N*-KNO<sub>3</sub>, and 0.3—4.94*N*-AgNO<sub>3</sub> in presence of CO(NH<sub>2</sub>)<sub>2</sub> (19 and 35%), mannitol (3—9%), or sucrose (5—50%) shows no obvious connexion with the viscosity; the formation of dissociable non-electrolyte-electrolyte complexes is postulated.

R. T.

**Influence of non-electrolytes on conductivity of aqueous electrolytes.** K. VOLKOV and A. ALMAZOV (Bull. Sci. Univ. Kiev, 1935, 1, 191—205).—The conductivity ( $\kappa$ ) and  $\eta$  of aq. KCl-dextrin (I) or sol. starch (II) do not run parallel. With const. concn. of (I) or (II), the % diminution in  $\kappa$  rises to a max. at 0.03—0.5*N*-KCl, thereafter steadily falling with further rise in [KCl], whilst when the relative concns. of (I) and KCl are maintained const. but the total concn. is progressively increased,  $\kappa$  rises asymptotically to a const. val. It is inferred that aq. (I) and (II) have a discontinuous structure, and that the effects are not due to dehydration of ions by the added colloids.

R. T.

**Electrochemistry of ternary systems in solvents of low dielectric constant.** E. J. GORENBEIN (Bull. Sci. Univ. Kiev, 1935, 1, 101—129).—Sp. conductivity in the systems AlBr<sub>3</sub>-MBr-solvent (M=Li, K, Rb, Cu, Ag; solvent=C<sub>6</sub>H<sub>6</sub>, PhMe, C<sub>2</sub>H<sub>4</sub>Br<sub>2</sub>, EtBr) rises with increase in the dielectric const. of the solvent. In systems containing Li, K, or Rb, Al is deposited at the cathode during electrolysis.

R. T.

(A) Compounds of aluminium bromide with lithium, copper, and silver bromide. (B) Electrochemical study of the systems AlBr<sub>3</sub>-SbBr<sub>3</sub> in toluene, (C) AlBr<sub>3</sub>-BiBr<sub>3</sub> in benzene, (D) aluminium bromide-silver and copper halides-organic solvents (ethyl bromide, ethylene dibromide, benzene). V. A. PLOTNIKOV (Mem. Inst. Chem.

4 A

Ukrain. Acad. Sci., 1935, 2, 3—9, 227—233, 235—244; 1936, 3, 89—109).—(A) [with E. J. GORENBEIN]. Conductivity in the systems AlBr<sub>3</sub>-EtBr-LiBr, -CuBr, and -AgBr is ascribed to the compounds LiBr, AlBr<sub>3</sub>, m.p. 192°, CuBr, AlBr<sub>3</sub>, m.p. 241°, and 2AgBr, 3AlBr<sub>3</sub>, m.p. 180—185°. Stability of the compounds towards H<sub>2</sub>O falls in the order given.

(B) [with V. A. KIKETZ and P. A. RADOMSKI]. Max. sp. conductivity  $\kappa$  is found for mixtures in which Sb : Al = 1 : 2, suggesting the compound SbBr<sub>3</sub>, 2AlBr<sub>3</sub>. The decomp. potential (18°) is 0.9 volt, Sb being deposited at the cathode.

(C) [with V. A. KIKETZ and L. A. KOROL]. The  $\kappa$ -composition curve has a max. corresponding with the compound 2BiBr<sub>3</sub>, 2AlBr<sub>3</sub>. Electrolysis with a Bi anode leads to deposition of Bi in accordance with Faraday's law (decomp. potential 0.9 volt).

(D) [with E. J. GORENBEIN]. The value of  $\kappa$  rises in the systems AlBr<sub>3</sub>-MX-EtBr, -C<sub>2</sub>H<sub>4</sub>Br<sub>2</sub>, or -C<sub>6</sub>H<sub>6</sub> (M=Cu, Ag; X=Cl, Br, I) with increasing [MX]; no obvious connexion exists between dipole moment of solvent and  $\kappa$ . Cu or Ag is deposited in theoretical yield at the cathode. Decomp. potentials are recorded.

R. T.

**Measurement of conductivity of fused salts, and conductivity in the system NaCl-CaCl<sub>2</sub>.** V. BARZAKOVSKI (Coll. Trans. 1st U.S.S.R. Conf. Non-aq. Solutions, Kiev, 1935, 153—158).—Apparatus for determining the conductivity ( $\kappa$ ) of fused salts is described. The  $\kappa$ -composition curves at 700—1000° have a min., and the temp. coeff. of  $\kappa$ -composition curves a max., at 70—80 mol.-% of CaCl<sub>2</sub>;  $\kappa$  rises with increasing temp.

R. T.

**Electrolysis of sodium chloride in liquid ammonia.** II. E. I. ACHUMOV and N. A. GONTCHAROV (J. Gen. Chem. Russ., 1936, 6, 534—541; cf. A., 1935, 1080).—Sp. conductivities are recorded for solutions of NaCl, NH<sub>4</sub>Cl, and NaCl+NH<sub>4</sub>Cl in liquid NH<sub>3</sub>, at -34° to 34°; for saturated solutions of NaCl max.  $\kappa$  is at -8.4°. Curves connecting decomp. potential with temp. are given for solutions of NaCl in NH<sub>3</sub> and H<sub>2</sub>O.

R. T.

(A) Diffusion of potassium ferrocyanide, ferricyanide, and dichromate, and of sodium, magnesium, potassium, and calcium chloride, and the mobility of the ions of these salts. (B) Diffusion coefficient of potassium perrhenate. S. PLEŚNIEWICZ (Rocz. Chem., 1936, 16, 223—240, 241—244).—(A) The diffusion coeffs.  $D$  in 0.1*N* solutions at 20° are: K<sub>4</sub>Fe(CN)<sub>6</sub> 0.845, K<sub>3</sub>Fe(CN)<sub>6</sub> 0.917, K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> 1.043, NaCl 1.166±0.007, MgCl<sub>2</sub> 0.832±0.003, KCl 1.449, CaCl<sub>2</sub> 0.896±0.008.  $D$  cannot be calc. from Nernst's equation  $D=RT/F^2[(1/v_k)+(1/v_a)] \cdot u_k u_a / (u_k + u_a)$ , since  $u$  applies to infinite dilution. The conception of mean transport nos.  $v$ , applying to a given concn. gradient, is introduced,  $v_a$  being equal to  $kv_k$ , and  $1/D = (F^2/RT)n_k n_a / (n_k + n_a) \cdot (1/v_k + 1/v_a)$ , where  $n_a$  and  $n_k$  are the valencies and  $v_a$  and  $v_k$  the mean transport nos. of the anion and cation, respectively, and  $k$  and  $F$  are const.

(B) The  $D$  of KReO<sub>4</sub> (0.01*N*) at 20° is 1.233, and the  $v$  of ReO<sub>4</sub>' at 18° is 44.07.

R. T.

**Structure of molecules in solution.** C. DUVAL (Document. sci., 1935, 4, 145—148; Chem. Zentr.,

1935, ii, 3051).—From observations on electrophoresis and analyses of the contents of the anode and cathode compartments the following structural formulæ are suggested: kainite  $[\text{MgSO}_4\text{Cl}(\text{H}_2\text{O})_3]\text{K}$ ;  $(\text{CrO}_3\text{SO}_4)_2\text{H}_2$ ;  $(\text{SO}_3\text{SO}_4)_2\text{H}_2$ ;  $(\text{CrO}_3\text{CrO}_4)_2\text{H}_2$ ;  $[\text{Co}(\text{CO}_3)_3]\text{Co}$ ;  $[\text{Co}(\text{H}_2\text{O})_3\text{Cl}_3]\text{H}$ ;  $[\text{Co}(\text{H}_2\text{O})_3\text{Cl}_3]_2\text{Co}$ ;  $[\text{Co}(\text{H}_2\text{O})_3\text{Cl}_3]\text{Li}$ .  
H. J. E.

**Solid electrolytes.** P. FISCHER (Bull. Sci. Univ. Kiev, 1935, 1, 131—140).—A review. R. T.

**Nomogram for the relation between quinhydrone potential and  $p_{\text{H}}$  at various temperatures.** G. KNAYSI (Food Res., 1936, 1, 297—299).  
E. C. S.

**Poisoning of platinum in hydrogen electrodes.** H. JABECZYNSKA-JEDRZEJEWSKA (Rocz. Chem., 1936, 16, 306—312).—Pt electrodes are poisoned by 0.00025N- $\text{H}_2\text{S}$ , the potential tending to a const. min. val. of 160 mv., irrespective of the  $[\text{H}_2\text{S}]$ . The effect increases with increasing  $p_{\text{H}}$ . Reactivation is possible by the successive action of nascent O and H.  
R. T.

**Potentials at the interface of two liquid phases.** III. K. KARCEWSKI (Rocz. Chem., 1936, 16, 254—258; cf. this vol., 928).—The potential at the interface  $\text{Bu}^n\text{OH}$ -aq. K salt becomes more positive with increasing  $[\text{K}_2\text{SO}_4]$ , and less positive in the case of KCl, KBr, KI, KCNS,  $\text{K}_2\text{CO}_3$ ,  $\text{HCO}_2\text{K}$ ,  $\text{KNO}_3$ ,  $\text{KClO}_3$ , and  $\text{KClO}_4$ .  
R. T.

**Influence of composition of solutions on the electrocapillary curve of mercury.** W. KEMULA and E. BEER (Rocz. Chem., 1936, 16, 259—269).—The electrocapillary curves obtained by the static and dynamic methods coincide in the case of conc. but not dil. solutions. Irregularities in the curves obtained by the dynamic method are ascribed to the influence of the  $\zeta$ -potential. The results for KCl,  $\text{BaCl}_2$ , and  $\text{LaCl}_3$  are in agreement with Stern's theory (Z. Elektrochem., 1924, 30, 508).  
R. T.

**Polarographic studies with the dropping mercury cathode.** LIX. Anomalous curves of certain potassium chloride solutions. A. R. WEIR (Coll. Czech. Chem. Comm., 1936, 8, 239—245).—The current-voltage curves for the electrolysis of aq. KCl saturated with  $\text{Hg}_2\text{Cl}_2$  are similar to those for NaCl except in solutions containing 45.6—59.5 g. of KCl per 1000 g. of  $\text{H}_2\text{O}$  which give variable curves of anomalous contour. These results are parallel with v.p. anomalies (cf. this vol., 678). J. G. A. G.

**Anode polarisation of metallic electrodes. I. Polycrystalline and liquid electrodes.** W. TRZEBIATOWSKI and M. SARNOWSKI (Rocz. Chem., 1936, 16, 187—198).—The polarisation of Cu anodes ( $0^\circ$ ,  $25^\circ$ , and  $50^\circ$ ) in aq.  $\text{CuSO}_4$ - $\text{H}_2\text{SO}_4$  varies with the crystal structure of the metal.  
R. T.

**Decomposition potentials of fused salts.** V. M. GUSKOV (Coll. Trans. 1st U.S.S.R. Conf. Non-aq. Solutions, Kiev, 1935, 159—173).—E.m.f. measurements relating to the cell  $\text{Mg}|\text{molten MgCl}_2|\text{Cl}$  (C anode; molten NaCl-KCl- $\text{MgCl}_2$  electrolyte) at 665—793° afford no evidence of the existence of complex anions of the type  $\text{MgCl}_3^-$ . The temp. coeff. of the e.m.f. is  $0.7 \times 10^{-3}$ . The results suggest that cryolite dissociates as follows:  $\text{Na}_3\text{AlF}_6 \rightleftharpoons 3\text{Na}^+ + \text{Al}^{+++} + 6\text{F}^-$ ,

the reaction at the C anode being  $2\text{Al}_2\text{O}_3 + 3\text{C} + 6\text{F}_2 \rightarrow 4\text{AlF}_3 + 3\text{CO}_2$ ;  $\text{CO}_2 + \text{C} \rightarrow 2\text{CO}$ .  
R. T.

**Decomposition potential of aluminium chloride amines.** V. A. PLOTNIKOV and M. S. FORTUNATOV (Mem. Inst. Chem. Ukrain. Acad. Sci., 1935, 2, 251—256).— $\text{N}_2$  is evolved, in accordance with Faraday's law, at a Pt anode from a molten mixture of  $\text{AlCl}_3$  amines. The decomp. potentials vary with temp. and c.d.  
R. T.

**Electrolysis of non-aqueous solutions.** V. S. FINKELSCHTEIN (Coll. Trans. 1st U.S.S.R. Conf. Non-aq. Solutions, Kiev, 1935, 54—71).—Previous explanations of deviations from Faraday's law are not satisfactory. In the system  $\text{AsCl}_3$ - $\text{Et}_2\text{O}$  the val. of the decomp. potential is affected only by addition of solvents the dipole moment of which is  $>$  that of  $\text{Et}_2\text{O}$ . Electrolysis in liquid  $\text{NH}_3$  and deposition of Al from non-aq. solvents are discussed.  
R. T.

**Strong oxidising agents in nitric acid solution.**

I. Oxidation potential of cerous-ceric salts.  
II. Oxidation potential of thalious-thallic salts. A. A. NOYES and C. S. GARNER (J. Amer. Chem. Soc., 1936, 58, 1265—1268, 1268—1270).—I. E.m.f. of cells of the type  $\text{Pt}-\text{N}_2$  (1 atm.)  $|\text{HClO}_4(c'), \text{HNO}_3(c) + \text{Ce}^{\text{IV}}(c_2) + \text{Ce}^{\text{III}}(c_1)|\text{Pt}$  at  $25^\circ$  and  $0^\circ$  are recorded.  $E_0$  varies little with considerable change in the  $\text{Ce}^{\text{III}}/\text{Ce}^{\text{IV}}$  ratio, acid concn., or ionic strength. It follows that nitrate complexes are formed only slightly, if at all, and that a hydrolytic reaction, such as  $\text{Ce}^{\text{IV}} + \text{H}_2\text{O} = \text{CeOH}^{+++} + \text{H}^+$ , does not occur appreciably. The  $\text{Ce}^{\text{III}}$ - $\text{Ce}^{\text{IV}}$  oxidation potential in  $\text{HNO}_3$  is  $1.609 \pm 0.0007$  volts at  $25^\circ$  and 1.601 volts at  $0^\circ$ .

II. E.m.f. measurements of cells of the type  $\text{Pt}-\text{H}_2$  (1 atm.)  $|\text{HClO}_4(c'), \text{HNO}_3(c) + \text{Tl}^{\text{III}}(c_2) + \text{Tl}^{\text{I}}(c_1)|\text{Pt}$  show that the formal oxidation potential of  $\text{Tl}^{\text{III}}-\text{Tl}^{\text{I}}$  is  $1.2303 \pm 0.0007$  volts at  $25^\circ$  and  $1.193 \pm 0.001$  volts at  $0^\circ$  in  $\text{HNO}_3$ . These vals. remain const. when  $\text{Tl}^{\text{I}}/\text{Tl}^{\text{III}}$  is varied 100-fold and over a wide range of  $[\text{HNO}_3]$ , showing that hydrolysis of  $\text{Tl}(\text{NO}_3)_3$  or formation of nitrate complexes does not occur appreciably.  
E. S. H.

**Extension of Arrhenius' conception of a chemical reaction.** J. A. CHRISTIANSEN (Z. physikal. Chem., 1936, B, 33, 145—155; cf. A., 1935, 707).—Assuming an open sequence of reactions with many or an infinite no. of steps in series with each other, the above concept leads for a unimol. reaction to an expression similar to Nernst's reaction velocity = (chemical force)/(chemical resistance). The force is equal to the difference in activity between the initial and final states of the system and the resistance to an integral which varies with temp.  
R. C.

**Kinetics of gas reactions: an attempt to connect thermal decomposition and oxidation processes.** M. W. TRAVERS (Nature, 1936, 138, 26—27).—The similarity in the curves representing the rate of thermal decomp. and that of oxidation of  $\text{CH}_2\text{O}$  and  $\text{MeCHO}$  can be accounted for by the formation of short-lived intermediates.  
L. S. T.

**Period of induction in the inflammation of gas mixtures.** A. E. MALINOVSKI (Acta Physicochim. U.R.S.S., 1935, 3, 509—516).—Induction periods of chain reactions ( $\alpha$ ) when the no. of active centres

generated in unit time is const. throughout the reaction, and (b) when no active centres are generated after the commencement of the reaction, are calc.

O. D. S.

**Kinetics of simultaneous polymerisation and ring formation.** M. STOLL (Trans. Faraday Soc., 1936, 32, 1031—1033).—A criticism of the work of Salomon (cf. this vol., 296).

O. J. W.

**Forjaz's effect.** L. ROSENKEVITSCH (Acta Physicochim. U.R.S.S., 1935, 3, 161—162).—The accelerating effect of a powerful alternating field on the reaction between EtOH and AcOH noted by Forjaz (A., 1934, 40) is attributed to the heating effect of the field.

A. J. M.

**Oxidation of hypophosphorous acid by iodine in aqueous sulphuric acid.** J. KAMECKI (Rocz. Chem., 1936, 16, 199—206).—The velocity of oxidation of  $\text{H}_3\text{PO}_2$  to  $\text{H}_3\text{PO}_3$  by (I) rises with increasing  $[\text{H}_2\text{SO}_4]$  to 1.0*N*, thereafter remaining const. Oxidation of  $\text{H}_3\text{PO}_3$  proceeds slowly.  $\text{H}_3\text{PO}_2$  is determined in presence of  $\text{H}_3\text{PO}_3$  by determining the latter in one sample, by the method of Wolf and Jung (A., 1932, 135), adding  $\text{H}_2\text{SO}_4$  to 1—2*N* and a small excess of I to another sample, and titrating excess of I after 2.5 hr. at 20° (in the dark).

R. T.

**Kinetics of the tervalent vanadium-iodine reaction.** J. B. RAMSEY and M. J. HELDMAN (J. Amer. Chem. Soc., 1936, 58, 1153—1157).—At 24–95° the reaction in  $\text{HClO}_4$  at const. ionic strength, is  $\propto [\text{I}_2']$  and  $[\text{V}^{III}]$ , and inversely  $\propto [\text{H}']$  and  $[\text{I}']$ . The rate-determining step is probably bimol., between I mols. and  $\text{VOH}^{II}$ . The salt effect has been determined and an explanation for its large negative magnitude is advanced.

E. S. H.

**Kinetics of the nitrite-iodine reaction.** G. G. DURRANT, R. O. GRIFFITH, and A. McKEOWN (Trans. Faraday Soc., 1936, 32, 999—1013).—The kinetics of the reaction between  $\text{NaNO}_2$  (and  $\text{KNO}_2$ ) and I have been investigated in phosphate buffers at 40°, 50°, and 60°. The reaction rate is given by an equation, which can be explained by a mechanism involving  $\text{NO}_2$  and I atoms as intermediaries. This mechanism is supported by results of experiments in which nitrite and oxalate react simultaneously with I.

O. J. W.

**Speed of decomposition of chromic acid in hot aqueous solutions of sulphur trioxide, and relation between this reaction and oxidising power.** H. C. S. SNETHLAGE (Rec. trav. chim., 1936, 55, 712—722).—The rate of decomp., yielding  $\text{O}_2$ , has been determined in aq.  $\text{H}_2\text{SO}_4$  at 133° and in  $\text{SO}_3$ – $\text{H}_2\text{SO}_4$  mixtures at 100°. There occur simultaneously (1) a pseudo-unimol. reaction of the  $\text{CrO}_3$  with  $\text{SO}_3$  or  $\text{H}_2\text{S}_2\text{O}_7$ , giving  $\text{Cr}_2\text{O}_3$ , and (2) a bimol. reaction, possibly  $2\text{CrO}_3 = \text{Cr}_2\text{O}_3 + \text{O}_2$ . As the  $\text{H}_2\text{SO}_4$  concn., *c*, rises above 60% the velocity passes through a max. (81%), then a min. (96–98%), and finally rises rapidly; below 60% there is no measurable decomp. The velocity coeff. of (1),  $k_1$ , rises slowly with *c* up to ~99%, then much more rapidly, corresponding with the appearance in the solvent of  $\text{H}_2\text{S}_2\text{O}_7$ . With (2) the velocity coeff.,  $k_2$ , rises with *c* up to 81%, then falls up to 99%. The relation of

$k_1$  and  $k_2$  to *c*, however, varies somewhat with  $[\text{CrO}_3]$ . These results explain the data obtained (A., 1935, 1140) for the oxidation of org. substances with  $\text{CrO}_3$ – $\text{H}_2\text{SO}_4$  mixtures; the oxidising power of the latter is probably governed by (2).

R. C.

**Rate of reaction of sodium sulphite with oxygen dissolved in water.** R. M. HITCHENS and R. W. TOWNE (Amer. Soc. Test. Mat., Preprint, June, 1936, 8 pp.).—The reaction proceeds with great rapidity and is complete in <1 min. at temp. approaching 100°, regardless of the type of  $\text{H}_2\text{O}$ , if a slight excess of  $\text{Na}_2\text{SO}_3$  is employed. A 20% excess of  $\text{Na}_2\text{SO}_3$  doubles the reaction rate and a 100% excess almost quadruples it.

R. B. C.

**Kinetics of hydrolysis of esters in alkaline media.** V. A. GOLTZSCHMIDT, N. K. VOROBJEV, and I. V. POTANOV (J. Gen. Chem. Russ., 1936, 6, 757—763).—The velocity coeffs.  $k$  of hydrolysis by aq. NaOH of a no. of esters,  $\text{R}\cdot\text{CO}_2\text{R}'$ , at 10°, 20°, and 30° fall with increase in the no. of C atoms in R and R'; for a given R,  $k_{\text{Et}}/k_{\text{Me}} = 0.57$ ,  $k_{\text{Pr}}/k_{\text{Et}} = 0.84$ , and  $k_{\text{Bu}}/k_{\text{Pr}} = 0.93$ , but for a given R',  $k_{\text{Et}}/k_{\text{Me}} = 0.84$ , and  $k_{\text{Pr}}/k_{\text{Et}} = 0.62$ . It is concluded that the activity coeff. and the energy of activation both fall with increase in mol. wt. of the ester.

R. T.

**Rates of esterification of alcohols in formic and acetic acids and of formic acid in *tert*-butyl alcohol.** A. KAILAN and S. ROSENBLATT (Monatsh., 1936, 68, 109—170).—The rate of esterification of menthol, borneol, cyclohexanol,  $\alpha$ -chloropropan- $\beta$ -ol, ethylene chloro-, bromo-, and iodo-hydrin,  $\beta\gamma$ -dichloro-,  $\beta\gamma$ -dibromo-,  $\beta\gamma$ -di-iodo-, and  $\beta$ -chloro-*n*-propyl alcohol was studied at 15° and 25° in AcOH and  $\text{HCO}_2\text{H}$ , with and without addition of HCl, and with varied initial  $[\text{H}_2\text{O}]$ . The rate in AcOH containing HCl was increased on increasing the  $[\text{H}_2\text{O}]$ . In absence of HCl, or in  $\text{HCO}_2\text{H}$ , it was reduced. The increase in rate due to HCl was  $\propto$  its concn. The rate of esterification decreases as the no. of halogen atoms in the mol. is increased. Replacement of one six-membered by two five-membered rings increases the rate.

H. J. E.

**Effect of pressure up to 12,000 kg. per sq. cm. on reactions in solution.** E. G. WILLIAMS, M. W. PERRIN, and R. O. GIBSON (Proc. Roy. Soc., 1936, A, 154, 684—703).—Velocity coeffs. have been measured, by means of the apparatus previously described (A., 1935, 1082), for the following reactions: the interaction of NaOEt and EtI in EtOH solution, between 15° and 30° at 5000, 8500, and 12,000 kg. per sq. cm.; the hydrolysis of  $\text{CH}_2\text{Cl}\cdot\text{CO}_2\text{Na}$  by aq. NaOH, between 40° and 80° at 1, 3000, 7600, and 12,000 kg. per sq. cm.; the esterification of  $\text{Ac}_2\text{O}$  by EtOH in EtOH solutions, between 15° and 40° at 1, 1000, 2000, and 3000 kg. per sq. cm., and in PhMe,  $\text{COMe}_2$ ,  $\text{C}_6\text{H}_{14}$ , and amyl ether solutions, at various temp. at 1 and 3000 kg. per sq. cm.; the decomp. of phenylbenzylmethylallylammonium bromide (I) in  $\text{CHCl}_3$  between 25° and 45° at 1 and 3000 kg. per sq. cm. In each case the temp. coeffs. of the reactions were measured, in an attempt to show whether the change in the velocity coeff. is due to a change in the const. *A* or *E* in the Arrhenius equation.

The reactions fall into three classes. (1) "Normal" reactions, where pressure has a small accelerating effect which falls at high pressures, the increase in velocity being of the order of 5 times at 12,000 kg. per sq. cm. The acceleration is due chiefly to a decrease in the activation energy. (2) "Slow" reactions, where pressure has a greater accelerating influence which increases with rise of pressure, the increase in velocity being of the order of 10 times at 5000 kg. per sq. cm., and 45 times at 8500 kg. per sq. cm. The consts.  $A$  and  $E$  of the Arrhenius equation both increase with rise of pressure. (3) Unimol. decomp. The decomp. of (I) in  $\text{CHCl}_3$  solution is retarded 1.5 times at 3000 kg. per sq. cm. The pressure effect on the  $\text{EtOH}$  and  $\text{Ac}_2\text{O}$  reaction varies with change of solvent, but it is always of the same order of magnitude.

L. L. B.

**Kinetic study of the hydrolysis and alcoholysis of phenyl acetate.** W. A. WATERS (J.C.S., 1936, 1014—1023).—The rates of decomp. of  $\text{PhOAc}$  by  $\text{EtOH-H}_2\text{O}$  mixtures containing  $\text{HCl}$  have been investigated. The reactions  $\text{PhOAc} + \text{EtOH} \rightarrow \text{EtOAc} + \text{PhOH}$  (1) and  $\text{PhOAc} + \text{H}_2\text{O} \rightarrow \text{AcOH} + \text{PhOH}$  (2) proceed simultaneously at comparable rates. The formation of  $\text{PhOH}$  followed a unimol. course in all experiments and was irreversible, no other aromatic product being formed. This supports the view that carboxylic esters undergo acid hydrolysis and alcoholysis by fission of an alkoxy-group. The crit. increment of activation for both  $\text{PhOH}$  and  $\text{AcOH}$  liberation is approx. the same, suggesting that the activated complexes in both (1) and (2) are the same, not involving  $\text{EtOH}$  or  $\text{H}_2\text{O}$ . Ester hydrolysis in acid solution may be a unimol. reaction occurring between activated ester-proton complexes and normal solvent mols.

D. C. J.

**Determination of parameters  $k$  and  $n$  in the differential equation  $dx/dt = k(a-x)^n t^{p-1}$ . Chemical applications.** J. M. GONZALEZ BARREDO (Anal. Fis. Quím., 1935, 33, 844—853).—Mathematical. The hydrolysis of  $\text{EtOAc}$  is discussed as an example.

**Graphical methods in kinetics.** J. L. G. CAAMAÑO (Anal. Fis. Quím., 1936, 34, 327—330).—Attention is directed to errors in the work of Gonzalez Barredo (preceding abstract).

F. R. G.

**Kinetics of bimolecular associations in solution and in the gaseous state. Mechanism of additions to double linkings. IV.** A. WASSERMANN (J. C. S., 1936, 1028—1034; cf. this vol., 685).—The kinetics of the addition of cyclopentadiene to acraldehyde, benzoquinone,  $\alpha$ -naphthaquinone, cyclopentadiene-benzoquinone, and cyclopentadiene are measured in  $\text{C}_6\text{H}_6$  solution, and compared with the kinetics of corresponding syntheses in the gas phase (*ibid.*, 297). The factor in the Arrhenius equation independent of temp. is much  $<$  the collision frequency in the gas phase, and it is suggested that this is due to the complicated structure of the reactants. The conclusion is reached that the collision frequency in solution is approx. the same as that in the gas phase both for "normal" and "slow" bimol. reactions.

D. C. J.

**Reaction of iodoacetate and of iodoacetamide with various thiol groups, with urease, and with yeast preparations.** C. V. SMYTHE (J. Biol. Chem., 1936, 114, 601—612).—The rates of reaction of  $\text{CH}_2\text{I}\cdot\text{CO}_2^-$  (I) and  $\text{CH}_2\text{I}\cdot\text{CO}\cdot\text{NH}_2$  (II) with a no. of substances containing  $\cdot\text{SH}$  were in the order: thioglucose  $>$  thiosalicylic acid  $>$  cysteine  $>$  glutathione  $>$  thioglycol; in all cases the rate with (II) was  $>$  that with (I). Urease was very resistant to inhibition by (I) but quite susceptible to that by (II);  $\text{NH}_2\text{Ac}$  and  $\text{CN}\cdot\text{CH}_2\cdot\text{CO}\cdot\text{NH}_2$  were ineffective. It is concluded that inactivation of urease by (II) requires that only 0.25—0.5 of the  $\cdot\text{SH}$  be destroyed. The inhibition of fermentation of yeast extracts by (I) is more rapid than that by (II).

H. D.

**Ionisation of amines in alcohol: a possible slow reaction.** A. G. OGSTON (J.C.S., 1936, 1023—1025).—A quant. investigation of the slow increase in electrical conductivity found when solutions of  $\text{NH}_3$  in  $\text{MeOH}$  and  $\text{EtOH}$  are diluted is made (cf. A., 1934, 1071). Similar behaviour is found using  $\text{NHEt}_2$ ,  $\text{NH}_2\text{Bu}^t$ ,  $\text{CH}_2\text{Ph}\cdot\text{NH}_2$ , and piperidine. A rapid change, accounting for 0.66 of the total, occurs in the first 2 min. and then the reaction becomes slow and of the first order. The effect is ascribed to a slow ionic reaction.

D. C. J.

**Rate of absorption of water by magnesium sulphate.** A. S. MIKULINSKI and R. N. RUBINSTEIN (Z. anorg. Chem., 1936, 228, 89—91).—The rate of absorption of  $\text{H}_2\text{O}$  by  $\text{MgSO}_4\cdot\text{H}_2\text{O}$  (I) and  $\text{MgSO}_4\cdot 2\text{H}_2\text{O}$  (II) in atm. of 100, 70, and 50% R.H. at  $18^\circ$  was measured. The initial rate is smaller for (I) than for (II).

H. J. E.

**Derivation of general formula for velocity of crystallisation of sucrose from experimental data.** A. KIROV (Sovet. Sach., 1933, No. 9, 30—33).—The crystallisation const. and velocity are calc. from the formula  $\Delta p = K\Delta C/\eta$  ( $C$ =concn.;  $\eta$ =viscosity).

CH. ABS. (e)

**Rate of dissolution of alkali borate glasses.** R. L. MÜLLER and C. V. WEINSTEIN (Acta Physicochim. U.R.S.S., 1935, 3, 465—502; cf. A., 1932, 447).—The rates of dissolution of glasses of formula  $\text{B}_2\text{O}_3 + \text{M}_2\text{O}$ , where M is Li, Na, K, Rb, or Cs, have been investigated for a series of compositions between  $\text{B}_4\text{O}_6$  and  $\text{M}_2\text{B}_4\text{O}_7$ . For glasses where the molar fraction,  $q$ , of  $\text{M}_2\text{B}_4\text{O}_7$  is  $> 0.1$  the rate is determined by diffusion and convection. When  $q$  is  $< 0.5$  the rate is independent of the rate of stirring of the liquid and has a temp. coeff. of 7—8% per  $1^\circ$ . It is deduced that the rate of dissolution is here determined by a chemical reaction at the solid-liquid interface which begins to be important in the range  $0.1 < q < 0.5$ . The formerly observed correlation between the molar conductivity and the rate of dissolution is fortuitous.

O. D. S.

**Catalytic oxidation effect of complex metallic compounds. XI. Catalytic oxidation in heavy water.** K. YAMASAKI (Bull. Chem. Soc. Japan, 1936, 11, 431—433).—The rate of oxidation of pyrogallol, alone or catalysed by complex Co salts, is greater in  $\text{H}_2\text{O}$  than in  $\text{D}_2\text{O}$ .

C. R. H.

**Kinetics of the oxidation of solutions of sulphurous acid.** S. S. VASSILIEV, L. I. KASCHTANOV, and T. L. KASTORSKAIA (Acta Physicochim. U.R.S.S., 1935, 3, 413—434).—The oxidation of aq.  $\text{SO}_2$  by air has been studied with and without the addition of 0.01% of  $\text{MnSO}_4$  as catalyst. For low  $[\text{SO}_2]$  the rate  $\propto [\text{SO}_2]$ , the catalysed being 7—8 times as fast as the uncatalysed reaction. For high  $[\text{SO}_2]$  the rate becomes equal to the rate of dissolution of  $\text{O}_2$ .

O. D. S.

**Acid catalysis in liquid ammonia. Kinetics of the ammonolysis of santonin in liquid ammonia in the presence of ammonium salts.** A. I. SCHATTENSTEIN (Acta Physicochim. U.R.S.S., 1935, 3, 37—52).—The kinetics of the ammonolysis of santonin were investigated polarimetrically. The catalytic effect of  $\text{NH}_2$ -acids [santonamide,  $\text{CO}(\text{NH}_2)_2$ ] and of several  $\text{NH}_4$  salts was examined. The velocity coeffs. for 0.1*N* solutions of catalysts are in the order:  $\text{NH}_4\text{Cl} > \text{NH}_4\text{Br} > \text{NH}_4\text{NO}_3 > \text{NH}_4\text{I} > \text{NH}_4\text{ClO}_4$ . The parallelism observed between conductivity and thermodynamic activity and catalytic activity in the case of aq. solutions does not hold when the solvent is liquid  $\text{NH}_3$ . If to the solution of the acid ( $\text{NH}_4$  salt) a neutral (Na) salt with the same anion is added, there is a definite increase in the reaction velocity. The proportionality between velocity coeff. and concn. of catalyst is the better the weaker electrolyte is the catalyst. The mechanism of the catalysis is discussed.

A. J. M.

**Acid-base catalysis of the mutarotation of glucose in protium oxide-deuterium oxide mixtures.** W. H. HAMILL and V. K. LA MER (J. Chem. Physics, 1936, 4, 395—401).—The velocity of the  $\text{H}_2\text{O}$ - $\text{D}_2\text{O}$ -catalysed reaction  $\propto$  the fraction of heavy glucose and depends only indirectly on the  $[\text{D}_2\text{O}]$  in the water. The velocity of the acid ion catalysis varies linearly with  $[\text{D}_2\text{O}]$ . The rate of  $\text{OAc}'$  catalysis varies linearly with the fraction of  $\text{D}_2\text{O}$  or of  $\text{AcOD}$ . The decrease in the rate of the  $\text{H}_2\text{O}$ - $\text{D}_2\text{O}$ -catalysed reaction with increasing  $[\text{D}_2\text{O}]$  arises from a decrease in the entropy of activation and not from an increase in the activation energy.

H. J. E.

**Inhibition of chemical reactions. VI. Influence of ether and nitrobenzene on the absorption of ethylene by sulphuric acid.** K. C. BAILEY and W. E. CALCUTT (Sci. Proc. Roy. Dublin Soc., 1936, 21, 309—315).— $\text{Et}_2\text{O}$  and  $\text{PhNO}_2$  inhibit the rate of absorption of  $\text{C}_2\text{H}_4$  (cf. A., 1932, 1085) in conc.  $\text{H}_2\text{SO}_4$ . Every  $\text{Et}_2\text{O}$  mol. in the surface appears to inhibit equally 4—5 adjacent  $\text{H}_2\text{SO}_4$  mols. from absorbing the gas. A similar explanation is impossible for  $\text{PhNO}_2$ . When the absorbing surface is constantly renewed the inhibiting effect of  $\text{Et}_2\text{O}$  or  $\text{PhNO}_2$  is  $<$  in a static system, indicating that the inhibitor acts at the gas-liquid interface rather than in the bulk of the liquid.

J. L. D.

**Ozone as oxidising catalyst. XI. Ozonisation of aliphatic aldehydes in different solvents and in the gaseous state.** E. BRINER and A. LARDON (Helv. Chim. Acta, 1936, 19, 850—857; cf. this vol., 570).—Ozonisation of  $\text{CH}_2\text{O}$ ,  $\text{MeCHO}$ ,  $\text{EtCHO}$ , and  $\text{PrCHO}$  in the gas phase and in solution in  $\text{H}_2\text{O}$ ,  $\text{CCl}_4$ , or  $\text{C}_6\text{H}_{14}$  has been studied. T. G. P.

**Release of protons and deuterons from organic molecules in general basic catalysis, exemplified by bromination of nitromethane.** O. RETZ (Z. physikal. Chem., 1936, 176, 363—387).—The rates of bromination,  $k$ , of  $\text{MeNO}_2$  and  $\text{CD}_3\text{NO}_2$  both in pure  $\text{H}_2\text{O}$  and  $\text{D}_2\text{O}$  and in presence of acetate and chloroacetate buffers have been measured at 25° and 35°.  $k$  falls with increasing D content of the  $\text{NO}_2$ -compound, linearly at first, but with increasing slowness at the higher D contents. The ratio of  $k$  for  $\text{MeNO}_2$  to that for  $\text{CD}_3\text{NO}_2$  under the same conditions is 4—7, which is therefore also the ratio of the rate of protolysis to that of deuterolysis, since these are the processes which determine the rate of bromination as a whole. There is, however, no detectable difference between the energies of activation. Substitution of  $\text{D}_2\text{O}$  for  $\text{H}_2\text{O}$  as solvent depresses  $k$  by ~20%. The ratio of the strength of  $\text{H}_2\text{O}$  as a base to that of  $\text{D}_2\text{O}$  is ~1.6. At 83° the distribution ratio of D between  $\text{H}_2\text{O}$  and  $\text{MeNO}_2$  is ~0.8. The prep. of  $\text{CD}_3\text{NO}_2$  is described.

R. C.

**Thermal decomposition of sodium sulphate in presence of silica and kaolin.** J. A. FIALKOV and S. D. SCHARGORODSKI (Mem. Inst. Chem. Ukrain. Acad. Sci., 1935, 2, 269—283).—Decomp. of  $\text{Na}_2\text{SO}_4$ - $\text{SiO}_2$  mixtures commences at 1100°, the velocity of the reaction increasing with rise of temp. and with the degree of dispersion of the  $\text{SiO}_2$ . It is catalysed by  $\text{CeO}_2$ ,  $\text{TiO}_2$ , and  $\text{Fe}_2\text{O}_3$ , but not appreciably by  $\text{Cr}_2\text{O}_3$  and  $\text{Al}_2\text{O}_3$ . At 1200° the greatest decomp. velocity is attained by heating with kaolin, and the least with river sand, kieselguhr and  $\text{SiO}_2$  gel being intermediate. Decomp. is greatly accelerated by raising the kaolin content of the mixtures. The products are  $\text{SO}_2$  (evolved chiefly during the first hr. of heating) and Na silicates, aluminates, and aluminosilicates. The mass is readily converted by dil.  $\text{H}_2\text{SO}_4$  into  $\text{SiO}_2$  gel and  $\text{Al}_2(\text{SO}_4)_3$ .

R. T.

**Catalytic oxidation of sodium sulphite in presence of cupriferous charcoal.** K. VOLKOV and D. STRASHESKO (Bull. Sci. Univ. Kiev, 1935, 1, 95—99).—The velocity of oxidation of  $\text{SO}_3''$  in presence of C-Cu increases with the  $[\text{Cu}'']$  of the solution;  $\text{SO}_3'''$  or  $\text{SO}_4''$  are not adsorbed by the C, and the reaction takes place exclusively in the aq. phase.

R. T.

**Effect of catalysts and ant catalysts on the kinetics and mechanism of oxidation of sulphur dioxide by ozone.** L. I. KASCHTANOV and V. P. RISHOV (J. Gen. Chem. Russ., 1936, 6, 732—747).—The stoichiometric coeff.  $a$  (no. of mols. of  $\text{SO}_2$  oxidised per mol. of  $\text{O}_3$ ) rises with increasing  $[\text{SO}_2]$  and diminishing  $[\text{O}_3]$  to a max. of 18; the val. of  $a$  is unaffected by varying the rate of flow of the gas mixture, by presence of  $\text{PhOH}$ , alone or with  $\text{MnSO}_4$ , or by presence of benzoquinone, and remains const. at 0—60°. The velocity of reaction increases with rising temp., and falls with increasing  $[\text{H}_2\text{SO}_4]$  in the absorbent solution. The reaction is catalysed by  $\text{MnSO}_4$ .  $\text{O}_3$  oxidises  $\text{PhOH}$  to benzoquinone, and Mn to  $\text{MnO}_4^-$ , but  $\text{MnO}_4^-$  production is inhibited by  $\text{PhOH}$ . The application of the above findings to desulphurisation of flue gas, with recovery of  $\text{H}_2\text{SO}_4$ , is discussed.

**Influence of crystalline addenda on the velocity of evolution of gas from carbonates.** II. B. SREBROW (*Kolloid-Z.*, 1936, 76, 149—153; cf. A., 1935, 942).—The rate of thermal decomp. of  $\text{ZnCO}_3$  at  $254^\circ$  and of  $\text{NiCO}_3$  at  $330^\circ$  is increased by adding small amounts of  $\text{ZnO}$ ,  $\text{MnO}_2$ ,  $\text{FeO}$ ,  $\text{Fe}_2\text{O}_3$ ,  $\text{CuO}$ ,  $\text{PbO}$ , or  $\text{WO}_3$ . E. S. H.

**Mechanism of catalytic oxidation of carbon monoxide on manganese dioxide.** III. Existence of a critical lower pressure limit in the heterogenous oxidation. F. CHARACHORIN, S. ELOVITZ, and S. ROGINSKI (*Acta Physicochim. U.R.S.S.*, 1935, 3, 503—508; cf. A., 1935, 942).—Results to be published (IV, V) are discussed. Comparison of rates of CO absorption and oxidation at  $17^\circ$  indicates that for  $p_{\text{CO}} < 0.525$  mm. reaction takes place according to  $\text{CO} + \text{MnO}_2 = \text{CO}_2 + \text{MnO}$ . Above 0.525 mm. reaction is mainly CO (adsorbed) +  $\text{O}_2$  (adsorbed)  $\rightarrow \text{CO}_2$ . The possibility of chain reactions is considered. O. D. S.

**Speed of dissociation of carbon monoxide in presence of iron and its oxides.** F. MEUNIER (*Rev. Mét.*, 1936, 33, 258—264).—The degree of dissociation of CO in the presence of Fe has been measured at temp. from  $460^\circ$  to  $850^\circ$ . At all temp. the rate of dissociation is very rapid at first but quickly falls. Thus at  $525^\circ$  the rate in the first sec. is about 12 times the rate after 75 sec. The results are discussed in relation to the reactions occurring in the different zones of the blast furnace. W. P. R.

**Catalytic oxidation of carbon.**—See B., 1936, 675.

**Catalytic oxidation of carbon.** H. M. CASSEL (*J. Amer. Chem. Soc.*, 1936, 58, 1309—1310).—C, deposited on a glass surface from a gas flame, is more readily oxidised by  $\text{O}_2$  at  $600^\circ$  when the glass surface is roughened than when it is smooth. The reaction is probably facilitated wherever two adjacent crystals touch each other or project into the gaseous phase. The catalytic effect of NaCl on the combustion of C is discussed in this light. E. S. H.

**Catalytic properties of charcoal.** I. "Peroxidase" activity. C. SCHWOB (*J. Amer. Chem. Soc.*, 1936, 58, 1115—1117).—The peroxidase activity of C in the indophenol reaction has been determined at room temp. and  $p_{\text{H}}$  4.5. A hydrosol of C shows peroxidase activity in the formation of indophenol; no catalase activity has been observed. The C sol affects the e.m.f. of the cell  $\text{Pt}|\text{H}_2\text{O}_2, \text{KCl} (0.1N)|\text{Hg}_2\text{Cl}_2, \text{Hg}$  in the same way as does potato peroxidase. E. S. H.

**Reduction of carbon dioxide to methane.**—See B., 1936, 676.

**Catalytic investigation of alloys.** II. Decomposition of formic acid vapour on copper-silver alloys. G. RIENACKER and W. DIETZ (*Z. anorg. Chem.*, 1936, 228, 65—76; cf. this vol., 941).—The decomp. of  $\text{HCO}_2\text{H}$  on Ag-Cu catalysts (3, 59, 84, 92, 97% Ag) was measured by a flow method at  $180$ — $235^\circ$ . The activation energies for pure Cu and Ag were 21.6 and 18.8 kg.-cal., respectively. With 3% Ag (i.e., with excess of Cu component

embedded in eutectic) the val. was 17.3 kg.-cal. With 59% Ag it was 27.7 kg.-cal. The effect of composition on the activity of the catalyst is discussed.

H. J. E.

**Catalyst poisoning from the point of view of the specificity of active centres.** I. Relative durations of sojourn of ethyl alcohol and acetaldehyde molecules on copper. II. Effect of temperature on relative durations of sojourn of ethyl alcohol and acetaldehyde, and true activation energy of ethyl alcohol dehydrogenation on copper. A. BORK and A. A. BALANDIN (*Z. physikal. Chem.*, 1936, B, 33, 54—72, 73—82).—I. The dehydrogenation of EtOH to MeCHO has been studied at  $258^\circ$  by a streaming method, and the effect of MeCHO examined. The rate is given by  $dm/dt = k(M-m)/N$ , where  $M$  and  $N$  are the no. of EtOH mols. and total no. of mols. of all kinds, respectively, passing over the catalyst in unit time and  $m$  is the no. of EtOH mols. decomposed in unit time, and  $k$  contains no adsorption magnitudes. The above durations of sojourn are equal, and that of H.

II. This equality persists down to  $200^\circ$ . The true energy of activation is 12,800 g.-cal. per mol., and even near equilibrium is uninfluenced by the back reaction. The logarithmic relation between the consts. of Arrhenius' equation holds (cf. this vol., 435). The heats of adsorption of EtOH and MeCHO on the catalyst are equal. R. C.

**Vapour-phase catalytic oxidation of toluene.**—See B., 1936, 682.

**Mechanism of decomposition of methyl alcohol.** E. KUSS (*Angew. Chem.*, 1936, 49, 483—486).—The decomp. of MeOH at surfaces of fused  $\text{SiO}_2$ , Ag wool, Pt gauze, Al, Cu, Fe, CaO, and compressed charcoal can be interpreted on the basis of the reactions (a)  $\text{MeOH} \rightleftharpoons \text{CH}_3\text{O} + \text{H}_2$ , (b)  $2\text{MeOH} \rightleftharpoons \text{Me}_2\text{O} + \text{H}_2\text{O}$ , (c)  $\text{Me}_2\text{O} \rightleftharpoons \text{CH}_3 + \text{CH}_3\text{O}$ , (d)  $\text{Me}_2\text{O} \rightleftharpoons \text{CO} + \text{C} + 3\text{H}_2$ , (e)  $\text{CH}_3\text{O} \rightleftharpoons \text{CO} + \text{H}_2$ , (f)  $2\text{CO} \rightleftharpoons \text{CO}_2 + \text{C}$ . Ag and Al are the best sp. catalysts for reactions (a) and (b), respectively. Fe is initially a good catalyst for (a), but deteriorates rapidly owing to deposition of C produced by reactions (e) and (f). J. W. S.

**Electrolytic oxidation of sodium chloride to sodium chlorate.** L. DELAVENNA and J. MAILLARD (*Compt. rend.*, 1936, 202, 1663—1664).—The yield of  $\text{NaClO}_3$  in the electrolytic oxidation of NaCl has been improved by preventing the escape of  $\text{Cl}_2$  by rapid circulation of the electrolyte under pressure, employing a high anodic c.d., and cooling the liquid. With a c.d. at the anode of 20 amp. per sq. dm., in saturated NaCl at  $0^\circ$ , under a pressure of 400 cm.  $\text{H}_2\text{O}$ , the efficiency is 95% and  $\text{NaClO}_3$  of 99.5% purity separates. M. S. B.

**Electrolysis of aluminosilicates.** M. S. FORTUNATOV (*Mem. Inst. Chem. Ukrain. Acad. Sci.*, 1935, 2, 257—259).—Electrolysis of molten 1:2:12  $\text{SiO}_2\text{--Al}_2\text{O}_3\text{--NaHCO}_3$  leads to deposition of Si at the cathode. Al is not deposited before most of the Si has been eliminated. R. T.

**Electrolytic separation of polonium and radium-D.** G. B. PEGRAM and J. R. DUNNING (*Physical Rev.*, 1935, [ii], 47, 325).—Po and Ra-D

can be completely separated from solutions and from each other by the use of the Fink-Rohrman rapidly-spinning disc cathode. L. S. T.

**Effect of ultrasonic radiation on electro-deposits.** W. T. YOUNG and H. KERSTEN (J. Chem. Physics, 1936, 4, 426—427).—Sound waves with a frequency of about 1700 kc. produce ripples in electro-deposited Fe, Co, Cd, Zn, brass, or black Ni. It is suggested that stationary waves are set up in the solution and that the metal ions are relatively more conc. in layers separated by half  $\lambda$ . For Fe and Zn the best effect was obtained in conc. solutions.

H. J. E.

**Standardisation of photochemical methods for the measurement of solar ultra-violet radiation.** H. S. MAYERSON (Amer. J. Hyg., 1935, 22, 106—136).—Methods of controlling errors in the bleaching of a COMe<sub>2</sub>-methylene-blue mixture by light are given. The blackening of ZnS is satisfactory if the change in reflexion factor is measured. The H<sub>2</sub>C<sub>2</sub>O<sub>4</sub>-UO<sub>2</sub>SO<sub>4</sub> method is best. CH. ABS. (e)

**Reactions induced by the photoactivation of the water molecule.** I. H. FRICKE and E. J. HART (J. Chem. Physics, 1936, 4, 418—422).—Unbuffered gas-free solutions of MeOH in H<sub>2</sub>O are decomposed to H<sub>2</sub> and CH<sub>2</sub>O (about 10—20% of the H<sub>2</sub> formed) on irradiation with  $\lambda$  1850—2000 Å. H<sub>2</sub>O alone is unchanged, but it absorbs these  $\lambda$  and serves to sensitise the decomp. of MeOH. H. J. E.

**Catalytic decomposition of hydrogen peroxide in a bromine-bromide solution. Effect of light on the steady-state rate.** R. LIVINGSTON and E. A. SCHOELD (J. Amer. Chem. Soc., 1936, 58, 1244—1246).—The rate is increased by light, but may be represented by  $V=k[\text{H}_2\text{O}_2][\text{H}^+][\text{Br}^-]$  for either the dark or light reaction. The increase in the abs. rate is explained by the increase in the steady-state [HBr]. The calc. average quantum yield for the reaction is < 1. E. S. H.

**Influence of wave-length of light on the development of the latent image.** (Mlle.) A. TOURNAIRE and E. VASSY (Compt. rend., 1936, 202, 1984—1986).—Measurements are recorded showing the effect of the time of development of the latent image on the density after development (for  $\lambda$  3520—2320 Å.). The development of the latent image depends on the  $\lambda$  of the light used. H. J. E.

**Photographic photometry in the extreme ultra-violet.** (MME.) R. HERMAN-MONTAGNE, L. HERMAN, and R. RICARD (Compt. rend., 1936, 202, 1668—1670).—When Na salicylate is used for sensitising Lumière plates (blue label) for use in the ultra-violet, the contrast factor for const. illumination is practically const. (to within 6%) not for the range 3000—1250 Å. only, but also up to 700 Å. These plates have been compared with those prepared by destroying the gelatin support of ordinary plates with dil. H<sub>2</sub>SO<sub>4</sub>. The latter are less sensitive than the former to strong but much more sensitive to feeble illumination, and are, therefore, more satisfactory for the detection of rays or bands of low intensity.

M. S. B.

**Photolysis of formaldehyde, acetaldehyde, and acetone at high temperatures.** E. I. AKEROYD and R. G. W. NORRISH (J.C.S., 1936, 890—894).—The results of previous workers are confirmed (cf. Leermakers, A., 1934, 976). MeCHO and CH<sub>2</sub>O exhibit chain reactions; COMe<sub>2</sub> does not. From vals. of the temp. coeffs. obtained from velocity readings between room temp. and 400° heats of activation of 9.8 kg.-cal. for MeCHO and 16.0 kg.-cal. for CH<sub>2</sub>O were obtained. A slight simplification of Leermakers' mechanism is proposed, and the propagation of the chains by Me radical carriers is confirmed.

D. C. J.

**Photochemical oxidation of formaldehyde and acetaldehyde.** J. E. CARRUTHERS and R. G. W. NORRISH (J.C.S., 1936, 1036—1042).—The oxidation of CH<sub>2</sub>O and MeCHO proceeds by short-length chains, that of CH<sub>2</sub>O being through HCO<sub>2</sub>H and of MeCHO through Ac<sub>2</sub>O<sub>2</sub> (cf. A., 1930, 434). No peroxide or peracid is formed in the case of CH<sub>2</sub>O. Quantum efficiencies for CH<sub>2</sub>O+O<sub>2</sub> and 2CH<sub>2</sub>O+O<sub>2</sub> give vals. of 12.6 and 9.0 mols. per quantum absorbed, respectively. For the MeCHO oxidation, determined in a closed system and by a flowing method, vals. of the order of 20 mols. per quantum absorbed are obtained.

D. C. J.

**Mechanism of the photo-decomposition of acetone.** R. SPENCE and W. WILD (Nature, 1936, 138, 206; cf. this vol., 437).—At room temp. the photo-decomp. of COMe<sub>2</sub> yields 1.5 vols. of C<sub>2</sub>H<sub>6</sub> to 1 of CO, and Ac<sub>2</sub> is also formed. At 60°, approx. equal amounts of CO and C<sub>2</sub>H<sub>6</sub> are formed together with some CH<sub>4</sub>. The primary photochemical process appears to be COMe<sub>2</sub>+ $h\nu$ →Me+MeCO (cf. A., 1934, 1184).

L. S. T.

**Photochemical peroxide formation.**—See this vol., 1091.

**Photochemical decomposition of vitamin-A.**—See this vol., 1159.

**Photo-reduction of fluorescent substances by ferrous ions.** J. WEISS (Nature, 1936, 138, 80—81).—A reply to criticism (this vol., 907). L. S. T.

**Effect of supersonic vibrations on chemical reactions.** S. SOKOLOV (Tech. Phys. U.S.S.R., 1936, 3, 176—182).—Exposure to supersonic vibrations tends to coagulate colloidal solutions which are on the point of coagulation, i.e., those in which the size of the particles is relatively great. On the other hand in some cases in which the colloid is almost completely pptd. exposure to supersonic vibrations results in re-dispersion of the colloid. Numerous examples of both cases are cited. Supersonic vibrations produce inversion in slightly acid solutions of sucrose but not in neutral solutions.

A. R. P.

**Sonic activation in chemical systems: oxidations at audible frequencies.** E. W. FLOSDORF, L. A. CHAMBERS, and W. M. MALISOFF (J. Amer. Chem. Soc., 1936, 58, 1069—1076).—A quant. investigation of the oxidation of H<sub>2</sub>O<sub>2</sub>, aq. NaCl, and aq. Na<sub>2</sub>SO<sub>3</sub> at audible frequencies shows that the reactions are brought about by the production of activated O in association with cavitation. A compound of Na 3-aminophthalhydrazide and

sonically-produced  $\text{H}_2\text{O}_2$  can be energised to produce chemiluminescence in absence of the usual secondary oxidants. E. S. H.

**Theoretical interpretation of radiochemical reactions via molecular clusters.** R. LIVINGSTON (Bull. Soc. chim. Belg., 1936, 45, 334—352; cf. A., 1934, 497).—A discussion of the various possible types of reaction occurring by  $\alpha$ -ray activation, based on the theories of Lind and of Mund (A., 1931, 1139). A theoretical expression is developed for the ionic yield in the special case where the chemical reaction occurs inside the "clusters" which, when applied to the system  $\text{Br}_2\text{--H}_2\text{--HBr}$ , gives results in fair agreement with the experiments of Lind and Livingston (this vol., 688), and when applied to the polymerisation of  $\text{C}_2\text{H}_2$  gives an expression very similar to that developed by Mund (A., 1931, 604).

R. C. M.

**Production of light water and determination of deuterium concentration in normal water.** N. MORITA and T. TITANI (Bull. Chem. Soc. Japan, 1936, 11, 403—413).— $\text{H}_2$  and  $\text{O}_2$  obtained respectively by fractional and complete electrolysis of  $\text{H}_2\text{O}$  were combined to form light  $\text{H}_2\text{O}$ . In this way variations in  $d$  due to the electrolytic separation of O isotopes were eliminated. By comparing  $d$  with the val. for ordinary  $\text{H}_2\text{O}$  the ratio D : H in the latter is 1 : < 5600.

C. R. H.

**Sodium xanthate.** L. FILIPCZYK and M. KULESZA (Rocz. Chem., 1936, 16, 245—253).—Pure Na xanthate (I) is prepared by adding excess of  $\text{CS}_2$  to NaOEt in EtOH, and, after 30 min. at  $0^\circ$ , adding 5 vols. of  $\text{Et}_2\text{O}$ , collecting the ppt. of  $\text{NaCS}_2(\text{OEt})_2\cdot\text{H}_2\text{O}$ , and dehydrating in vac. at  $35^\circ$ . When (I) is dissolved in ordinary distilled  $\text{H}_2\text{O}$  an emulsion forms, and the titre of the solution (I in KI) falls rapidly, whilst with twice-distilled,  $\text{CO}_2$ -free  $\text{H}_2\text{O}$  the clear solution obtained remains unchanged for 3—10 hr. R. T.

**Cuprous thiocyanate. Formation of coloured cuprous thiocyanate precipitates.** D. KRÜGER, W. BÜSSEM, and E. TSCHIRCH (Ber., 1936, 69, [B], 1601—1610).—Pure white  $\text{CuCNS}$ , obtained by slow, spontaneous decomp. of very dil. solutions of  $\text{Cu}(\text{CNS})_2$ , has an X-ray diagram with very few lines and appears to have a cryst. form of high symmetry, probably hexagonal or trigonal. Black  $\text{Cu}(\text{CNS})_2$  gives a diagram with many lines and appears of lower symmetry.  $\text{CuCNS}$  obtained by addition of  $\text{Na}_2\text{S}_2\text{O}_3$  to solutions of  $\text{Cu}(\text{CNS})_2\text{--H}_2\text{SO}_4$  appears rhombic and yields a diagram rich in lines; its formation cannot be attributed to  $\text{Na}_2\text{S}_2\text{O}_3$  or  $\text{Na}_2\text{S}_4\text{O}_6$  embedded in the lattice. Addition of small amounts of KI to neutral or acid solutions of  $\text{Cu}(\text{CNS})_2$  accelerates the separation of  $\text{CuCNS}$  and leads to the formation of ppts. ranging in colour from sandy to intensely violet. The possibility that the colour is due to adsorbed I is rendered improbable by the shade of the ppts. and excluded by the observation that violet deposits are obtained from solutions of  $\text{CuSO}_4\text{--KCNS--KI}$  of such small concn. that free I is not present. X-Ray examination of the violet material shows the presence of both modifications of  $\text{CuCNS}$  described above and a no. of new lines, including a very characteristic double line, not identical with those of  $\text{CuI}$

or  $\text{Cu}(\text{CNS})_2$  and ascribed to a third modification of  $\text{CuCNS}$ . H. W.

**Order of affinity of metals for copper, iron, cobalt, and nickel.** A. S. RUSSELL (Nature, 1936, 138, 161).—Certain metals show a definite order with respect to their power of combining with Cu, Fe, Co, and Ni. For combination with Cu, the order is Al, Sn, Zn, Cd, Hg, and Pb. If Cu be competed for by two of these metals the one earlier in the series combines to the exclusion of the other. When added to a compound of Cu and one of these metals, a metal earlier in the series displaces the combined metal completely. Ternary and even quaternary compounds may temporarily be formed, but ultimately the metal lower in the series is set free. With a metal later in the series no reaction occurs. With Fe the most stable compounds are  $\text{AlFe}_3$ ,  $\text{SnFe}_2$ ,  $\text{ZnFe}_7$ , and  $\text{HgFe}_4$  and the order is Al, Sn, Zn, Hg, Cd, and Pb. Neither Sn nor Zn can displace Al from  $\text{AlFe}_3$ , which is most easily prepared by adding Al to a Sn-Fe or Zn-Fe compound in Hg. With Co the most stable compounds are  $\text{AlCo}$ ,  $\text{SnCo}_2$ ,  $\text{ZnCo}$ , and  $\text{HgCo}$ , and with Ni,  $\text{AlNi}$ ,  $\text{Sn}_4\text{Ni}_5$ ,  $\text{ZnNi}$ , and  $\text{HgNi}$ . With Co and Ni, the order is the same as for Fe. L. S. T.

**Cuprotartrates.**—See this vol., 1093.

**Complex compounds of dicarboxylic acid hydrazides.** K. A. JENSEN and B. BAK (Z. anorg. Chem., 1936, 228, 83—88).—The blue cryst. compounds  $[\text{Cu}\{\text{X}(\text{NH}\cdot\text{NH}_2)\}_2]\text{SO}_4$  ( $\text{X}=\text{CHO}$ , Ac, or Bz) were prepared by interaction of aq.  $\text{CuSO}_4$  with the corresponding hydrazide and pptn. with EtOH. Hydrazides of the dicarboxylic acids yielded a series of cryst. compounds of the general formula  $[\text{Cu}\{(\text{NH}_2\cdot\text{NH})\text{C}(\text{O})_2(\text{CH}_2)_n\}_2]\text{SO}_4$  ( $n=2\text{--}8$ ). Hydrazides of  $\text{H}_2\text{C}_2\text{O}_4$  and  $\text{CH}_2(\text{CO}_2\text{H})_2$  gave compounds of variable composition containing > 1 atom of Cu to 1 mol. of hydrazide. H. J. E.

**Reactions in the solid state. II. Investigation of the formation of copper ferrite by the Hahn emanation method.** R. JAGITSCH and A. MASCHIN (Monatsh., 1936, 68, 101—108; cf. A., 1935, 1333).—Addition of  $\text{CuO}$  to active  $\text{Fe}_2\text{O}_3$  lowers the temp. at which the escape of emanation is a min. from approx.  $950^\circ$  to  $850^\circ$ .  $\text{CuO}$  has no effect up to  $650^\circ$ .  $\text{Fe}_2\text{O}_3$  decreases the escape of emanation from active  $\text{CuO}$  at  $> 600^\circ$ . Changes in activity with time at  $660\text{--}800^\circ$  were measured. The rate of formation of crvst. ferrite increases rapidly above  $700^\circ$ . H. J. E.

**Dehydration of brucite.** J. GARRIDO (Compt. rend., 1936, 203, 94—95).—The dehydration of brucite at temp. between  $500^\circ$  and  $1100^\circ$  has been studied in relation to the crystal form of the  $\text{MgO}$  formed.

C. R. H.

**Mechanism of dehydration of calcium sulphate hemihydrate.** H. B. WEISER, W. O. MILLIGAN, and W. C. EKHOLM (J. Amer. Chem. Soc., 1936, 58, 1261—1265).—Isobaric dehydration gives a definite step, indicating that  $\text{CaSO}_4\cdot 0.5\text{H}_2\text{O}$  is a true hydrate. X-Ray examination shows that the hemihydrate and its dehydration product do not possess identical structures. E. S. H.

**Preparation of anhydrous calcium sulphate.** S. D. WILSON and L. TING-HSI (J. Chem. Eng. China, 1936, 3, 131).—Anhyd.  $\text{CaSO}_4$  for use as a laboratory desiccating agent is prepared from gypsum by heating at  $160^\circ$ , hydrating to give a slab of  $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ , breaking this up, screening, and heating the sized fragments separately at  $240$ – $260^\circ$  for 2 hr. C. I.

**Formation of crystalline calcium silicate hydrate.** W. KOHLER (Tonind.-Ztg., 1935, 59, 739–740, 754–756; Chem. Zentr., 1935, ii, 3215).—Wollastonite was unchanged by heating for 14 days with 4 times its quantity of  $\text{H}_2\text{O}$  at  $100^\circ$ ,  $150^\circ$ ,  $212^\circ$ , and  $290^\circ$ .  $2\text{CaO} \cdot \text{SiO}_2$  when treated with  $\text{H}_2\text{O}$  at  $212^\circ$  and  $290^\circ$  formed  $2 \cdot 2\text{CaO} \cdot \text{SiO}_2 \cdot \text{H}_2\text{O}$ , which commenced to lose  $\text{H}_2\text{O}$  at  $>300^\circ$ . Hydrothermal treatment of  $3\text{CaO} \cdot \text{SiO}_2$  gave  $\text{Ca}(\text{OH})_2$  and doubly refractive needles of  $\text{CaO} \cdot \text{SiO}_2 \cdot 0.25\text{H}_2\text{O}$ , which may also be prepared hydrothermally from a mixture of ground quartz and  $\text{CaO}$ . H. J. E.

**Synthesis of hydrated monocalcium silicates under pressure.** (MLLE.) J. FORET (Compt. rend., 1936, 203, 80–83).— $\text{CaO}$  and  $\text{SiO}_2$ , 1 : 1, heated under pressure in presence of  $\text{H}_2\text{O}$  at temp. between  $100^\circ$  and  $200^\circ$ , yield  $\text{Ca}_1$  silicate of two different structures according as the temp. is  $<$  or  $> 140^\circ$ . C. R. H.

**Action of calcium carbide on methyl alcohol.**—See this vol., 1091.

**Crystallisation of zinc borate.** R. PARIS and P. MONDAIN-MONVAL (Compt. rend., 1936, 202, 2075–2077).—Crystallisation of  $3\text{ZnO} \cdot 2\text{B}_2\text{O}_3$  commences at  $500^\circ$ . The rate increases to a max. at  $820^\circ$  and then decreases up to the m.p. ( $980^\circ$ ). H. J. E.

**Argento-mercuric compound.** P. SPACU (Compt. rend., 1936, 202, 1987–1989).—The compound  $\text{Hg}(\text{CN})_2 \cdot \text{AgNO}_3 \cdot 2\text{H}_2\text{O}$  has a characteristic X-ray spectrum, and is therefore not a mixture of  $\text{Hg}(\text{CN})_2$  and  $\text{AgNO}_3$ . H. J. E.

**Antagonisms and alliances, experimentally demonstrated in effervescent and silent corrosion of aluminium, zinc, iron, tin, and lead in dilute acids, are of electrical nature.** P. RONCERAY (Bull. Soc. chim., 1936, [v], 3, 1301–1303).—The electrical nature of corrosion is discussed. E. S. H.

**Theory agrees with experimental results concerning intrinsic and extrinsic impurities in metals immersed in dilute acids.** P. RONCERAY (Bull. Soc. chim., 1936, [v], 3, 1303–1306).—The role of impurities in the dissolution of metals in acids is discussed. E. S. H.

**Alumina.** T. NAKAI and Y. FUKAMI (J. Soc. Chem. Ind. Japan, 1936, 39, 203–204B).—Heating samples of  $\text{Al}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$  obtained from different sources produced  $\gamma\text{-Al}_2\text{O}_3$  at the same temp. but on subsequent further heating the change  $\gamma\text{-Al}_2\text{O}_3 \rightarrow \alpha\text{-Al}_2\text{O}_3$  took place at different temp. with the different samples. On heating  $\text{Al}(\text{NO}_3)_3$ ,  $\text{Al}(\text{OAc})_3$ ,  $\text{Al}_2(\text{SO}_4)_3$ , and  $\text{AlCl}_3$ ,  $\gamma\text{-Al}_2\text{O}_3$  was first formed in all cases. T. W. P.

**Preparation of synthetic zeolites.** J. K. DELIMARSKI (Bull. Sci. Univ. Kiev, 1935, 1, 175–189).—Synthetic zeolite (I), in common with kaolin, under-

goes exothermic transformation at  $900$ – $1000^\circ$ . (I) is a salt of "permuteic acid" (II), sols of which may be obtained by treating (I) with dil.  $\text{HCl}$ . Gels of (II) yield (I) when treated with 4–5*N*- $\text{NaOH}$ ; such gels as do not exhibit the exothermic transformation at  $900^\circ$  will not yield active (I). R. T.

**[Reaction of tin with dilute acids.]** P. RONCERAY (Bull. Soc. chim., 1936, [v], 3, 1290–1294).—Thin Sn foil, impure, but without external heterogeneity, dissolves in dil.  $\text{HCl}$  or  $\text{H}_2\text{SO}_4$  with effervescence, but with thicker foil there is no effervescence. In the latter case, dissolution takes place through the reaction  $\text{Sn} + 2\text{HCl} + \text{O} \rightarrow \text{SnCl}_2 + \text{H}_2\text{O}$ . E. S. H.

**By their antagonisms and alliances, corrosion reactions tend towards a maximum or a minimum.** P. RONCERAY (Bull. Soc. chim., 1936, [v], 3, 1306–1309).—Observations on the corrosion of tinplate in dil.  $\text{HCl}$  are discussed. E. S. H.

**Conditions for the preparation of oxide hydrates from ethylates and for the detection of hydrates from the  $p$ - $x$  curves.** P. A. THIESSEN and R. KOPPEN (Z. anorg. Chem., 1936, 228, 57–60; cf. A., 1931, 323).—A reply to criticisms by Weiser and Milligan (A., 1935, 433; this vol., 287). The formation of stable oxide hydrates of Sn, Si, Al, and Cr is reaffirmed. H. J. E.

**[Reaction of lead with dilute acids.]** P. RONCERAY (Bull. Soc. chim., 1936, [v], 3, 1294–1297).—Observations on the conditions under which effervescence occurs are reported. E. S. H.

**Hexametaphosphoric acid.** (MME.) R. SALIH (Bull. Soc. chim., 1936, [v], 3, 1391–1396).— $\text{H}_6(\text{PO}_3)_6$  has been prepared by decomp.  $\text{Pb}_3(\text{PO}_3)_6$  with  $\text{H}_2\text{S}$ . The aq. solution gives white gelatinous ppts. with  $\text{Ag}^+$  or  $\text{Pb}^{++}$ . Conductometric titration curves with  $\text{NaOH}$  show that all the H atoms are replaceable, the first four more easily than the remaining two. E. S. H.

**Preparation of hypophosphoric acid from  $\text{PCl}_3$ .** J. H. KOLITOWSKA (Rocz. Chem., 1936, 16, 313–317).— $\text{PCl}_3$  is hydrolysed at  $0^\circ$  in an acetate buffer at  $p_{\text{H}}$  5.7, and 0.1*N*-I is added;  $\text{H}_4\text{P}_2\text{O}_6$  is obtained in 10% yield. The probable reaction is  $\text{O} \cdot \text{PH}(\text{OH})_2 + \text{I}_2 \rightarrow 2\text{HI} + [\text{PO}(\text{OH})_2]_2$ . R. T.

**Isotopic separation of oxygen, chlorine, bromine, and nitrogen by chemical methods.** E. OGAWA (Bull. Chem. Soc. Japan, 1936, 11, 428–430).—Experiments which support the author's theories are described (cf. this vol., 1043). C. R. H.

**Hydrolysis of sulphur by water below  $100^\circ$ .** E. CHERBULIEZ and R. WEIBEL (Helv. Chim. Acta, 1936, 19, 796–801).—Hydrolysis proceeds by the reaction  $4\text{S} + 3\text{H}_2\text{O} = 2\text{H}_2\text{S} + \text{H}_2\text{S}_2\text{O}_3$ . T. G. P.

**Reactions of selenium oxychloride and selenium tetrachloride with pyridine.**—See this vol., 998.

**Polymetatelluric acid esters.**—See this vol., 1097.

**Hexaiodotellurates of aromatic amines and heterocyclic bases.** T. KARANTASSIS and L. CAPAPOS (Compt. rend., 1936, 203, 83–84).—The hexaiodotellurates of  $\alpha$ - and  $\beta$ - $\text{C}_{10}\text{H}_7 \cdot \text{NH}_2$ ,  $m\text{-C}_6\text{H}_4(\text{NH}_2)_2$ ,

benzidine, dianisidine, piperidine, and cinchonine have been prepared. The general formula is  $I_6Te(HB)_2$  or  $I_6TeH_2B$  according to whether  $B$  (base) is uni- or bi-valent. They are cryst., anhyd., and hydrolysed by  $H_2O$ . C. R. H.

**Preparation of Bjerrum's green hydrate of chromic chloride.** M. G. DE CELIS (Anal. Fis. Quim., 1936, 34, 553—556).—A modified method of prep. consists in slowly adding a solution of Recoura's chlorosulphate, cooled to  $0^\circ$ , to  $Et_2O$  saturated with  $HCl$ , at  $0^\circ$ , at the same time passing in a current of gaseous  $HCl$ . The yield of  $[CrCl(H_2O)_5]Cl_2 \cdot H_2O$  is  $>80\%$ . L. A. O'N.

**Extraction of uranium-X by ferric hydroxide precipitation.** M. BACHELET (Compt. rend., 1936, 203, 69—71).—Aq.  $UO_2(NO_3)_2$  (200 g. per litre) is treated, in presence of  $Fe^{III}$  salt, with sufficient aq.  $NH_3$  to give  $p_H$  3.55, at which  $p_H$  little U is pptd. The  $Fe(OH)_3$  ppt., containing U-X and some U, is collected, washed, and, after dissolving in  $HCl$ , is added to a solution of  $(NH_4)_2CO_3$  and  $(NH_4)_2S$ . U-X and U dissolve as double carbonates and, after concn.,  $HCl$  is added, and the solution boiled and filtered from S, which is inactive. Pptn. with aq.  $NH_3$  followed by ignition of the ppt. yields  $U_3O_8$  85—95% active. C. R. H.

**Isotope exchange between hydrogen bromide and bromine.** B. TOPLEY and J. WEISS (J.C.S., 1936, 912).—Br containing the radioactive isotope is added to approx. equiv. amounts of dry  $HBr$  in  $CCl_4$  solution, and the free Br immediately removed by Hg. The  $HgBr$  and the  $HBr$  in the filtrate are converted into  $AgCl$  and the sp. activities of the two  $AgBr$  samples are found to be equal. This complete interchange occurs at room temp. in  $<2$  min. Possible mechanisms of the interchange are discussed. D. C. J.

**Steel, partly tinned and polished, does not effervesce with dilute acids.** P. RONCERAY (Bull. Soc. chim., 1936, [v], 3, 1297—1301). E. S. H.

**Ferric hydroxides, and ferrous and silver ferrites.** A. KRAUSE (Rocz. Chem., 1936, 16, 318—322).—Polemical, against Rodt (cf. A., 1934, 1320). R. T.

**Preparation and composition of wustite phases.** E. E. WOOD and J. B. FERGUSON (J. Washington Acad. Sci., 1936, 26, 289—293).—Attempts to obtain  $FeO$  by heating  $Fe(OH)_2$  prepared in an atm. of  $N_2$  gave a product containing 80.4%  $FeO$ . The product always contained some  $Fe^{III}$ , the amount being the greater the higher was the temp. of dehydration. A wustite is probably a primary product. The action of heat on  $FeC_2O_4$  in vac. does not give pure  $FeO$ .  $Fe$  and  $Fe_3O_4$  produced by the thermal decomp. of wustite recombine at higher temp. An attempt to make  $FeO$  by the complete combination of  $Fe$  and  $Fe_3O_4$  was unsuccessful. The limits of the wustite field were determined. A. J. M.

**Metal carbonyls. Metal carbonyl hydrides.** W. HIEBER [with K. KRAMER and H. SCHULTEN] (Angew. Chem., 1936, 49, 463—464; cf. A., 1932, 485; 1933, 685).— $Co(CO)_4$  (3 mols.) reacts with bases yielding *Co carbonyl hydride*  $Co(CO)_4H$  (2 mols.) and

$Co(CO)_3$  (1 mol.) with strong bases or  $Co(OH)_2$  (1 mol.) with weak bases. The compound has m.p.  $-22^\circ$  and decomposes above  $-18^\circ$  yielding  $Co(CO)_4$  and  $H_2$ . With complex *o*-phenanthroline-Ni and -Co ions it yields the compounds  $[Co(CO)_4]_2[Ni(C_{12}H_8N_2)_3]$  and  $[Co(CO)_4]_2[Co(C_{12}H_8N_2)_3]$ . With conc. solutions containing  $[Ni(NH_3)_6]^{2+}$  it yields the compound  $[Co(CO)_4]_2[Ni(NH_3)_6]$ . Action of conc. aq.  $NH_3$  on  $Co(CO)_4$  yields the compound  $[Co(CO)_4]_2[Co(NH_3)_6]$ . The series relationships of the Fe, Co, and Ni carbonyls and carbonyl hydrides and their structures are discussed. J. W. S.

**Action of ammonium chloride on oxides.** E. MONTIGNIE (Bull. Soc. chim., 1936, [v], 3, 1388—1389).—Aq.  $NH_4Cl$  partly dissolves hydroxides of Mg, Sn, Cd, Zn, Mn, or Fe. With hydroxides of Ni, Co, Cu, and Hg the products are  $NiCl_2 \cdot 8NiO \cdot 13H_2O$ ,  $CoCl_2 \cdot 3CoO \cdot 3H_2O$ ,  $CuCl_2 \cdot 3CuO \cdot xH_2O$ , and  $2HgCl_2 \cdot HgO$ , respectively.  $Ag_2O$  is converted into  $AgCl$ . E. S. H.

**Basic salts. XIV. Constitution of solid basic salts of bivalent metals. II. Basic nickel halides with simple laminated lattices.** W. FEITKNECHT and A. COLLET (Helv. Chim. Acta, 1936, 19, 831—841; cf. this vol., 669).—The hydrolysis of aq.  $NiCl_2$  above  $100^\circ$  yields  $NiCl_2 \cdot 3Ni(OH)_2$  or  $NiCl_2 \cdot Ni(OH)_2$  according to the concn. An ill-defined basic bromide, of ideal formula  $NiBr_2 \cdot 3Ni(OH)_2$ , has but a narrow homogeneity range. The lattices of these compounds have been studied by means of X-rays. T. G. P.

**Recent advances in microanalysis.** (MLLE.) A. LACOURT (Bull. Soc. chim. Belg., 1936, 45, 189—212).—The trustworthiness of methods for determining the elements is tested (see also this vol., 1132). J. G. A. G.

**Analytically useful efficiency of chemical reactions.** A. SCHLEICHER (Z. anal. Chem., 1936, 105, 385—392).—The analytical efficiency of a reaction is made up of two factors, a capacity and an intensity factor; both factors can be derived from the abs. quantity in g. and the logarithm of the enrichment ( $\alpha$ ), where  $\alpha$  is the product of the relation between the initial and final concn. of the reactants, and the relation of the reaction consts. A. R. P.

**Foaming analysis.** W. O. OSTWALD and A. SIEHR (Kolloid-Z., 1936, 76, 33—46).—Foaming analysis is the production of a foam in a solution by agitation with a gas followed by continuous separation of the foam, thus giving a "spumate" and a residue. Apparatus and technique for foaming analysis are described. Examples of the recovery of dissolved substances from aq. solutions are given, and the technical applications of the process discussed. E. S. H.

**Determination of acidity in heavy water mixtures.** V. K. LA MER and S. KORMAN (Science, 1936, 83, 624—626).—D substitution exerts an influence  $>$  expected on the chemical properties of acid-base catalysis and acid dissociation consts. The quinhydrone electrode is satisfactory for measurements in the second case, and data are given for  $H_2O$ , quinol,  $AcOH$ , salicylic acid, etc. The effect of D

substitution appears to be sp., but, in general, is more pronounced for weaker acids. The potential of the quinhydrone electrode in HCl and DCl solutions is 0.0345 volt more positive in D<sub>2</sub>O than in H<sub>2</sub>O, owing to unsymmetrical distribution of D in  $QH_2 + 2DCl \rightleftharpoons QD_2 + 2HCl$ . Other exchange equilibrium consts. are tabulated.

L. S. T.

**New fluorescent indicators (naphthionic acid and Schaeffer's salt).** M. DÉRIBÉRE (Ann. Chim. Anal., 1936, [iii], 18, 173; cf. this vol., 810).—The fluorescence of Schaeffer's salt changes from zero below  $p_H$  5.0, through bluish-violet and greenish-blue to bright blue above  $p_H$  11. That of naphthionic acid changes from zero below  $p_H$  3 to bright blue between  $p_H$  6.5 and 9, thence to yellow-green between  $p_H$  10 and 12.

E. C. S.

**Indicators.** I. M. KOLTHOFF (Ind. Eng. Chem. [Anal.], 1936, 8, 237—239).—Future developments are discussed.

E. S. H.

**Preparation of diphenylamine indicator solution.** H. M. STATE (Ind. Eng. Chem. [Anal.], 1936, 8, 259).—Dissolution in H<sub>2</sub>SO<sub>4</sub> is facilitated by first melting the amine and then adding H<sub>2</sub>SO<sub>4</sub> to the liquid.

E. S. H.

**Determination of chlorides.**—See this vol., 1038.

**Determination of active chlorine in bleach liquors.**—See B., 1936, 692.

**Vanadium sulphate as a reducing agent.** II. **Determination of chlorates, nitrates, and persulphates.** P. C. BANERJEE (J. Indian Chem. Soc., 1936, 13, 301—304).—Chlorates and nitrates are reduced to chlorides and NH<sub>3</sub>, respectively, by VSO<sub>4</sub> in boiling dil. H<sub>2</sub>SO<sub>4</sub> and in a current of CO<sub>2</sub>. The reduction of persulphates takes place at room temp. in the presence of Fe<sup>III</sup> salt. In each case the excess of VSO<sub>4</sub> is titrated with KMnO<sub>4</sub> solution.

C. R. H.

**Application of Andrews' iodine monochloride method to the iodine bromide process.** R. LANG (Z. anal. Chem., 1936, 106, 12—23).—ICl solution treated with saturated aq. KBr in presence of CCl<sub>4</sub> first liberates I, which on further addition of KBr disappears again. This is attributed to the suppression of the [I'] through the action of excess of Br', causing recombination of I and Br (produced by initial decomp. of IBr) re-forming IBr. Presence of KBr (1.3 mol. per litre) also prevents hydrolysis of IBr to yield HBr, I, and HIO<sub>3</sub>, whereas KCl does not. To apply the IBr process to the determination of I or of I' by KIO<sub>3</sub>, the sample, containing >0.16 g. of I, is treated with 22 g. of KBr and 5 c.c. of conc. HCl and diluted to 100 c.c., 5 c.c. of CCl<sub>4</sub> being added. It is titrated with KIO<sub>3</sub> with vigorous agitation until the CCl<sub>4</sub> is decolorised. The method can also be used for titration of Sb<sup>III</sup> etc. in presence of [HCl] too great for the ICl method. For titration of reducing agents, e.g., CH<sub>2</sub>O, 10 c.c. of 0.05M-CH<sub>2</sub>O are treated with 5 c.c. of aq. ICl and 20 c.c. of 2.5N-NaOH in which 15 g. of KBr are dissolved. After 5—10 min., a further 22 g. of KBr are added and 10 c.c. of conc. HCl. The solution is diluted to 200 c.c. and titrated with KIO<sub>3</sub> in presence of CCl<sub>4</sub>. Other oxidising agents [KIO<sub>4</sub>, KMnO<sub>4</sub>, KBrO<sub>3</sub>, KClO<sub>3</sub>, Ce(SO<sub>4</sub>)<sub>2</sub>, chloramine-T, Br,

and K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>] can be used in place of KIO<sub>3</sub> in the titration of I' by this method.

J. W. S.

**Nephelometric determination of fluorine [in minerals].** R. E. STEVENS (Ind. Eng. Chem. [Anal.], 1936, 8, 248—252).—Decomp. of the mineral is effected by the Berzelius method and the resulting solution of F' and NaCl is treated with gelatin, EtOH, and CaCl<sub>2</sub>. CaF<sub>2</sub> is formed as a protected colloid and may be determined nephelometrically. The accuracy is about 1% of F. AsO<sub>4</sub><sup>'''</sup>, SO<sub>4</sub><sup>''</sup>, and PO<sub>4</sub><sup>'''</sup> interfere and should be removed.

E. S. H.

**Fluorescence method for the determination of low concentrations of ozone.** M. KONSTANTINOVA-SCHLESINGER (Acta. Physicochim. U.R.S.S., 1935, 3, 435—450).—Small quantities of O<sub>3</sub> are determined by passing the gas through an alcoholic solution of dihydroacridine. The acridine formed by oxidation is determined by photometric measurement of the intensity of its fluorescence.

O. D. S.

**Volumetric determination of selenocyanate.** G. SPACU and C. G. MACAROVICI (Z. anal. Chem., 1936, 105, 408—410).—KCNS<sub>2</sub> can be titrated in 20% aq. KNO<sub>3</sub> (to prevent hydrolysis) with 0.1N-AgNO<sub>3</sub>, using diphenylcarbazone as indicator.

**Potentiometric titration of selenocyanate.** R. RIPAN-TILICI (Z. anal. Chem., 1936, 105, 410—412).—The solution is titrated with Hg(ClO<sub>4</sub>)<sub>2</sub> using an amalgamated Pt wire as indicator electrode.

A. R. P.

**Determination of arsenic in analytical reagents.** C. BUSQUETS (Anal. Fis. Quím., 1936, 34, 557—579).—An apparatus for the rapid determination of small quantities (<0.0001 mg.) of As, by a modified Gutzeit method, is described. Limits of As permissible in the common reagents are tabulated.

L. A. O'N.

**Volumetric determination of antimony, arsenic, and iodide in the presence of bromide by L. W. Andrews' method.** A. MUTSCHIN (Z. anal. Chem., 1936, 106, 1—11).—The acidity in the titration of Sb<sup>III</sup> by Andrews' method (with KIO<sub>3</sub> in presence of CCl<sub>4</sub> or CHCl<sub>3</sub>) is preferably 20 c.c. of conc. HCl ( $d$  1.19) per 100 c.c. of final solution. It should be <15 c.c., but can be increased to 30 c.c. when large quantities of Sb are to be titrated; too high acidity retards the reaction. For the titration of HSbO<sub>2</sub> with KIO<sub>3</sub> in presence of ICl, the [HCl] should be 30—40 c.c. per 100 c.c. of final solution. Too little leads to hydrolysis of the ICl. Moderate addition of KBr or H<sub>2</sub>SO<sub>4</sub>, or dilution, does not affect the results. Potentiometric titration must be carried out in H<sub>2</sub>SO<sub>4</sub> solution, the potential change for 0.025 c.c. of 0.025M-KIO<sub>3</sub> being 0.2—0.3 volt. The optimum [HCl] for the titration of As<sup>III</sup> with KIO<sub>3</sub> in presence or absence of ICl is 30—40 c.c. per 100 c.c. of final solution. I' can be titrated with KIO<sub>3</sub> by Andrews' method in presence of any quantities of Cl' or Br'.

J. W. S.

**Micro-determination of silicon.** F. DE EDS and C. W. EDDY (J. Biol. Chem., 1936, 114, 667—672).—Si is determined by addition of (NH<sub>4</sub>)<sub>2</sub>MoO<sub>4</sub> and reducing the resultant yellow complex to a blue one with *p*-hydroxyphenylglycine; the colour de-

veloped is compared with a standard in a photo-electric colorimeter. H. D.

**Microchemical test for silicon.** L. W. STAPLES (Amer. Min., 1936, 21, 379—383).—1 mg. of the mineral is heated with 2 mg. of fluorite and 2 drops of conc.  $\text{H}_2\text{SO}_4$  in a Pt or Pb spoon at  $>75^\circ$  for 10 min. The  $\text{SiF}_4$  evolved is retained by 1 drop of dil.  $\text{HNO}_3$  (1:7) placed on the underside of a celluloid slide covering the spoon, which is embedded in a charcoal block. A small particle of NaCl is added to the solution of  $\text{H}_2\text{SiF}_6$  and the  $\text{Na}_2\text{SiF}_6$  is identified under the microscope. Ge but not Zr, Ti, or Sn minerals give the test.  $\text{BF}_3$  is not volatilised at the temp. used. The test is preferable to the metaphosphate bead, the Rb silicomolybdate, and the benzidine tests. L. S. T.

**Determination of carbon monoxide in air.**—See B., 1936, 693.

**Aqueous alcoholic uranyl magnesium reagent.** A. KRASSILCHIK (Compt. rend., 1936, 203, 78—80).—Errors arising from the micro-determination of Na by means of Blanchetiere's reagent are discussed and an improved technique is described. C. R. H.

**Determination of silver by means of potassium ferricyanide.** M. I. PERIE and M. M. LOBUNETZ (Bull. Sci. Univ. Kiev, 1935, 1, 141—145).—Excess of standard  $\text{K}_3\text{Fe}(\text{CN})_6$  and 2—3 g. of  $\text{KNO}_3$  are added to the solution at  $80$ — $90^\circ$ , the solution is filtered (ppt. washed with 2%  $\text{KNO}_3$ ), 1—2 g. of  $\text{ZnSO}_4$  and 10 c.c. of 10% KI are added to the filtrate, and the I liberated is titrated with standard  $\text{Na}_2\text{S}_2\text{O}_3$ . The results are 0.3% low; if, instead of filtering, the ppt. of  $\text{Ag}_3\text{Fe}(\text{CN})_6$  is allowed to settle and a sample of the supernatant fluid is taken, the error is +0.6%. R. T.

**Reaction adaptable to the volumetric determination of silver chloride.** G. A. D. HASLEWOOD (J.C.S., 1936, 1049).—Glacial AcOH added to a solution of AgCl in  $\text{Na}_2\text{S}_2\text{O}_3$  gives a cryst. ppt. corresponding with  $\text{Na}_5\text{Ag}_3(\text{S}_2\text{O}_3)_4 \cdot 2\text{H}_2\text{O}$ . The mother-liquor contains approx. 0.3 mg. per 100 c.c. calc. as AgCl. The ppt. from a known wt. of AgCl gives good results on dissolution in 0.01N-I and back titration with 0.005N- $\text{Na}_2\text{S}_2\text{O}_3$ . D. C. J.

**Rapid detection of silver halide in presence of silver cyanide.** R. E. D. CLARK (J.C.S., 1936, 1050).—On addition of  $\text{HNO}_3$ ,  $\text{AgNO}_3$ , and 5%  $\text{HgNO}_3$  solutions to a solution suspected of containing halide and  $\text{CN}'$ , the black coloration obtained if  $\text{CN}'$  is present dissolves in excess of  $\text{HgNO}_3$ , leaving a permanent white ppt. if halides are present. D. C. J.

**Gravimetric determination of barium by weighing as anhydrous oxalate.** G. DÍAZ VILLAMIL (Anal. Fís. Quím., 1936, 34, 580—586; cf. A., 1924, ii, 783).—Ba may be determined by pptn. as oxalate, drying in a current of air at  $250^\circ$  for 1 hr., and weighing as  $\text{BaC}_2\text{O}_4$ . This is definite and stable below  $300^\circ$ , and is little hygroscopic. It is not necessary to add EtOH before pptn. The accuracy is  $\pm 0.2\%$ . L. A. O'N.

**Determination of radioactivity.** A. R. OLSON, W. F. LIBBY, F. A. LONG, and R. S. HALFORD (J. Amer. Chem. Soc., 1936, 58, 1313—1314).—Modi-

fied procedure is described. The radioactive material is dissolved and the solution introduced into a counter. E. S. H.

**Sensitive reagents for the detection and determination of magnesium.** F. P. DWYER (J. Proc. Austral. Chem. Inst., 1936, 3, 184—186).—A 0.1% EtOH solution of *pp'*-dinitrodiazaminobenzene when added to aq.  $\text{Mg}(\text{OH})_2$  gives a heliotrope colour, whilst *p*-nitrobenzenediazoamino-4-nitronaphthalene gives a sky-blue.  $0.1 \times 10^{-6}$  g. of Mg per ml. may be detected with this reagent. *p*-Nitrobenzenediazoaminoazobenzene gives a cornflower-blue and 4-nitronaphthalene-4'-aminoazobenzene a cerise-blue. No hydroxide other than  $\text{Mg}(\text{OH})_2$  gives a colour with the latter. R. S.

**Polarisation effects in the spectral analysis of zinc and tin.** R. BRECKPOT (Natuurwetensch. Tijds., 1936, 18, 173—180).—Several elements (particularly In, Tl, Pb, Mg) show increased intensity when placed in the anode of an arc. Similar effects are observed, but to a smaller degree, with Sn. In these cases intensification is not due, as with Cu, to fractional volatilisation of the impurities. With Sn, As gives more intense lines in the cathode. Similar effects are obtained with either metals or oxides, and they are connected with the differences in ionisation potential of the impurities and the base metals. S. C.

**Spectrographic investigation in analysis.** J. VAN CALKER (Z. anal. Chem., 1936, 105, 396—406).—The spectrum is excited by an arc of 30,000 volts at 0.02 amp. operated from a Röntgen inductor supplied with 15—20 amp. at 100 volts at the primary. The substance is placed in a small cavity in the lower electrode consisting of a Cu, Fe, or Ag wire 8 mm. thick. The technique adopted is illustrated by the qual. analysis of bauxite, by the detection of Pb in a Swedish bituminous coal shale, by the analysis of a mineral  $\text{H}_2\text{O}$ , and by the detection and determination of minute amounts of Hg. A. R. P.

**Determination of cuprous oxide, cupric oxide, and copper in mixtures.** Microscopical method. S. ZERFOSS and M. L. WILLARD (Ind. Eng. Chem. [Anal.], 1936, 8, 303).—A statistical method is based on a microscopical count of the various particles, identified by the action of dil. HCl. E. S. H.

**Potentiometric determination of cerous salts with ferrocyanide.** I. A. ATANASIU (Z. anal. Chem., 1936, 105, 422—423).—Polemical against Spacu (this vol., 443). A. R. P.

**Colorimetric determination of iron as  $\text{Fe}(\text{CNS})_3$ .** M. BERTIAUX (Document. sci., 1935, 4, 49—52; Chem. Zentr., 1935, ii, 3135).—The effect of the concn. of the  $\text{NH}_4\text{CNS}$  solution on the intensity of the red colour has been studied. H. J. E.

**Detection of ferricyanide ions in insoluble ferricyanides.** L. KÜHLBERG (Z. anal. Chem., 1936, 106, 30—32).—When HCl-sol. ferricyanides (e.g., of Cd and Zn) or ferricyanides of metals with readily oxidisable hydroxides (Mn and Ce) are treated with a 1% solution of leuco-malachite-green in 50% HCl (I) and the solution diluted, a green colour is produced.  $\text{Hg}_3[\text{Fe}(\text{CN})_6]_2$  and  $\text{Cu}_3[\text{Fe}(\text{CN})_6]_2$  are detected by

decomp. with 1%  $\text{NiSO}_4$  and addition of excess of  $\text{NaOH}$ , when the  $\text{Ni}(\text{OH})_3$  pptd. yields a green colour on addition of (I).  $\text{Ni}_3[\text{Fe}(\text{CN})_6]_2$  and  $\text{Co}_3[\text{Fe}(\text{CN})_6]_2$  can be treated directly with  $\text{NaOH}$ , the  $\text{Ni}(\text{OH})_3$  and  $\text{Co}(\text{OH})_3$  oxidising the reagent.  $\text{Fe}(\text{CN})_6^{4-}$  in Turnbull's blue can be detected by treatment with 1% aq.  $\text{Ti}_2\text{SO}_4$  and then with excess of  $\text{NaOH}$ . The ppt.  $[\text{Ti}(\text{OH})_3, \text{Fe}(\text{OH})_3 \text{ and } \text{Fe}(\text{OH})_2]$  is collected and treated with an  $\text{AcOH}$  solution of benzidine, when the appearance of a blue colour indicates presence of  $\text{Fe}(\text{CN})_6^{4-}$ . This method can also be used to detect the presence of  $\text{Fe}(\text{CN})_6^{3-}$  in  $\text{Fe}(\text{CN})_6^{4-}$ .

J. W. S.

**Potentiometric determination of tungsten.** A. K. BABKO (Bull. Sci. Univ. Kiev, 1935, 1, 147—153).—The W is reduced to  $\text{W}^{\text{V}}$  by  $\text{Hg-Bi}$  in conc.  $\text{HCl}$ , and the  $\text{W}^{\text{V}}$  is determined by electro-titration to  $\text{W}^{\text{VI}}$  by means of  $\text{K}_2\text{Cr}_2\text{O}_7$ . Reduction to  $\text{W}^{\text{IV}}$  involves the use of large amounts of Zn, and is not recommended.  $\text{W}^{\text{III}}$ , obtained as  $[\text{W}_2\text{Cl}_9]^{3-}$  by reduction with  $\text{Hg-Pb}$  at  $50^\circ$ , has a high potential, and its transition to  $\text{W}^{\text{V}}$  is not distinct.  $\text{Hg-Pb}$  in the cold gives W as a complex,  $[\text{WCl}_5]^{2-}$ , having a lower potential than  $[\text{W}_2\text{Cl}_9]^{3-}$ , but considerable time is required for complete reduction. The method proposed consists in reduction with  $\text{Hg-Pb}$  to appearance of a red coloration (due to  $\text{W}^{\text{III}}$ ), and oxidation to a potential of +0.1 volt ( $\text{W}^{\text{V}}$ ), followed by further oxidation to  $\text{W}^{\text{VI}}$  (+0.35 volt).

R. T.

**Separation of tungsten from tin by 8-hydroxyquinoline in presence of sodium oxalate.** A. JÍLEK and A. RYŠANEK (Coll. Czech. Chem. Comm., 1936, 8, 246—260; cf. A., 1933, 584).—The quantities of W found in W-Sn mixtures by the method previously given are high since the W ppt. retains some stannic acid. The wt. of ppt. obtained from 40—100 mg. of W and 5—200 mg. of Sn in a medium of aq.  $\text{Na}_2\text{C}_2\text{O}_4$ ,  $\text{NaOAc}$ , 2%  $\text{AcOH}$ , and the reagent corresponds with the W, since the co-pptd. Sn compensates for the W left in solution. Double pptn. effects quant. separation. The solution is treated with 50 c.c. of 10%  $\text{H}_2\text{C}_2\text{O}_4$ , neutralised with  $\text{NaOH}$ , diluted to 200—250 c.c., and 2 c.c. of reagent (2 g. of 8-hydroxyquinoline in 5 c.c. of  $\text{Ac}_2\text{O}$ ) are added to the solution at  $60-80^\circ$ . After 1 hr. the ppt. is removed, washed first with aq.  $\text{Na}_2\text{C}_2\text{O}_4$  at  $70^\circ$ , then with reagent, and finally with  $\text{H}_2\text{O}$ , boiled with conc.  $\text{H}_2\text{SO}_4$ , cooled, and reheated after addition of  $\text{H}_2\text{O}_2$ . Excess of  $\text{NaOH}$  is added, and repptn. is effected with  $\text{H}_2\text{C}_2\text{O}_4$  etc. as above. The ppt. is ignited in presence of  $\text{H}_2\text{C}_2\text{O}_4$ .

J. G. A. G.

**Colour reactions of ter- and quadri-valent titanium.** M. SCHENK (Helv. Chim. Acta, 1936, 19, 625—639).—Aq.  $\text{Ti}^{\text{III}}$  and  $\text{Ti}^{\text{IV}}$  sulphates react to give a brownish-violet complex containing  $\text{Ti}^{\text{III}}$  and  $\text{Ti}^{\text{IV}}$  in the ratio 4:3.  $\text{Ti}^{\text{III}}$  sulphate gives an intense blue compound with conc. aq. alkali thiocyanates, but the reaction is unsuitable for quant. analysis. The reaction between  $\text{Ti}^{\text{IV}}$  solutions and  $\text{H}_2\text{O}_2$  has been investigated.

T. G. P.

**Separation of bismuth from lead and copper.** E. A. OSTROUMOV (Z. anal. Chem., 1936, 106, 36—45).—Bi and Pb can be separated by Moser and Maxymovicz'  $\text{Br}^--\text{BrO}_3^-$  hydrolysis method (A., 1926, 264),

by Feigl and Ordell's pyrogallol method, or by Pinkus and Dernies' cupferron method (A., 1928, 1109). The method of Benkert and Smith (A., 1897, ii, 435) leads to irregular results. Bi can be separated from Cu by Moser and Maxymovicz' method and also by a modification of the cyanide method. In each case the first method is preferred. The pyrogallol method cannot be used in presence of a large excess of Cu.

J. W. S.

**Specific reaction for bismuth by production of the monoxide.** N. A. TANANAEV (Z. anal. Chem., 1936, 105, 419—422).—The reagent,  $\text{K}_4\text{Mn}(\text{CN})_6$  (I), is prepared by adding aq. 10%  $\text{MnSO}_4$  to a 0.5—0.33-saturated KCN solution until the ppt. first formed only just redissolves. On adding a Bi solution in 1:10  $\text{HCl}$  to (I) a black ring of  $\text{BiO}$  forms at the interface. To detect Bi in Cu the metal is dissolved in  $\text{HNO}_3$ ,  $\text{FeCl}_3$  added followed by aq.  $\text{NH}_3$ , and the well-washed ppt. dissolved in 1:10  $\text{HCl}$  for the test. Ag and Hg do not interfere.

A. R. P.

**Analytical chemistry of tantalum, niobium, and their mineral associates.** XXXI. Determination of tungsten in earth-acid minerals. W. R. SCHOELLER and E. F. WATERHOUSE (Analyst, 1936, 61, 449—455; cf. this vol., 696).—The W is pptd. with the earth acids by tartaric hydrolysis at fairly high concn. (cf. A., 1934, 983) and then determined by pptn. with a slightly ammoniacal aq. Mg salt (A., 1935, 1217). High  $\text{WO}_3$  contents lead to negative errors of 0.0003—0.002 g., and it is recommended that for such cases a correction, deduced by experiment on a synthetic mixture, be applied.

J. W. S.

**Thermoregulator of the ordinary type, regulating the heating current without a relay.** K. KALINOWSKI (Rocz. Chem., 1936, 16, 288—289).

R. T.

**Apparatus for the maintenance of a graded series of constant temperatures.** S. O. MAST (Science, 1936, 84, 69—70).

L. S. T.

**Precision m.-p. apparatus.** E. B. HERSHBERG (Ind. Eng. Chem. [Anal.], 1936, 8, 312—313).—A mechanically-stirred, electrically-heated, cyclic liquid bath for use with capillary-tube specimens is described.

E. S. H.

**Micro-determination of b.p. of liquids at different pressures.** E. E. HAYS, F. W. HART, and R. G. GUSTAVSON (Ind. Eng. Chem. [Anal.], 1936, 8, 286).—The apparatus can be used for determining b.p. at pressures between 10 and 900 mm.

E. S. H.

**Adiabatic calorimeter.** W. WEINRICH and H. GASTARI (Ind. Eng. Chem. [Anal.], 1936, 8, 307—310).—Apparatus in which the rate of  $\text{O}_2$  absorption and rate of temp. change due to the heat of reaction of finely-divided substances with  $\text{O}_2$  are measured is described. Adiabatic conditions are maintained by a differential thermopile and a photo-electric relay; the  $\text{O}_2$  pressure is controlled automatically by an electronic relay and an electrolysis cell. Experiments with bituminous coal at 1 atm. and 50 initial temp. show that  $\text{O}_2$  absorption and rise of temp. are nearly linear functions of time.

Balanced circuit for resistance thermometers, combustible gas indicators, etc. M. G. JACOBSON (Physical Rev., 1935, [ii], 47, 336). L. S. T.

Simon desorption method between temperatures of 90° and 40° abs. A. VAN ITTERBEEK and W. VEREYCHEN (Physica, 1936, 3, 666—671).—Apparatus is described by means of which temp. of 67—45° abs. are obtained. O. D. S.

Spectral transmission of developed photographic emulsions. M. ROULLEAU (Compt. rend., 1936, 202, 2066—2067).—Data for the transmission of various types of plate for  $\lambda$  8650—3650 Å. are discussed. The type of developer used has a small influence. H. J. E.

Physical methods in chemical laboratories. XXXII. New method of quantitative emission spectrum analysis, applicable also as a micro-method. G. SCHEIBE and A. RIVAS (Angew. Chem., 1936, 49, 443—446).—The material is dissolved and about 0.01 c.c. of the solution placed on each electrode of a C arc. The initial spectrum is photographed over a period of 30 sec., the arc current being maintained const. The relative intensities of certain lines of each element are measured. The method is particularly applicable to the determination of traces of one metal in another and is illustrated by data for Mg in Al and Al and Cr in Fe. J. W. S.

Identification of crystalline materials. Classification and use of X-ray diffraction patterns. J. D. HANAWALT and H. W. RINN (Ind. Eng. Chem. [Anal.], 1936, 8, 244—247).—The identification of X-ray patterns by comparison with a collection of standard patterns is discussed. E. S. H.

Improved grating microspectrograph and its use in chemical microscopy. E. E. JELLEY (J. Roy. Microscop. Soc., 1936, [iii], 56, 101—112).—An improved grating instrument, allowing visual observation of orthoscopic and conoscopic interference effects and their spectra, is described. Spectra may be photographed without disturbing the adjustments of the crystal and polarising microscope. The dispersion is such that the distance between centres of adjacent perforations of the film corresponds with 50 m $\mu$ , the perforations providing an accurate  $\lambda$  scale. A Wollaston prism on a sliding mount provides for the study of pleochroism. A technique for studying and recording the dichroism and trichroism of minute crystals is described. N. M. B.

Arc support for routine spectroanalysis. R. BRECKPOT (Bull. Soc. chim. Belg., 1936, 45, 375—378).—An improved form of Gramont's support is described. The electrode holders are detachable, thus permitting the removal of oxide dust which would otherwise cause contamination. Fumes should be drawn into a glass dust chamber above the arc. R. C. M.

Polarisation effects in the Hilger E1 quartz spectrograph. J. W. ELLIS and J. KAPLAN (Physical Rev., 1935, [ii], 47, 255).—Serious limitations encountered when the light is partly or wholly polarised are described. L. S. T.

Technique of polarimetric determination in condensed gases. A. I. SCHATTENSTEIN (Acta

Physicochim. U.R.S.S., 1935, 3, 53—60).—The method of determining the rotation of the plane of polarisation of optically active substances dissolved in condensed gases is described. The results of determinations of the sp. rotation of sucrose in liquid NH<sub>3</sub>, and of santonamide in the presence of salts in liquid NH<sub>3</sub>, are recorded. A. J. M.

Magneto-optic method of chemical analysis. III. Location of minima and quantitative analysis. S. S. COOPER and T. R. BALL (J. Chem. Educ., 1936, 13, 326—328; cf. this vol., 949).—Procedure is detailed using salicylic acid as an example. L. S. T.

Photography of minima in magneto-optic apparatus. G. HUGHES and R. GOSLIN (Physical Rev., 1935, [ii], 47, 317).—The reality and reproducibility of the min. have been photographically demonstrated. L. S. T.

Automatic ionisation spectrometer. W. A. WOOSTER and A. J. P. MARTIN (Proc. Roy. Soc., 1936, A, 155, 150—172).—An apparatus in which a crystal, having been once set, is moved automatically through a pre-arranged series of reflecting positions has been designed. The crystal and ionisation chamber are moved together slowly through the reflecting ranges while the ionisation current is automatically recorded, and rapidly in between. L. L. B.

Physical methods in chemical laboratories. XXXI. Determination of dielectric loss as a physico-chemical method of investigation. L. ROHDE, P. WULFF, and H. SCHWINDT (Angew. Chem., 1936, 49, 437—443).—The method of measurement of dielectric loss factor is described and its application to the testing of commercial oils etc. discussed. Presence of OH groups produces especially high losses. In presence of CO<sub>2</sub>H groups, the loss factor increases with rising temp. to a max. and then decreases, this being attributed to the dissociation of double mols. J. W. S.

Mass spectrograph. W. B. PIETENPOL (Physical Rev., 1935, [ii], 47, 331—332).—A new type well suited to bracketing methods of determining isotopic wts. is described. L. S. T.

Construction and use of Geiger-Muller counters. G. L. LOCHER (Physical Rev., 1935, [ii], 47, 326).—Technique of construction, criteria, and tests are described. L. S. T.

High-speed Geiger-counter circuit. H. V. NEHER and W. W. HARPER (Physical Rev., 1936, [ii], 49, 940—943).—An improved circuit is described. N. M. B.

New ion source for mass spectroscopy. A. J. DEMPSTER (Physical Rev., 1935, [ii], 47, 331; cf. A., 1935, 677). L. S. T.

Measurement of small rapidly changing gas volumes. H. LORENZ (Z. Physik, 1936, 100, 761—769).—Vols. of 0.1 c.c. changing within 0.1 sec. can be measured to 0.01 c.c. A. B. D. C.

Burette with automatic zero adjustment. J. BITSKEI and B. BITSKEI (Z. anal. Chem., 1936, 105, 406—408).—The burette has a conical upper end which protrudes just inside a pear-shaped bulb having

its lower end inclined downwards and joined to a thick-walled vertical tube passing to the bottom of the stock-bottle holding the standard solution. The bottle is provided with a side-tube and rubber bulb for forcing the liquid into the burette. A. R. P.

**The micro-balance.** G. GORBACH (*Mikrochem.*, 1936, 20, 254—336).—A comprehensive review.

**Pressure regulator for a partial vacuum.** E. CHERBULIEZ (*Helv. Chim. Acta*, 1936, 19, 794—795). T. G. P.

**Experimental methods for the kinetic study of the oxidation of metals.** G. VALENSI (*Bull. Soc. chim.*, 1936, [v], 3, 1405—1422).—Apparatus and technique, with the corresponding methods of calculation of results, are described. E. S. H.

**Jena glass apparatus for the chemical laboratory.** P. H. PRAUSNITZ and H. SCHÄFER (*Oesterr. Chem.-Ztg.*, 1936, 39, 114—116).—New and modified apparatus is described. E. S. H.

**Apparatus for determination of the adsorption of small quantities of gas by solutions.** H. E. BENT, W. F. GRESHAM, and N. B. KEEVIL (*J. Amer. Chem. Soc.*, 1936, 58, 1307—1309).—Apparatus and procedure are described. E. S. H.

**Electrodialyser.** F. E. BARTELL (*Ind. Eng. Chem. [Anal.]*, 1936, 8, 247).—Apparatus is described. E. S. H.

**Micro-vaporimetric determination of mol. wt.** J. B. NIEDERL, O. R. TRAUTZ, and A. A. PLENTL (*Ind. Eng. Chem. [Anal.]*, 1936, 8, 252—255).—Modified apparatus for v.d. determinations of substances of b.p.  $> 320^\circ$  is described. E. S. H.

**Measuring the thickness of thin, flowing, liquid films.** H. H. BECK and K. G. WECKEL (*Ind. Eng. Chem. [Anal.]*, 1936, 8, 258—259).—The shift in the reflected beam, when an incident beam of light is directed on to the surface at  $45^\circ$ , gives a measure of changes in thickness of films covering the surface. E. S. H.

**Making extremely thin films.** J. D. HOWE and E. M. PURCELL (*Physical Rev.*, 1935, [ii], 47, 329; cf. this vol., 183). L. S. T.

**Concentric cylinder viscosimeters.** L. SQUIRES and R. L. DOCKENDORFF (*Ind. Eng. Chem. [Anal.]*, 1936, 8, 295—297).—By applying the relation between friction factor and Reynolds no.,  $\eta$  of liquids can be determined in a concentric-cylinder viscosimeter even when the liquids are so fluid that their motion during the determination is turbulent. E. S. H.

**Modification of the suspended-level viscosimeter.** E. H. PAYNE and C. C. MILLER (*Ind. Eng. Chem. [Anal.]*, 1936, 8, 300—302). E. S. H.

**Dynamic surface tension from liquid bells.** E. BUCHWALD and H. KÖNIG (*Ann. Physik*, 1936, [v], 26, 659—672).—In a method for the determination of the dynamic surface tension  $\alpha_{dyn}$ , a stream of liquid impinges on a plate forming a liquid bell. A surface tension equation based on the theory of Boussinesq holds over a wide range of conditions if the thickness of the bell is  $>$  a certain val.  $\alpha_{dyn}$  is  $5-8\% > \alpha_{stat.}$  for  $H_2O$ ,  $EtOH$ ,  $AcOH$ , and  $EtOAc$ ,

and 16.4% greater in the case of  $CCl_4$ , owing to diminished mol. orientation, whilst the  $\alpha_{dyn}$  and of  $C_6H_6$  are equal. R. S.

**Preparation of flattened copper tubing coils.** E. P. BARRETT and W. L. BARRETT (*Ind. Eng. Chem. [Anal.]*, 1936, 8, 311).—Procedure for flattening, coiling, and joining Cu tubes is described. E. S. H.

**Laboratory stirrer.** E. B. HERSHBERG (*Ind. Eng. Chem. [Anal.]*, 1936, 8, 313).—Agitation of solid-liquid mixtures is facilitated by attaching corrosion-resistant alloy wire to a glass stirrer. E. S. H.

**Organic combustion apparatus for highly volatile and inflammable liquids.** J. H. BRUUN and W. B. M. FAULCONER (*Ind. Eng. Chem. [Anal.]*, 1936, 8, 315—316). E. S. H.

**Apparatus for [quantitative] semi-micro-hydrogenations.** L. ZECHMEISTER and L. VON CHOLNOKY (*Chem.-Ztg.*, 1936, 60, 655—656).—A simple volumetric method, of accuracy 1—3%, for use at room temp. and in presence of a catalyst is described. R. C. M.

**Illumination of menisci.** J. ZELENY (*Rev. Sci. Instr.*, 1936, [ii], 7, 289; cf. Collins and Blaisdell, *ibid.*, 213).—A simple and efficient method, using white paper ruled at  $45^\circ$  with black lines, is described. N. M. B.

**Technique for making sound ingots for density determinations.** P. G. WALDO and W. P. DAVEY (*Physical Rev.*, 1935, [ii], 47, 338). L. S. T.

**High-speed oil-diffusion pump.** H. W. EDWARDS (*Physical Rev.*, 1935, [ii], 47, 259; cf. A., 1935, 840). L. S. T.

**Centrifugal filtration tube.** D. F. HOUSTON and C. P. SAYLOR (*Ind. Eng. Chem. [Anal.]*, 1936, 8, 302).—The centrifuge tube is provided with a filtration crucible, perforated support, and receiver for the filtrate. E. S. H.

**Filter trains.** P. BRUERE (*J. Pharm. Chim.*, 1936, [viii], 24, 49—58).—Filters for the ventilators of rooms used for collective gas protection are described and their control is discussed. F. N. W.

**Ultrafiltration and concentration by ultrafiltration by a centrifuge method.** R. BRINKMAN and J. VAN STEINFORN (*Biochem. J.*, 1936, 30, 1523—1525).—By coating porcelain cylinders with water-glass, ultrafilters are obtained which are not clogged by the disperse phase, and will withstand prolonged use. 2 c.c. of filtrate can be obtained in 10 min. J. N. A.

**Micro- and macro-Kjeldahl steam-distillation apparatus.** J. M. FIFE (*Ind. Eng. Chem. [Anal.]*, 1936, 8, 316).—Modified apparatus is described. E. S. H.

**Glass head for laboratory water still.** P. F. SHARP and E. B. STRUBLE (*Ind. Eng. Chem. [Anal.]*, 1936, 8, 316). E. S. H.

**Moisture tube.** H. B. ALEXANDER (*Ind. Eng. Chem. [Anal.]*, 1936, 8, 314).—The apparatus is based on the principle of distillation with a  $H_2O$ -immiscible solvent. E. S. H.

**Overhead heater for rapid evaporation, drying, and charring.** L. F. NIMS and M. K. HORWITT (Ind. Eng. Chem. [Anal.], 1936, 8, 275).—Heating is by radiation from an electrical heating element, placed above the containers. E. S. H.

**Battery-type stand assembly for distilling equipment.** R. L. MOBLEY (Ind. Eng. Chem. [Anal.], 1936, 8, 281). E. S. H.

**Lecture experiment in combustion chemistry.** K. CLUSIUS and H. GUTSCHMIDT (Angew. Chem., 1936, 49, 446—447).—The temp. of an electric oven is raised slowly while a current of air is drawn through it and a drop of hydrocarbon periodically dropped in. The temp. when the drop first ignites spontaneously is noted. The temp. is then allowed to fall and the temp. noted when drops cease to ignite. Addition of 1%  $\text{Fe}(\text{CO})_5$  or 1.5%  $\text{EtNO}_2$  raises or lowers the ignition temp., respectively, and illustrates the effects of knocks and antiknocks. J. W. S.

**Distribution of gas in liquids.** P. H. PRAUSNITZ (Kolloid-Z., 1936, 76, 227).—A lecture experi-

ment, illustrating the influence of surface tension on bubble size, is described. E. S. H.

**Conception of elements in chemistry. II. Ancient Greek philosophy.** V. A. PLOTNIKOV, I. L. KATZNELSON, and O. V. BERNSCHEIN (Mem. Inst. Chem. Ukrain. Acad. Sci., 1936, 3, 3—36).—Philosophical. R. T.

**Ruska's researches on the alchemy of Al-Razi.** R. WINDERLICH (J. Chem. Educ., 1936, 13, 313—315). L. S. T.

**Beraut's theory of calcination (1747).** D. MCKIE (Ann. Sci., 1936, 1, 269—293).—Historical. E. S. H.

**Precursors of rhenium and masurium.** J. G. F. DRUCE (Chem. and Ind., 1936, 577—578).—Several of the unsubstantiated claims for the discovery of new elements during the last century possibly corresponded with Ma and two, perhaps, to Re, whilst others may have been Hf. R. C. M.

## Geochemistry.

**Content of heavy water (deuterium oxide) in medicinal mineral waters.** K. HANSEN, E. RUSTUNG and J. HVEDING (Klin. Woch., 1935, 14, 684—685; Chem. Zentr., 1935, ii, 2921).—No deviation from the normal isotope ratio was detected in many medicinal waters. J. S. A.

**Geochemical significance of the hydrolysis of sulphur by water.** E. CHERBULIEZ and A. HERZENSTEIN (Helv. Chim. Acta, 1936, 19, 801—806; cf. this vol., 1079).—The origin of the S compounds and especially the significance of the ratio  $\text{H}_2\text{S} : \text{S}_2\text{O}_3^{2-}$  in natural waters are discussed. T. G. P.

**Alkali waters of the London chalk layers.** J. LEPERSONNE (Bull. Soc. géol. Belg., 1934—1935, 58, 38—63; Chem. Zentr., 1935, ii, 3080).—Normal hard  $\text{H}_2\text{O}$  and strongly alkaline fresh  $\text{H}_2\text{O}$  are found. The latter comes from a base exchange in the glauconite-bearing sands, and contains  $\text{NaHCO}_3$ ,  $\text{Na}_2\text{SO}_4$ ,  $\text{NaCl}$ ,  $\text{NaBr}$ , and  $\text{NaI}$ . H. J. E.

**Mineral waters of Arequipa, Peru.** E. POZZI-ESCOR (Bull. Soc. chim., 1936, [v], 3, 1382).—Free  $\text{Cl}_2$  and  $\text{NaIO}_3$  have been detected. E. S. H.

**Colorimetric determination of the  $p_{\text{H}}$  of some Peruvian waters.** L. PRÓ Y CASTILLO (Bol. Soc. Quim. Peru, 1936, 2, 7—8).—The  $p_{\text{H}}$  vals. of natural waters (at the temp. of the source), and drinking waters have been determined. L. A. O'N.

**Radioactivity of some natural springs in the Kabylie de Collo (Constantine, Algeria).** M. ROUBAULT (Compt. rend., 1936, 203, 100—101).—Eight springs occurring in eocene schists and in granite masses were examined, those from the latter sources having the greatest activity. C. R. H.

**Alkali metals in natural waters.** R. BOSSUET (Compt. rend., 1936, 203, 63—65).—Natural waters of Corsica, Algeria, Tunis, and Madagascar are

divided into two groups according to the presence or absence of Cs. C. R. H.

**"Brown" snowfall in New Hampshire and Vermont.** W. O. ROBINSON (Science, 1936, 83, 596).—Dust of colloidal dimensions from the fall of brown snow at Wells River, Vermont, contained  $\text{SiO}_2$  48.9,  $\text{Al}_2\text{O}_3$  20.4,  $\text{Fe}_2\text{O}_3$  6.1,  $\text{CaO}$  5.4,  $\text{MgO}$  3.2, loss on ignition 16.0%. L. S. T.

**Sulphur in cyrtolite and its indication of galena.** O. B. MUENCH (Amer. Min., 1936, 21, 374—378).—The S determinations recorded throw no light on the low val. for the at. wt. of Pb obtained for Bedford cyrtolite (A., 1935, 558). Both samples of Bedford cyrtolite contained the same % S. L. S. T.

**Mineralogy and origin of the Taconic limonites.** D. H. NEWLAND (Econ. Geol., 1936, 31, 133—155).—Siderite is probably the parent source of much of the limonite of the Taconic belt of eastern New York and western New England. The deposits are consistently manganiferous (1—2%) and the high  $\text{SiO}_2$  content (10—20%) is due partly to admixed detrital quartz and feldspar and partly to amorphous  $\text{SiO}_2$  in the groundmass. Appreciable amounts of carbonaceous matter are frequently present and pyrite and Zn are const. minor constituents. L. S. T.

**Mineralised spherulitic limestone in the Cheltenham [St. Louis] fireclay.** V. T. ALLEN (Amer. Min., 1936, 21, 369—373).—The limestone described contains quartz, calcite, pyrite, ankerite, and sphalerite, probably deposited in this order. The spherulites have  $\text{CaCO}_3$  75.57,  $\text{MgCO}_3$  1.64,  $\text{Al}_2\text{O}_3 + \text{Fe}_2\text{O}_3$  1.12,  $\text{Na}_2\text{O}$ ,  $\text{K}_2\text{O}$ , and  $\text{BaO}$  none, insol. 18.88% [R. F. ROLUFS]. The origin of the spherulites is discussed. L. S. T.

**Nepheline contrasts.** N. L. BOWEN and R. B. ELLESTAD (Amer. Min., 1936, 21, 363—368).—

Chemical analyses of nepheline from a Na-rich phonolite, typical of the E. African Rift, and from a K-rich melilite-leucite nephelinite, typical of the Central African Rift, show that the two nephelines are Na- and K-rich, respectively, emphasising, contrary to the view of Morozewicz (A., 1929, 45), the variability of the composition of nepheline and its control by the parent magma. L. S. T.

**Metamorphic differentiation at contacts between serpentinite and siliceous country rocks.** A. H. PHILLIPS and H. H. HESS (Amer. Min., 1936, 21, 333—362).—The changes in mineralogical composition, supported by chemical analyses, which have resulted from the permeation of hydrothermal solutions along contacts between serpentinite and siliceous country rock are described for several localities. An explanation of the origin of the mineral zones is given and the general process of metamorphic differentiation involved is discussed. L. S. T.

**Ejected blocks of the Laacher See district.** G. KALB and P. M. HOPMANN (Tsch. Min. Petr. Mitt., 1936, 48, 1—26; cf. A., 1935, 60; 1936, 307).—Further examples are given of the formation of sanidinites of various kinds from cryst. schists. L. J. S.

**Rare stylolites.** P. B. STOCKDALE (Amer. J. Sci., 1936, [v], 32, 129—133).—In all observed cases the origin is consistent with the solution theory. L. J. S.

**Variation of the lead-uranium-thorium ratio in a single crystal of uraninite.** C. M. ALTER and E. M. KIPP (Amer. J. Sci., 1936, [v], 32, 120—128; cf. this vol., 135).—Successive layers of a single crystal from Wilberforce, Ontario, were dissolved in  $\text{HNO}_3$  and the following determinations made on the outer (I), intermediate (II), and central (III) sections. (I) was brown, and U had already been leached from it, but (II) and (III) were black and pure, and from these the age is now given as  $760 \times 10^7$  years. (I) Pb 9.739, U 37.848, Th 8.360%; Pb/(U+0.36Th) 0.2383; (II) 11.927, 58.475, 14.093%; 0.1877; (III) 11.865, 60.699, 8.051%; 0.1866. L. J. S.

**Tectonics of the Nemours region.** M. GAUTIER (Compt. rend., 1936, 202, 2092—2094). H. J. E.

**Tin occurrence in marble at Arandis, S.W. Africa.** P. RAMDOHR (Neues Jahrb. Min., 1935, A, 70, 1—48; Chem. Zentr., 1935, ii, 3080).—The minerals are described. H. J. E.

**Thermal analysis of the hydrated iron ores of Krivoi Rog.** V. A. IZBEKOV and K. J. SKARTSCHENKO (Mem. Inst. Chem. Ukrain. Acad. Sci., 1935, 2, 31—44).—The presence and approx. content of hydrated ores can be determined from the heating curves of the ore, under standard conditions. R. T.

**Zircon discoloured by sunlight (hyacinthine).** K. CHUDOKA (Deut. Goldschmiede-Ztg., 1935, 38, 303—304; Chem. Zentr., 1935, ii, 3219).—Zircons from Laacher Lake and Mongka lost their rose colour after 1 min. irradiation in direct sunlight and became grey. A brownish-red colour was restored by exposure to  $\text{RaBr}_2$ , or (more slowly) on keeping in the dark. The latter effect is due to radioactive substances in the mineral. H. J. E.

**Rare earth content of European and Japanese argillite.** E. MINAMI (Nachr. Ges. Wiss. Göttingen, 1935, IV, 1, 155—170; Chem. Zentr., 1935, ii, 3218).—The average rare earth contents of European and Japanese palaeozoic argillites were 0.0243 and 0.0225%, respectively. That of Japanese mesozoic argillite was 0.0173%. H. J. E.

**Origin of the segmental coloration of amethyst and smoky quartz.** C. FRONDEL (Amer. Museum Nov., 1935, No. 758, 15 pp.).—Examples are described. The phenomenon is attributed to the variation, with respect to crystallographic forms, of the rates of absorption of pigment during growth. CH. ABS. (e)

**Primary banding in basic plutonic rocks.** R. R. COATS (J. Geol., 1936, 44, 407—419).—The nature and suggested modes of origin of the mineralogically dissimilar bands often observed in basic plutonic rocks are reviewed. A mechanism, supported by experiments with labradorite and pyroxene, involving simultaneous crystallisation and differential settling of two or more minerals in a lighter magma, is suggested for the production of some of these bands. L. S. T.

**Granitic sequence in the Southern Complex of Upper Michigan.** R. M. DICKEY (J. Geol., 1936, 44, 317—340).—Granites representing three distinct periods of pre-Cambrian intrusion are described. L. S. T.

**Helium content of beryls.** H. J. WALKER (Physical Rev., 1935, [ii], 47, 969).—A discussion. The He content of beryls may be due to the disintegration of non-radioactive Be isotopes. L. S. T.

**Sun-burning [of basaltic rocks].** W. HOPPE (Z. deut. geol. Ges., 1935, 87, 452—473; Chem. Zentr., 1935, ii, 3220).—The phenomenon is found in basic but not in acid basalts. It differs from normal weathering in that it originates in the glassy material, in which hydrolysis and subsequent hydration occur. A grey layer is formed. It may be produced artificially by boiling for 40 hr. with  $\text{H}_2\text{O}$ , followed by prolonged treatment with  $\text{CO}_2$ . H. J. E.

**Sun-burning [of basaltic rocks].** H. STUTZEL (Z. deut. geol. Ges., 1935, 87, 473—480; Chem. Zentr., 1935, ii, 3220; cf. preceding abstract).—The characteristic appearance of the rock is described. H. J. E.

**Immiscible silicate melts, approximating in their composition to that of natural rocks.** D. P. GRIGORIEV (Zentr. Min., 1935, A, 242—254; Chem. Zentr., 1935, ii, 3219).—Melts of complex silicate tend to separate into two layers. A melt of alum (10), quartz (30),  $\text{MgCO}_3$  (30),  $\text{CaF}_2$  (5), and  $\text{B}_2\text{O}_3$  (2 pts.) forms on slowly cooling an upper dark glassy layer containing tridymite, a lower layer of Mg mica, and an intermediate layer. H. J. E.

**Baryte deposits of Virginia.** R. E. EDMUNDSON (Amer. Inst. Min. Met. Eng., 1936, Tech. Publ., 725, 17 pp.).—Baryte in Virginia occurs in fissure veins, replacement deposits, breccia zones, and residual deposits, in limestones and igneous rocks. The average content of BaO in the limestones is 0.06% and in a pegmatite 0.12%. The mineral could not have

been derived by leaching from these country-rocks. It was no doubt deposited by magmatic waters.

L. J. S.

**Ore-body zoning.** L. B. RILEY (Econ. Geol., 1936, 31, 170—184).—A method for examining ore-body zoning, *i.e.*, spacial variation of minerals and elements around and within an ore, is described. Examination of an incompletely oxidised Ag-Pb ore body at Sierra Mojada, Coahuila, Mexico, is used to illustrate the method, optical and micro-chemical tests being employed to detect the ions and minerals present.

L. S. T.

**Gold-bismuth occurrence in British Columbia.** H. V. WARREN (Econ. Geol., 1936, 31, 205—211).—Galenobismutite (I) (Bi 51.00, Pb 30.50, Fe 1.50, S 16.40, total 99.40%) and cosalite (II) (Pb 41.20, Bi 39.35, Cu 3.60, S 16.40, total 100.55%) accompany the pyrite (III) which occurs massive or cryst. to the extent of 10—25% in the quartz veins of the Cariboo Gold Quartz Mine. Free Au is associated with (I) and (II), which proves the hypogene nature of the ore bodies. A telluride has also been found with (I). The paragenesis is probably (III) and quartz, followed by (III); galena and sphalerite; ankerite (?); (II), (I), and Au. L. S. T.

**Minor intrusions of Glen Shee, Perthshire.** W. O. WILLIAMSON (Geol. Mag., 1936, 73, 145—157).—Additional data are given (*cf.* this vol., 185).

L. S. T.

**Xenolithic pegmatite in the Dalbeattie "granite."** M. MACGREGOR (Geol. Mag., 1936, 73, 171—185).—A pegmatite containing numerous xenoliths of more basic rock found in this "granite" is described. Interaction of the xenoliths and the pegmatite, and the origin of the xenolithic pegmatite, are discussed.

L. S. T.

**Heavy accessories of certain pre-Cambrian intrusives of the Canadian Shield.** E. L. BRUCE and W. JEWITT (Geol. Mag., 1936, 73, 193—213).—All the granites from the different localities examined contain zircon, apatite, and titanite, and some contain rutile. The crystal habits of these heavy accessories vary widely.

L. S. T.

**Hierro and Gomera Islands (Canary Archipelago).** E. JÉRÉMINE (Bull. Soc. franç. Min., 1935, 58, 350—362).—Trachytes, basalts, limburgites, tephrites, and basaltic tuffs composing Hierro Island are described, and an analysis of ankaratrite from Ajate, near Valverde, is given. Trachytes, phonolites, trahitites, andesites, and basalts from Gomera are also described.

L. S. T.

**Tin deposits of Llallagua, Bolivia.** E. AHLFELD (Econ. Geol., 1936, 31, 219—221).—A discussion of previous conclusions (A., 1935, 601).

L. S. T.

**Xenoliths in the Organ batholith, New Mexico.** K. C. DUNHAM and M. A. PEACOCK (Amer. Min., 1936, 21, 312—320).—The geology and mineralogy of large xenoliths near South Canyon and metamorphic effects are described. Green diopside [F. A. GONYER] ( $\text{SiO}_2$  53.10,  $\text{TiO}_2$  0.17,  $\text{Al}_2\text{O}_3$  2.55,  $\text{Fe}_2\text{O}_3$  none,  $\text{Cr}_2\text{O}_3$  none,  $\text{FeO}$  0.97,  $\text{MnO}$  0.08,  $\text{MgO}$  17.25,  $\text{CaO}$  25.80,  $\text{H}_2\text{O}$  0.04, total 99.96%) is associated with the uvarovite.

L. S. T.

**Peculiar type of zoning in feldspar.** J. M. TREFETHEN (Amer. Min., 1936, 21, 327—329).

L. S. T.

**Hydrothermal leaching in the Virginia mining district, New Mexico.** S. G. LASKY (Econ. Geol., 1936, 31, 156—169).—The tourmaline-Cu deposits of this district lie along veins that have been plugged and reopened repeatedly during the process of mineral deposition. Between the second and third stages of deposition the solutions removed calcite, sericite, and chlorite from interstitial and included fragments of altered wall rock in the veins, producing first- and second-stage minerals, chiefly specularite, quartz, and chalcopryite, on which minerals of later stages were deposited. A mechanism is suggested to account for their presence at places previously traversed by alkaline or neutral solutions.

L. S. T.

**Hydrothermal experiments with lead and zinc minerals.** O. H. KRISTOFFERSON (Econ. Geol., 1936, 31, 185—204).—The extent to which  $\text{PbCl}_2$  and  $\text{ZnCl}_2$  can be transported in the vapour phase in presence of  $\text{H}_2\text{O}$  and  $\text{HCl}$  vapour at temp.  $>500^\circ$  has been determined. Below  $290^\circ$ , sphalerites ( $\text{ZnS}$ ) from various localities were unaffected by steam + 20%  $\text{HCl}$ . Above  $290^\circ$ , the Zn volatilises as  $\text{ZnCl}_2$ , and curves showing decomp. and volatilisation from  $300^\circ$  to  $500^\circ$  are given. Steam alone had no effect. Galena from Yellowstone, Wisconsin, is tarnished by steam above  $300^\circ$  owing to oxide formation. With steam and  $\text{HCl}$  in a dynamic system, volatilisation commences at  $300^\circ$ , and at  $400^\circ$   $\text{PbCl}_2$  accumulates in the system; at  $475^\circ$ , loss by volatilisation practically equals the amount of  $\text{PbCl}_2$  formed, and above  $475^\circ$  the amount volatilised increases rapidly. The bearing of these results on the deposition of minerals is discussed.

L. S. T.

**Ice as an agent of rock weathering.** O. R. GRAWE (J. Geol., 1936, 44, 173—182).

L. S. T.

**South Hill lamprophyre, Jersey.** H. G. SMITH (Geol. Mag., 1936, 73, 87—91).—The mineral composition of the intrusion is described.

L. S. T.

**Reverse and oscillatory zoning in plagioclase feldspars.** E. S. HILLS (Geol. Mag., 1936, 73, 49—56).—A discussion of Phemister's theory (A., 1934, 862), and other possible causes of reverse zoning.

L. S. T.

**Pyroxmangite, new locality: identity of sobralite and pyroxmangite.** E. P. HENDERSON and J. J. GLASS (Amer. Min., 1936, 21, 273—294).—Pyroxmangite (I) from Idaho has  $\text{SiO}_2$  45.47,  $\text{MnO}$  27.06,  $\text{FeO}$  20.91,  $\text{CaO}$  2.62,  $\text{MgO}$  2.14,  $\text{Fe}_2\text{O}_3$  1.50,  $\text{H}_2\text{O}$  0.32, total 100.02% [E. P. HENDERSON] and  $\alpha$  1.737,  $\beta$  1.740,  $\gamma$  1.754 ( $\pm 0.001$ ). Physical, optical, chemical, and X-ray properties agree with those of the mineral from the original locality at Iva, S. Carolina. Sobralite from Sweden is identical with (I). Comparison of (I) and rhodonite shows differences in optical properties, and X-ray patterns indicate a structural difference which justifies the retention of both mineral species.

L. S. T.

**Amygdaloidal dykes.** R. S. MOEHLMAN (Amer. Min., 1936, 21, 329—331).

L. S. T.

**Notation of polymorphic modifications.** A. K. BOLDYREV (Tsch. Min. Petr. Mitt., 1936, 47, 517—

522)—Four different notations are noted; that which gives  $\alpha$ ,  $\beta$ ,  $\gamma$  in the chronological order of discovery of each modification is recommended. For example,  $\alpha$ -quartz (low quartz, quartz<sub>-575</sub>,  $\beta$ -quartz of Boeke) and  $\beta$ -quartz (high quartz, quartz<sub>+575</sub>,  $\alpha$ -quartz of Boeke). Boeke's notation, according to the order of lower temp. stability, is not practicable when there are several modifications, as with ice and S. L. J. S.

**Chemical composition of the titanomagnetites.** G. JOURAVSKY (Compt. rend., 1936, 202, 1689—1691).—The chemical composition and physical properties of titanomagnetites (I) are not in agreement with the assumption that they are solid solutions of magnetite and ilmenite in a state of false equilibrium through rapid cooling.  $\text{Al}_2\text{O}_3$  and  $\text{MgO}$  are both present in considerable amount and may both play an important part in the formation of (I).

M. S. B.

**Uranotile.** V. BILLIET (Natuurwetensch. Tijds., 1936, 18, 79).—X-Ray investigation confirms the formula  $\text{CaO}, 2\text{UO}_3, 2\text{SiO}_2, 6\text{H}_2\text{O}$ . Uranotile forms rhombic crystals isomorphous with sklodowskite (A., 1924, ii, 868).

D. R. D.

**New cobalt minerals.** L. DE LEENHEER (Natuurwetensch. Tijds., 1936, 18, 77—78).—Three Co minerals found in Katanga (Belgian Congo) are described, viz., black ore,  $2\text{Mn}_2\text{O}_3, 3\text{Co}_2\text{O}_3, 5\text{CuO}, 15\text{H}_2\text{O}$  or  $(\text{Mn}, \text{Co})_2\text{O}_3, \text{CuO}, 3\text{H}_2\text{O}$ ; boodtite,  $5\text{Co}_2\text{O}_3, \text{CuO}, \text{Fe}_2\text{O}_3, 11\text{H}_2\text{O}$  or  $2[\text{Co}_2\text{O}_3(\text{CuO}, \text{Fe}_2\text{O}_3)], 3\text{H}_2\text{O}$ ; and a mineral  $3(\text{Mn}_2\text{O}_3, \text{MnO}_2), \text{Co}_2\text{O}_3, 3\text{CuO}, 8\text{H}_2\text{O}$ . Mindigi spherocobaltite is a mixture containing 57% of rhombohedral mixed crystals of  $\text{CoCO}_3$ ,  $\text{MgCO}_3$ , and  $\text{FeCO}_3$ , and small proportions of malachite, quartz, hematite, mindigit, chalcopryrite, bornite, linnæite, phyllite, cyanite, and tourmaline.

D. R. D.

**Dissolution, transportation, and precipitation of manganese.** W. S. SAVAGE (Econ. Geol., 1936, 31, 278—297).—Primary Mn in rocks is dissolved mainly by the action of percolating carbonated waters. Peat solution is the next most effective solvent. Distilled  $\text{H}_2\text{O}$  is a poor solvent, but has a solvent action on the Mn in diabase > that on the Mn in syenite. Oxygenated  $\text{H}_2\text{O}$  has the least solvent action, but is more effective on diabase than on syenite. Mn is transported chiefly as  $\text{Mn}(\text{HCO}_3)_2$  in  $\text{H}_2\text{CO}_3$ -acid waters, and when these become neutral or slightly alkaline some unstable  $\text{Mn}(\text{OH})_2$  will be formed and remain in solution. Further transportation can take place with  $\text{Mn}(\text{HCO}_3)_2$  and  $\text{Mn}(\text{OH})_2$  in unstable equilibrium until conditions which result in pptn. are encountered. The presence of org. matter in the  $\text{H}_2\text{O}$  does not appear to affect the transportation of Mn under these conditions. Conditions which effect pptn. such as aeration, the alkaline reaction of certain bacteria, and passage over a limestone bed are discussed.

L. S. T.

**Genesis of the Tri-state zinc and lead ores.** J. RIDGE (Econ. Geol., 1936, 31, 298—313).—The jasperoid is composed of small xenomorphic crystals of quartz, the dark colour being due to org. matter. The paragenesis of the minerals is discussed.

L. S. T.

**Structure and primary mineralisation of the zinc mine at Balmat, New York.** J. S. BROWN (Econ. Geol., 1936, 31, 233—258).—The geology of the district, the nature of the deposit and its constituent minerals are described. The origin of the Zn ores from solutions derived from underlying igneous masses, probably a pre-Cambrian granite, is discussed. A chemical and a mineralogical analysis of the ore are recorded.

L. S. T.

**Elasticity of rock melts.** M. P. VOLAROVITSCHEV and A. A. LEONTEVA (Z. anorg. Chem., 1936, 228, 28—32).—Measurements at 870—1120° on two basalts and one diabase are recorded. The temp. of initial crystallisation was 1060—1150°.

H. J. E.

**Economic application of the insoluble residue method.** H. S. McQUEEN (Amer. Inst. Min. Met. Eng., 1936, Tech. Publ. 724, 12 pp.).—The residues obtained by treatment of limestone and dolomites or other sedimentary rocks containing  $\text{MgCO}_3$  and  $\text{CaCO}_3$  with dil. HCl permit correlations to be made between widely separated regions and different geological provinces. The successful economic application of the method in the drilling of  $\text{H}_2\text{O}$ , oil, and gas wells, in the study of ore deposits, and in the sp. investigation of limestones, is described.

L. S. T.

**Luminescence investigations with fluorites and other minerals.** H. HABERLANDT (Sitzungsber. Akad. Wiss. Wien, 1934, IIa, 143, 591—596; Chem. Zentr., 1935, ii, 3066; cf. A., 1935, 915).—The yellowish-white photo-fluorescence of certain fluorites is due to bituminous impurities. Lines of the rare earths and of U were observed for other specimens.

H. J. E.

**Synthetic emerald.** JAEGER and ESPIG (Deut. Goldschmiede-Ztg., 1935, 38, 347—349; Chem. Zentr., 1935, ii, 2992).—Synthetic emeralds identical in physical properties, crystal structure, zoned structure, etc. with the natural stone have been prepared and are now produced industrially.

J. S. A.

**Tin in Rumania.** G. CRUGLICOV (Miniera, 1935, 10, No. 5—6, 5—8; No. 7—8; 5—9; Chem. Zentr., 1935, ii, 2936).—Deposits in the mountains of southern Roumania are considered to be of economic val.

J. S. A.

**Formation of carbon dendrites.** K. D. LUKE, W. M. MADGIN, and H. L. RILEY (Nature, 1936, 138, 161—162).—The formation of C dendrites by the cathodic reduction of colloidal solutions of graphitic oxide is described.

L. S. T.

**Crystals of pyrites in ironstone concretions in coal formations.** A. SCHÖP (Natuurwetensch. Tijds., 1936, 18, 167—172).—Ironstone (sphaeroidite) consists of ankerite or some carbonate of similar composition and not of pure siderite. The reason for the occurrence therein of  $\text{FeS}_2$  is discussed.

D. R. D.

**Alteration of coal seams by intrusion of igneous dykes.**—See B., 1936, 674.

**Rate of fall of meteoric material on the earth.** C. C. WYLLIE (Physical Rev., 1935, [ii], 47, 192).—The annual amount of meteoric material estimated is 10 g. per sq. mile.

L. S. T.

## Organic Chemistry.

**Variation of physical constants in homologous series. I. Hydrocarbons.** V. G. ARANDA (Anal. Fis. Quim., 1936, **34**, 513—524).—The mol. vol. at 20° of hydrocarbons is given by  $V = aM + b$ , where  $a$  is 1.155, the quotient of the increment for each  $\text{CH}_2$  and its mol. wt. ( $M$ ), and  $b$  is for paraffins 30.3; olefines 25.8; diolefines 21.3; cyclopentanes 16.7; cyclohexanes 14.8; cycloheptanes 9.7; cyclohexenes 6.4; cyclohexadienes 4.4; aromatic hydrocarbons —0.8. Hence  $d$  is  $1/(1.155 + b/M)$ , where  $b$  has the above vals.;  $d$  is thus a hyperbolic function of  $M$  and when  $M$  is high,  $d$  for all the series approaches the val. 0.8658.  $n^{20}$  has similarly a common formula  $(1.815M + a)^{1/2}/(0.825M + c)^{1/2}$ , where, for the paraffins,  $a$  is 33.382,  $c$  28.759; olefines,  $a$  29.268,  $c$  24.066; cyclohexanes,  $a$  and  $c$ , 14.800; cyclohexenes,  $a$  6.786,  $c$  6.207; aromatic hydrocarbons,  $a$  0.358,  $c$  —1.379.  $d$  is thus a hyperbolic function of  $M$  tending to the val. 1.4832 for high vals. of  $M$ . The surface tension similarly may be represented  $(2.7857 + d)^4/(1.155M + b)$  and the parachor,  $2.7857M - d$ , where  $b$  has the vals. given above and  $d$  is for paraffins 28.6; olefines 23.2; diolefines 17.8; cyclohexanes 6.1; cyclohexenes 0.7; cyclohexadienes —4.7; aromatic hydrocarbons —10.1.

F. R. G.

**Decomposition of gaseous paraffins induced by ethylene oxide.** L. S. ECHOLS, jun., and R. N. PEASE (J. Amer. Chem. Soc., 1936, **58**, 1317; cf. Heckert and Mack, A., 1929, 1243).— $\text{C}_3\text{H}_8$  and  $n$ - and  $iso$ - $\text{C}_4\text{H}_{10}$ , but not  $\text{C}_2\text{H}_6$ , are "cracked" in presence of decomposing  $(\text{CH}_2)_2\text{O}$  at 425°. The relative amount of olefine produced increases with the size of the paraffin and the amount initially present. Fletcher's results (this vol., 570) on the accelerated decomp. of  $\text{MeCHO}$  by  $(\text{CH}_2)_2\text{O}$  are confirmed.

H. B.

**Action of nitrosyl chloride on  $n$ -hexane in presence of light.** S. MITCHELL and S. C. CARSON (J.C.S., 1936, 1005—1006).— $\text{NOCl}$  and  $n$ - $\text{C}_6\text{H}_{14}$  in bright sunlight form a brown oil, which on steam-distillation gives  $\text{COMeBu}^a$  and  $\text{COEtPr}^a$ . By excluding red light, a blue solution which probably contains  $\beta\beta$ - and  $\gamma\gamma$ -chloronitrosohexanes is obtained. The blue liquid undergoes two changes with red light; in the absence of  $\text{O}_2$ , oxime hydrochlorides are formed, and in its presence, photo-oxidation takes place.

F. R. S.

**Heptadecane. Action of selenium on stearic acid.** S. H. BERTRAM (Chem. Weekblad, 1936, **33**, 457—459).— $\text{C}_{17}\text{H}_{36}$  is formed in approx. 50% yield by heating stearic acid with Se at 310—325°. The remainder is dehydrogenated to  $\text{C}_{17}\text{H}_{34}$ . There is no evidence of formation of oleic or elaidic acid.

S. C.

**Olefine formation.** S. C. J. OLIVIER (Rec. trav. chim., 1936, **55**, 567—568).—Contrary to Taylor (A., 1935, 1465)  $\text{CHMeBr}$ , and  $\text{KOH}$ -aq.  $\text{EtOH}$  give mainly  $\text{C}_6\text{H}_8\text{Br}$  and a little  $\text{C}_6\text{H}_8$ , but no  $\text{MeCHO}$ .

R. S. C.

**Inhibition of chemical reactions. VI. Influence of ether and nitrobenzene on the absorption of ethylene by sulphuric acid.**—See this vol., 1075.

**Significance of organo-compounds of alkali metals in synthesis.** K. ZIEGLER (Angew. Chem., 1936, **49**, 455—460, 499—502).—A review.

E. W. W.

**Effect of oxygen on reaction between bromine and butadiene.** G. B. HEISIG and H. M. DAVIS (J. Amer. Chem. Soc., 1936, **58**, 1095—1097).—Addition (method: A., 1935, 827) of  $\text{Br}$  (1 mol.) to butadiene (1 mol.) occurs much more rapidly with  $\ll 2$  mm. of  $\text{O}_2$ , the total pressure being atm. Reaction is fast even in presence of  $\text{O}_2$  (2 and 375 mm.). These and previous results (*loc. cit.*) suggest a chain mechanism with short chains initiated at the surface.

H. B.

**Unimolecular elimination and the significance of the electrical conduction, racemisation, and halogen replacement of organic halides in solution.** E. D. HUGHES, C. K. INGOLD, and A. D. SCOTT (Nature, 1936, **138**, 120—121).— $\text{Bu}^n\text{Cl}$  absorbs  $\text{Br}$  quantitatively in  $\text{SO}_2$  to yield isobutylene dibromide and  $\text{HCl}$ , suggesting a somewhat rapid equilibrium  $\text{Bu}^n\text{Cl} + \text{CMe}_2\text{CH}_2 + \text{HCl}$ . Pure  $\text{CHPhMeCl}$  in pure  $\text{SO}_2$  does not give a conducting solution, but addition of  $\text{Br}$  produces a quant. yield of  $\text{CHPhBr} + \text{CH}_2\text{Br}$ . When conditions of purity are such that conduction takes place,  $\text{CHPh}:\text{CH}_2$  and  $\text{HCl}$  are present. These results and others on racemisation, and unimol. replacement of halogen in  $\text{SO}_2$ , are grouped under a general mechanism in which ionisation of the halide determines the rate, and the instability of an alkyl cation containing a potential proton is responsible for the production of olefine.

L. S. T.

**Heavy chloroform,  $\text{CDCl}_3$ .** R. TRUCHET (Compt. rend., 1936, **202**, 1997—1998).—Addition of  $\text{D}_2\text{O}$  to a suspension of  $\text{CaO}$  in  $\text{CCl}_3\text{CHO}$  affords mainly trichlorodeuteromethane, b.p. 61.3—61.5°, as shown by its Raman spectrum which includes three pairs of lines, three polarisable and three non-polarisable. The increment in mol. refraction due to  $\text{D}$  is 1.11.

J. L. D.

**$s$ -Tetrachlorodideuteroethane.** F. W. BREUER (J. Amer. Chem. Soc., 1936, **58**, 1289—1290).— $\text{C}_2\text{D}_2$  and  $\text{Cl}_2$  in presence of light and a carrier (prepared by action of  $\text{Cl}_2$  on a mixture of  $\text{Fe}_2\text{O}_3$ ,  $\text{Fe}$ ,  $\text{Al}_2\text{O}_3$ ,  $\text{Sb}$ , and sand on asbestos) give  $s$ -tetrachlorodideuteroethane (I), b.p.  $145.7 \pm 0.05/737$  mm. The v.p. of (I) at 20—80° is 6—9% < that of  $s$ - $\text{C}_2\text{H}_2\text{Cl}_4$ .

H. B.

**Bromination of nitromethane.**—See this vol., 1075.

**Decomposition of methyl alcohol.**—See this vol., 1076.

**Synthesis under pressure of aliphatic compounds.** (SIR) G. T. MORGAN (Bull. Soc. chim. Belg., 1936, **45**, 287—312).—A review. At 400°/200 atm. using  $\text{CoSO}_4$  with some  $\text{CuO}$  and  $\text{MnO}$  as catalyst,  $\text{CO}_2$  and  $\text{H}_2$  give a mixture containing  $\text{MeOH}$  (17%),  $\text{EtOH}$  (22%), higher alcohols, chiefly normal (11%), and  $\text{CH}_4$  (47%). From  $\text{EtOH}$  and  $\text{CO}_2$  at 370°/150 atm.  $\text{Bu}^n\text{OH}$  (19.5%), hexyl (4.6%), octyl (1.2%), and higher alcohols (1%) are obtained. Using  $\text{H}_3\text{PO}_4$  and  $\text{Cu}_3(\text{PO}_4)_2$  as catalyst at 330—340°, from  $\text{MeOH}$ ,

the largest yield of AcOH is 44.9% with 9.5% Me<sub>2</sub>O. EtCO<sub>2</sub>H and higher acids may be obtained similarly in small yield from the corresponding alcohol, the active substance being the olefine derived by dehydration from the alcohol.

F. R. S.

#### Action of calcium carbide on methyl alcohol.

A. CONTARDI and B. CIOCCA (R. Ist. lombardo Sci. Lett., Rend., [ii], 1935, 68, 126—128; Chem. Zentr., 1935, ii, 3085).—Ca(OMe)<sub>2</sub> and C<sub>2</sub>H<sub>2</sub> are formed vigorously at room temp.; hence CaC<sub>2</sub> cannot be used, in the presence of MeOH, for determination of H<sub>2</sub>O.

H. N. R.

**Electrolysis of organic substances in non-aqueous media.** II. G. GIACOMELLO (Gazzetta, 1936, 66, 350—357; cf. A., 1935, 1349).—Electrolysis of NaOMe in MeOH containing CO<sub>2</sub> yields at the cathode H<sub>2</sub>, CH<sub>4</sub>, CO<sub>2</sub>, and some CO, and Na<sub>2</sub>CO<sub>3</sub>; that of NaOMe and HCO<sub>2</sub>Me in MeOH gives H<sub>2</sub> and much more CO, with some CO<sub>2</sub> and CH<sub>4</sub>. Conductivity of NaOMe—HCO<sub>2</sub>Me mixtures suggests the formation of compounds, HCO<sub>2</sub>Me, NaOMe and HCO<sub>2</sub>Me, (NaOMe)<sub>2</sub>, probably enolic complex ions. Electrolysis of a mixture of NaOMe and CO(OEt)<sub>2</sub> yields H<sub>2</sub>, CO<sub>2</sub>, hydrocarbons, and CO, with resins at the anode. ClCO<sub>2</sub>Et also yields H<sub>2</sub> and CO<sub>2</sub>. When NaOMe in MeOH containing CO<sub>2</sub> is electrolysed in a cell with porous compartments, both Na<sup>+</sup> and CO<sub>2</sub> increase at the cathode. This is ascribed to the formation of MeO·CO<sub>2</sub>Na, dissociating into [CO<sub>2</sub>Na]<sup>+</sup> and OMe<sup>−</sup>, the former yielding CO<sub>2</sub> and Na, and thus CO<sub>2</sub>, H<sub>2</sub>, and NaOMe.

E. W. W.

**Nitro-chromic reaction and its application to the determination of small quantities of alcohol.** D. A. WEBB (Sci. Proc. Roy. Dublin Soc., 1936, 21, 281—284).—Modifications of Agulhon's reaction (cf. A., 1911, ii, 1140) described enable the [EtOH] to be determined to ±2%. The method is applied to small quantities of biological fluids.

J. L. D.

**Synthesis of monohydric unsaturated alcohols with systems of double linkings.** P. PELKIS (Mem. Inst. Chem. Ukrain. Acad. Sci., 1936, 3, 45—60).—CMe<sub>2</sub>:CH·COMe (I), CH<sub>2</sub>:CH·CH<sub>2</sub>Br, and Mg in Et<sub>2</sub>O afford βδ-dimethyl-Δ<sup>βδ</sup>-heptadien-8-ol, b.p. 58°/2 mm. (yield 75%). When CHPh:CH·COMe is taken in place of (I) the product is α-phenyl-γ-methyl-Δ<sup>αα</sup>-hexadien-γ-ol, b.p. 122—123°/2 mm. (31% yield), whilst with CHPh:CH·COPh αγ-diphenyl-Δ<sup>αα</sup>-hexadien-γ-ol, b.p. 170—170.5°/2 mm., is obtained, in 18.7% yield.

R. T.

**New constituents in the unsaponifiable matter of sperm blubber oil.** S. UENO and R. KOYAMA (Bull. Chem. Soc. Japan, 1936, 11, 394—403).—Laborious fractionation of the unsaponifiable matter of the oil has yielded the following substances; heptanol (4-iododiphenyl-4'-urethane, m.p. 150°); octan-α-ol, b.p. 95—97°/17 mm. (further identified as its phenyl- and α-naphthyl-urethane); alcohol C<sub>9</sub>H<sub>20</sub>O, b.p. 102—105°/15 mm., oxidised to an acid (amide, C<sub>9</sub>H<sub>19</sub>ON, m.p. 97°); decan-α-ol (phenylurethane, m.p. 72.5°; α-naphthylurethane, m.p. 66°); dodecanol (α-naphthylurethane, m.p. 74°; two isomeric phenylurethanes, m.p. 71° and 69.5°, respectively), as a mixture of two isomerides named "catadontidaeyl"

and "isocatadontidaeyl alcohol"; "agorophyl alcohol," C<sub>8</sub>H<sub>16</sub>O, b.p. 94—95°/15 mm.; "macrocephaly alcohol," C<sub>10</sub>H<sub>20</sub>O, b.p. 100—102°/15 mm.; alcohol, C<sub>11</sub>H<sub>22</sub>O, b.p. 140—141°/17 mm., converted by ozonolysis into *n*-nonoic acid and (probably) H<sub>2</sub>C<sub>2</sub>O<sub>4</sub>, and therefore Δ<sup>β</sup>-undecen-α-ol; "odontocetyl alcohol," C<sub>12</sub>H<sub>24</sub>O, b.p. 156—158°/17 mm.; ethers, C<sub>18</sub>H<sub>34</sub>O, b.p. 120°/17 mm. converted by hydrogenation (Pt-black) at 100 atm. into C<sub>18</sub>H<sub>38</sub>O, b.p. 223—224°/75 mm., and reduced by HI to decan-α-ol among other substances, thus indicating the constitution C<sub>10</sub>H<sub>21</sub>·O·C<sub>8</sub>H<sub>17</sub>.

A. T.

**Hydroxylation of the double linking.** N. A. MILAS and S. SUSSMAN (J. Amer. Chem. Soc., 1936, 58, 1302—1304).—CHR:CHR' with Bu'OH-anhyd. H<sub>2</sub>O<sub>2</sub> (prep. described) in presence of a little OsO<sub>4</sub> gives (mainly) OH·CHR·CHR'·OH. The following are prepared: OH·CMe<sub>2</sub>·CH<sub>2</sub>·OH; OH·CMe<sub>2</sub>·CHMe·OH; glycerol (from allyl alcohol); OH·CHPh·CH(OH)·CO<sub>2</sub>H; OH·CHMe·CH(OH)·CO<sub>2</sub>H; *dl*- and *meso*-tartaric acids (from fumaric and maleic acid, respectively).

H. B.

**Photochemical peroxide formation.** III. **Oxidation of glycerol by molecular oxygen in ultra-violet light.** Photochemical production of perglycerol. R. CANTIENI (Ber., 1936, 69, [B], 1796—1798).—In analogy with the behaviour of primary alcohols, glycerol (I) is assumed to yield perglycerol (II), OH·CH<sub>2</sub>·CH(OH)·CH<sub>2</sub>·O<sub>2</sub>H and the photo-oxidation of (I) to follow the course: OH·CH(CH<sub>2</sub>·OH)<sub>2</sub> + 7(II) → 3H<sub>2</sub>CO<sub>3</sub> + H<sub>2</sub>O + 7OH·CH(CH<sub>2</sub>·OH)<sub>2</sub>. The rate of formation of (II) diminishes when the concn. of (I) is >10%. At the commencement of the reaction approx. equal amounts of (II) are produced in equal intervals of time, but the change tends towards an equilibrium.

H. W.

**Properties of the two modifications of glyceryl trinitrate.** J. HACKEL (Rocz. Chem., 1936, 16, 213—222).—The formation of the stable modification of glyceryl trinitrate, m.p. 13°, is favoured by presence of C<sub>6</sub>H<sub>5</sub>(NO<sub>2</sub>)<sub>3</sub> or kieselguhr, whilst cellulose nitrate and Et and Ph carbamate favour crystallisation of the unstable form, m.p. 1.9°; many other substances are without effect. The stable form is more sensitive to shock than the unstable one, but the explosive power and velocity of detonation are the same for both forms.

R. T.

**Explosions arising from ethers.** E. C. WILLIAMS (Chem. and Ind., 1936, 580—581).—All ethers studied form peroxides on storage, but the rate of formation is variable. Danger occurs whenever an ether is dry-distilled, and with practically all ethers explosions have been experienced. Peroxides are determined by adding acidified KI—EtOH and titrating the I liberated; they may be destroyed by adding FeSO<sub>4</sub>, NaHSO<sub>3</sub>, acidified KI, or Na<sub>2</sub>SO<sub>3</sub>. The ether may also be distilled with steam. Oxidation inhibitors such as NHPh<sub>2</sub>, α- and β-C<sub>10</sub>H<sub>7</sub>·OH, and quinol retard development of peroxides.

F. R. S.

**Relative mobilities of normal alkyl radicals in their chlorothioformates.** P. CARRÉ and L. PEIGNÉ (Compt. rend., 1936, 202, 2159—2161; cf. A.,

1935, 1105).—The temp. of decomp. of  $\text{ClCOSR}$  into  $\text{RCl}$  and  $\text{COS}$  in presence of quinoline ( $\text{R} = n\text{-alkyl}$ ,  $\text{C}_1\text{—C}_{11}$ ) shows an alternation effect with the no. of C in the radical. The results are compared with those of  $\text{ClCO}_2\text{R} \rightarrow \text{RCl} + \text{CO}_2$  and discussed in terms of the mobility of the radicals.

F. N. W.

**Synthesis and hydrolysis of phosphoric esters derived by methylation of  $\beta$ -hydroxyethyl dihydrogen phosphate.** O. BAILLY and J. GAUMÉ (Bull. Soc. chim., 1936, 3, [v], 1396—1405).— $\text{Na}_2\beta$ -hydroxyethyl phosphate (I) with an equimol. amount of  $\text{Me}_2\text{SO}_4$  gives  $\text{Me}\beta$ -hydroxyethyl H phosphate, isolated as *Ca* salt, which with dil.  $\text{Na}_2\text{CO}_3$  at  $100^\circ$  is converted quantitatively into (I) (cf. A., 1926, 1225; 1935, 471). (I) with aq.  $\text{AgNO}_3$  affords  $\text{Ag}_2\beta$ -hydroxyethyl phosphate, which with  $\text{MeI—Ag}_2\text{O}$  affords  $\text{Me}_2\beta$ -methoxyethyl phosphate, b.p.  $112\text{—}113^\circ/9$  mm., hydrolysed rapidly by cold *N-NaOH* to *Na Me*  $\beta$ -methoxyethyl phosphate, which when heated loses 50% of its P to give  $\text{NaPO}_3$ , but is stable in boiling *N-NaOH* (cf. A., 1926, 384).  $\text{OMe}[\text{CH}_2]_2\text{OH}$  with  $\text{P}_2\text{O}_5$  in anhyd.  $\text{Et}_2\text{O}$  affords  $\beta$ -methoxyethyl H phosphate (*Ca*, *Sr*, and *Ba* salts). J. L. D.

**Boric esters of polyalcohols.** A. DUPIRE (Compt. rend., 1936, 202, 2086—2087; cf. A., 1932, 937).—Almost quant. yields of the borates of  $(\text{CH}_2\text{OH})_2$ , glycerol, propane- $\alpha\beta$ -diol,  $\alpha$ -chloropropane- $\beta\gamma$ -diol, and butane- $\alpha\gamma$ -diol were prepared from the alcohol and acid in presence of  $\text{PhMe}$ . H. J. E.

**Boric acid derivatives of tetrasubstituted glycerol.** P. PASTUREAU and (Mlle.) M. VEILER (Compt. rend., 1936, 202, 1683—1685; cf. A., 1925, i, 500).— $\gamma$ -Chloro- $\beta\delta$ -dimethylpentane- $\beta\delta$ -diol (cf. A., 1934, 753) with  $\text{H}_3\text{BO}_3$  in  $\text{H}_2\text{O}$  gives a *H borate*, m.p.  $132^\circ$ . *H borates* (m.p. in parentheses) of the following are prepared:  $\beta\delta$ -dimethylpentane- $\beta\gamma\delta$ -triol ( $118^\circ$ ),  $\beta\gamma\delta$ -trimethylpentane- $\beta\delta$ -diol ( $72^\circ$ ),  $\delta$ -chloro- $\gamma\epsilon$ -dimethylhexane- $\gamma\epsilon$ -diol ( $58^\circ$ ), and  $\delta$ -chloro- $\epsilon$ -methyl- $\gamma$ -ethylhexane- $\gamma\epsilon$ -diol ( $55^\circ$ ). Aryl-substituted glycerols do not give similar derivatives. J. L. D.

**$\alpha$ -Halogenated thioethers.** H. BOHME (Ber., 1936, 69, [B], 1610—1615).— $\text{CH}_2\text{Cl Et sulphide}$  (I), b.p.  $128\text{—}131^\circ/760$  mm., is obtained in 60% yield by passing  $\text{HCl}$  into a suspension of polyoxymethylene in  $\text{EtSH}$  at room temp. It is hydrolysed by  $\text{H}_2\text{O}$  to  $\text{CH}_2\text{O}$ ,  $\text{EtSH}$ , and  $\text{HCl}$ , which react with formation of  $\text{CH}_2(\text{SEt})_2$ , b.p.  $184^\circ/763$  mm. [also obtained from (I) and  $\text{NaSEt}$  in  $\text{EtOH}$ ], and oxidised by  $\text{H}_2\text{O}_2$  in  $\text{AcOH}$  to the sulphone, m.p.  $104^\circ$ . (I) and  $\text{BzO}_2\text{H}$  in  $\text{CHCl}_3$  at  $-15^\circ$  give  $\text{CH}_2\text{Cl Et sulphone}$ , b.p.  $128^\circ/14$  mm., m.p.  $33^\circ$ .  $\text{OEt-CH}_2\text{ Et sulphide}$ , b.p.  $134\text{—}136^\circ/735$  mm., is derived from (I) and  $\text{NaOEt}$  in  $\text{EtOH}$  or from  $\text{CH}_2\text{Cl-OEt}$  and  $\text{NaSEt}$ .  $\text{OEt-CH}_2\text{ Et sulphone}$  has b.p.  $122^\circ/13$  mm.  $\text{CH}_2\text{Ph Et sulphide}$ , b.p.  $222\text{—}223^\circ/750$  mm., obtained from (I) and  $\text{MgPhBr}$  is oxidised to the sulphoxide, m.p.  $49^\circ$ , and sulphone, m.p.  $84^\circ$ .  $\text{Ethylthiolacetoneitrile}$ , b.p.  $72\text{—}73^\circ/13$  mm., from (I) and  $\text{Hg}(\text{CN})_2$ , is hydrolysed by fuming  $\text{HCl}$  to ethylthiolacetic acid, b.p.  $118^\circ/11$  mm. H. W.

**Bromomethanetrisulphonates.** H. J. BACKER and P. TERPSTRA (Rec. trav. chim., 1936, 55, 602—605).—Crystallographic and solubility data are given

for the  $\text{Li}_3$  ( $+9\text{H}_2\text{O}$ ),  $\text{Na}_3$  ( $+3\text{H}_2\text{O}$ ),  $\text{Rb}_3$  (I) ( $+ \text{H}_2\text{O}$ ),  $\text{Cs}_3$  ( $+ \text{H}_2\text{O}$ ),  $\text{Ba}_{1.5}$  ( $+9\text{H}_2\text{O}$ ), and *tristrychnine* ( $+3\text{H}_2\text{O}$ ) salts. X-Ray analysis of (I) is reported.

R. S. C.

**Structure of the isomeride of isoprenesulphone.** H. J. BACKER, J. STRATING, and A. J. ZUTHOFF (Rec. trav. chim., 1936, 55, 761—764).— $\text{COEt-CH}_2\text{Cl}$ , b.p.  $114^\circ$  [obtained with  $\text{COMe-CHMeCl}$  (I), b.p.  $133\text{—}135^\circ$ , from  $\text{COMeEt}$  and  $\text{Cl}_2$ ], with  $(\text{NH}_4)_2\text{SO}_3$  at  $70^\circ$  gives *n-butan- $\beta$ -one- $\alpha$ -sulphonic acid* (*Ba* and *K* salt, hygroscopic). (I) gives similarly *n-butan- $\beta$ -one- $\gamma$ -sulphonic acid* [*Ba* ( $+ \text{H}_2\text{O}$ ) and *K* salts].  $\text{OH-CH}_2\text{-SO}_3\text{K}$  and  $\text{CH}_2\text{Ac-CO}_2\text{Et}$  give a product, hydrolysed by  $\text{H}_2\text{SO}_4$  to *n-butan- $\gamma$ -one- $\alpha$ -sulphonic acid* (II) (*Ba* and *K* salts). Crystallographic data of the *Ba* salts are given. (II) is identical with the acid given by  $\text{O}_3$  from the isomeride (ultra-violet illumination) of isoprenesulphone (A., 1935, 1105), the structure of which is thus proved to be *3-methyl-4:5-dihydrothiophen 1:1-dioxide*.

R. S. C.

**Syntheses using tautomeric sodium organic compounds.** G. V. TSCHELINCEV (J. Gen. Chem. Russ., 1936, 6, 650—657).—Theoretical. R. T.

**Reaction of iodoacetate and of iodoacetamide with thiol groups, with urease, and with yeast preparations.**—See this vol., 1074.

**Kinetics of hydrolysis of esters in alkaline media.**—See this vol., 1073.

**Action of liquid ammonia on acetone compounds of  $\alpha$ -hydroxy-acids.** H. ŌEDA (Bull. Chem. Soc. Japan, 1936, 11, 385—389).—*dl*-Lact-, *l*-leuc-, *dl*-mandel-, and *l*- $\alpha$ -hydroxy- $\beta$ -phenylpropionamide were synthesised by treating the respective  $\text{CMe}_2$  compounds with liquid  $\text{NH}_3$ , best at  $-33^\circ$ .

A. T.

**Keto-enol tautomerism of ethyl acetoacetate.** M. BEYAERT (Natuurwetensch. Tijds., 1936, 18, 209—228).—The methods employed for determining the % of enol in keto-enol tautomerides in general and  $\text{CH}_2\text{Ac-CO}_2\text{Et}$  in particular are reviewed. Equilibrium between the two forms of this ester is established only very slowly in the vapour phase, and attempts to determine the composition of the vapour at equilibrium were unsuccessful. The dielectric const. and  $n$  at various temp. of the pure keto-form and mixtures of this with the enolic form (up to 90% enolic) have been determined and follow the additive mixture law.

D. R. D.

**Condensation of acetaldehyde with ethyl  $\alpha$ -methylacetoacetate.** T. WENDLING (Bull. Soc. chim., 1936, [v], 3, 790—798).— $\text{CHMeAc-CO}_2\text{Et}$  (I),  $\text{MeCHO}$  (II),  $\text{K}_2\text{CO}_3$ , and  $\text{H}_2\text{O}$  at  $5^\circ$  give *Et  $\alpha$ -methyl- $\alpha$ -( $\alpha'$ -hydroxyethyl)acetoacetate*, b.p.  $87\text{—}88^\circ/1.2$  mm., which with  $\text{AcCl}$  gives the *acetate*, b.p.  $108\text{—}111^\circ/1.1$  mm., and regenerates (I) and (II), slowly when kept and more rapidly at higher temp. It is decomposed by  $\text{Ac}_2\text{O}$  into (I) and (II), a trace of  $\text{Et}_2$  ethyldenedi- $\alpha$ -methylacetoacetate being also formed. Attempts to prepare its pyrazolone failed, only that of (I) being isolated.

H. G. M.

**Preparation of hydroxy-acids [dihydroxystearic acid].** A. W. RALSTON and S. T. BAUER (Oil and Soap, 1936, 13, 170—171; cf. B., 1931, 199).

—A prep., m.p. 114–116°, consisting apparently essentially of the same dihydroxystearic acid, m.p. 124–127°, as is obtained by oxidising oleic acid (I) with alkaline  $\text{KMnO}_4$ , has been obtained by oxidising (I) in a solution containing  $\text{NaOH}$  (4%) and  $\text{Ni}(\text{NO}_3)_2$  (0.5%) and a few crystals of  $\text{MnCl}_2$  through which  $\text{Cl}_2$  was bubbled. The intermediate formation of  $\text{Ni}_2\text{O}_7$  is postulated. E. L.

**Sodium xanthate.**—See this vol., 1078.

**Preparation of polyenes.** Synthesis of hexatriene- $\alpha\zeta$ -dicarboxylic acid and octatetraene- $\alpha\theta$ -dicarboxylic acid. R. KUHN and C. GRUNDMANN (Ber., 1936, 69, [B], 1757–1765).—The synthesis follows the lines:  $\text{CHMe}\cdot\text{CH}\cdot\text{CO}_2\text{Et} \rightarrow$

$\text{CO}_2\text{H}\cdot[\text{CH}\cdot\text{CH}]_2\cdot\text{CO}_2\text{H}$ . Thus  $\text{Et}_2\alpha$ -acetoxymuconate is converted by  $\text{Al-Hg}$  in  $\text{Et}_2\text{O-H}_2\text{O}$  into  $\text{Et}_2\alpha$ -acetoxy- $\alpha\delta$ -dihydromuconate, b.p. 144–146°/2 mm., hydrolysed by  $\text{KOH-MeOH}$  to  $\text{Me}_2$  trans-trans-muconate, m.p. 56°, and by  $\text{KOH-H}_2\text{O}$  to trans-trans-muonic acid, m.p. 298° (Berl.; decomp.). Similarly  $\text{CMe}_2\cdot\text{CH}\cdot\text{CO}_2\text{Me}$ ,  $\text{KOEt}$ , and  $\text{Et}_2\text{C}_2\text{O}_4$  afford the *K* salt,  $\text{CO}_2\text{Et}\cdot\text{C}(\text{OK})\cdot\text{CH}\cdot\text{CMe}\cdot\text{CH}\cdot\text{CO}_2\text{Me}$ , converted by successive treatment with  $\text{Ac}_2\text{O}$ ,  $\text{Al-Hg}$ , and hydrolysis into trans-trans- $\beta$ -methylmuconic acid, m.p. 232° (decomp.).  $\text{Et}_2\alpha$ -acetoxy- $\Delta^{\gamma\epsilon}$ -hexatriene- $\alpha\zeta$ -dicarboxylate is converted into  $\text{Et}_2\alpha$ -acetoxy- $\Delta^{\beta\delta}$ -hexadiene- $\alpha\zeta$ -dicarboxylate (I), b.p. 158–160°/1 mm., hydrolysed by  $\text{KOH-MeOH-H}_2\text{O}$  to  $\Delta^{\gamma\epsilon}$ -hexatriene- $\alpha\zeta$ -dicarboxylic acid (II), m.p. 316–318° (decomp.) when placed in bath at 250° and quickly heated, gradual decomp. > 280° when slowly heated [ $\text{Me}_2$  ester, m.p. 172°, from (II) through the acid chloride or with  $\text{CH}_3\text{N}_2$ , but best obtained from (I) and  $\text{KOH-MeOH}$ ;  $\text{Et}_2$  ester, m.p. 90°]. (II) and  $\text{Br}$  in diffuse daylight afford  $\alpha\beta\gamma\delta\epsilon\zeta$ -hexabromosuberlic acid, gradual decomp. > 200°. (III) is hydrogenated ( $\text{PtO}_2$  in 0.1*N*- $\text{NaOH}$ ) to suberic acid, m.p. 141–142°. (II) is reduced by  $\text{Na-Hg}$  to  $\Delta^{\beta\delta}$ -hexadiene- $\alpha\zeta$ -dicarboxylic acid, m.p. 190°, the constitution of which is established by its condensation with  $\text{CHPh}\cdot\text{CH}\cdot\text{CHO}$  in presence of  $\text{Pb}$  oxide and  $\text{Ac}_2\text{O}$  to  $\alpha\mu$ -diphenyl- $\Delta^{\gamma\epsilon\eta\theta}$ -dodecahexaene, m.p. 263°; it is isomerised by boiling 20%  $\text{KOH}$  to  $\Delta^{\gamma\epsilon}$ -hexadiene- $\alpha\zeta$ -dicarboxylic acid, m.p. 225–227°.  $\text{Et}$   $\gamma$ -methylsorbatate,  $\text{Et}_2\text{C}_2\text{O}_4$ , and  $\text{KOEt}$  afford *Et* ethoxalyl- $\gamma$ -methylsorbatate, m.p. 103.5°, transformed by successive treatment with  $\text{Ac}_2\text{O}$ ,  $\text{Al-Hg}$ , and  $\text{KOH-H}_2\text{O}$  into  $\gamma$ -methyl- $\Delta^{\gamma\epsilon}$ -hexatriene- $\alpha\zeta$ -dicarboxylic acid, m.p. 296° (decomp.).  $\text{Et}_2\text{C}_2\text{O}_4$  and  $\text{Me}$  octatriene-carboxylate in presence of  $\text{KOEt}$  give *Et* ethoxalyl-octatrienecarboxylate, m.p. 119–120°; condensation occurs better in presence of  $\text{KOPr}^{\delta}$ . The mixture of esters is converted by  $\text{Ac}_2\text{O}$  followed by  $\text{Al-Hg}$  and  $\text{KOH-MeOH}$  into  $\text{Me}_2$   $\Delta^{\gamma\epsilon\eta\theta}$ -octatetraene- $\alpha\theta$ -dicarboxylate, m.p. 212°, hydrolysed by 5%  $\text{KOH}$  to  $\Delta^{\gamma\epsilon\eta\theta}$ -octatetraene- $\alpha\theta$ -dicarboxylic acid, m.p. 309° (decomp.), which is reduced by  $\text{Na-Hg}$  to octatriene- $\alpha\theta$ -dicarboxylic acid, m.p. 195° (decomp.). H. W.

**Acyclic keto-acids.** N. A. PREOBRASHENSKI, M. N. SCHTSCHUKINA, and A. F. VOMPE (Ber.,

1936, 69, [B], 1618–1620).— $\text{Et}_2$  ethylsuccinate,  $\text{Et}_2\text{C}_2\text{O}_4$ , and  $\text{NaOEt}$  in  $\text{Et}_2\text{O}$  at room temp. yield *Et*<sub>2</sub> ethoxalylethylsuccinate (yield 80–90%), which passes when distilled under diminished pressure into  $\text{CO}$  and  $\text{Et}_3$  butanetricarboxylate. It is hydrolysed by boiling conc.  $\text{HCl}$  to  $\gamma$ -keto- $\alpha$ -ethylglutaric acid [semicarbazone, m.p. 177–178° (decomp.); 1-phenyl-5-ethylpyridazin-6-one, m.p. 159–160° (decomp.)], the *Et* ester, b.p. 148.5°/15 mm., 269°/741.5 mm. (semicarbazone, m.p. 130.5–131°), of which condenses with  $\text{HCO}_2\text{Et}$  to *Et*<sub>2</sub>  $\gamma$ -keto- $\beta$ -aldehydo- $\alpha$ -ethylglutarate; this could not be distilled without decomp. and gives a phenylhydrazine and semicarbazone which are difficult to purify. H. W.

**Rotatory power of methyl tartrate: influence of solvent, temperature, and neutral salts.** Y. K. HENG (Bull. Soc. chim., 1936, [v], 3, 1004–1019).—In aq. solution  $\alpha$  is reduced by the addition of neutral salts. The effect depends on the cation, showing a periodicity which corresponds with the periodic table. Salts of  $\text{Fe}^{\text{III}}$  and  $\text{Th}$  increase  $\alpha$ . The influence of temp. varies according to the solvent. E. S. H.

**Cuprotartrates.** Y. K. HENG (Bull. Soc. chim., 1936, [v], 3, 993–1004).—The reactions of  $\text{NaOH}$  +  $\text{Cu}(\text{OH})_2$  with tartaric acid, tartramide, and Me tartrate have been investigated by following the change in optical rotation. The curves obtained show the existence of the salts  $2\text{C}_4\text{H}_4\text{O}_6\text{NH}_2\cdot\text{CuO}$ ,  $[\text{CuO}\cdot\text{C}_4\text{H}_4\text{O}_6\text{NH}_2]_2\text{Na}_2$ ,  $[2\text{C}_4\text{H}_4\text{O}_6(\text{NH}_2)_2\cdot\text{CuO}]_2\text{Na}_2$ , and  $[\text{C}_4\text{H}_4\text{O}_6\text{Me}_2\cdot\text{CuO}]\text{Na}$ . E. S. H.

**Preparation and constitution of alginic acid.** V. C. BARRY and T. DILLON (Sci. Proc. Roy. Dublin Soc., 1936, 21, 285–287; cf. A., 1932, 931; 1935, 550).—Extraction of the fronds of *Laminaria digitata* with aq.  $\text{NH}_3$  (details given) affords alginic acid,  $\text{C}_6\text{H}_{10}\text{O}_7$  (equiv. wt. 192;  $[\alpha]_D^{20}$  –133.4° in  $\text{H}_2\text{O}$ , for the Na salt, which supports the view that the polymerising unit is the uronic acid). J. L. D.

**Derivatives of alginic acid. I. Acetylation of alginic acid.** V. C. BARRY, T. DILLON, and P. O'MUINEACHAIN (Sci. Proc. Roy. Dublin Soc., 1936, 21, 289–296).—Alginic acid (I) (cf. preceding abstract) affords a trace of  $\text{Ac}_1$  (?) with  $\text{NaOAc}$  and boiling  $\text{Ac}_2\text{O}$  and a  $\text{Ac}_3$  derivative with  $\text{Ac}_2\text{O}$  containing  $\text{ZnCl}_2$  at 80°. (I) with boiling  $\text{Ac}_2\text{O}$  containing a little I affords  $\text{Ac}_3$  and  $\text{Ac}_2$  derivatives and with  $\text{HI}$  in  $\text{Ac}_2\text{O}$  affords, in good yield,  $\text{Ac}_2$  derivatives,  $[\alpha]_D^{20}$  –93.1°, –113.9°, and –136.8° (Na salt) in  $\text{H}_2\text{O}$ , respectively, which are probably derivatives of degradation products of (I) of different degrees of polymerisation. The results support the view that the entire uronic acid is the polymerising unit. J. L. D.

**Glycuronic acid.** A. LEULIER (J. Pharm. Chim., 1936, [viii], 24, 64–76, 122–131).—A review.

**n-Butyl esters of thio-acids.** E. MULLER and A. FREYTAG (J. pr. Chem., 1936, [ii], 145, 318–320).— $\text{NaBu}\cdot\text{SO}_4$  (modified prep.), aq.  $\text{KOH}$ , and  $\text{CS}_2$  give  $\text{Bu}^n\text{SH}$ , which with  $\text{Pb}(\text{OAc})_2\cdot\text{EtOH}$  affords the stable *Pb* salt. With the appropriate acid chloride in  $\text{Et}_2\text{O}$  this gives >80% yields of *S-Bu*<sup>n</sup> thio-propionate, b.p. 64.5°/15 mm., -butyrate, b.p. 80.1°/12

mm., and -isovalerate, b.p. 86.5°/12 mm., only slowly attacked by oxidising agents. R. S. C.

$\alpha\beta$ -,  $\alpha\gamma$ -,  $\beta\gamma$ -Disulphobutyric acids. H. J. BACKER and N. BENNINGA (Rec. trav. chim., 1936, 55, 605—614).— $\text{SO}_3\text{H}\cdot\text{CHMe}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$  and oleum at 90° give mainly  $\alpha\beta$ -disulphocrotonic acid, hydrogenated (Pt-black) in dil. AcOH to  $\alpha\beta$ -disulphobutyric acid ( $\text{Ba}_{1-}$ ,  $+2\text{H}_2\text{O}$ , and  $\text{Ti}_3$  salts), the tristrychnine salt,  $+9\text{H}_2\text{O}$ , of which, when recrystallised, yields the d-acid (I),  $[\text{M}]_D^{+16}$  in  $\text{H}_2\text{O}$  ( $\text{Na}_3$  salt,  $[\text{M}]_D^{-6}$  in  $\text{H}_2\text{O}$ ). The non-resolvable acid (A., 1935, 1107) is thus proved to be the  $\beta\beta$ -disulpho-acid.  $\text{Br}\cdot[\text{CH}_2]_3\cdot\text{CO}_2\text{NH}_4$  and  $(\text{NH}_4)_2\text{SO}_3$  at 135° give  $\gamma$ -sulphobutyric acid,  $+0.5\text{H}_2\text{O}$ , m.p. 93—93.5° (distrychnine,  $+2.5\text{H}_2\text{O}$  (non-resolvable),  $\text{Ba}$ ,  $+5\text{H}_2\text{O}$ , and  $\text{Ag}_2$  salts;  $\text{Me}_2$  ester, b.p. 150—153°), which with oleum at 85—95° gives  $\alpha\gamma$ -disulphobutyric acid ( $\text{Ba}_{1-}$  salt,  $+8\text{H}_2\text{O}$ ), the tristrychnine salt,  $+8\text{H}_2\text{O}$ , of which leads to the active acid (II),  $[\text{M}]_D^{+7.2}$  ( $\text{Ba}_{1-}$  salt,  $[\text{M}]_D^{+9.1}$ ).  $\text{CH}_2\text{Cl}\cdot\text{CH}\cdot\text{CH}\cdot\text{CO}_2\text{NH}_4$  and  $(\text{NH}_4)_2\text{SO}_3$  at 50° give  $\gamma$ -sulphocrotonic acid (III) ( $+0.5\text{H}_2\text{O}$ ), m.p. 94—96° after sintering at about 87°, hygroscopic ( $\text{Ba}$ ,  $+3\text{H}_2\text{O}$ ,  $\text{Na}_2$ , hygroscopic,  $\text{Ag}_2$ , and diguinine,  $+1.5\text{H}_2\text{O}$ , salts; dichloride, b.p. 118—121°/2 mm.;  $\text{Me}_2$  ester, b.p. 140—142°/2 mm.; monoamide, hygroscopic solid), which with  $(\text{NH}_4)_2\text{SO}_3$  at 80° gives  $\beta\gamma$ -disulphobutyric acid,  $+2\text{H}_2\text{O}$ , m.p. 95°, hygroscopic [ $\text{Ba}_{1-}$ ,  $+5\text{H}_2\text{O}$ , and  $\text{Ti}_3$  salts; also obtained from  $\text{CHCl}\cdot\text{CH}\cdot\text{CH}_2\cdot\text{CO}_2\text{NH}_4$  and  $(\text{NH}_4)_2\text{SO}_3$  at 65°, the tristrychnine salt,  $+5\text{H}_2\text{O}$ , decomposes about 245°, of which leads to the d-acid (IV),  $[\text{M}]_{D_{460}}^{+59}$  in  $\text{H}_2\text{O}$  ( $\text{Ba}_{1-}$  salt,  $[\text{M}]_{D_{460}}^{+59}$  in  $\text{H}_2\text{O}$ ). (I) and (II), having an  $\alpha$ - $\text{SO}_3\text{H}$ , racemise in hot alkali, but (IV) does not. The addition of  $\text{KHSO}_3$  to (III) at 80° in 0.1M and 0.5M solution has  $k$  0.64 and 1.24, respectively, compared with 187 for  $\text{CHMe}\cdot\text{CH}\cdot\text{CO}_2\text{H}$  in 0.1M and 0.063 for  $\text{SO}_3\text{H}\cdot\text{CMe}\cdot\text{CH}\cdot\text{CO}_2\text{H}$  in M solution. R. S. C.

Formation of carbonyl compounds by the explosive decomposition of nitric esters. G. DENIGES (Compt. rend., 1936, 202, 1998—2000).—Me, Et, Pr<sup>a</sup>, Pr<sup>b</sup>, Bu<sup>a</sup>, Bu<sup>b</sup>, CH<sub>3</sub>Ph, and  $\alpha$ -phenylethyl nitrate decompose when heated to give CH<sub>2</sub>O, MeCHO, EtCHO, COMe<sub>2</sub>, PrCHO, COMeEt, PhCHO, and CPhMe, respectively. The rate of reaction is much decreased in CO<sub>2</sub>. Aldehydes corresponding with the higher esters undergo secondary decomposition. J. L. D.

Isomerisation of hydroxyaldehydes. VI. S. N. DANILOV and A. M. GACHOKIDZE (J. Gen. Chem. Russ., 1936, 6, 704—719).— $\beta$ -Bromoglucose tetra-acetate in 50% AcOH and Zn at 15—25° yield glucal triacetate, the Br-, Br<sub>1</sub>-, Cl<sub>2</sub>-, or Cl<sub>1</sub>-derivatives of which with aq. Pb(OH)<sub>2</sub> yield orthosaccharic acid (I) (phenylhydrazide, m.p. 176°; Ac<sub>4</sub> derivative, m.p. 110°, and its phenylhydrazide, m.p. 143°). (I) and MeI-Ag<sub>2</sub>O yield the Me ester, m.p. 81.5°, of tetramethylorthosaccharic acid (II), m.p. 92—94° (phenylhydrazide, m.p. 113°), obtained by hydrolysing the ester with aq. Ba(OH)<sub>2</sub>. Glucal and MeI-Ag<sub>2</sub>O yield 3:4:6-trimethylglucal, which is chlorinated in CHCl<sub>3</sub> to 1:2-dichloro-3:4:6-trimethylglucal, an oil, converted by shaking with Ag<sub>2</sub>CO<sub>3</sub> into the 2-Cl-derivative, an oil, and this yields trimethylortho-

saccharic acid (III) when warmed with aq. Pb(OH)<sub>2</sub>. (III), MeI, and Ag<sub>2</sub>O afford (II). R. T.

Photo-decomposition of acetone.—See this vol., 1077.

Preparation of  $\beta$ -chloroethyl and  $\beta$ -vinyl ketones. J. DÉCOMBE (Compt. rend., 1936, 202, 1685—1687; cf. A., 1907, i, 241, 418; 1908, i, 390, 398).—COMe<sub>2</sub>, COMeEt, and COEt<sub>2</sub> with CH<sub>2</sub>O in presence of K<sub>2</sub>CO<sub>3</sub> (cf. A., 1933, 1144) afford  $\alpha$ -hydroxybutan- $\gamma$ -one (I),  $\beta$ -hydroxymethylbutan- $\gamma$ -one (II), and  $\beta$ -hydroxymethylpentan- $\gamma$ -one (III), b.p. 97—98°/20 mm. (phenylhydrazone, m.p. 103°), respectively. (I), (II), and (III) in conc. HCl containing some AlCl<sub>3</sub> at 0° afford  $\alpha$ -chloro-,  $\beta$ -chloromethylbutan- $\gamma$ -one, b.p. 60—62°/16 mm., and  $\beta$ -chloromethylpentan- $\gamma$ -one, b.p. 65—66°/14 mm., respectively, which are unstable in air, and by distilling in presence of a little (I) give  $\Delta^a$ -buten- $\gamma$ -one,  $\beta$ -methyl- $\Delta^a$ -buten- $\gamma$ -one, b.p. 29—31°/60 mm. (oxime, m.p. 43°), and  $\beta$ -methyl- $\Delta^a$ -penten- $\gamma$ -one, b.p. 119—120° (semicarbazone, m.p. 158°), respectively. J. L. D.

Utilisation of molecular refraction for determining constitution and configuration of sugars. I. C. N. RIEBER (Z. physikal. Chem., 1936, 176, 358—362).—The mol. refraction of a methyloside is  $>$  that of the corresponding sugar by  $7.50 \pm 0.02$  ( $\Delta R_o$ ) or  $4.61 \pm 0.02$  ( $\Delta R_L$ ). R. C.

Reduction and oxidation by ultra-violet irradiated sugar. P. HOLTZ (Arch. exp. Path. Pharm., 1936, 182, 141—159).—Irradiation (especially in presence of O<sub>2</sub>) of glucose, fructose, arabinose, glycerol, sorbitol, and glucosamine produces reducing substances, the resulting solutions (in common with those of ascorbic acid, reductone, and sugar heated with alkali) having absorption max. between 265 and 290 m $\mu$ ; probably readily-enolised  $\cdot\text{CO}\cdot$  is formed. The products accelerate the autoxidation of cysteine and adrenaline. The bearing of the data on biological reducing systems and the possibility of a similar formation from irradiation of the skin are discussed. F. O. H.

Action of X-rays on glucose. P. HOLTZ and J. P. BECKER (Arch. exp. Path. Pharm., 1936, 182, 160—163).—X-Irradiation of glucose (I) in PO<sub>4</sub>''' buffer at  $\mu$  7.6 yields solutions which reduce methylene-blue and have an absorption max. at 275—290 m $\mu$ , i.e., similar to that of ultra-violet-irradiated (I) or of (I) heated in alkaline solution (cf. preceding abstract). F. O. H.

Action of dilute alkalis on glucose. I. R. NODZU and R. GOTO (Bull. Chem. Soc. Japan, 1936, 11, 381—385).—The distillate of a dil. Na<sub>2</sub>CO<sub>3</sub> solution of glucose is shown to contain acetol and a little Ac, but no COMe-CHO. Results are confirmed by spectroscopic evidence. A. T.

Acid-base catalysis of mutarotation of glucose.—See this vol., 1075.

Syntheses with 5:6-anhydroisopropylidene-glucose. III. 6-Glucosylpiperidine. H. OHLE, E. EULER, and W. MALERCZYK (Ber., 1936, 69, [B], 1636—1639).—5:6-Anhydroisopropylideneglucose (I) gives mainly monoglucosylamine when treated with a large excess of amine in the cold. In EtOH much

by-product, apparently formed by polymerisation of (I), results when the reactants are used in equimol. amount, but the proportion recedes with increasing amount and increasing concn. of amine. The following are described: *isopropylidene-6-d-glucosyl-methylamine*, b.p. 200—210° (bath)/0.15 mm., and *-dimethylamine*, m.p. 85°,  $[\alpha]_D^{25} + 8.7^\circ$  in  $\text{CHCl}_3$ , *-ethylamine*, b.p. 190—200° (bath)/0.15—0.2 mm., m.p. 86°,  $[\alpha]_D^{25} - 8.5^\circ$  in  $\text{CHCl}_3$ , and *-diethylamine*, b.p. 120—125° (bath)/0.05 mm.,  $[\alpha]_D^{25} + 10.5^\circ$  in  $\text{CHCl}_3$ , *-benzylamine*, b.p. 275° (bath)/0.05 mm., m.p. 109.5°,  $[\alpha]_D^{25} - 2.6^\circ$  in  $\text{CHCl}_3$ , and *-dibenzylamine*, m.p. 133°,  $[\alpha]_D^{25} + 1.5^\circ$  in  $\text{CHCl}_3$ , *isopropylidene-6-d-glucosylpiperidine* (II), m.p. 115°,  $[\alpha]_D^{25} + 2.8^\circ$  in  $\text{CHCl}_3$  [*flavianate*,  $\text{C}_{14}\text{H}_{25}\text{O}_5\text{N}$ ,  $\text{C}_{10}\text{H}_6\text{O}_8\text{N}_2\text{S}$ ,  $0.5\text{H}_2\text{O}$ , m.p. 115—117° (decomp.), *diacetate*], does not condense with  $\text{COMe}_2$  in presence of anhyd.  $\text{CuSO}_4$  or conc.  $\text{H}_2\text{SO}_4$ . *isodisopropylidene-6-p-toluenesulphonate* and *piperidine* at 100° afford *isodisopropylidene-6-d-glucosylpiperidine*, b.p. 155°/0.2 mm.,  $[\alpha]_D^{25} + 32.37^\circ$  in  $\text{CHCl}_3$  [*monoflavianate*, m.p. 75° (decomp.)], hydrolysed by  $0.05N\text{-H}_2\text{SO}_4$  at 50° to (II), thus establishing the position of the piperidine residue at 6. Hydrolysis of (II) by  $N\text{-H}_2\text{SO}_4$  at 20° gives  *$\beta$ -6-d-glucosylpiperidine*, m.p. 150—151° (decomp.),  $[\alpha]_D^{25} + 47.3^\circ$  in  $\text{H}_2\text{O}$  (equilibrium val.), which could not be condensed with  $\text{COMe}_2$  in presence of anhyd.  $\text{CuSO}_4$ . It gives a *phenylosazone*, m.p. 131°, and is acetylated predominatingly to the  *$\beta$ -tetra-acetate*, m.p. 134°,  $[\alpha]_D^{25} + 13.4^\circ$  in  $\text{CHCl}_3$ . H. W.

**Molecular transformation of  $\lambda$ -glucosides.** R. KUHN and A. DANSI (Ber., 1936, 69, [B], 1745—1754; cf. Amadori, A., 1926, 60; 1929, 429; 1931, 1039, 1149).—The “labile” compound, m.p. 114—115°,  $[\alpha]_D^{25} - 92.5^\circ$  to  $-35.5^\circ$  in EtOH, obtained from glucose and *p*- $\text{C}_6\text{H}_4\text{Me}\cdot\text{NH}_2$  in boiling EtOH, is  *$\beta$ -p-toluidino-d-glucopyranoside* (I), since it is converted by  $\text{Ac}_2\text{O}$  in  $\text{C}_5\text{H}_5\text{N}$  into the tetra-acetate, m.p. 143—146°,  $[\alpha]_D^{25} - 57.5^\circ$  in  $\text{MeOAc}$ , identical with that derived from *p*- $\text{C}_6\text{H}_4\text{Me}\cdot\text{NH}_2$  and acetobromoglucose or *d*-glucose 2 : 3 : 4 : 6-tetra-acetate. It is transformed by  $\text{Me}_2\text{SO}_4$  into 2 : 3 : 4 : 6-tetramethyl-*p*-toluidinoglucose, m.p. 147°,  $[\alpha]_D^{25} + 163^\circ$  in MeOH, identical with the product from *p*- $\text{C}_6\text{H}_4\text{Me}\cdot\text{NH}_2$  and 2 : 3 : 4 : 6-tetramethylglucose. The “stable” isomeride (II), m.p. 150—152°,  $[\alpha]_D^{25} - 40^\circ$  in  $\text{H}_2\text{O}$ , cannot be methylated similarly, since it is unstable towards alkali. Treatment with  $\text{Ag}_2\text{O}$  and MeI gives *p*- $\text{C}_6\text{H}_4\text{Me}\cdot\text{NHMe}$  as sole cryst. product. With  $\text{BzCl}$  it affords a *tetrabenzoate*, m.p. 119—120°, instead of the pentabenzoate required by Amadori’s formulation of it as a Schiff’s base. Catalytic hydrogenation ( $\text{PtO}_2$  in EtOH) readily gives the  $\text{H}_2$ -derivative  $\text{C}_{13}\text{H}_{21}\text{O}_5\text{N}$ , m.p. 195°,  $[\alpha]_D^{25} + 26^\circ$  in  $\text{C}_5\text{H}_5\text{N}$ ,  $+25^\circ$  in  $N\text{-HCl}$ , not identical with *N*-*p*-tolylglucosamine. Attempts to prepare an undoubted Schiff’s base from *al*-glucose 2 : 3 : 4 : 5 : 6-penta-acetate and *p*- $\text{C}_6\text{H}_4\text{Me}\cdot\text{NH}_2$  gave only gummy products. Oxidation of (II) with  $\text{CrO}_3$  affords about twice as much  $\text{AcOH}$  as is obtained from (I) or *p*- $\text{C}_6\text{H}_4\text{Me}\cdot\text{NH}_2$ , showing that isomerisation is accompanied by the production of a fresh Me which must be in the sugar residue, since (II) gives *p*- $\text{C}_6\text{H}_4\text{Me}\cdot\text{NH}_2$  when hydrolysed. In view of the possibility that (II) is the *p*-toluidide

of a sugar carboxylic acid the following compounds have been prepared, none of which is identical with (II): *saccharin-p-toluidine*, m.p. 178—178.5°; *deoxy-glucono-p-toluidide*, m.p. 176°,  $[\alpha]_D^{25} + 10^\circ$  in  $\text{C}_5\text{H}_5\text{N}$ ; *d-glucono-p-toluidide*, m.p. 179°,  $[\alpha]_D^{25} + 15.9^\circ$ ; *p-toluidino-2-deoxyglucose*, m.p. 192° (decomp.),  $[\alpha]_D^{25} - 67.5^\circ$  to  $+10.0^\circ$  in 48 hr. in  $\text{EtOH-H}_2\text{O}$  (1 : 1) or  $[\alpha]_D^{25} + 42.5^\circ$  after addition of 2 drops of conc.  $\text{HCl}$ . The great reactivity of the *N*-glucosides is illustrated by the conversion of (I) by 4-nitro-5-amino-*o*-xylene into 4-nitro-5-amino-*o*-xylyl-*d*-glucoside, m.p. 213° (decomp.),  $[\alpha]_D^{25} + 54.6^\circ$  in  $\text{EtOH-H}_2\text{O}$  (4 : 1),  $0.0^\circ$  in  $\text{C}_5\text{H}_5\text{N}$ . H. W.

**Glycosides of madder.** R. HILL and D. RICHTER (Nature, 1936, 138, 38).—The glycoside obtained from various species of *Galium* and *Rubia* is the primveroside of purpurincarboxylic acid. The glycoside of alizarin has been cryst. from the products of enzymic hydrolysis and identified as primverose, and a primveroside of rubiadin has been obtained from the roots of *G. verum*. L. S. T.

**Saponins of the cyclopentanohydrophenanthrene group.** V. Tigonin. R. TSCHESCHE (Ber., 1936, 69, [B], 1665—1668).—Treatment of the mother-liquors obtained after the isolation of lanadigin from the leaves of *Digitalis lanata* with cholesterol affords *cholesterol tigonide*,  $\text{C}_{56}\text{H}_{92}\text{O}_{27}\cdot\text{C}_{27}\text{H}_{46}\text{O}$  ( $+4\text{H}_2\text{O}$  and  $+5\text{H}_2\text{O}$ ), gradual decomp.  $>200^\circ$ , transformed by  $\text{C}_5\text{H}_5\text{N}$  into *tigonin* (I),  $\text{C}_{58}\text{H}_{92}\text{O}_{27}$  (also  $+1\text{H}_2\text{O}$ ), m.p. 260° after softening at  $220^\circ$ . (I) is hydrolysed by  $\text{H}_2\text{SO}_4$  to galactose, glucose, and xylose (2 : 2 : 1-mol.). Since tigonin has only 1 OH at  $\text{C}_3$  the sugar mols. must be united thereto, probably as a chain. (I) is less suitable than digitonin as a pptg. agent for sterols. H. W.

**Saponins and sapogenins. IV. Isolation of amolonin and determination of hydrolysis products.** P. C. JURIS and C. R. NOLLER (J. Amer. Chem. Soc., 1936, 58, 1251—1255).—Details are given for the isolation of *amolonin* (I),  $\text{C}_{63}\text{H}_{87}\text{O}_{14}(\text{OH})_{17}$ ,  $[\alpha]_D^{25} - 75.5^\circ$  in  $\text{C}_5\text{H}_5\text{N}$  ( $\text{Ac}_{17}$  derivative,  $[\alpha]_D^{25} - 33.53^\circ$  in  $\text{C}_5\text{H}_5\text{N}$ ), from the bulbs of *Chlorogalum pomeridianum*, Kunth. (I) is hydrolysed (50% aq. MeOH containing 5%  $\text{H}_2\text{SO}_4$ ) to tigonin,  $\text{C}_{27}\text{H}_{43}\text{O}_2(\text{OH})$  (1 mol.), *d*-glucose (3 mols.), *d*-galactose (1 mol.), and *l*-rhamnose (2 mols.). Chlorogenin is  $\text{C}_{27}\text{H}_{42}\text{O}_2(\text{OH})_2$  (cf. A., 1935, 673). H. B.

**Mannans. III. Constitution of salep-mannan. Other carbohydrates of *Tubera salep*.** F. KLAGES and R. NIEMANN (Annalen, 1936, 523, 224—234; cf. A., 1934, 1093).—*T. salep* contains  $\text{H}_2\text{O}$  12, ash 1.5, and insol. matter 3%.  $\text{H}_2\text{O}$  removes 30% of salep-mannan (I) and 13% of a dextrin, composed of varying amounts of glucose and mannose. 5%  $\text{NaOH}$  then removes 31% of starch, and finally  $\text{CuSO}_4\text{-NH}_3$  removes 2% of cellulose. (I) is proved by methylation and hydrolysis to consist of mannose units joined in the 1 : 4 positions. The max. mol. wt. (yield of tetramethylglucose) is 12,000, the min. (f.p. depression of  $\text{C}_6\text{H}_6$ ) 5600. (I) closely resembles mannan-A and -B from ivory nut in solubility, rate of hydrolysis,  $[\alpha]$ , and  $[\alpha]$  of derivatives. The viscosity of mannans is unusually low. Probably

the mols. are joined together (e.g., bridged by  $\text{CH}_2\text{O}$ ) to give the rigid natural structures. R. S. C.

**Fructose anhydrides. XVII. Constitution of sinistrin.** H. H. SCHLUBACH and W. LOOP (Annalen, 1936, 523, 130—143).—Expression of the bulbs of *Scilla maritima* and purification of the extract with basic  $\text{Pb}(\text{OAc})_2$  and  $\text{H}_2\text{S}$  followed by pptn. of the carbohydrates with  $\text{EtOH}$  yields sinistrin (I),  $[\alpha]_D^{20}$   $-44.5^\circ$  in  $\text{H}_2\text{O}$ , the homogeneity of which is established by its identity in  $[\alpha]$ , half period of acid hydrolysis, and mol. size in  $\text{H}_2\text{O}$  with a specimen obtained by hydrolysis (Zemplén) of the optically homogeneous triacetate (II),  $[\alpha]_D^{20}$   $-23.5^\circ$ . (I) is a white hygroscopic powder which rapidly becomes a syrup when exposed to air. It contains 0.11% of ash. It does not reduce Fehling's solution. It decomposes at about  $215^\circ$  after softening at  $170^\circ$ , but degradation is obvious after some hr. at  $60^\circ$ . Acid hydrolysis effects 94.4% fission according to reducing power and 88.5% fission according to  $[\alpha]$ . The maximal aldose val. (Auerbach-Bodlander) is 1.8%. Since reversion and simultaneous formation of furfuraldehyde derivatives inhibit the complete hydrolysis of polyfructosans and a similar small aldose val. is observed with other fructosans, it is concluded that (I) is formed exclusively of fructose units. The formation of an optically inactive reducing sugar could not be confirmed. (II) is readily methylated in  $\text{COMe}_2$  according to Haworth to non-cryst. methylsinistrin,  $[\alpha]_D^{20}$   $-57.0^\circ$  in  $\text{CHCl}_3$ , which retains solvent very obstinately. It is hydrolysed by successive treatments with  $\text{H}_2\text{C}_2\text{O}_4$ - $\text{EtOH}$  and 0.25%  $\text{HCl}$  and the product is treated with  $\text{MeOH}$ - $\text{HCl}$  and benzoylated, whereby the following are isolated: pentamethylfructose, b.p.  $66^\circ/0.01$  mm.,  $[\alpha]_D^{20}$   $+62.0^\circ$ , hydrolysed to 1:3:4:6-tetramethylfructose, b.p.  $74^\circ/0.01$  mm.; trimethylmethylfructoside benzoate, b.p.  $130^\circ/0.01$  mm., converted into a trimethylmethylfructoside, b.p.  $77^\circ/0.01$  mm., and thence into a trimethylfructose, b.p.  $90^\circ/0.01$  mm.,  $[\alpha]_D^{20}$   $+19.2^\circ$  to  $+13.7^\circ$  in  $\text{CHCl}_3$ ,  $+5.8^\circ$  to  $0^\circ$  in  $\text{H}_2\text{O}$ , which gives the osazone of 3:4:6-trimethylfructose in small amount, but is probably a mixture of isomerides; dimethylmethylfructoside dibenzoate giving a dimethylmethylfructoside, b.p.  $92^\circ/0.01$  mm., and thence a dimethylfructose, b.p.  $132^\circ/0.01$  mm.,  $[\alpha]_D^{20}$   $-6.8^\circ$  in  $\text{CHCl}_3$ ,  $[\alpha]_D^{20}$   $-45.2^\circ$  to  $-54.6^\circ$  in  $\text{H}_2\text{O}$ ,  $-19.3^\circ$  to  $-23.7^\circ$  in abs.  $\text{MeOH}$ , which yields a monomethylfructosazone, m.p.  $202^\circ$ . The ratio of di:tri:tetra-methylfructose appears to be 1:3:1. H. W.

**Enzymic degradation of starch.** J. BLOM, A. BAK, and B. BRAAE (Z. physiol. Chem., 1936, 241, 273—287).—The limit of hydrolysis of starch (I) by  $\alpha$ -amylase (II) is at 47%; there are checks at 33% and 40%. The limit for purest  $\beta$ -amylase (III) [(II) destroyed by  $\text{AcOH}$  at  $0^\circ$  and  $p_H$  3.6] is  $53.1 \pm 0.5\%$ , this val. being independent of the concn. of (III) and of the presence of maltose, and the limit for (II)+(III) is  $80.1 \pm 0.4\%$ . Very high concns. of malt amylase (free from maltase but containing complement) convert (I) quantitatively into disaccharides and amylase from *Aspergillus oryzae* converts (I) quantitatively into monosaccharides. The capability to give the "starch-iodide" reaction

is destroyed partly by (III) and wholly by (II). These results and the properties of the dextrans produced at the different stages of hydrolysis indicate that the disaccharide residues in (I) are united by four different types of linking which exhibit unequal resistance to attack. The (I) mol. is probably made up of 30n monosaccharide or 15n disaccharide residues.

W. McC.

**Nature of cellulose.** E. HEUSER (Amer. Dye-stuff Rep., 1936, 25, 55—60, 80—83, 116—120, 135—137, 315—318, 338—339).—A review.

A. J. H.

**Cellulose as a highly polymerised compound.** K. FREUDENBERG (Ber., 1936, 69, [B], 1627—1631).—A historical account of the conception of cellulose as a highly polymerised compound. H. W.

**Action of metallic sodium on cellulose.** P. SCHORIGIN and N. N. MAKAROVA-SEMLJANSKAJA (Ber., 1936, 69, [B], 1713—1721).—Examination of the action of Na in liquid  $\text{NH}_3$  on cellulose shows that all its 3 OH groups participate in the change. There is no marked difference in the reactivity of the individual OH groups and the product is stable to Na. The individual Na atoms are united with different firmness, as shown by the marked partial alcoholysis of the  $\text{Na}_3$  derivatives; probably this is due mainly to the heterogeneous structure of cellulose. Only about one third of the ONa groups are active towards  $\text{MeI}$ , and the methylcellulose produced is a mixture of products in which the no. and position of the Me vary. During attempts to establish the presence of free OH at 6 it is shown that re-etherification does not occur during the action of  $\text{CPh}_3\text{Cl}$  on methylcellulose. The interaction of  $\text{Na}_3$  cellulose and  $\text{CS}_2$  is very sluggish and the products have a very low sap. val. The alkoxy-structure of "soda cellulose" is confirmed, since its reactions are similar in principle to those of  $\text{Na}_3$  cellulose. H. W.

**Selenium-substituted amino-acids. I. Synthesis of  $\alpha\alpha'$ -diamino- $\beta\beta'$ -diselenodipropionic acid (selenocystine).** A. FREDGA (Svensk Kem. Tidskr., 1936, 48, 160—165).—Interaction of  $\text{CH}_2\text{Cl}\cdot\text{CH}(\text{NH}_2)\cdot\text{CO}_2\text{Me}\cdot\text{HCl}$  with  $\text{K}_2\text{Se}_2$  in alkaline medium at room temp. and subsequent evaporation gives  $\alpha\alpha'$ -diamino- $\beta\beta'$ -diselenodipropionic acid (I), two forms, rectangular plates, m.p. about  $215^\circ$  (decomp.) after becoming grey at about  $180^\circ$ , and rhombic plates (*r*- and *meso*-isomerides) (*Cu* salt). (I) is transformed by Hg in acid solution followed by  $\text{Na}_2\text{S}$  and  $\text{CH}_2\text{PhCl}$  in alkaline solution into benzylselenol-cysteine,  $\text{C}_{10}\text{H}_{11}\text{O}_2\text{NSe}\cdot\text{H}_2\text{O}$ , m.p. about  $185^\circ$  (decomp.) after softening at  $150^\circ$ . H. W.

**New type of hypnotic amide. Diethylacet- $\beta$ -ketopropylamide.** W. A. LOTT and W. G. CHRISTIANSEN (J. Amer. Pharm. Assoc., 1936, 25, 310).— $\text{CHET}_2\cdot\text{COCl}$  with  $\text{C}_5\text{H}_5\text{N}$  (in  $\text{C}_6\text{H}_6$ ) yields the mol. compound, which with aminoacetone hydrochloride affords the above amide, m.p.  $96$ — $97^\circ$ , having no pronounced hypnotic activity. F. O. H.

**Action of magnesium ethyl bromide on butyryl-ethylanilide.** M. MONTAGNE and Y. ISAMBERT (Compt. rend., 1936, 203, 331—333).—The action of  $\text{MgEtBr}$  on butyryl-ethylanilide (I) in boiling  $\text{Et}_2\text{O}$

or PhMe gives considerable amounts of  $C_2H_5$ ,  $CEt_2Pr^a \cdot OH$ , and  $\beta$ -hydroxy- $\alpha$ - $\beta$ -diethylhexethylamylide (II), b.p. 155—157°/3 mm. (II) passes when distilled under atm. pressure or boiled with NaOH-EtOH into  $COEtPr^a$  and (I) and is hydrolysed by boiling 48% HBr to  $NHPhEt$  and neutral products, including  $\delta$ -ethyl- $\Delta^8$ -heptene, b.p. 138—145°/760 mm. (*di*-bromide, b.p. 95—100°/20 mm.), and a lactone  $CP^a \begin{cases} \text{CHET} \cdot CO \\ \text{CHMe} \cdot O \end{cases}$  or  $CHET \begin{cases} \text{CHET} \cdot CHET \\ O \cdot CO \end{cases}$ , b. 132°/18, mm. The formation of ketone or *tert.* amine as from  $HCO \cdot NPhEt$  or  $HCO \cdot NEt_2$  is scarcely observed.

H. W.

**Transformation of carbamide into ammonium carbonate.** E. TOPORESCU (Compt. rend., 1936, 202, 2075).—2% aq.  $CO(NH_2)_2$ , placed in the inner cell of a parchment dialyser, with 6% aq. NaCl in the outer compartment, was partly converted into  $(NH_4)_2CO_3$  in 24 hr. at 40°.

H. J. E.

**Oxidation products of thiocarbamide.** The dioxide as derivative of sulphoxylic acid. J. BOESEKEN (Proc. K. Akad. Wetensch. Amsterdam, 1936, 39, 717—721).— $CS(NH_2)_2$  in 50% EtOH with slightly more than the calc. amount of an acid and  $\frac{1}{2}$  mol. of  $H_2O_2$  affords salts of dithioformamidine (I).  $CS(NH_2)_2$  in neutral solution with  $H_2O_2$  or  $AcO_2H$  affords thiocarbamide dioxide (II) and not, as suggested by Barnett (J.C.S., 1910, 97, 63), formamidinesulphinic acid. It is neutral to litmus and to Congo-red, and is a strong reducing agent, pptg. many metals from solutions. Dil. NaOH reacts to form  $Na_2S_2O_3$ , and  $Ba(OH)_2$  affords  $BaSO_4$  and  $CO(NH_2)_2$ . With  $AcO_2H$ , (II) affords formamidinesulphonic acid (III), also obtainable from  $CS(NH_2)_2$  and 3 mols. of  $AcO_2H$ , whereas  $AcO_2H$  in presence of  $NaNO_3$  and  $AcOH$  converts  $CS(NH_2)_2$  into the nitrate of (I). (III) does not react with cold, acid  $KMnO_4$  solution, but  $Ba(OH)_2$  affords  $BaSO_3$  and  $CN \cdot NH_2$ . No experimental details are given.

P. G. C.

(A) Hydrazides, (B) azides, of unsaturated fatty acids. (c) Hydrazides and azides of naphthenic acids. A. OSKERKO (Mem. Inst. Chem. Ukrain. Acad. Sci., 1935, 2, 69—77, 79—92, 293—302).—(A) The hydrazides of oleic acid (I), m.p. 95—96° (hydrochloride, m.p. 110—112°), erucic acid (II), m.p. 77—78° (hydrochloride, m.p. 120—121°), and undecenoic acid (III), m.p. 84—85° (hydrochloride, m.p. 128—130°), are obtained by boiling the Me esters of the appropriate acids with  $N_2H_4 \cdot H_2O$ .

(B) The azides of (I), (II), and (III), prepared from the above hydrochlorides and aq.  $NaNO_2$ , or from the acid chlorides and  $NaN_3$  in  $COMe_2$ , are oils, readily decomp. at room temp. to yield carbimides; when boiled with EtOH they yield respectively the urethane of (I), m.p. 42—43°, of (II), m.p. 47—48°, and of (III), m.p. 53—54°.

(c) The hydrazide, m.p. 28—29° (hydrochloride, m.p. 157—159°), and azide (IV), an oil, of decahydronaphthoic acid (V) have been prepared by the above methods. (IV) decomposes at room temp. to yield the carbimide, b.p. 194—196°/7 mm., of (V), the urethane, b.p. 84—86°/3 mm., of which is obtained by boiling with EtOH. Gaseous or aq.  $NH_3$  converts (IV) into the amide of (V).

R. T.

**Complex compounds of dicarboxylic acid hydrazides.**—See this vol., 1078.

**Reaction of semicarbazones with alcohols.** E. W. McCLELLAND and C. E. SALKELD (J.C.S., 1936, 1050).—*iso*- $C_5H_{11} \cdot OH$  and the aldehyde or ketone semicarbazone react with elimination of  $NH_3$  to give *isoamyl benzylidene*-, m.p. 103°,  $\alpha$ -phenylethylidene-, m.p. 74°, *o*-hydroxybenzylidene-, m.p. 140°, *piperonylidene*-, m.p. 83°, and *o*-nitrobenzylidene-hydrazine-carboxylate, m.p. 95°.

F. R. S.

**Organo-arsenic compounds. III.** H. N. DAS-GUPTA (J. Indian Chem. Soc., 1936, 13, 305—308).— $AsMeCl_2$  and  $C_2H_2$  give methyl- $\beta$ -dichlorovinylarsine and methyl- $\beta$ -chlorovinylchloroarsine, b.p. 110—115°, which with  $H_2O_2$  affords methyl- $\beta$ -chlorovinylarsinic acid, m.p. 149—150°, with  $MgPhBr$  yields phenyl-methyl- $\beta$ -chlorovinylarsine, and with the appropriate reagents forms methyl- $\beta$ -chlorovinylarsenious sulphide, cyanide, and oxide.

F. R. S.

**Resolution of  $\alpha$ -arsino-carboxylic acids.** H. J. BACKER and C. H. K. MULDER (Rec. trav. chim., 1936, 55, 594—601).—*d*- $\alpha$ -Arsino-propionic, -butyric, -valeric, -hexoic, -heptioic, -octoic, -nonoic, and -phenyl-acetic acids (I), m.p. 134°, 127°, 116—117°, 96°, 82—83°, 114°, and 115°,  $[M]_D +41^\circ$ ,  $+25.7^\circ$ ,  $+19.3^\circ$ ,  $+6.1^\circ$ ,  $+21.9^\circ$ ,  $+3^\circ$ ,  $+3.4^\circ$ , and  $+3.1^\circ$  in  $H_2O$ , respectively, are obtained from the *dl*-acids by way of the diquinine salts,  $+6$ ,  $5$ ,  $4$ ,  $3$ ,  $2$ ,  $5.5$ ,  $5$ , and  $6H_2O$ , respectively. The *Ba H* salts have  $[M]_D -8.5^\circ$ ,  $-10.5^\circ$ ,  $-15.7^\circ$ ,  $-8.2^\circ$ ,  $-19.4^\circ$ ,  $-5^\circ$ ,  $-7.5^\circ$ , and  $+4.2^\circ$  in  $H_2O$ , respectively, there being an inversion in all except the last case; addition of a third equiv. of *Ba* has little effect. The *Ba* salts, except that of (I), do not racemise. The free acids racemise slowly [(I) fast], slightly faster in presence of HCl.

R. S. C.

**Polymetatelluric acid esters.** M. PATRY (Compt. rend., 1936, 202, 2088—2090).— $MeOH$ ,  $EtOH$ , and  $Pr^aOH$  dissolve hydrated  $TeO_3$  in the cold.  $Bu^aOH$  and  $C_5H_{11} \cdot OH$  dissolve it on heating. By refluxing and evaporating a residue is obtained from which the normal esters  $(TeO_4R_2)_n$  can be extracted with  $Et_2O$  (except in the case of  $MeOH$ ). *sec.* and *tert.* saturated alcohols do not react with polymetatelluric acid, but glycerol and  $CH_2Ph \cdot OH$  readily yield esters. The properties of polymetatelluric esters (I) are reviewed. Orthotelluric acid dissolves slowly when heated with  $MeOH$ ,  $EtOH$ ,  $PrOH$ ,  $BuOH$ , and  $C_5H_{11} \cdot OH$ . Evaporation of the solution yields (I). A solution of  $CH_2N_3$  in  $Et_2O$  with hydrated  $TeO_3$  yields the normal ester,  $TeMe_2O$ , on evaporation.

H. J. E.

**Formation of organo-magnesium halides and their behaviour towards halogen acids, their ammonium and amine salts, and towards aniline.** J. HOUBEN, J. BOEDLER, and W. FISCHER (Ber., 1936, 69, [B], 1766—1788).—The use of *Mg* powder in the prep. of Grignard reagents is not generally advisable, since when preserved it readily absorbs  $H_2O$  and is partly converted into  $MgO$  and  $Mg(OH)_2$ , whereby ultimately the Würtz-Fittig synthesis is facilitated; if used, it should be freshly filed from a *Mg* block, but does not then exceed

Mg turnings in activity, particularly if the latter are freshly triturated in a warm mortar. In the complete absence of air and moisture (presence of Na) in the alkyl halide series  $C_1$  to  $C_{16}$  the mean yields of  $MgAlkHal$  are 97.6%, 89.6%, and 85.8%, respectively, in the cases of chloride, bromide, and iodide. The min. yield of 79.7% is observed in the case of Mg cetyl iodide. Grignard's observation that the Würtz-Fittig synthesis predominates when  $C$  is  $>6$  is therefore erroneous under these conditions. Contrary to Hess *et al.* (A., 1921, i, 777),  $MgEtI$  is completely decomposed by  $HBr$ , although, under some conditions, only partly by  $HI$ ; if excess of the latter is used, complete decomp. of  $MgEtI$  and all other Grignard reagents, whether "individual" or in  $Et_2O$ , is achieved. A ready prep. of  $HBr$  or  $HI$  from  $Br$  or  $I$  and boiling tetrahydronaphthalene is described. Only  $MgEtI$  (and possibly  $MgMeI$ ) is smoothly decomposed by  $NH_4Cl$ ,  $NH_4Br$ , and  $NH_4I$ , whereas  $NH_4F$  is without action.  $NH_4Cl$  and  $NH_4Br$  are inactive towards  $MgEtCl$  and  $MgEtBr$ , whereas both are decomposed by  $NH_4I$ . Possibly the difference is due to the differing solubility of the  $NH_4$  salts in the Grignard solutions and depends somewhat on their state of division.  $NH_2Me.HCl$  is only slightly more active than  $NH_4Cl$ .  $NEt_3.HCl$  is more active, whereas  $NEt_3I$  is completely ineffective even in presence of  $FeCl_3$ .  $NH_2Ph.HCl$  is as vigorous as  $NH_2Ph$  in its action on  $MgEtCl$ . With mixtures of Grignard reagents a difficultly explicable inactivation is observed. The apparent inertia of a mixture of  $NHPh.MgI$  and  $MgMeI$  towards  $CO_2$  in a closed vessel (Houben, A., 1905, i, 873) is caused by the liberation of an equal vol. of  $CH_4$  thus:  $NHPh.MgI + MgMeI + CO_2 = MgMeI + NHPh.CO_2.MgI = MgI.NPh.CO_2.MgI + CH_4$ .

H. W.

**Complex compounds of the olefines with metallic salts. II. Homologues of Zeise's salt.** J. S. ANDERSON (J.C.S., 1936, 1042—1049).—The formation of compounds of  $PtCl_2$  with olefines has been shown to be effected by the reactions (a) displacement of  $Cl'$  from  $PtCl_2$  anion and (b) displacement of one olefine from such complexes by another olefine. By this reaction, compounds analogous to ethylene Pt chloride (I) may be obtained and evidence is advanced that bis-olefine compounds may exist. Reaction (b) affords conclusive evidence that the attachment of the olefines is truly co-ordinative, and not by principal valencies. The co-ordinating ability decreases in the order  $C_6H_4 > CHPh.CH_3 > indene > cyclohexene > CPh.CH_2$  and  $CPhMe.CH_3$ , and this is discussed in relation to steric and polar influences on the double linking. With  $K_2PtCl_4$ , styrene gives  $K$  styrenetrichloroplatinite, which with tetramminoplatinous chloride forms tetramminoplatinous styrenetrichloroplatinite, whilst indene yields  $K$  indenetrichloroplatinite, converted by  $[CoCl_2.en_2]Cl$  into 1:6-dichlorobisethylenediaminocobaltic indenetrichloroplatinite. cycloHexene with  $EtOH-H_2PtCl_4$  gives a complex, which with  $[CoCl_2.en_2]Cl$  yields 1:6-dichlorobisethylenediaminocobaltic cyclohexenetrichloroplatinite. Styrene with Zeise's salt gives  $K$  styrenetrichloroplatinite, and with (I) forms distyreneplatinous chloride.  $\Delta^B$ -Amylene with (I) yields

amyleneplatinous chloride. Anilinium carbonyltrichloroplatinite does not react with styrene.

F. R. S.

**Contact transformation of cis- and trans-dimethylcyclohexane.** E. I. MARGOLIS (Ber., 1936, 69, [B], 1710—1713).—With *o*-, *m*-, and *p*-dimethylcyclohexane passage over Os-asbestos at 50—70° does not cause isomerisation of the *trans*- into the *cis*-form.

H. W.

**Addition and additive products of halogens to benzene derivatives. VII. Addition of chlorine to penta- and hexa-chlorobenzene.** T. VAN DER LINDEN (Rec. trav. chim., 1936, 55, 569—576; cf. this vol., 975).— $C_6HCl_5$  and liquid  $Cl_2$  in light give (5 months) mainly mixed crystals (I), m.p. 90—92°, of 1:2:3:3:4:4:5:5:6:6-nonachloro- $\Delta^1$ -cyclohexene (91.5%) and an isomeride thereof (8.5%) with a little  $C_6Cl_6$  [probably produced by loss of  $Cl$  from (I), less probably by direct substitution]. The nature of (I) is determined by quant. reaction with  $Zn-EtOH$  to  $C_6HCl_5$  and with  $NaOH-MeOH$  to much  $C_6Cl_6$  and a little octachloro- $\Delta^{2:5}$ -cyclohexadiene (II).  $C_6Cl_6$  and an excess of liquid  $Cl_2$  in light give (3 months) dodecachlorocyclohexane (III), sublimes from 250°, m.p. about 285° (decomp. with liberation of  $Cl_2$ ; sealed tube), not volatile in steam, almost odourless, and stable to fuming  $HNO_3$ .  $C_6Cl_6$  and  $3Cl_2$  give very slowly (III) and decachlorocyclohexene (IV), m.p. about 92°. (III) and (IV) react only slowly with  $NaOH-EtOH$ . The substance, m.p. 66—68°, of Smith *et al.* (A., 1934, 40) is not (III); it may be a stereoisomeride (chair-boat forms), but this is improbable. Addition of  $Cl_2$  probably occurs first at  $CH:CCl$  and then mainly at the ends of the conjugated system of ethylenic linkings thus produced. cycloHexadienes with conjugated linkings are too unstable to exist. The preferential formation of certain isomerides by addition of  $Cl_2$  to  $C_6H_6$  and its derivatives probably depends on energy relations. (II) is the only  $Cl$ -derivative in this series to lose  $HCl$  to  $Zn-EtOH$ .

R. S. C.

**Isomerisation of cyclic hydrocarbons with isolated systems of double linkings.** J. M. SLOBODIN (J. Gen. Chem. Russ., 1936, 6, 129—136).—1-Vinyl- $\Delta^3$ -cyclohexene when heated at 200—235° in presence of floridin is converted into 1-vinyl- $\Delta^2$ -cyclohexene (I), b.p. 130—137°, yielding 1- $\alpha$ -hydroxyethyl-1:2:3-trihydroxycyclohexane (II), m.p. 48°, on oxidation with  $KMnO_4$  at 0°. (II) yields  $\alpha$ -ketoadipic acid with  $K_2Cr_2O_7$  and  $H_2SO_4$  in  $H_2O$  (at the b.p.). (I) with maleic anhydride at 100° affords (III). *d*-Limonene at 210—235° in presence of floridin yields chiefly islimonene.

R. T.

**Phenylcyclopentylmethane and cyclohexylcyclopentylmethane and their behaviour during catalytic hydrogenation.** J. I. DENISSENKO (Ber., 1936, 69, [B], 1668—1670).—cycloPentanone and  $CH_2Ph.MgCl$  yield 1-benzylcyclopentan-1-ol, b.p. 129—130°/11 mm., dehydrated by anhyd.  $H_2C_2O_4$  to phenyl- $\Delta^1$ -cyclopentenylmethane, b.p. 120—122°/10 mm., catalytically hydrogenated (Pt-black in  $EtOH$ )

to *phenylcyclopentylmethane* (I), b.p. 234—236°/750 mm. When passed with  $H_2$  over Pt-C at 190—200°, (I) gives *cyclopentylcyclohexylmethane* (II), b.p. 224—226°/750 mm. Passage of (I) or (II) over Pt-C at 300—310° is accompanied by fission of the *cyclopentyl* groups and gives mainly *n*-hexylbenzene. H. W.

**Terpenoid ring systems. II. Polyionone.** H. VOGEL and M. STOHL (Ber., 1936, 69, [B], 1573—1575; cf. A., 1933, 1055).—Polyionone (improved prep.) is probably  $CRMe:CH:C(CH:CHR):CH:COR$  ( $R=CH:CH-C \begin{smallmatrix} CMe_2 \cdot CH_2 \\ CMe \cdot CH_2 \end{smallmatrix} > CH_2$ ). It is readily

autoxidised and must be preserved under  $N_2$  in the dark. When its solution in  $Et_2O$  is placed over 25% HCl a bluish-violet zone is formed and after agitation the acid layer becomes dark violet, whilst the ethereal solution becomes lighter in colour. H. W.

**Formation of carbon chains during the catalytic hydrogenation of alkyl halides.** M. BUSCH and W. WEBER [with C. DARBOVEN, W. RENNER, H. J. HAHN, G. MATHAUER, F. STRATZ, K. ZITZMANN, and H. ENGELHARDT] (J. pr. Chem., 1936, [iii], 146, 1—55).—Under conditions similar to those adopted with Pd, Pt causes little elimination of Br from PhBr. Os, Ru, and Rh are similarly unsuitable. Kelber's Ni in presence of KOH— $EtOH-H_2$  is inactive; with  $N_2H_4$  as source of H, however, the change is very rapid, and only with PhCl is Pd superior to Ni. The formation of  $Ph_2$  is never observed. Diaryl production is not therefore due to intermediate radical formation, but is a sp. action of Pd. Since  $Ph_2$  is produced only in min. amount from PhBr and Pd— $CaCO_3$  in  $H_2O$  in presence of  $H_2$  or  $N_2H_4$ , a sp. action of MeOH (EtOH) is indicated, and when PhBr is heated in KOH—MeOH containing Pd— $CaCO_3$   $Ph_2$  is obtained in 15—20% yield which is not influenced by presence of  $H_2$  or  $N_2H_4$ . H is derived therefore from MeOH, and, accordingly,  $CH_2O$  is detected in the solution. The initial reaction is therefore  $PdH_2 + PhBr \rightarrow HBr + PdPhH$ . In presence of active H in sufficient concn. the following step is  $PdPhH + 2H \rightarrow PdH_2 + C_6H_6$ , whereas in its absence reaction is  $PdPhH + PhBr \rightarrow PdPh_2 + HBr$  and  $PdPh_2 + H_2 \rightarrow PdH_2 + Ph_2$ . The favourable influence of  $N_2H_4$  on the yield of diaryl depends on its power of reaction with  $CH_2O$  to form  $(CH_2)_2N_2$  which is ultimately reduced to  $NH_2Me$ , whereby the concn. of active H is diminished. As expected, an optimal concn. of  $N_2H_4$  is observed. The hydrogenation of PhBr under widely varied conditions is described. With compounds  $C_6H_4XY$  ( $X=Cl$  or  $Br$ ;  $Y=NH_2$ ,  $NMe_2$ ,  $Me$ ,  $CO_2H$ ,  $OMe$ , or  $OH$ ), Cl is less readily eliminated than Br, and Cl-compounds are therefore less suitable for the production of diaryls. Little difference in the degree of diaryl formation is observed between *m*- and *p*-derivatives, whereas *o*-compounds are more difficult to hydrogenate and nuclear union is seldom observed. Loss of halogen increases with increasing concn. of  $N_2H_4$ , but greater production of diaryl is not general. *p*- $C_6H_4Br \cdot COMe$  in presence of  $N_2H_4$  affords the azine and hydrazone of CPhMe and *pp'*-diacetophenonedihydrazone, decomp. 195—200°, which passes when preserved into the diazine,

$OMe < \begin{smallmatrix} C_6H_4 \cdot C_6H_4 \\ N \quad N \end{smallmatrix} > CMe$  or  $\begin{smallmatrix} N \cdot CMe \cdot C_6H_4 \cdot C_6H_4 \cdot CMe \cdot N \\ N \cdot CMe \cdot C_6H_4 \cdot C_6H_4 \cdot CMe \cdot N \end{smallmatrix}$  decomp. > 350°. 3-Bromopyridine affords  $C_5H_5N$  and 3:3'-dipyridyl. *p*- $C_6H_4Br_2$  affords  $Ph_2$ , *p*- $C_6H_4Ph_2$ , and (*p*- $C_6H_4Ph$ ) $_2$ , isolated by extraction of the catalyst with suitable solvents, and *p*-quinquiphenyl, m.p. 395°, *p*-sexiphenyl, m.p. 475°, and *p*-septiphenyl, m.p. 545°, obtained by fractional sublimation under diminished pressure from the catalyst. Hydrogenation of *m*- $C_6H_4Br_2$  in presence of KOH—MeOH— $H_2O$ —Pd— $N_2H_4$  at 140° yields *m*-noniphenyl  $C_{54}H_{38}$ , m.p. 166° after softening at 163°, *m*-deciphenyl, m.p. 184° after softening at 180°, *m*-undeciphenyl, m.p. 202° after softening at 195°, *m*-duodeciphenyl, m.p. 223° after softening at 214°, *trideciphenyl*, m.p. 245° after softening at 239° ( $NO_2$ -derivative, (?)  $(NO_2)_3C_6H_2 \cdot [C_6H_3 \cdot NO_2]_{11} \cdot C_6H_2(NO_2)_3$ , m.p. 185° (decomp.); *Cl*-derivative,  $C_{78}H_{41}Cl_{13}$ , m.p. 156° after softening at 152°), whereas in boiling solution *m*-quinquiphenyl, m.p. 112°, with products composed of 11—14 nuclei and containing Br results. When *m*- $C_6H_4I_2$  is used the product is greatly contaminated with coloured materials. *o*- $C_6H_4Br_2$  gives  $C_6H_6$ , some  $Ph_2$ , and very little more complex material. 3:5- $C_6H_3MeBr_2$  yields 3:3'-ditolyl, *m*-tritolyl,  $C_6H_3Me(C_6H_4Me)_2$ , m.p. 65°, and a little more complex product. With phenols little chain formation is observed, whereas 2:4- $C_6H_3Br_2 \cdot OMe$  gives PhOMe with considerable amounts of *pp'*- and some *oo'*-dianisole. 1:8- $C_{10}H_6Br_2$  affords  $C_{10}H_8$ , di- and tetra-hydronaphthalene, with indications of the presence of perylene, but analogous experiments with 1:8- $C_{10}H_6I_2$  are unsatisfactory. 1:6-Dibromo-2-naphthol gives  $\beta$ - $C_{10}H_7 \cdot OH$  and 2:2'-dihydroxy-1:1'-dinaphthyl. 3:5-Dibromopyridine yields diprydil (30%), *terpyridyl* (18%), m.p. 249—251°, (?) *quaterpyridyl* (5%), m.p. 290° (*hydrochloride*; *perchlorate*), and (?) *quinquipyridyl* (2%), m.p. 330°. *s*- $C_6H_3Br_3$  yields highly complex products, m.p. 241° after softening at 235°, m.p. 259—261°, and m.p. 280—285°, respectively, probably containing 30, 16, and 22  $C_6H_6$  nuclei, respectively. *pp'*-Dibromodiphenylmethane affords 4:4'-dibenzylidiphenyl, m.p. 114—115°, *terdiphenylmethane*, m.p. 179—180° after softening at 175°, *quaterdiphenylmethane*, m.p. 239—240°, and (?) *quinquidiphenylmethane*, m.p. 280°. 2:2'-Dibromodiphenylmethane yields  $CH_2Ph$ , and fluorene (14% yield). 2:2'-Dibromo-5:5'-diaminodiphenylmethane gives 5:5'-diaminodiphenylmethane and diaminofluorene, m.p. 164° (yield 3.5%). Dihydrophenanthrene (yield about 30%) and  $(CH_2Ph)_2$  are obtained from 2:2'-di-iododibenzyl. Under the usual conditions  $CH_2PhCl$  and  $CH_2PhBr$  afford PhMe and  $(\cdot CH_2Ph)_2$ , but in very conc. solution  $CH_2PhCl$  affords  $CH_2Ph \cdot OEt$  and  $N(CH_2Ph)_2 \cdot NH_2$ .  $CHPhCl_2$  gives  $(\cdot CHPhCl)_2$  further hydrogenated to stilbene.  $CPhCl_3$  gives a mixture of  $\alpha$ - and  $\beta$ -( $CPhCl_2$ ) which also appears to be derived from  $(\cdot CPhCl)_2$ . Drastic reduction of  $(\cdot CPhCl)_2$  affords  $(\cdot CH_2Ph)_2$ , also obtained from stilbene. *o*- $C_6H_4Cl \cdot CH_2Cl$  gives *o*- $C_6H_4Cl \cdot CH_2 \cdot OMe$ , whereas *p*- $C_6H_4Cl \cdot CH_2Cl$  affords *p*- $C_6H_4Cl \cdot CH_2 \cdot OEt$  and  $(\cdot CH_2Ph)_2$ .  $(\cdot CHPh)_2$  and  $CHPh \cdot OMe$  result from  $CH_2PhBr$ . Phenylcyclohexylmethyl chloride gives  $\alpha\beta$ -diphenyl- $\alpha\beta$ -dicyclohexylethane, m.p. 198—200°.  $CHPhBr \cdot CO_2Et$  yields  $(\cdot CHPh \cdot CO_2H)_2$ , but

$\text{CH}_2\text{Cl}\cdot\text{CO}_2\text{H}$  gives  $\text{OH}\cdot\text{CH}_2\cdot\text{CO}_2\text{H}$ .  $\text{CHPh}\cdot\text{CHBr}$  affords diphenylbutadiene (and polymerides) which could not be hydrogenated further. H. W.

**Nuclear-substituted derivatives of isopropylbenzene.** W. QVIST and A. SALO (*Acta Acad. Aboensis Math. Phys.*, 1934, 8, No. 4, 30 pp.; *Chem. Zentr.*, 1934, ii, 594—595).—The  $\text{Pr}^i$  group in  $\text{PhPr}^i$  is more readily replaced by Cl than in *p*-cymene. Passage of  $\text{Cl}_2$  into  $\text{PhPr}^i$ , in  $\text{CCl}_4$  at  $0^\circ$  in presence of I in daylight, affords mainly 2:4:5-trichlorocumene (I), b.p.  $240\text{--}245^\circ$ , which with  $\text{HNO}_3$  gives 2:4:5-trichloro-1:3-dinitrobenzene, m.p.  $102\text{--}5\text{--}103\text{--}5^\circ$ ; this with  $\text{EtOH}\cdot\text{NH}_3$  yields 6-chloro-2:4-dinitro-m-phenylenediamine, m.p.  $249\text{--}249\text{--}5^\circ$ , and, with  $\text{NH}_4\text{Ph}$ , 6-chloro-2:4-dinitro-1:3-dianilinobenzene, m.p.  $188^\circ$ . (I) is accompanied by *p*- $\text{C}_6\text{H}_4\text{Cl}_2$ ; 1:2:4:5- $\text{C}_6\text{H}_2\text{Cl}_4$ , m.p.  $139\text{--}5\text{--}140\text{--}5^\circ$ , yielding the 3- $\text{NO}_2$ , m.p.  $99\text{--}100^\circ$ , and 3:3-( $\text{NO}_2$ ) $_2$ , m.p.  $232\text{--}233^\circ$ , compounds, with  $\text{HNO}_3$ ; 1:3:4:5- $\text{C}_6\text{H}_2\text{Cl}_4$  and  $\text{C}_6\text{HCl}_5$ . Passage of  $\text{Cl}_2$  into  $\text{PhPr}^i$  containing I and Fe at  $0^\circ$  in the dark affords *p*-chlorocumene (II), b.p.  $190\text{--}200^\circ$ , 3:4-dichlorocumene (III), b.p.  $120\text{--}125^\circ/9\text{ mm.}$ , (I), b.p.  $125\text{--}130^\circ/9\text{ mm.}$ , 2:4:5:6-tetrachlorocumene (IV), m.p.  $41\text{--}41\text{--}5^\circ$ , and 2:3:4:5:6-pentachlorocumene (V), m.p.  $81\text{--}82^\circ$ . (II) is oxidised to *p*- $\text{C}_6\text{H}_4\text{Cl}\cdot\text{CO}_2\text{H}$  and (III) to 2:4:5- $\text{C}_6\text{H}_2\text{Cl}_3\cdot\text{CO}_2\text{H}$ , m.p.  $164\text{--}165^\circ$ . (IV) with  $\text{HNO}_3$  yields 2:4:5:6-tetrachloro-1:3-dinitrobenzene, m.p.  $153\text{--}154^\circ$ , yielding 6-chloro-2:4-dinitro-1:3:5-trianilinobenzene, m.p.  $179\text{--}180^\circ$ , with  $\text{NH}_2\text{Ph}$ . (V) with  $\text{HNO}_3$  yields  $\text{C}_6\text{Cl}_5\cdot\text{NO}_2$ , m.p.  $144\text{--}145^\circ$ , reduced to  $\text{C}_6\text{Cl}_5\cdot\text{NH}_2$ , m.p.  $232\text{--}233^\circ$ .

CH. ABS. (r)

**Condensation of aryl methyl ketones.** K. BERNHAUER, P. MÜLLER, and F. NEISER (*J. pr. Chem.*, 1936, [ii], 145, 301—308).—Condensation of ketones,  $\text{COArMe}$ , by  $\text{KHSO}_4$  and a little  $\text{H}_2\text{SO}_4$  to triarylbenzenes is favoured by the presence of negative and hindered by that of positive substituents in the Ar.  $\text{COPhEt}$ ,  $\text{COPhPr}^a$ ,  $\text{COPhPr}^b$ ,  $\alpha$ - and  $\beta$ - $\text{C}_{10}\text{H}_7\cdot\text{COMe}$ , and  $\text{COPh}\cdot\text{CH}_2\text{Ph}$  (I) do not thus condense, presumably owing to steric hindrance. Yields are as stated, reaction being effected at  $80\text{--}85^\circ$  unless otherwise stated: *s*- $\text{C}_6\text{H}_3\text{Me}_3$  (37%); also obtained by I at  $195^\circ$  or in poor yield by  $\text{HgI}_2$  at  $240\text{--}250^\circ$ ; *s*-tri-*p*-tolyl-, m.p.  $170^\circ$  (14%), *p*-chlorophenyl-, m.p.  $238^\circ$  (46%); also obtained by I at  $170^\circ$ , *m*-nitrophenyl-, m.p.  $298\text{--}299^\circ$  (68%), *p*-diphenyl-, (51% at  $125^\circ$ ), m.p.  $230\text{--}231^\circ$ , and *p*-nitro-*p*-diphenyl-benzene, m.p.  $345\text{--}346^\circ$  (32% at  $160^\circ$ ). *p*-Nitrophenyl-4-acetophenone, m.p.  $151^\circ$ , b.p.  $256\text{--}265^\circ/10\text{ mm.}$ , is obtained in 11% yield from *p*- $\text{NO}_2\cdot\text{C}_6\text{H}_4\text{Ph}$ ,  $\text{AcCl}$ , and  $\text{AlCl}_3$  in  $\text{PhNO}_2$  at  $80^\circ$ . (I) with I at  $330\text{--}340^\circ$  gives an 18% yield of *s*-tetraphenylfuran, m.p.  $168\text{--}5\text{--}169^\circ$  [identified by oxidation by  $\text{HNO}_3\text{--AcOH}$  to  $(\text{CPhBz})_4$ ], probably by dehydrogenation of the intermediate  $\text{CH}_2\text{Ph}\cdot\text{CPh}\cdot\text{CHPhBz}$ .

R. S. C.

**Dipole moments of certain polynitro-compounds.**—See this vol., 924.

**Chlorination of *p*-chlorotoluene.** H. WAHL (*Compt. rend.*, 1936, 202, 2161—2163).—Direct chlorination of *p*- $\text{C}_6\text{H}_4\text{MeCl}$  ( $20\text{--}40^\circ$ ; Fe catalyst) yields 1:2:4- (58%) and 1:3:4- $\text{C}_6\text{H}_3\text{MeCl}_2$  (42%).

At  $100^\circ$  without catalyst, side-chain substitution occurs except in presence of  $\text{PbCl}_2$ , when normal nuclear substitution results. F. N. W.

**Plano-radiate compounds. IV. Hexa(-chloro- and -iodo-methyl)benzene.** H. J. BACKER (*Rec. trav. chim.*, 1936, 55, 591—594; cf. this vol., 715).— $\text{C}_6(\text{CH}_2\cdot\text{OH})_6$  (I) gives mixtures with  $\text{HCl}\text{--H}_2\text{SO}_4$  and  $\text{SOCl}_2$ .  $\text{Cl}_2$  and  $\text{C}_6\text{Me}_6$  in boiling  $\text{C}_2\text{HCl}_5$  give hexa(chloromethyl)benzene, m.p.  $287\text{--}5^\circ$  (crystallographic data given), converted by hot  $\text{KOAc}\text{--Ac}_2\text{O}$  into  $\text{C}_6(\text{CH}_2\cdot\text{OAc})_6$  (I) and HI saturated at  $0^\circ$  give hexa(iodomethyl)benzene, decomp. from  $200^\circ$ . Hexa(alkylthiomethyl)benzenes,  $\text{C}_6(\text{CH}_2\cdot\text{SR})_6$ , give mixtures with  $\text{HgCl}_2$ ; however, when R is Me, Et, or Bu<sup>a</sup>, a tetra-, m.p.  $100\text{--}102^\circ$ , octa-, m.p.  $98\text{--}99^\circ$ , and tetra-iodide, m.p.  $84\text{--}5^\circ$ , respectively, are obtained. R. S. C.

**Nitroschlorides of the benzene series.** R. PERROT (*Compt. rend.*, 1936, 203, 329—331).—When  $\text{NOCl}$  is added to the unsaturated aromatic compound dissolved in  $\text{CCl}_4$  or  $\text{CHCl}_3$  at a low temp. nitroschlorides of the following compounds are obtained, frequently better characterised by converting them by piperidine in  $\text{C}_6\text{H}_6$  into the corresponding nitrol-piperidines, the m.p. of which are recorded in parentheses:  $\text{CHPh}\cdot\text{CH}_2$ , m.p.  $102\text{--}5^\circ$  ( $136^\circ$ ); *p*-tolylethylene, m.p.  $101^\circ$  ( $163\text{--}5^\circ$ );  $\text{CHPh}\cdot\text{CHMe}$ , m.p.  $129\text{--}5^\circ$  ( $115^\circ$ );  $\text{CH}_2\cdot\text{CHPhMe}$ , m.p.  $89^\circ$  ( $122^\circ$ );  $\text{CHPh}\cdot\text{CHBr}$ , m.p.  $99\text{--}100^\circ$  ( $162\text{--}163^\circ$ ); anethole, m.p.  $126^\circ$  (about  $90^\circ$ );  $\text{CPh}\cdot\text{CH}_2$ , m.p.  $95^\circ$  ( $131^\circ$ );  $\text{CHPh}\cdot\text{CMc}_2$ , m.p.  $121\text{--}5^\circ$  ( $163^\circ$ );  $\text{CHPh}\cdot\text{CHPh}$ , m.p.  $138^\circ$  ( $155^\circ$ ); cyclohexene, m.p.  $150^\circ$  ( $119^\circ$ ); 1:4-dihydronaphthalene, m.p.  $143\text{--}144^\circ$  ( $146^\circ$ ); indene, blackens at about  $150^\circ$  ( $157^\circ$ );  $\text{COPh}\cdot\text{CH}\cdot\text{CHPh}$ , m.p.  $116^\circ$  (about  $60^\circ$ ). The mol. wt. of the compounds of each series determined cryoscopically in  $\text{C}_6\text{H}_6$  or dioxan is 1.3—1.8 times as great as that expected. H. W.

**Resolution of an allene hydrocarbon into optical antipodes by asymmetric catalysis.** P. MAITLAND and W. H. MILLS (*J.C.S.*, 1936, 987—998).— $\beta$ -Hydroxy- $\beta$ -phenyl- $\beta$ -1-naphthylpropionophenone, m.p.  $167\text{--}169^\circ$ , obtained from  $\text{Mg}$ , 1- $\text{C}_{10}\text{H}_7\cdot\text{Br}$ , and  $\text{CH}_2\text{Bz}_2$ , is converted (HCl) into *Ph*  $\beta$ -phenyl- $\beta$ -1-naphthylvinyl ketone, m.p.  $107\text{--}108^\circ$ , which with 1- $\text{C}_{10}\text{H}_7\cdot\text{MgBr}$  yields  $\alpha$ -diphenyl- $\alpha$ -di-1-naphthylallyl alcohol (I), m.p.  $187\text{--}189^\circ$ . The ketone may also be prepared by dehydration (HCl) of  $\alpha$ -bromo- $\beta$ -phenyl- $\beta$ -1-naphthylpropionophenone, m.p.  $196\text{--}198^\circ$ , obtained from 1- $\text{C}_{10}\text{H}_7\cdot\text{MgBr}$  and  $\text{CHPh}\cdot\text{CHBz}$ . Dehydration of (I) with  $\text{Ac}_2\text{O}$  or *p*- $\text{C}_6\text{H}_4\text{Me}\cdot\text{SO}_3\text{H}$  affords *r*- $\alpha$ -diphenyl- $\alpha$ -di-1-naphthylallene (II), m.p.  $242\text{--}244^\circ$ . With *d*-camphor- $\beta$ -sulphonic acid, (I) is dehydrated to a mixture of (II) and the *d*-allene, m.p.  $158\text{--}159^\circ$ ,  $[\alpha]_{\text{D}}^{25} +43^\circ$  in  $\text{C}_6\text{H}_6$ , and with the *l*-acid, the *l*-allene, m.p.  $158\text{--}159^\circ$ ,  $[\alpha]_{\text{D}}^{25} -43^\circ$  in  $\text{C}_6\text{H}_6$ , is obtained. The optically active allenes show great configurative stability and it is difficult to racemise them by heating. The configuration of (II) is confirmed by conversion with either  $\text{AcOH}$  and  $\text{HCl}$  or I into 1:3-diphenyl-1-naphthyl-4:5-benzindine, m.p.  $233\text{--}234^\circ$ , the optically active forms of (II) giving an inactive product. Oxidation ( $\text{KMnO}_4$ ) of (II) gives  $\text{COPh}\cdot\text{C}_{10}\text{H}_7\cdot 1$  and reduction

(HI-P) affords  $\alpha\gamma$ -diphenyl- $\alpha\gamma$ -di-1-naphthyl- $\Delta^a$ -propene, m.p. 167—169°, which is obtained when the reaction product of  $\beta$ -phenyl- $\beta$ -1-naphthylpropionophenone and  $1\text{-C}_{10}\text{H}_7\text{MgBr}$  is dehydrated with  $\text{Ac}_2\text{O}$ . The mechanism of the asymmetric catalysis is discussed. F. R. S.

**Diphenylindenes. III. Hydrogenation of diphenylindenes and diphenylindone and other reactions of this group.** A GARCÍA BANUS and E. DE SALAS (Anal. Fis. Quim., 1935, 33, 53—71).—Reduction of both 1:2- and 2:3-diphenylindene (I) (cf. A., 1929, 688) by P and HI or Na and amyl alcohol gives two forms of diphenylhydrindene (cf. Bergmann *et al.*, A., 1930, 1030), whilst catalytic H (PtO<sub>2</sub>) yields solely the isomeride, m.p. 124—125°. Contrary to de Fazi (A., 1931, 731), the existence of two forms of (I) is considered not to be due to stereoisomerism. Reduction of 2:3-diphenylindone (II) with Zn and AcOH or H<sub>2</sub>, and Pt or PtO<sub>2</sub> with HCl gives *cis*-2:3-diphenylhydrindone (III), m.p. 157—158°, and 1-hydroxy-2:3-diphenylindene (IV), two forms, m.p. 84—85° and 134—135°, both of which give the same Ac derivative (cf. Thiele *et al.*, A., 1912, i, 866), whilst Fe and AcOH or H<sub>2</sub> and Pt on BaSO<sub>4</sub> or PtO<sub>2</sub> yields *trans*-2:3-diphenylhydrindone (V), m.p. 100—101° (cf. Schenk *et al.*, A., 1928, 1035). (III) is converted into (V) by distillation at 22 mm., whilst they both give the same phenylhydrazone, m.p. 137—139°, and a sparingly sol. polymeride, m.p. 200—201° (decomp.), which by distillation under reduced pressure yields (V), which is also formed from  $\text{CHPh}\cdot\text{CHPh}\cdot\text{COCl}$  with  $\text{AlCl}_3$  in  $\text{CS}_2$ . (III) is assigned the *cis*-structure on the basis of its greater reactivity than (V) and its formation by hydrogenation in acid. (III), (IV), and (V) with PbO<sub>2</sub> all yield (II). 1-Amino-2:3-diphenylindene hydrochloride (improved prep.) (A., 1929, 688) with  $\text{HgCl}_2$  and NaOH in EtOH gives 1-imino-2:3-diphenylindene, m.p. 141—142°. Similarly 9-aminofluorene yields 9-iminofluorene, m.p. 123—124°, which with dil. HCl gives fluorenone. F. R. G.

**Naphthalene homologues of coal tar.** O. KRUBER and W. SCHADE [in part with W. MORNEWEG] (Ber., 1936, 69, [B], 1722—1729).—A neutral fraction, b.p. 258—260°, is converted by conc.  $\text{H}_2\text{SO}_4$  at 45° into 1:7-dimethylnaphthalene-4-sulphonic acid [Na salt (I); corresponding sulphonamide, m.p. 204—205°], transformed by superheated steam in presence of 70%  $\text{H}_2\text{SO}_4$  into 1:7-dimethylnaphthalene (II), b.p. 261—262°/760 mm. (picrate, m.p. 121°). (I) is transformed by molten KOH into 1:7-dimethyl-4-naphthol, m.p. 102°, which with  $\text{PhN}_2\text{Cl}$  gives the dye  $\text{C}_{18}\text{H}_{16}\text{ON}_2$ , m.p. 137°. (II) is oxidised by  $\text{CrO}_3$  in 50% AcOH to 1:7-dimethyl-5:8-naphthaquinone, m.p. 135—136°, and 3-methyl-o-phthalic acid, m.p. 157°. Treatment of (II) with dil.  $\text{HNO}_3$  followed by  $\text{K}_3\text{Fe}(\text{CN})_6$  gives 1:7- $\text{C}_{10}\text{H}_6(\text{CO}_2\text{H})_2$ , m.p. 308° (decomp.) after softening (*Me*<sub>2</sub> ester, m.p. 89°), which is obtained synthetically by converting 2:8- $\text{NH}_2\cdot\text{C}_{10}\text{H}_6\cdot\text{SO}_3\text{H}$  into 2:8- $\text{CN}\cdot\text{C}_{10}\text{H}_6\cdot\text{SO}_3\text{H}$  and thence into 2:8-dicyanonaphthalene, m.p. 152—154°, which is hydrolysed with 40% KOH-EtOH. The isolation of 2- $\text{C}_{10}\text{H}_7\text{Et}$  from a suitable coal-tar fraction is described. H. W.

**Nitration of 2-ethylnaphthalene. Synthesis of 2-ethyl-8-naphthol.** G. LEVY (Compt. rend., 1936, 203, 337—339).—Nitration of 2- $\text{C}_{10}\text{H}_7\text{Et}$  affords 2:1- $\text{C}_{10}\text{H}_6\text{Et}\cdot\text{NO}_2$  and an oil which is reduced by Fe and AcOH to a mixture of amines from which 2:8- $\text{C}_{10}\text{H}_6\text{Et}\cdot\text{NH}_2$  [hydrochloride; Ac derivative (I), m.p. 148.5—149° (corr.)] is separated. (I) is converted by 1%  $\text{H}_2\text{SO}_4$  at 200° into 2-ethyl-8-naphthol (II) m.p. 51° (picrate, m.p. 145°), synthesised as follows.  $(\text{CH}_2\cdot\text{CO})_2\text{O}$ , PhEt, and  $\text{AlCl}_3$  in benzene afford  $\beta$ -p-ethylbenzoylpropionic acid, m.p. 102—103°, reduced (Clemmensen) to  $\gamma$ -p-ethylphenylbutyric acid, m.p. 70°, the chloride, b.p. 143—145°/18 mm., of which is cyclised by  $\text{AlCl}_3$  to 8-keto-2-ethyl-5:6:7:8-tetrahydronaphthalene, b.p. 152—154°/18 mm. [semicarbazone, m.p. 197° (corr.)], dehydrogenated by Se to (II). H. W.

**1- and 2-Mononitroanthracene.** M. BATTEGAY and P. BÖHLER (Compt. rend., 1936, 203, 333—335).—Treatment of 2-anthracenyldiazonium borofluoride (I) in 80%  $\text{H}_2\text{SO}_4$  with conc.  $\text{HNO}_3$  at 10—15° and of the solution with EtOH at 70° affords  $\text{N}_2$ , MeCHO, a violet-black insol. substance, and 1-nitroanthracene, m.p. 146°, identified by reduction to 1-aminoanthracene and oxidation to 1-nitroanthraquinone. (I) is transformed by  $\text{NaNO}_2$  in presence of  $\text{CuSO}_3\cdot\text{Cu}_2\text{SO}_4$  into anthracene and 2-nitroanthracene, m.p. 172°, identified by conversion into 2-aminoanthracene and 2-nitroanthraquinone. H. W.

**Extremely weak acids.**—See this vol., 1069.

**Dissociable organic oxides. 9-Phenylanthracene and its derivatives.** C. DUFRASSE, L. VELLUZ, and (MME.) L. VELLUZ (Compt. rend., 1936, 203, 327—329).—9-Phenylanthracene (I), 10-bromo- (II) and 10-iodo- (III), m.p. 132°, -9-phenylanthracene, 9-phenylanthracene-10-carboxylic acid (IV), m.p. 264°, and its *Me* ester (V), m.p. 162° (obtainable only by use of  $\text{CH}_2\text{N}_2$ ), are photo-oxidisable, but the process is complicated by the evolution of halogen from (II) and (III) and is irregular in the case of (IV). (I) gives an oxide,  $\text{C}_{20}\text{H}_{14}\text{O}_2$ , in poor yield by reason of its extreme sensitiveness to light, and its thermal decomp. occurs vigorously at about 155° with appreciable liberation of  $\text{O}_2$ . (V) affords a normally dissociable oxide,  $\text{C}_{22}\text{H}_{16}\text{O}_4$ . The presence of *meso*-H is invariably an obstacle to the dissociability of the photo-oxides of anthracene. H. W.

**Hydrophenanthrenes and related ring systems from dieneinenes.** P. S. PINKNEY, G. A. NESTY, R. H. WILEY, and C. S. MARVEL (J. Amer. Chem. Soc. 1936, 58, 972—976; cf. A., 1933, 591, 1270).—1-Acetylenylcyclohexanol (I), b.p. 83—84°/25 mm., m.p. 31—32° (*Hg* derivative, m.p. 175.5—176.5°), obtained in 81% yield from cyclohexanone (II) (in Et<sub>2</sub>O-*tert*-amyl alcoholic K *tert*-amylaldehyde) and Et<sub>2</sub>O- $\text{C}_2\text{H}_2$  at -15° followed by aq.  $\text{NH}_4\text{Cl}$ , is converted by successive treatment with  $\text{MgEtBr}$  and cyclopentanone or (II) into  $\alpha$ -1-hydroxycyclopentyl- $\beta$ -1-hydroxycyclohexylacetylene (III), m.p. 93—94°, or  $\alpha\beta$ -di-1-hydroxycyclohexylacetylene (IV) [also obtained by Dupont's method (A., 1914; i, 134)], respectively. (IV) is dehydrated (40%  $\text{H}_2\text{SO}_4$ ) to  $\alpha\beta$ -di- $\Delta^1$ -cyclohexenylacetylene, b.p. 126—128°/3 mm., which is

reduced [ $\text{H}_2$  (1500—2000 lb.), Raney Ni, methylcyclohexane,  $250^\circ$ ] to *s*-dicyclohexylethane, b.p.  $93-94^\circ/2$  mm., and is converted by AcOH-conc.  $\text{H}_2\text{SO}_4$  or, better, 85%  $\text{HCO}_2\text{H}$  into 9-keto- $\Delta^{11}$ -dodecahydrophenanthrene (V), b.p.  $130-132^\circ/2$  mm. (2:4-dinitrophenylhydrazones, m.p.  $227-228^\circ$ ), and a little of an isomeric ketone, m.p.  $93-94^\circ$  (2:4-dinitrophenylhydrazone, m.p.  $186-187^\circ$ ) [not identical with the 9-keto- $\Delta^{10}$ -dodecahydrophenanthrene, m.p.  $88-90^\circ$  (2:4-dinitrophenylhydrazone, m.p.  $226-227^\circ$ ), of Rapson and Robinson (A., 1935, 1498)]. (IV) and AcOH-conc.  $\text{H}_2\text{SO}_4$  give a smaller yield of (V) and a little dodecahydrobenzil (? 2:4-dinitrophenylhydrazone, m.p.  $120-121^\circ$ ), whilst (IV) and 85%  $\text{HCO}_2\text{H}$  afford (V) and 3-keto-2:5-dichloropentamethylene-tetrahydrofuran (2:4-dinitrophenylhydrazone, m.p.  $162-162.5^\circ$ ) (Dupont, loc. cit.). Clemmensen reduction of (V) gives  $\Delta^{11}$ -dodecahydrophenanthrene, b.p.  $81-82^\circ/1.5$  mm. (cf. Schmidt and Mezger, A., 1907, i, 1022), which is reduced further (Ni; as above) to tetradecahydrophenanthrene, b.p.  $86-89^\circ/2$  mm. (also obtained by similar repeated reduction of phenanthrene); this could not be dehydrogenated (Se at  $300-320^\circ$ ).

(III) is similarly dehydrated to  $\alpha$ - $\Delta^1$ -cyclopentenyl- $\beta$ - $\Delta^1$ -cyclohexenylacetylene, b.p.  $103-104^\circ/2.5$  mm., reduced (Ni) to  $\alpha$ -cyclopentyl- $\beta$ -cyclohexylethane, b.p.  $74-76^\circ/2$  mm., and cyclised (as above) to 4-keto-1:2-trimethylene-3:4:5:6:7:8:9:10-octahydronaphthalene, b.p.  $114-116^\circ/2.5$  mm. (2:4-dinitrophenylhydrazone, m.p.  $221-222^\circ$ ) (ozonolysis product, adipic acid), which is reduced (Clemmensen) to the 1:2-trimethylenecyclooctahydro-, b.p.  $74-76^\circ/3$  mm., and thence (Ni) to the 1:2-trimethylenedecaahydro-naphthalene, b.p.  $71-72^\circ/2.5$  mm. H. B.

**cis- and trans-as-Octahydrophenanthrene.** J. VAN DE KAMP and E. MOSETTIG (J. Amer. Chem. Soc., 1936, 58, 1062—1063).—Repeated fractionation of *as*-octahydrophenanthrene (from 1- $\beta$ -phenylethylcyclohexanol and  $\text{P}_2\text{O}_5$ ) gives 70% of *cis*- (I), b.p.  $142.6-142.8^\circ/9.2$  mm., and 20% of *trans*- (II), b.p.  $135.5-135.7^\circ/10.5-10.8$  mm., forms. (I) gives an Ac derivative, an oil (semicarbazone, m.p.  $211-213^\circ$ ), oxidised to an octahydrophenanthrenecarboxylic acid, m.p.  $230-232^\circ$ ; the corresponding derivatives from (II) have m.p.  $94-94.5^\circ$ ,  $230-231.5^\circ$ , and  $226-228^\circ$ , respectively. H. B.

**Spiran by-product in the phenanthrene synthesis.** M. T. BOGERT (Science, 1936, 84, 44-45; cf. A., 1933, 601).—Evidence that the lower-b.p. fraction obtained from the crude *as*-octahydrophenanthrene by van de Kamp and Mosettig (preceding abstract) is a spiran and not a phenanthrene derivative is summarised. L. S. T.

**Aromatic hydrocarbons. XXI. Structure of pyrene according to the anellation process.** E. CLAR (Ber., 1936, 69, [B], 1671—1685).—Chemical evidence permits the following fine structures for pyrene. The absorption spectrum of it and its derivatives indicates *A* (*symm-pyr*-condition) and not *B*; it reacts at positions 3 and 8 and, with  $K=6$ , is the first representative of the *symm-pyr*-condition of which there is no sign in  $\text{Ph}_2$  or phenanthrene. The state *B* can be forced by anellation in the

3:4:9:10-position. The absorption spectra of pyrenes invariably give evidence of the *o*-condition represented by *C* or *D*, of which the former is preferred by reason of its derivation from phenanthrene.

In addition, in certain derivatives a further *o*-condition is evidenced apparently related to the unsymmetrical structure of the mol. Greater complexity of the mol. has no spectroscopically novel effect. Pyrene,  $o\text{-C}_6\text{H}_4\text{Me}\cdot\text{COCl}$ , and  $\text{AlCl}_3$  in  $\text{C}_6\text{H}_6$  yield 3-*o*-toluoylpyrene, m.p.  $139-140.5^\circ$  or m.p.  $107^\circ$  and m.p.  $137^\circ$  after re-solidification, whence 2':3'-naphtha-3:4-pyrene (I), m.p.  $265-266^\circ$ , and a substance,  $\text{C}_{24}\text{H}_{14}$ , m.p. (indef.)  $220-260^\circ$  (very unstable picrate, m.p.  $205^\circ$ ). 3-Pyrenoyl-*o*-benzoic acid, m.p.  $220-222^\circ$ , passes at  $>300^\circ$  into 3:4-phthaloylpyrene, m.p.  $250-251^\circ$ . (I) and maleic anhydride in boiling xylene afford 2':3'-naphtha-3:4-pyrene-endo-1':4'- $\alpha\beta$ -succinic anhydride, decomp.  $298-300^\circ$ , or m.p.  $272-273^\circ$  and decomp.  $298-300^\circ$  after re-solidification.  $\text{CPh}_2\text{Cl}_2$ , pyrene, and  $\text{AlCl}_3$  in  $\text{C}_6\text{H}_6$  yield 1'-phenylindeno-2':3':3:4-pyrene, m.p.  $279-280^\circ$ . 3:5:8-Tribromopyrene has m.p.  $259-260^\circ$ . H. W.

**Perylene and its derivatives. XLVIII.** The perylene tribromide of K. Brass and E. Clar. A. ZINKE and A. PONGRATZ (Ber., 1936, 69, [B], 1591—1593).—Repetition of the work of Brass and Clar (A., 1932, 57) shows that it is impossible to obtain a stable product of const. composition by the addition of Br to perylene (I) in  $\text{C}_6\text{H}_6$ ; the intermediate substance is very unstable and the Br content varies with conditions of prep. and age. (I) exposed in a thin layer to Br vapour rapidly absorbs 4 Br but evolution of HBr commences immediately. Recrystallisation of the product from boiling PhMe or  $\text{PhNO}_2$  leads to 3:9-dibromoperylene. The intermediate substance is therefore  $\text{C}_{20}\text{H}_{12}\text{Br}_4$  and, probably, a normal tetrabromide. H. W.

**Preparation of rubrene.** W. KOBLITZ and H. WITTMAYER (Ber., 1936, 69, [B], 1806).—Triphenylpropargyl alcohol is gradually treated with  $\text{SOCl}_2$  containing a little  $\text{AlCl}_3$  at  $0^\circ$ ; the solution is washed with  $\text{H}_2\text{O}$  and aq.  $\text{NaHCO}_3$  and the  $\text{C}_6\text{H}_6$  solution is evaporated to dryness. The residue is heated at  $120^\circ/\text{vac.}$ , thereby giving rubrene in 40% yield. H. W.

**Attempted partial synthesis of ergostane.** E. FERNHOLZ (Ber., 1936, 69, [B], 1792—1795).—Norcholy! Me ketone, m.p.  $112^\circ$  [semicarbazone, m.p.  $235^\circ$  (decomp.)], obtained by heating a mixture of Ba cholanate (I) and  $\text{Ba}(\text{OAc})_2$  at  $400^\circ$ , is converted by treatment with  $\text{MgPr}^6\text{Br}$  followed by boiling AcOH into  $\Delta^{24}\psi$ -ergostene,  $\text{C}_{29}\text{H}_{51}\cdot\text{CHMe}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{CMe}\cdot\text{CMe}_2$ , m.p.  $103^\circ$ , hydrogenated (Pt-sponge in  $\text{Et}_2\text{O}$ ) to  $\psi$ -ergostane, m.p.

64°,  $[\alpha]_D^{25} +25.3^\circ$  in  $\text{CHCl}_3$ . (I) and  $(\text{EtCO}_2)_2\text{Ba}$  at 370°/vac. afford very small amounts of norcholy Et ketone [*semicarbazone*, m.p. 215° (decomp.)]. Ba allocholanate yields norallocholy Me ketone, m.p. 113° [*semicarbazone*, m.p. 218° (decomp.)], whence two hydrocarbons,  $\text{C}_{28}\text{H}_{48}$ , m.p. 128°,  $[\alpha]_D^{25} +19.4^\circ$  in  $\text{CHCl}_3$ , and m.p. 54—56°,  $[\alpha]_D^{25} +21.6^\circ$  in  $\text{CHCl}_3$ , each of which is hydrogenated to ergostane, m.p. 81—82°,  $[\alpha]_D^{25} +22.9^\circ$ , probably containing an isomeride in small amount. H. W.

**Preparation of aniline from benzene and ammonia in a high-frequency high-tension field.** V. K. RAZUMOV (Men. Inst. Chem. Ukrain. Acad. Sci., 1935, 2, 261—268).—The reactions  $\text{C}_6\text{H}_6 + \text{NH}_3 + \text{O} \rightarrow \text{NH}_2\text{Ph} + \text{H}_2\text{O}$ ;  $\text{C}_6\text{H}_6 + \text{NH}_2\text{Ph} + \text{O} \rightarrow \text{NHPh}_2 + \text{H}_2\text{O}$ ;  $\text{C}_6\text{H}_6 + \text{O} \rightarrow \text{PhOH}$  take place when the gas mixture is passed through a high-frequency high-tension electromagnetic field. R. T.

**Alkylation of aniline in presence of mixed catalysts.** III. Mono-methyl- and -ethyl-aniline. N. I. SCHUJIN, A. N. BITKOVA, and A. F. ERMILINA (J. Gen. Chem. Russ., 1936, 6, 774—779).—The velocity of alkylation of  $\text{NH}_2\text{Ph}$  by EtOH or MeOH in presence of  $\text{Al}_2\text{O}_3$  is > with  $\text{Al}_2\text{O}_3\text{--Fe}_2\text{O}_3$ , but the product in the latter case is free from dialkyl derivatives.  $\text{NHPhMe}$  is obtained in 45% yield in presence of 1:1  $\text{Al}_2\text{O}_3\text{--Fe}_2\text{O}_3$  at 350°, and  $\text{NHPhEt}$  in 59% yield at 350° ( $\text{Al}_2\text{O}_3$  30—40,  $\text{Fe}_2\text{O}_3$  60—70%). The latter reaction is more rapid than the former, but loss of alcohol due to side reactions is greater. R. T.

**Hexaiodotellurates of aromatic amines etc.**—See this vol., 1079.

**Addition of chlorocarbamide to doubly-bound carbon.** I. RIBAS, E. TAPIA, and A. CAÑO (Anal. Fis. Quim., 1936, 34, 501—506).—*cyclo*Hexene with  $\text{NH}_2\text{CO}\cdot\text{NHCl}$  (I) gives, in addition to the chlorohydrin (cf. Detoeuf, A., 1922, i, 236), 2-chlorocyclohexylcarbamide, m.p. 185°, which with aq. KOH yields 2-amino-4:5-cyclohexano-oxazoline (cf. Birkenbach *et al.*, A., 1931, 832). (I) with  $\text{CHPh}\cdot\text{CHMe}$  gives probably  $\beta$ -chloro- $\beta$ -phenylisopropylcarbamide, m.p. 135°, and a liquid, b.p. 110—113°, probably a mixture of  $\text{CHPhCl}\cdot\text{CHMeCl}$  with the chlorohydrin. F. R. G.

**Phenylurethane anaesthetics.** II. E. S. COOK and T. H. RIDER (J. Amer. Chem. Soc., 1936, 58, 1079—1081; cf. A., 1930, 1031).— $\gamma$ -Dimethylamino-, m.p. 131—132.5° (all m.p. are corr.),  $\gamma$ -diethylamino-, m.p. 140.5—142.5°,  $\gamma$ -di-n-propylamino-, m.p. 159.5—160.5°,  $\gamma$ -di-n-butylamino-, m.p. 123—124°,  $\gamma$ -( $\beta$ -phenylethylmethylamino)-, m.p. 192.5—193.5°, and  $\gamma$ -piperidino-, m.p. 169—169.5°, -propyl, and  $\beta$ -diethylamino-, m.p. 137.5—138.5°, and  $\beta$ -piperidino-, m.p. 88—89.5°, - $\alpha$ -methyl ethyl phenylcarbamate hydrochlorides are prepared from the appropriate amino-alcohol and  $\text{PhNCO}$  in  $\text{Et}_2\text{O}$  followed by HCl.  $\text{NHPh}\cdot\text{CO}_2\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{NET}_2\cdot\text{HCl}$  has m.p. 142.5—143.5° (lit. 138—139°). Pharmacological data are given; the  $\text{NHPh}\cdot\text{CO}_2$  group appears to be more active than  $p\text{-NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{CO}_2$  in causing anaesthesia of mucous surfaces.  $\gamma$ -( $\beta$ -Phenylethylmethylamino)propyl alcohol, b.p. 155—157°/12 mm., is prepared from  $\text{CH}_2\text{Ph}\cdot\text{CH}_2\cdot\text{NHMe}$  and  $\text{CH}_2\text{Br}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{OH}$ . H. B.

**Molecular rearrangement of sulphenanilides.** III. M. L. MOORE and T. B. JOHNSON (J. Amer. Chem. Soc., 1936, 58, 1091—1094; cf. A., 1935, 1120, 1359; this vol., 200).—2:4- $\text{NO}_2\cdot\text{C}_6\text{H}_3\text{Cl}\cdot\text{SOCl}$  and  $\text{NH}_2\text{Ar}$  in  $\text{Et}_2\text{O}$  give 4-chloro-2-nitrobenzenesulphen-anilide (I), m.p. 102°, and -o-toluidide (II), m.p. 127°, whilst  $\text{NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{SOCl}$  and  $o\text{-C}_6\text{H}_4\text{Cl}\cdot\text{NH}_2$  afford o- (III), m.p. 130°, and p- (IV), m.p. 99—101°, -nitrobenzenesulphen-o-chloroanilide. (I) heated alone at 150—160° or, better, in an excess of  $\text{NH}_2\text{Ph}$  at 180—190° rearranges to 4-chloro-2-nitro-4'-aminodiphenyl sulphide, m.p. 127—129°; similarly, (II) in  $o\text{-C}_6\text{H}_4\text{Me}\cdot\text{NH}_2$  gives 4-chloro-2-nitro-4'-amino-3'-methyldiphenyl sulphide, m.p. 113—115°, whilst (IV) in  $o\text{-C}_6\text{H}_4\text{Cl}\cdot\text{NH}_2$  affords 3'-chloro-4-nitro-4'-aminodiphenyl sulphide, m.p. 127—129°.  $o\text{-NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{S}\cdot\text{NH}\cdot\text{C}_6\text{H}_4\text{R}$  ( $\text{R}=\text{H}$ , o-Cl, o- and p-Me) heated with  $\text{C}_6\text{H}_5\text{R}'\cdot\text{NH}_2$  ( $\text{R}'=\text{H}$ , o- and p-Me) give the aminodiphenyl sulphides derived from  $o\text{-NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{S}\cdot\text{NH}\cdot\text{C}_6\text{H}_4\text{R}'$ ; such displacement does not occur when  $\text{R}'$  is o-Cl. Thus, (III) heated in o- and p- $\text{C}_6\text{H}_4\text{Me}\cdot\text{NH}_2$  affords 2-nitro-4'-amino-3', m.p. 101—103°, and 2-nitro-2'-amino-5', m.p. 105—107°, -methyldiphenyl sulphide, respectively. All  $\text{ArS}\cdot\text{NHAr}'$  are decomposed by acids to  $\text{Ar}_2\text{S}_2$  and  $\text{NH}_2\text{Ar}'$ . H. B.

**Preparation of naphthidine.** S. COHEN and R. E. OESPER (Ind. Eng. Chem. [Anal.], 1936, 8, 306—307).— $\alpha\text{-C}_{10}\text{H}_7\cdot\text{NH}_2\cdot\text{HCl}$  is diazotised and converted with  $\text{Na}_2\text{SO}_3$  into azonaphthalene (yield quant.), which is then reduced in EtOH at the boil with  $\text{SnCl}_2$  and HCl. The solution is rapidly cooled, and more HCl added to ppt. naphthidine hydrochloride. The crude base obtained on basification is recryst. from  $\text{EtOH}\text{--}\text{C}_5\text{H}_5\text{N}$ . The yield is 33.5%, m.p. 198—199°. S. C.

**Derivatives of (A) NN-2:4-di- [and] (B) NN-2:4:6-tri-nitrophenylmethylhydrazine.** J. J. BLANKSMA and (Miss) M. L. WACKERS (Rec. trav. chim., 1936, 55, 655—660, 661—668).— $\text{NHMe}\cdot\text{NH}_2$  and 2:4- $\text{C}_6\text{H}_3\text{Cl}(\text{NO}_2)_2$  (I) or 2:4:6- $\text{C}_6\text{H}_2\text{Cl}(\text{NO}_2)_3$  in warm EtOH give NN-2:4-di-, m.p. 144° (Ac derivative), and NN-2:4:6-tri-nitrophenylmethylhydrazine, m.p. 171° (Ac derivative, m.p. 222°) [structure proved by condensation with aldehydes and expected because (I) condenses much faster with  $\text{NH}_2\text{Me}$  than with  $\text{NH}_3$ ]. Aldehydes are readily characterised by these hydrazines; reaction is rapid in hot EtOH containing a little  $\text{H}_2\text{SO}_4$  and the m.p. are conveniently lower than those of the non-methylated compounds. The following are described: 2:4-di- and 2:4:6-tri-nitrophenylmethylhydrazones and 2:4:6-trinitrophenylhydrazones, respectively, of  $\text{PhCHO}$ , m.p. 206°, 214°, 270°, o-, m.p. 176°, 164°, 246°, m-, m.p. 195°, 159°, 252°, and p- $\text{C}_6\text{H}_4\text{Cl}\cdot\text{CHO}$ , m.p. 199°, 211°, 255°, o- (II), m.p. 183°, 224°, 265° (lit. 215°), m-, m.p. 239°, 216°, 251°, and p- $\text{NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{CHO}$ , m.p. 246°, 233°, 250°, o-, m.p. 191°, 220°, 275°, and p- $\text{OH}\cdot\text{C}_6\text{H}_4\cdot\text{CHO}$  (III), m.p. 225°, 224°, 284°, p- $\text{OMe}\cdot\text{C}_6\text{H}_4\cdot\text{CHO}$ , m.p. 185°, 180°, 252°, 3:4- $\text{CH}_2\text{O}_2\cdot\text{C}_6\text{H}_3\cdot\text{CHO}$ , m.p. 212°, 236°, 260°, 4:3- $\text{OH}\cdot\text{C}_6\text{H}_4(\text{OMe})\cdot\text{CHO}$  (IV), m.p. 178°, 200°, 276°, furfuraldehyde, m.p. 190°, 204°, 246° (lit. 230°), hydroxymethyl- (V), m.p. 100°, 196°,

216°, and 5-methyl-furfuraldehyde, m.p. 171°, 182°, 218°, MeCHO, m.p. 118°, 152°, —; 2:4-dinitrophenylhydrazones of *o*-, m.p. 209°, *m*-, m.p. 256°, and *p*-C<sub>6</sub>H<sub>4</sub>Cl·CHO, m.p. 270°, (II), m.p. 252°, (III), +H<sub>2</sub>O, m.p. 260°, (IV), m.p. 270°, and (V), m.p. 184°.

R. S. C.

***p*-tert.-Butylphenol**, a substance with the odour of Russian leather. G. SANDULESCU and S. SABETAY (Riechstoffind., 1935, 10, 84; Chem. Zentr., 1935, ii, 3021).—Butylphenol, m.p. 93–94°, b.p. 233–234°/762 mm., 127.5–128.5°/20 mm., and its Et, b.p. 110–111°/13 mm., *Pr*<sup>a</sup>, b.p. 122–123°/13 mm., *Pr*<sup>β</sup>, b.p. 113–114°/13 mm., *Bu*<sup>a</sup>, b.p. 136–137°/13 mm., and *Bu*<sup>β</sup>, b.p. 126–128°/13 mm., ethers are described. H. N. R.

**Sulphonation of 2-ethylnaphthalene.** Synthesis of 6-ethyl-β-naphthol. G. LEVY (Compt. rend., 1936, 202, 1679–1680; cf. A., 1932, 734, 842; 1933, 1287).—2-C<sub>10</sub>H<sub>7</sub>Et with conc. H<sub>2</sub>SO<sub>4</sub> at 95° affords 2:6-C<sub>10</sub>H<sub>6</sub>Et·SO<sub>3</sub>H, the Na salt of which after fusion with alkali gives 6-ethyl-β-naphthol (I), m.p. 97–98° (*picrate*, m.p. 106–107°). *p*-Methoxybenzyl chloride with CHNa(CO<sub>2</sub>Et)<sub>2</sub> affords Et<sub>2</sub> *p*-methoxybenzylethylmalonate, b.p. 161°/2 mm.; the corresponding acid, m.p. 131.5–132.5°, is decarboxylated to α-*p*-methoxybenzylbutyric acid, b.p. 195°/13 mm., the amyl ester, b.p. 188°/13 mm., of which is reduced by Bouveault's method to β-*p*-methoxybenzyl-*n*-butyl alcohol (II), b.p. 165°/13 mm. (II) with SOCl<sub>2</sub> and some NPhMe<sub>2</sub> affords the chloride, b.p. 160°/13 mm., which cannot be converted directly into β-*p*-methoxybenzylvaleronitrile (III), b.p. 172–175°/13 mm., but only through the *I*-compound, b.p. 165°/13 mm. (III) with boiling MeOH–KOH affords β-*p*-methoxybenzylvaleric acid, b.p. 205°/13 mm., the chloride, b.p. 175°/13 mm., of which with AlCl<sub>3</sub> in hexane is cyclised to 6-methoxy-4-keto-2-ethyl-1:2:3:4-tetrahydronaphthalene, b.p. 180°/13 mm. (*semicarbazone*, m.p. 171–172°), which is reduced (Clemmensen) to 6-methoxy-2-ethyl-1:2:3:4-tetrahydronaphthalene, b.p. 148–153°/13 mm. Dehydrogenation followed by demethylation yields 6-methoxy-2-ethylnaphthalene, m.p. 57–59°, and (I), respectively. J. L. D.

**Dyes from resorcinol, sulphuric acid, and alcohols.** E. BERTONASCO (G. Farm. Chim. Sci. affini, 1935, 84, 58–64; Chem. Zentr., 1935, ii, 3096).—MeOH, EtOH, PrOH, Bu<sup>β</sup>OH, and glycerol all give dyes on warming with resorcinol and conc. H<sub>2</sub>SO<sub>4</sub>. The products may be esters of resorcinol-disulphonic acid. H. N. R.

**Exchange between dihydroxybenzenes and heavy water.** F. K. MUNZBERG (Z. physikal. Chem., 1936, B, 33, 39–46).—In the exchange of H for D between resorcinol (I) and D<sub>2</sub>O in which it is dissolved the H of OH groups are exchanged immeasurably rapidly, two H of the nucleus in the *o*-position to OH are exchanged at a measurable rate by way of an enol-keto transformation (cf. following abstract), and the other two nuclear H are replaced directly and very slowly. Orcinol (II) behaves similarly. In quinol (III) H of both OH are rapidly exchanged, but all the nuclear H are exchanged very slowly and at the same rate;

apparently there is no kinetically effective enol-keto change. It is inferred that in the ring of (I) and (II) the C–C linkings are alternately double and single and do not exchange positions periodically, whilst in the ring of (III) there are at most two double linkings. R. C.

**Exchange between trihydroxybenzenes and heavy water.** F. K. MUNZBERG (Z. physikal. Chem., 1936, B, 33, 23–38).—In the exchange of H for D between pyrogallol (I) and D<sub>2</sub>O in which it is dissolved the H of OH groups are exchanged immeasurably rapidly, and the nuclear H more slowly, but each at a different rate. Experiments with Na gallate (II) show that in (I) the two nuclear H in the *o*-position to OH are exchanged more rapidly than the isolated nuclear H. All the H of phloroglucinol are quickly exchanged. Since in C<sub>6</sub>H<sub>6</sub> the H is not readily exchanged for D (A., 1934, 1080), it is inferred that H attached to C is readily exchanged if keto-enol tautomerism is possible. Hence the above compounds must contain double linkings, as, e.g., in the Kekulé formula. It appears that in the ring in (I) and (II) two different kinds of C–C linking alternate with each other and exchange positions on the average once in 1.4 × 10<sup>6</sup> sec. at 50°. R. C.

**Lichen substances. LXVIII. Preparation of higher homologues of orcinol.** Y. ASAHINA [with M. MIYASAKA and T. SEKIZAWA] (Ber., 1936, 69, [B], 1643–1646).—Et α-3:4:5-trimethoxybenzoylpropionate is converted by 5% KOH–EtOH at 60° into 3:4:5-trimethoxypropionophenone, m.p. 33°, reduced by Na and EtOH to 3:5-dimethoxypropylbenzene, b.p. 147°/29 mm., converted by boiling HI (*d* 1.7) into divarin, b.p. 169°/8 mm. (monohydrate, m.p. 51°; Br<sub>3</sub>-derivative, m.p. 99°). Similarly Et α-3:4:5-trimethoxybenzoylvalerate yields 3:4:5-trimethoxyvalerophenone, converted successively into olivetol Me<sub>2</sub> ether and olivetol (Br<sub>3</sub>-derivative, m.p. 87°). Et α-3:4:5-trimethoxybenzoyl-*n*-heptanoate, m.p. 39°, is transformed into 3:4:5-trimethoxyphenyl-*n*-hexyl ketone, b.p. 175–176°/4 mm., m.p. 29° (*semicarbazone*, m.p. 112°), whence sphaerophorol Me<sub>2</sub> ether, b.p. 150°/5 mm., and sphaerophorol, b.p. 175–176°/5 mm. (monohydrate, m.p. 57°; Br<sub>3</sub>-derivative, m.p. 75°). H. W.

**Catalytic hydrogenation of some epoxides.** P. WEILL and F. KAYSER (Bull. Soc. chim., 1936, [v], 3, 841–844).—Catalytic reduction (Ni) of triphenylethylene oxide in EtOH at 35–40° yields solely αββ-triphenylethyl alcohol. Similarly α-anisyl-ββ-diphenyl- and α-tolyl-β-phenyl-ethylene oxides give solely α-anisyl-ββ-diphenyl- and α-tolyl-β-phenyl-ethyl alcohol. H. G. M.

**Transformations of brominated derivatives of cholesterol.** II. H. H. INHOFFEN (Ber., 1936, 69, [B], 1702–1710).—A modified prep. of the tri-bromoketone (I) from cholesterol is given (cf. this vol., 854). Treatment of (I) with KOAc in C<sub>6</sub>H<sub>6</sub>–EtOH affords the dibromide (II), m.p. 162–163° (decomp.), the constitution of which is supported by its absorption spectrum. When boiled with EtOH containing a little HBr it gives the enol ether of cholesterol-3:6-dione. Further treatment of (I) with

KOAc in EtOH gives the *enol acetate* (III), m.p. 158—159° after softening, also obtained directly from

(I). Hydrolysis of (III) by HCl-EtOH leads to the *o-diketone* (IV or V), m.p. 160—161°, which reduces

$\text{NH}_3\text{-Ag}_2\text{O}$  and gives a red-brown colour with  $\text{FeCl}_3$ ; its absorption spectrum indicates the presence of three conjugated double linkings. It yields a *di-oxime*, decomp. about 180° after softening, and a *quinoxaline* derivative,  $\text{C}_{33}\text{H}_{46}\text{N}_2$ , m.p. 175° (decomp.), which is unchanged by boiling  $\text{Ac}_2\text{O}$ . In support of structure (V) it reacts with  $\text{Ac}_2\text{O}$  without regenerating (III) and contains 1 OH (Zerevitinov). H. W.

**alloCholesterol and epiallocholesterol.** R. SCHOENHEIMER and E. A. EVANS, jun. (J. Biol. Chem., 1936, **114**, 567—582).—Cholestenone and hot  $\text{Al}(\text{OPr}^i)_3\text{-Pr}^i\text{OH}$  give a 1 : 1 mol. compound, m.p. 141°,  $[\alpha]_D^{21} + 84.1^\circ$  in  $\text{C}_6\text{H}_6$ , separable by digitonin (I) into *allocholesterol* (II), m.p. 132°,  $[\alpha]_D^{23} + 43.7^\circ$  in  $\text{C}_6\text{H}_6$  [pptd. by (I); *acetate*, m.p. 85°], and *epiallocholesterol* (III), m.p. 84°,  $[\alpha]_D^{24} + 120.8^\circ$  in  $\text{C}_6\text{H}_6$  [not pptd. by (I); *acetate*, m.p. 82.5°]. Hydrogenation ( $\text{PtO}_2$ ) of (II) in amyl ether gives *epicoprosterol* (IV), that of (III) gives (IV) and *epidihydrocholesterol*. (II) or (III) with hot 0.033*N*-HCl-EtOH gives  $\Delta^{2:4}$ -cholestadiene (V), m.p. 79°,  $[\alpha]_D^{23} - 112.5^\circ$  in  $\text{C}_6\text{H}_6$  (absorption max. at 229, 235, and 240  $\text{m}\mu$ ). The substance hitherto known as (II) is a 2 : 3 mixture of (II) and cholesterol (VI), since (a) its behaviour is paralleled by that of a synthetic mixture and (b) with HCl it gives about 40% of (V) with unchanged (VI), the latter being hitherto considered as the product of the reaction. Thirty-one examples show that the Rosenheim test is given only by those sterols having conjugated ethylenic linkings or capable of giving this system [e.g., containing  $\text{CH}:\text{CH}:\text{C}(\text{OH}):\text{CH}$ ] under the conditions of the test, but that compounds with  $\text{CO}:\text{C}:\text{C}:\text{C}$  do not give it. The hydrocarbon,  $\text{C}_{26}\text{H}_{42}$ , of Windaus *et al.* (A., 1915, i, 677) gives the test. The usual *cis-trans* nomenclature (referring to the H on  $\text{C}_{(5)}$ ) of sterols may be misleading and offers difficulty with  $\Delta^4$ - and  $\Delta^5$ -compounds. It is proposed to name compounds according to the relation of the Me on  $\text{C}_{(10)}$  to, first, the OH on  $\text{C}_{(3)}$  and, second, the H on  $\text{C}_{(5)}$ . Thus, dihydro-, epidihydro-, allo-, and epiallo-cholesterol are *cis-trans*, *trans-trans*, *cis*, and *trans*, respectively, coprosterol and epicoprosterol are *cis-cis* and *trans-cis*, cholesterol and epicholesterol are *cis* and *trans*, respectively. Only those compounds with a *cis*-configuration of OH-Me (first title) are pptd. by (I), and relationships are always clear.

R. S. C.

**Sterol group. XXIV. Constitution of calciferol.** I. M. HEILBRON, R. N. JONES, K. M. SAMANT, and F. S. SPRING. **XXV. Reactions of the isomeric ethers of cholesterol.** J. H. BEYNON, I. M. HEILBRON, and F. S. SPRING (J.C.S., 1936, 905—907, 907—910; cf. this vol., 981).—XXIV. Calciferol is (I), because (a) with  $\text{CrO}_3\text{-AcOH}$  or  $\text{KMnO}_4$ , best at room temp., it gives an *aldehyde* (II),  $\text{C}_{21}\text{H}_{34}\text{O}$ ,

an oil, the *semicarbazone*, m.p. 242°, of which has an absorption spectrum very similar to that of citral-semicarbazone (proof of the 7 : 8 ethylenic linking) and (b) with  $\text{O}_3$  gives  $\text{CH}_2\text{O}$  (proof of the presence of  $\text{CH}_2$ ) and a *keto-acid* (III),  $\text{C}_{13}\text{H}_{12}\text{O}_3$  (*semicarbazone*, m.p. 219°) (proof of the

22 : 23 and 7 : 8 ethylenic linkings).

**XXV. Cholesteryl *p*-toluenesulphonate (IV) and KOAc in hot EtOH give *cis-cholesteryl Et ether* (V), m.p. 47°,  $[\alpha]_D^{20} + 49.78^\circ$  in  $\text{CHCl}_3$ , and in  $\text{CH}_2\text{Ph-OH}$  at 100° some *trans*- and much *cis-cholesteryl benzyl ether* (VI), b.p. 170°/0.001 mm.,  $[\alpha]_D^{20} + 15.77^\circ$  in  $\text{CHCl}_3$ . (V), (VI), and the *cis*-Me ether with halogen acids in AcOH give the cholesteryl halide and with  $\text{Br-AcOH-Et}_2\text{O}$  give 3 : 5 : 6-tribromocholestan. *Cholesteryl iodide*, thus prepared, has m.p. 106.5—107°,  $[\alpha]_D^{20} - 11.94^\circ$ . The *trans*-ethers do not eliminate the alkoxy-group thus; with Br there are formed the *dibromides*, m.p. 107°, 80°, and 107°,  $[\alpha]_D^{20} - 52.95^\circ$ ,  $-50.75^\circ$ , and  $-50.2^\circ$  in  $\text{CHCl}_3$ , of *trans-cholesteryl* Me, Et, and  $\text{CH}_2\text{Ph}$  ether, respectively. Thus, the *cis*-ethers may have a  $\Delta^4$ -ethylenic linking, but this is unlikely as they do not give the colour with  $\text{SbCl}_5$  given by *allocholesterol* and its Me ether and  $\psi$ -cholesterene. (IV) with aq. KOH or aq. KOAc gives cholesterol and dicholesteryl ether (VII), with KOAc-AcOH gives *trans-cholesteryl acetate*, with  $\text{Ag}_2\text{O-H}_2\text{O}$  or dil.  $\text{H}_2\text{SO}_4$  gives (VII), and with  $\text{H}_2\text{SO}_4\text{-EtOH}$  *trans-cholesteryl Et ether*. The *cis-trans* nomenclature requires confirmation. R. S. C.**

**Derivative of vitamin-D and several sterols.** M. SUMI (Bull. Inst. Phys. Chem. Res. Japan, 1936, **15**, 635—640).—The following have been prepared : *calciferyl*, m.p. 132°,  $[\alpha]_D^{20} + 149.97^\circ$ , *cholesteryl*, m.p. 168°,  $[\alpha]_D^{20} 0^\circ$ , *sitosteryl*, m.p. 190°,  $[\alpha]_D^{20} + 2.5^\circ$ , and *ergosteryl  $\beta$ -naphthoate*, m.p. 175°, and the *anthraquinone-2-carboxylates* of the last three, m.p. 170° (or >250°),  $[\alpha]_D^{20} 0^\circ$ , m.p. 189° (or 253°),  $[\alpha]_D^{20} - 1.3^\circ$ , and m.p. 195° (or 200°), respectively. W. O. K.

**Pinacol-pinacolin rearrangement. VIII. Rearrangement of 7 : 8-dihydroxy-7 : 8-diarylace-naphthenes.** W. E. BACHMANN and E. J. H. CHU (J. Amer. Chem. Soc., 1936, **58**, 1118—1121).—The following are prepared from acenaphthenequinone and  $\text{MgArBr}$  in  $\text{Et}_2\text{O-C}_6\text{H}_6$  : 7 : 8-dihydroxy-7 : 8-

diphenyl-, m.p. 154.3—155.3° [a stereoisomeride, m.p. 173.5—175.6° (lit. 171—173°), is obtained from 1 : 8-C<sub>10</sub>H<sub>6</sub>Bz<sub>2</sub> and 1% Na-Hg in Et<sub>2</sub>O-C<sub>6</sub>H<sub>6</sub> followed by dil. AcOH], -di-p-diphenyl-, m.p. 220°, -di-p-tolyl- (I), m.p. 182—182.5°, -di-m-tolyl-, m.p. 152.3—153.3°, -dianisyl-, m.p. 168—169°, -diphenetyl-, m.p. 144.5—145.5°, -di-p-chlorophenyl- (II), m.p. 222—223°, and -di-p-fluorophenyl- (III), m.p. 220—221°, -acenaphthene (A). Diastereoisomerides, m.p. 154.3—155.3°, 78—79.5°, and 153.5—154.5°, respectively, of (I), (II), and (III) are obtained by reduction (as above) of the appropriate 1 : 8-C<sub>10</sub>H<sub>6</sub>(COAr)<sub>2</sub>. (A) are rearranged by I in boiling AcOH into 8-keto-7 : 7-diarylaacenaphthenes (B) (62—100% yield), viz., 8-keto-7 : 7-diphenyl- (IV), m.p. 171.3—172.4°, -di-p-diphenyl- (V), m.p. 248—249°, -di-p-tolyl-, m.p. 128.5—129.5°, -di-m-tolyl-, m.p. 147.5—148.5°, -dianisyl-, m.p. 151.5—152.5°, -diphenetyl-, m.p. 122.8—123°, -di-p-chlorophenyl-, m.p. 145.5°, and -di-p-fluorophenyl-acenaphthene, m.p. 127.5—128.5°, respectively. (IV) is synthesised from  $\alpha$ -C<sub>10</sub>H<sub>7</sub>-CPh<sub>2</sub>-COCl and SnCl<sub>4</sub> in CS<sub>2</sub>; the chloride of di-p-diphenyl- $\alpha$ -naphthylacetic acid, m.p. 216—217° (from the CAr<sub>2</sub>Cl and 45% Na-Hg in Et<sub>2</sub>O-C<sub>6</sub>H<sub>6</sub> followed by CO<sub>2</sub>), similarly gives (V). Fusion of (B) with KOH (at usually 250°) affords 8-benzhydryl-, m.p. 226°, 8-di-p-diphenylmethyl-, m.p. 247—248°, 8-di-p-, m.p. 159.3—160.3°, and -m-, m.p. 189.5—190.5°, -tolylmethyl-, 8-dianisylmethyl-, m.p. 173.5—174.5°, 8-diphenetylmethyl-, m.p. 170—171°, 8-di-p-chlorophenylmethyl-, m.p. 225—226°, and 8-di-p-fluorophenylmethyl-, m.p. 221—222°, -1-naphthoic acid, whilst oxidation (CrO<sub>3</sub>, AcOH) of (A) gives 1 : 8-C<sub>10</sub>H<sub>6</sub>Bz<sub>2</sub> and 1 : 8-di-p-phenylbenzoyl-, m.p. 219—220°, 1 : 8-di-p-, m.p. 181.5—182.5°, and -m-, m.p. 157.3—158.3°, -toluoyl-, 1 : 8-dianisoyl-, m.p. 215—216°, 1 : 8-diethoxybenzoyl-, m.p. 197—197.5°, 1 : 8-di-p-chlorobenzoyl-, m.p. 188°, and 1 : 8-di-p-fluorobenzoyl-, m.p. 166.5—167.5°, -naphthalene. The appropriate (A) with dry HCl in cold CHCl<sub>3</sub> afford the dichlorides, converted by NaI in COMe<sub>2</sub> into 7 : 8-diphenyl-, m.p. 161.3°, 7 : 8-di-p-diphenyl-, m.p. 189.5—190.5°, 7 : 8-di-p-tolyl-, m.p. 137.2—137.7°, 7 : 8-di-p-chlorophenyl-, m.p. 204.5—205.5° (obtained using AcOH-HI), and 7 : 8-di-p-fluorophenyl-, m.p. 153.5—154.5°, -acenaphthylene. H. B.

**Conversion of carboxylic acids into their homologues.** F. ARNDT and B. EISTERT (Ber., 1936, 69, [B], 1805).—Mainly a reply to Preobrashenski *et al.* (A., 1935, 872; this vol., 1002) concerning the transitions, R·CO<sub>2</sub>H  $\rightarrow$  R·COCl  $\rightarrow$  R·CO·CHN<sub>2</sub>  $\rightarrow$  CH<sub>2</sub>R·CO<sub>2</sub>H. The yields of esters from diazoketones (I) are considerably improved if Ag<sub>2</sub>O is added in successive small quantities to the mixtures of (I) and alcohols. Ag<sub>2</sub>O acts as alkali and source of colloidal Ag which is the actual catalyst. H. W.

**Synthesis of dibenzoyl disulphide.** R. S. SHELTON and T. H. RIDER (J. Amer. Chem. Soc., 1936, 58, 1282—1284).—Bz<sub>2</sub>S<sub>2</sub>, m.p. (tube) 129—130° (decomp.), (bar) 132°, is prepared by oxidation (H<sub>2</sub>O<sub>2</sub>) of BzSH (from BzCl and 35% aq. NaHS in O<sub>2</sub>). H. B.

**Action of secondary amines on dibenzoyl disulphide.** L. SZPERL and M. WASILEWSKA

(Rocz. Chem., 1936, 16, 207—212).—(Ph·CO·S)<sub>2</sub> (I) and NHPr<sup>a</sup><sub>2</sub> in C<sub>6</sub>H<sub>6</sub> at room temp. yield *benzdi-n-propylamide*, b.p. 290—291°/746 mm., together with BzSH, H<sub>2</sub>S, and S, whilst with NPhMe (27 hr. at the b.p.) the chief product is NPhMeBz. (I) does not react with NPhPh<sub>2</sub>. R. T.

**Nitration of ethyl phenylacetate.** J. F. J. DIPPY and J. E. PAGE (J.S.C.I., 1936, 55, 190—192).—Nitration of CH<sub>2</sub>Ph·CO<sub>2</sub>Et with (a) HNO<sub>3</sub>-H<sub>2</sub>SO<sub>4</sub> gives 2 : 4-dinitrophenylacetic acid, (b) HNO<sub>3</sub>-AcOH, Et *p*-nitrophenylacetate (poor yield), and (c) HNO<sub>3</sub>-Ac<sub>2</sub>O, Et *o*-nitrophenylacetate, easily hydrolysed to the acid. F. R. S.

**Mechanism of substitution reactions. Substitution of bromine and chlorine in  $\alpha$ -bromo- and  $\alpha$ -chloro-phenylacetic acids by chloride and bromide ions in aqueous solution.** M. J. YOUNG and A. R. OLSON (J. Amer. Chem. Soc., 1936, 58, 1157—1162).—The heats of activation and collision factors for these reactions are determined at 15—50° and compared with those for the halogenosuccinate system (A., 1934, 847; this vol., 569). In accordance with theory, the reaction *l*-CHBrPh·CO<sub>2</sub>H + Cl<sup>-</sup>  $\rightarrow$  *d*-CHClPh·CO<sub>2</sub>H + Br<sup>-</sup> is accompanied by complete inversion in configuration. H. B.

**Configuration of aminophenylacetic acid.** H. REIHLEN and L. KNOPFLE (Annalen, 1936, 523, 199—210).—Me d(-)- $\alpha$ -aminophenylacetate (hydrochloride, m.p. 202°, [ $\alpha$ ]<sub>D</sub> -121° in H<sub>2</sub>O; Ac, m.p. 114—117°, [M]<sub>5893</sub> -363° in MeOH, and Bz derivative, m.p. 101.5°, [M]<sub>5893</sub> -270° in MeOH; [M] are given also for 3 other  $\lambda$  and 6 solvents) readily affords d(-)- $\alpha$ -aminophenylacetamide, decomp. > 150°, [M]<sub>5893</sub> -188° in H<sub>2</sub>O (Ac, m.p. 175°, [ $\alpha$ ]<sub>D</sub> -242° in CHCl<sub>3</sub>, and Bz derivative, m.p. 217.5°, [ $\alpha$ ]<sub>D</sub> -119° in CHCl<sub>3</sub>), stable to dehydrating agents. Hydrogenation (Pt-C) of d(-)- $\alpha$ -NH<sub>2</sub>·CHl h·CO<sub>2</sub>H (I) in 2N-HCl at 70° gives d(-)- $\alpha$ -aminocyclohexylacetic acid (II) {Me [hydrochloride, m.p. 186° (decomp.); Ac, m.p. 118°, [M]<sub>D</sub> -53° in CHCl<sub>3</sub>, and Bz derivative, m.p. 130°, [M]<sub>D</sub> -105° in CHCl<sub>3</sub>] and Et ester (hydrochloride, m.p. 167°; Ac, m.p. 93°, [M]<sub>D</sub> -116° in CHCl<sub>3</sub>, and Bz derivative, m.p. 125°, [M]<sub>D</sub> -117° in CHCl<sub>3</sub>)}. Comparison of [M] in 4 solvents of the Ac, m.p. 61.5°, [M]<sub>D</sub> +112° in CHCl<sub>3</sub>, and Bz derivative, m.p. 110.5°, [M]<sub>D</sub> +115° in CHCl<sub>3</sub>, of the Me ester and the Bz derivative, m.p. 77.5—78°, [M]<sub>D</sub> +137° in CHCl<sub>3</sub>, of the Et ester of *l*(+)-valine (III) and of the effects of acid and alkali on [ $\alpha$ ] for (III) with the corresponding [M] and changes in the (II) series proves the configurations of (I) and (II) stated above. *dl*-(I) is hydrogenated only after purification by way of the nitrate. R. S. C.

**Condensation of (A) dihydroxydiethylamine with potassium cyanide, formaldehyde, and benzaldehyde, (B)  $\beta$ -hydroxypropylamine with potassium cyanide, benzaldehyde, and cyclohexanone.** V. F. LIUBOMUDROV (Ukrain. Chem. J., 1936, 11, 119—122, 123—126).—(A) NH(CH<sub>2</sub>·CH<sub>2</sub>·OH)<sub>2</sub>·HCl, aq. KCN, and aq. CH<sub>2</sub>O (12 hr. at room temp.) afford CN·CH<sub>2</sub>·N(CH<sub>2</sub>·CH<sub>2</sub>·OH)<sub>2</sub>, hydrolysed by aq. HCl to yield di-( $\beta$ -hydroxyethyl)-aminoacetic acid. *Di*-( $\beta$ -hydroxyethyl)aminophenyl-

acetic acid, m.p. 143—144°, is prepared analogously, using PhCHO in place of CH<sub>2</sub>O.

(b) OH·CHMe·CH<sub>2</sub>·NH<sub>2</sub>·HCl, PhCHO, and aq. KCN afford  $\beta$ -hydroxypropylaminophenylacetonitrile, m.p. 90° (hydrochloride, m.p. 121—122°), yielding an unidentified substance, m.p. 199—200°, when hydrolysed with aq. HCl. The product obtained when cyclohexanone is substituted for PhCHO in the reaction is 1-cyano-1- $\beta$ -hydroxypropylaminocyclohexane, m.p. 49—50° (hydrochloride, m.p. 115°). R. T.

**Partial racemisation.** I. H. LETTRE, H. BARNBECK, and H. STAUNAU (Ber., 1936, 69, [B], 1594—1598).—Partial racemates are defined as compounds related to the true racemates or pseudoracemates in which the components differ either sterically or by different substitution. Investigation of the system OH·CHPh·CO<sub>2</sub>H—hexahydromandelic acid shows that *r*-mandelic acid (I) is a true racemate. *r*-Hexahydromandelic acid (II) is also racemic. l(+)-Mandelic acid and d(−)-hexahydromandelic acid give a partial racemate the m.p. of which is > that of either component. (I) and (II) give an unbroken series of mixed crystals. Where partial racemism occurs [(I)–(II); malic acid (III)–tartaric acid (IV)] the corresponding racemic compounds are isomorphous, and where this is not the case [(I)–(III); (I)–(IV)] the racemic compounds are not isomorphous. Further examples are quoted from the lit. and the relationship may be general. H. W.

**$\beta$ -Arylacrylic compounds.** Y. DE SCHUTTENBACH (Ann. Chim., 1936, [xi], 6, 53—96).—Comparison of the rates of hydrolysis of CHPh:CPh·CO<sub>2</sub>Me (I), *p*-OMe·C<sub>6</sub>H<sub>4</sub>:CH:CPh·CO<sub>2</sub>Me (II), and CH<sub>2</sub>O<sub>2</sub>:C<sub>6</sub>H<sub>3</sub>:CH:CPh·CO<sub>2</sub>Me (III) and of esterification of the corresponding acids shows that the appreciable retarding action of the double linking is accentuated when  $\beta$ -Ph is replaced by  $\beta$ -CH<sub>2</sub>O<sub>2</sub>:C<sub>6</sub>H<sub>3</sub> and further enhanced by  $\beta$ -*p*-C<sub>6</sub>H<sub>4</sub>:OMe. The absorption in the ultra-violet is displaced towards the visible during passage from (I) to (II) and thence to (III). *Me*  $\alpha$ -phenyl- $\beta$ -*p*-anisylacrylate, b.p. 250°/25 mm., m.p. 90—91°, and *Me*  $\alpha$ -phenyl- $\beta$ -piperonylacrylate, m.p. 106—107°, are obtained by condensation of CH<sub>2</sub>Ph·CO<sub>2</sub>Me with Na powder and the appropriate aldehyde. CPhMe:CH·CO<sub>2</sub>Me is transformed by MgMeI into the alcohol, CPhMe:CH·CMe<sub>2</sub>·OH, dehydrated to  $\beta$ -phenyl- $\gamma$ -methyl- $\Delta^{\beta}$ -butene, b.p. 107—108°/18 mm., which is oxidised to CPhMe by CrO<sub>3</sub> in AcOH. CPhMe:CH·CO<sub>2</sub>Me and MgPhBr give CPh<sub>2</sub>Me·CH<sub>2</sub>·COPh. Addition of CHPh:CPh·CN to CH<sub>2</sub>Ph·MgCl in boiling Et<sub>2</sub>O gives  $\alpha\beta\gamma$ -triphenylbutyronitrile, m.p. 192°; under apparently identical conditions a second experiment gave the impure diastereoisomeride, m.p. 129—131°, hydrolysed to acids, C<sub>22</sub>H<sub>19</sub>O<sub>2</sub>, m.p. 138° and m.p. 152—153°, respectively. H. W.

$\alpha\beta\gamma$ -Tribromocinnamylacetic [tribromo- $\delta$ -phenyl- $\Delta^{\gamma}$ -pentoic] acid. H. LOHAUS and W. GUSSMANN (Annalen, 1936, 523, 294—299).— $\alpha\beta\gamma$ -Tribromo- $\delta$ -phenyl- $\Delta^{\gamma}$ -pentoic acid (I), m.p. 157°, obtained from  $\alpha\beta$ -trans- $\gamma\delta$ -cis- $\gamma$ -cis-bromo- $\delta$ -phenylpentadienoic acid (II) and Br·CHCl<sub>3</sub>, gives (II) with NaI·COMe<sub>2</sub> or Zn dust in dry Et<sub>2</sub>O, and with KMnO<sub>4</sub>·COMe<sub>2</sub> gives an isomeride, +2H<sub>2</sub>O, m.p. 163°, and

mesodibromotartaric acid, whence it follows that (I) has the annexed formula. (I) gives a 2:1 pyridinium compound, C<sub>27</sub>H<sub>23</sub>O<sub>4</sub>NBr<sub>6</sub>, decomp. 142°, stable to hot AcOH, converted into its components by hot alcoholic

alkali or conc. HCl. The mother-liquor from the prep. of (I) yields the 1:1 pyridinium compound, m.p. 85°, of a dibromophenyl- $\Delta^{\gamma}$ -pentoic acid. The Me ester of (II) with Br·CHCl<sub>3</sub> gives the *Me* ester, m.p. 59—60°, of (I) [also obtained from (I) by CH<sub>2</sub>N<sub>2</sub>], and a *Me* dibromo- $\delta$ -phenyl- $\Delta^{\gamma}$ -pentoate (III), m.p. 117°, isolated in this reaction as 1:1 pyridinium compound (IV), m.p. 151° (decomp.), or by the action of C<sub>5</sub>H<sub>5</sub>N·Et<sub>2</sub>O on the tetrabromide of (II). (IV) and O<sub>3</sub> in H<sub>2</sub>O give CHO·CO<sub>2</sub>Me, but no PhCHO, wherefore it is probable that one Br in (III) is in the Ph nucleus. R. S. C.

**5:6:7:8-Tetrahydro- $\alpha$ -naphthylamine-4-carboxylic acid, and certain of its derivatives.** S. I. SERGIEVSKAJA and V. V. NESVADBA (J. Gen. Chem. Russ., 1936, 6, 633—666).—4-Nitro-5:6:7:8-tetrahydro-1-naphthylamine is diazotised, and the product is treated with CuCN to yield the corresponding 1-nitrile (I), m.p. 121°, reduced by SnCl<sub>2</sub> in HCl at room temp. to 4-cyano-5:6:7:8-tetrahydro-1-naphthylamine, m.p. 114° (*Ac* derivative, m.p. 203°). (I) and HCl (140°:10 hr.) yield 1-nitro-5:6:7:8-tetrahydronaphthalene-4-carboxylic acid, m.p. 161—162°, the *Et* ester, m.p. 37°, of which is reduced by H<sub>2</sub> (Pt-black) to the *Et* ester, m.p. 90° (*Ac* derivative, m.p. 165—166°), of 5:6:7:8-tetrahydro- $\alpha$ -naphthylamine-4-carboxylic acid, from which the free acid, m.p. 188° (decomp.), is obtained by boiling with EtOH·KOH. R. T.

**New type of vanadyl salicylate.** P. BRAUMAN (Compt. rend., 1936, 202, 1992—1994).—Addition of Li<sub>2</sub>CO<sub>3</sub> to a mixture of 50% aq. VOCl<sub>3</sub> and excess of OH·C<sub>6</sub>H<sub>4</sub>:CO<sub>2</sub>Et in MeOH gives a mixture of a blue product [of type R'O(VO)O·C<sub>6</sub>H<sub>4</sub>:CO<sub>2</sub>R] and a green product, which cannot be separated. With Bu or isoamyl *p*-hydroxybenzoate only the green compounds are formed, of composition V<sub>2</sub>C<sub>15</sub>H<sub>28</sub>O<sub>10</sub> and V<sub>2</sub>C<sub>16</sub>H<sub>30</sub>O<sub>10</sub>, respectively. With the Ph ester the green product is V<sub>2</sub>C<sub>12</sub>H<sub>22</sub>O<sub>10</sub>, and is a derivative of OH·C<sub>6</sub>H<sub>4</sub>:CO<sub>2</sub>Me. The green compounds probably contain MeOH of crystallisation. The composition OMe(VO)O(VO)O·C<sub>6</sub>H<sub>4</sub>:CO<sub>2</sub>R, 3MeOH is suggested. H. J. E.

**Action of mixed organo-magnesium compounds on aromatic *N*-diethylamides with phenolic groups.** P. COUTURIER (Compt. rend., 1936, 202, 1994—1996; cf. A., 1926, 837; 1927, 458).—Diethylamides (m.p. in parentheses), prepared by interaction of the acid chloride and NHET<sub>2</sub>, of the following acids are described: *o*- (104°), *m*- (84°), and *p*-hydroxybenzoic (121°), protocatechuic [(149—151°) *Ac*<sub>2</sub> derivative (72°)], gallic [(137°) *Ac*<sub>2</sub> derivative (113°)], and anisic acid (42°). Salicyldiethylamide with MgEtBr in boiling Et<sub>2</sub>O, C<sub>6</sub>H<sub>6</sub>, or Bu<sub>2</sub>O affords *o*-hydroxypropiophenone, m.p. 20—22°. The *m*- and *p*-analogues react less easily. The other amides do not react. *p*-OMe·C<sub>6</sub>H<sub>4</sub>:CO·NET<sub>2</sub> reacts more

readily with  $\text{MgEtBr}$  than the phenol to give  $p\text{-OMe-C}_6\text{H}_4\text{-COEt}$  and a *tert.* base, the hydrochloride of which decomposes at  $90^\circ$  into  $\text{NH}_4\text{Et}_2\text{HCl}$  and an unsaturated hydrocarbon (cf. A., 1905, i, 116; 1926, 942; 1910, i, 728).  
J. L. D.

**Oxidation of phenols with peracetic acid.** C. GRUNDMANN [with H. TRISCHMANN] (Ber., 1936, 69, [B], 1755—1757).—*o*-Hydroxycinnamic acid is oxidised by  $\text{AcO}_2\text{H}$  in the dark to *cis-cis*-muconic acid in very small amount; in presence of light a more or less complete isomerisation to the *trans-trans*-acid takes place. 2:2'-Dihydroxydiphenyl gives 2'-hydroxy-2-phenyl-*p*-benzoquinone, m.p.  $193^\circ$  (Berl; corr.; decomp.), and  $\alpha$ -*o*-hydroxyphenylmuconolactone,  $\text{O} < \text{CO} > \text{C}_6\text{H}_4 > \text{C}:\text{CH}:\text{CH}:\text{CH}:\text{CO}_2\text{H}$ , m.p.  $194\text{--}195^\circ$  (Berl; corr.).  
H. W.

**Action of light on  $\beta$ -bromobenzylidenepyruvic acid.** M. REIMER (J. Amer. Chem. Soc., 1936, 58, 1108—1111).—Exposure of a saturated  $\text{C}_6\text{H}_6$ -solution of  $\text{CHPh}:\text{CBr}:\text{CO}:\text{CO}_2\text{H}$  (I) (A., 1924, i, 642) in a quartz tube and  $\text{N}_2$  atm. to bright sunlight gives about 80% of a dimeride (II) (+2MeOH), m.p.  $201^\circ$  (decomp.) [ $\text{Me}_2$  ester ( $\text{CH}_2\text{N}_2$ ), m.p.  $212^\circ$  and then slow decomp.]; a yellow intermediate is formed in diffused light (not in dark); this changes rapidly in sunlight into (II). In presence of dry  $\text{O}_2$ , (II) and  $\beta\beta$  (or  $\beta\gamma$ )-dibromo- $\gamma$  (or  $\beta$ )-hydroxy- $\alpha$ -keto- $\gamma$ -phenylbutyric acid (+ $\text{H}_2\text{O}$ ), m.p.  $107^\circ$  (opaque; clear at  $109^\circ$ ) [also obtained from (I) and Br (vapour) in  $\text{H}_2\text{O}$ ], are produced. In moist  $\text{C}_6\text{H}_6$ , some  $\beta\beta\gamma$ -trihydroxy- $\alpha$ -keto- $\gamma$ -phenylbutyric acid (III), m.p.  $134^\circ$  (decomp.), is formed. Finely-divided (I) is converted by prolonged exposure into a dimeride, m.p.  $280^\circ$  (decomp.) ( $\text{Me}_2$  ester, m.p.  $233\text{--}234^\circ$ ). (III), which is cleaved by alkaline  $\text{H}_2\text{O}$ , to mandelic acid and  $\text{H}_2\text{C}_2\text{O}_4$  and is oxidised by  $\text{Pb}(\text{OAc})_4$  to  $\text{PhCHO}$ , is also formed from (I) and  $\text{KMnO}_4$  in aq.  $\text{COMe}$ , + little  $\text{H}_2\text{SO}_4$  at  $-3^\circ$  to  $0^\circ$ .  
H. B.

**Hydrogen esters of tetrachlorophthalic acid.** V. TETERIN and S. ZONIS (J. Gen. Chem. Russ., 1936, 6, 658—662).—*Mono*-esters of the following alcohols are obtained by boiling with  $\text{C}_6\text{H}_5\text{Cl}_4(\text{CO}_2\text{H})_2$  (I) in  $\text{C}_6\text{H}_6$ ,  $\text{C}_6\text{H}_5\text{-CHCl}_2$ , or  $\text{C}_6\text{H}_5\text{-Et}_2\text{O}$  (2—10 hr.):  $\text{MeOH}$ , m.p.  $142^\circ$ ; *n*-, m.p.  $105\text{--}106^\circ$ , *iso*-, m.p.  $97\text{--}98^\circ$ , and *sec*-. $\text{BuOH}$ , m.p.  $121\text{--}122^\circ$ ; *iso*-. $\text{C}_5\text{H}_{11}\text{-OH}$ , m.p.  $112\text{--}113^\circ$ ;  $\beta$ -naphthylethyl alcohol, m.p.  $179\text{--}180^\circ$ ; *p*-nitrobenzyl alcohol, m.p.  $179\text{--}180^\circ$ ; cyclohexanol, m.p.  $150\text{--}151^\circ$ ; menthol, m.p.  $99\text{--}100^\circ$ ; benzhydrol, m.p.  $149\text{--}150^\circ$ ;  $\beta$ -naphthylmethyl-, m.p.  $155\text{--}155.5^\circ$ , and -ethylcarbinol, m.p.  $159.6\text{--}161^\circ$ . Esters were not obtained under the above conditions with  $\text{OH-CH}_2\text{-CH}_2\text{Cl}$ ,  $\text{OH-CHCl-CHCl-CH}_2\text{Cl}$ ,  $\text{PhOH}$ , and certain *tert.* alcohols. The esters of alcohols of low b.p. decompose when heated to yield the anhydride of (I) and the alcohol, whilst esters of *sec.* alcohols afford (I) and unsaturated hydrocarbons.  
R. T.

**Constituents of natural phenolic resins. VII. Arctigenin.** R. D. HAWORTH and W. KELLY (J.C.S., 1936, 998—1003; cf. this vol., 985).—*l*-Arctigenin is A ( $\text{R}=\text{H}$ ,  $\text{R}'=\text{Me}$ ), (a) because its

*Et* ether (I) ( $\text{A}$ ,  $\text{R}=\text{Et}$ ,  $\text{R}'=\text{Me}$ ; obtained by hot  $\text{Et}_2\text{SO}_4\text{-KOH-EtOH}$ ), an oil [ $\text{Br}_2$ -, m.p.  $128\text{--}129^\circ$ , and ( $\text{NO}_2$ )<sub>2</sub>-derivative, m.p.  $166\text{--}167^\circ$ ], has an absorption spectrum identical with that of the *dl*-ether, which is synthesised, whereas the isomeric ether ( $\text{A}$ ;  $\text{R}=\text{Me}$ ,  $\text{R}'=\text{Et}$ ; also synthesised) has an absorption spectrum which, although similar, has a lower intensity of absorption at the max.,  $2800 \text{ \AA}$ , and (b) because (I) with  $\text{Pb}(\text{OAc})_4\text{-AcOH}$  at  $80^\circ$  gives the lactones (II), m.p.  $223\text{--}224^\circ$ , of 6-methoxy-7-ethoxy-1-3':4'-dimethoxyphenyl-2-hydroxymethylnaphthalene-3-carboxylic acid, and (III), m.p.  $247\text{--}248^\circ$ , of 6:7-dimethoxy-1-3'-methoxy-4'-ethoxyphenyl-3-hydroxymethylenenaphthalene-2-carboxylic acid, which are both synthesised. The lactones, also synthesised, expected from the alternative formula ( $\text{A}$ ;  $\text{R}=\text{Me}$ ,  $\text{R}'=\text{Et}$ ) for (I) differ from (II)

(I) differ from (II) and (III). 3:4- $\text{OMe-C}_6\text{H}_3(\text{OEt})\text{-CHO}$  (IV) and hot  $\text{KMnO}_4\text{-aq. NaHCO}_3$  give 3-methoxy-4-ethoxybenzoic acid, m.p.  $195^\circ$ , the chloride (V), b.p.  $158\text{--}160^\circ/0.2 \text{ mm.}$ , m.p.  $73^\circ$ , of which with  $\text{NaOEt}$  and  $\text{CH}_2\text{Ac-CO}_2\text{Et}$  gives a product, converted by  $\text{NH}_4\text{Cl-aq. NH}_3$  into *Et* 3-methoxy-4-ethoxybenzoylacetate, m.p.  $79\text{--}78^\circ$ . With  $\text{NaOEt}$  and  $\text{CH}_2\text{Br-CO}_2\text{Et}$  this yields  $\beta$ -3-methoxy-4-ethoxybenzoylpropionic acid (VI), m.p.  $136\text{--}137^\circ$ . *O*-Ethyleugenol and  $\text{I-HgO-Et}_2\text{O-H}_2\text{O}$  give the oxide (VII), b.p.  $137\text{--}138^\circ/0.2 \text{ mm.}$ , m.p.  $37\text{--}38^\circ$ . (IV),  $\text{CN-CH}_2\text{-CO}_2\text{Na}$ , and aq.  $\text{NaOH}$  give  $\alpha$ -cyano- $\beta$ -3-methoxy-4-ethoxyphenylacrylic acid, m.p.  $212\text{--}213^\circ$ , reduced (2%  $\text{Na-Hg-CO}_2$ ;  $0^\circ$ ) to  $\alpha$ -cyano- $\beta$ -3-methoxy-4-ethoxyphenylpropionic acid, m.p.  $152\text{--}153^\circ$  [ $\text{Me}$  ester (VIII), m.p.  $61\text{--}62^\circ$ ]. The Na derivative of (VIII) with *O*-methyl-eugenol oxide in  $\text{EtOH}$  gives  $\beta$ -3:4-dimethoxybenzyl- $\alpha$ -3-methoxy-4-ethoxybenzylbutyrolactone [=dl-(I)], m.p.  $105\text{--}106^\circ$  [ $\text{Br}_2$ -, m.p.  $88\text{--}89^\circ$ , and ( $\text{NO}_2$ )<sub>2</sub>-derivative, m.p.  $159^\circ$ ]. 3:4-( $\text{OMe})_2\text{C}_6\text{H}_3\text{-CH}_2\text{-CNa}(\text{CN})\text{-CO}_2\text{Me}$  and (VII) in  $\text{EtOH}$  give  $\alpha$ -3:4-dimethoxybenzyl- $\beta$ -3-methoxy-4-ethoxybenzylbutyrolactone ( $\text{A}$ ;  $\text{R}=\text{Me}$ ,  $\text{R}'=\text{Et}$ ), m.p.  $95\text{--}96^\circ$  [ $\text{Br}_2$ -, m.p.  $99\text{--}100^\circ$ , and ( $\text{NO}_2$ )<sub>2</sub>-derivative, m.p.  $172\text{--}173^\circ$ ]. (VII) and  $\text{CHNaAc-CO}_2\text{Et}$  in  $\text{EtOH}$  at room temp. afford  $\alpha$ -acetyl- $\beta$ -3-methoxy-4-ethoxybenzylbutyrolactone, m.p.  $87\text{--}88^\circ$ , the Na derivative of which with 3:4-( $\text{OMe})_2\text{C}_6\text{H}_3\text{-COCl}$  in  $\text{C}_6\text{H}_6$  yields  $\alpha$ -3:4-dimethoxybenzoyl- $\beta$ -3-methoxy-4-ethoxybenzylbutyrolactone, m.p.  $129\text{--}130^\circ$ , converted by warming with  $\text{HCl-MeOH}$  and subsequent dehydration with  $\text{KHSO}_4$  at  $180^\circ$  into the lactone, m.p.  $189\text{--}190^\circ$ , of 6-methoxy-7-ethoxy-1-3':4'-dimethoxyphenyl-3-hydroxymethyl-3:4-dihydronaphthalene-2-carboxylic acid, which is oxidised by  $\text{Pb}(\text{OAc})_4$  to the lactone, m.p.  $243\text{--}244^\circ$ , of 6-methoxy-7-ethoxy-1-3':4'-dimethoxyphenyl-3-hydroxy-

and (III). 3:4- $\text{OMe-C}_6\text{H}_3(\text{OEt})\text{-CHO}$  (IV) and hot  $\text{KMnO}_4\text{-aq. NaHCO}_3$  give 3-methoxy-4-ethoxybenzoic acid, m.p.  $195^\circ$ , the chloride (V), b.p.  $158\text{--}160^\circ/0.2 \text{ mm.}$ , m.p.  $73^\circ$ , of which with  $\text{NaOEt}$  and  $\text{CH}_2\text{Ac-CO}_2\text{Et}$  gives a product, converted by  $\text{NH}_4\text{Cl-aq. NH}_3$  into *Et* 3-methoxy-4-ethoxybenzoylacetate, m.p.  $79\text{--}78^\circ$ . With  $\text{NaOEt}$  and  $\text{CH}_2\text{Br-CO}_2\text{Et}$  this yields  $\beta$ -3-methoxy-4-ethoxybenzoylpropionic acid (VI), m.p.  $136\text{--}137^\circ$ . *O*-Ethyleugenol and  $\text{I-HgO-Et}_2\text{O-H}_2\text{O}$  give the oxide (VII), b.p.  $137\text{--}138^\circ/0.2 \text{ mm.}$ , m.p.  $37\text{--}38^\circ$ . (IV),  $\text{CN-CH}_2\text{-CO}_2\text{Na}$ , and aq.  $\text{NaOH}$  give  $\alpha$ -cyano- $\beta$ -3-methoxy-4-ethoxyphenylacrylic acid, m.p.  $212\text{--}213^\circ$ , reduced (2%  $\text{Na-Hg-CO}_2$ ;  $0^\circ$ ) to  $\alpha$ -cyano- $\beta$ -3-methoxy-4-ethoxyphenylpropionic acid, m.p.  $152\text{--}153^\circ$  [ $\text{Me}$  ester (VIII), m.p.  $61\text{--}62^\circ$ ]. The Na derivative of (VIII) with *O*-methyl-eugenol oxide in  $\text{EtOH}$  gives  $\beta$ -3:4-dimethoxybenzyl- $\alpha$ -3-methoxy-4-ethoxybenzylbutyrolactone [=dl-(I)], m.p.  $105\text{--}106^\circ$  [ $\text{Br}_2$ -, m.p.  $88\text{--}89^\circ$ , and ( $\text{NO}_2$ )<sub>2</sub>-derivative, m.p.  $159^\circ$ ]. 3:4-( $\text{OMe})_2\text{C}_6\text{H}_3\text{-CH}_2\text{-CNa}(\text{CN})\text{-CO}_2\text{Me}$  and (VII) in  $\text{EtOH}$  give  $\alpha$ -3:4-dimethoxybenzyl- $\beta$ -3-methoxy-4-ethoxybenzylbutyrolactone ( $\text{A}$ ;  $\text{R}=\text{Me}$ ,  $\text{R}'=\text{Et}$ ), m.p.  $95\text{--}96^\circ$  [ $\text{Br}_2$ -, m.p.  $99\text{--}100^\circ$ , and ( $\text{NO}_2$ )<sub>2</sub>-derivative, m.p.  $172\text{--}173^\circ$ ]. (VII) and  $\text{CHNaAc-CO}_2\text{Et}$  in  $\text{EtOH}$  at room temp. afford  $\alpha$ -acetyl- $\beta$ -3-methoxy-4-ethoxybenzylbutyrolactone, m.p.  $87\text{--}88^\circ$ , the Na derivative of which with 3:4-( $\text{OMe})_2\text{C}_6\text{H}_3\text{-COCl}$  in  $\text{C}_6\text{H}_6$  yields  $\alpha$ -3:4-dimethoxybenzoyl- $\beta$ -3-methoxy-4-ethoxybenzylbutyrolactone, m.p.  $129\text{--}130^\circ$ , converted by warming with  $\text{HCl-MeOH}$  and subsequent dehydration with  $\text{KHSO}_4$  at  $180^\circ$  into the lactone, m.p.  $189\text{--}190^\circ$ , of 6-methoxy-7-ethoxy-1-3':4'-dimethoxyphenyl-3-hydroxymethyl-3:4-dihydronaphthalene-2-carboxylic acid, which is oxidised by  $\text{Pb}(\text{OAc})_4$  to the lactone, m.p.  $243\text{--}244^\circ$ , of 6-methoxy-7-ethoxy-1-3':4'-dimethoxyphenyl-3-hydroxy-

*methyl-naphthalene-2-carboxylic acid*.  $\alpha$ -Acetyl- $\beta$ -3:4-dimethoxybenzylbutyrolactone and (V) lead similarly to  $\alpha$ -3-methoxy-4-ethoxybenzoyl- $\beta$ -3:4-dimethoxybenzylbutyrolactone, m.p. 123—124°, the lactone, m.p. 192—193°, of 6:7-dimethoxy-1-3'-methoxy-4'-ethoxyphenyl-3-hydroxymethyl:4-dihydronaphthalene-2-carboxylic acid, and (III). 3:4-(OMe)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>·CO·CH<sub>2</sub>·CH<sub>2</sub>·CO<sub>2</sub>Na (IV), and Ac<sub>2</sub>O at 100° give the  $\gamma$ -lactone, m.p. 180°, converted by hot NaOMe into  $\beta$ -3:4-dimethoxybenzoyl- $\alpha$ -3-methoxy-4-ethoxybenzylidenepropionic acid, m.p. 188—189°; when the  $\beta$ -methylene-derivative (prep. by CH<sub>2</sub>O and aq. NaOH at room temp.), m.p. 180°, thereof is kept with HCl-AcOH and the product is heated first with dil. NaOH and then with dil. acid, (II) is obtained. (VI), veratraldehyde, and Ac<sub>2</sub>O lead similarly to  $\beta$ -3-methoxy-4-ethoxybenzoyl- $\alpha$ -3:4-dimethoxybenzylidenepropionic acid (IX), m.p. 189—190°, by way of the  $\gamma$ -lactone, m.p. 162—163°, and thence to the  $\beta$ -methylene-derivative, m.p. 176—177°, of (IX), and the lactone, m.p. 214—215°, of 6:7-dimethoxy-1-3'-methoxy-4'-ethoxyphenyl-2-hydroxy-methyl-naphthalene-3-carboxylic acid. R. S. C.

**Bile acids. XLIX. Oxidation product of bilianic acid. Effect of carbamide on oxidations with nitric acid.** M. SCHENCK (Z. physiol. Chem., 1936, 242, 81—88; cf. this vol., 605).—Oxidation of bilianic acid (I) at room temp. with HNO<sub>3</sub> gives the tetrabasic acid (II), C<sub>21</sub>H<sub>35</sub>O<sub>10</sub>N, decomp. 175—180°. There is no action if CO(NH<sub>2</sub>)<sub>2</sub> is added. Hot HNO<sub>3</sub> oxidises (I), but only small yields of biloidanic acid are obtained. CO(NH<sub>2</sub>)<sub>2</sub> does not interfere with the action of cold HNO<sub>3</sub> on the hydroxamic acid C<sub>21</sub>H<sub>36</sub>O<sub>8</sub>N<sub>2</sub>, but it prevents the oxidation of the lactam of bilianic acid oxime. W. McC.

**Aldehydes and hydroxyaldehydes of the polymethylenic series. I. Transformations of hexahydrobenzaldehyde.** E. D. VENUS-DANILOVA (J. Gen. Chem. Russ., 1936, 6, 697—703).—Hexahydrobenzaldehyde (I) and HgBr<sub>2</sub> in C<sub>5</sub>H<sub>5</sub>N (140—144°; 4 hr.) yield cyclopentyl Me ketone, higher yields of which are obtained from (I), H<sub>2</sub>SO<sub>4</sub>, and HgSO<sub>4</sub> in aq. EtOH. R. T.

**Transformations between stereoisomeric ald-oximes.** W. THIELACKER and L. H. CHOU (Annalen, 1936, 523, 143—153).— $\beta$ -2:6-Dichloro-3-nitrobenzaldehyde is quantitatively converted by cold, dil. NaOH into HCl and 6-chloro-3-nitrosalicylonitrile, whereas the  $\alpha$ -isomeride (II) is completely unchanged. The proportion of (I) in a mixture of the oximes can therefore be determined by titration (Volhard). It is thus shown that the same equilibrium mixture is formed from (I) or (II) under the action of very conc. HCl. When the method is applied to the equilibration of (I) and (II) in org. media it is found that the end-point of the titration is greatly obscured by the solvent, and the results are not very accurate. In EtOH, COMe, and EtOAc (I) tends to an equilibrium greatly displaced towards (II); (II) is isomerised much more slowly, and accidental catalytic influences are strongly in evidence. Attempts to follow the isomerisation of (I) and (II) in Et, *d*-tartrate by alteration of  $[\alpha]$  are hampered by the great dependence of this val. on time, but experiments with  $\alpha$ - and  $\beta$ -anisaldoxime in the same solvent show

that an equilibrium and not a complete isomerisation occurs (position of equilibrium deduced from m.p. of products). Similarly, an equilibrium ensues in the molten oximes. H. W.

**Reactions of aminoethyl alcohol with aldehydes and malonic acid.** A. I. KIPRIANOV and T. S. KUSNER (J. Gen. Chem. Russ., 1936, 6, 641—644).—NH<sub>2</sub>·CH<sub>2</sub>·CH<sub>2</sub>·OH (I), CH<sub>2</sub>(CO<sub>2</sub>H)<sub>2</sub>, and PhCHO in EtOH at the b.p. yield cinnamic acid; in the cold the product, m.p. 135—136° (decomp.), is CHPh·C(CO<sub>2</sub>H)<sub>2</sub>·NH<sub>2</sub>·CH<sub>2</sub>·CH<sub>2</sub>·OH (II). An analogous product, m.p. 137° (decomp.), is obtained when furfuraldehyde is taken in place of PhCHO, whilst salicylaldehyde gives the salt, m.p. 196—197°, of (I) and coumarin-3-carboxylic acid, and piperonaldehyde yields an unstable product, converted into piperonylideneacrylic acid during recrystallisation. (II) yields cinnamic acid when heated at the m.p., and CHPh·C(CO<sub>2</sub>H)<sub>2</sub> when treated with aq. acids. R. T.

**Conversion of ald-oximes into carboxylic acids by hot alkali. Elimination of water from ald-oximes.** E. JORDAN and C. R. HAUSER (J. Amer. Chem. Soc., 1936, 58, 1304—1305).—Some aromatic  $\beta$ -ald-oximes (I) are converted (slowly) into a mixture of the  $\alpha$ -oxime (II) and the corresponding acid by 2*N*-NaOH at 97—100°; (II) undergoes slower conversion into the acid. (I) thus eliminates H<sub>2</sub>O [to give ArCN which is then hydrolysed] more readily than (II). Benzaldoxime and *m*-nitro-, *p*-methoxy-, and 3:4-methylenedioxy-benzald-oximes are used. In agreement with Brady and Goldstein (A., 1927, 973),  $\alpha$ - and  $\beta$ -furfurald-oximes similarly undergo interconversion; furoic acid is produced in greater amount from the  $\beta$ . H. B.

**Synthesis of a pyrogallolaldehyde [methyl ether].** F. MAUTHNER (J. pr. Chem., 1936, [ii], 145, 313—317).—CPh<sub>2</sub>Cl<sub>2</sub> (prep. in excellent yield by PCl<sub>5</sub> at 160—170°), b.p. 167°/14 mm., and Me gallate in C<sub>6</sub>H<sub>6</sub> give Me 3-hydroxy-4:5-diphenyl-methylenedioxybenzoate, which with MeI-NaOMe yields Me 4:5-diphenylmethylenedioxy-3-methoxybenzoate, hydrolysed by fuming HCl to gallic acid 3-Me ether, m.p. 220—222°, which at 250—270° gives pure pyrogallol 1-Me ether, b.p. 136—137°/13 mm., m.p. 37—40°. With Zn(CN)<sub>2</sub> (modified prep.) and HCl in Et<sub>2</sub>O this affords 3:4-dihydroxy-2-methoxybenzaldehyde (less probably the 2:3-dihydroxy-4-methoxy-compound), m.p. 118—119° [green FeCl<sub>3</sub> colour; *p*-nitrophenylhydrazone, m.p. 249—250° (decomp.)], which with MeI-K<sub>2</sub>CO<sub>3</sub>-COMe<sub>2</sub> yields 2:3:4-(OMe)<sub>3</sub>C<sub>6</sub>H<sub>4</sub>·CHO (*p*-nitrophenylhydrazone, m.p. 198—199°). R. S. C.

**Reaction of  $\alpha\beta$ -dibromo- $\beta$ -phenylethyl methyl ketone with azides.** V. A. KUZMIN and S. G. FRIDMAN (Mem. Inst. Chem. Ukrain. Acad. Sci., 1935, 2, 55—67).—CHPhBr·CHBr·COMe does not react with NaN<sub>3</sub> in Et<sub>2</sub>O, C<sub>6</sub>H<sub>6</sub>, or ligroin, at the b.p., or with AgN<sub>3</sub> in Et<sub>2</sub>O: in boiling EtOH or COMe<sub>2</sub> a monoazide, C<sub>10</sub>H<sub>9</sub>ON<sub>3</sub>, m.p. 78—79° [semi-carbazone, m.p. 167° (decomp.)], is obtained. H. I.

**Ketones of the formula CHRPh·CO·R'. P.** JULIEN (Bull. Soc. chim., 1936, 3, [v], 1347—1353;

cf. A., 1930, 213).—MgPr<sup>2</sup>Br with CHPrPh·CN in PhMe or xylene at 80–100° affords  $\alpha$ -phenyl-*n*-butyl Pr<sup>2</sup> ketone, b.p. 134–135°/17 mm. (semicarbazone, m.p. 152°). The following are prepared similarly:  $\alpha$ -phenyl- $\beta$ -methyl-*n*-propyl Et ketone, b.p. 130–145°/23 mm. (semicarbazone, m.p. 181°);  $\alpha$ -phenyl-*n*-amyl Pr<sup>2</sup>, b.p. 142–145°/15 mm. (semicarbazone, m.p. 107°), and Bu<sup>2</sup> ketone, b.p. 280–282° (semicarbazone, m.p. 116°);  $\alpha$ -phenyl- $\gamma$ -methyl-*n*-butyl Me, b.p. 138–145°/22 mm. (semicarbazone, m.p. 118°), Et, b.p. 132–140°/14 mm. (semicarbazone, m.p. 127–128°), Pr<sup>2</sup>, b.p. 139–144°/19 mm. (semicarbazone, m.p. 156°), and Bu<sup>2</sup> ketone, b.p. 153–160°/20 mm. (semicarbazone, m.p. 109°). MgPrBr with  $\alpha$ -phenyl- $\beta$ -methylbutyramide in Et<sub>2</sub>O affords  $\alpha$ -phenyl- $\beta$ -methyl-*n*-propyl Pr ketone, b.p. 135–137°/23 mm. (semicarbazone, m.p. 162°). J. L. D.

**Preparation of dibenzyl and benzyl methyl ketones.** C. D. HURD and C. L. THOMAS (J. Amer. Chem. Soc., 1936, 58, 1240; cf. A., 1933, 821).—CH<sub>2</sub>Ph·CO<sub>2</sub>H heated with Ac<sub>2</sub>O–KOAc followed by slow distillation gives 41% of CO(CH<sub>2</sub>Ph)<sub>2</sub> (I) and 16% of COMe·CH<sub>2</sub>Ph (II). (I) and (II) arise by pyrolysis of (CH<sub>2</sub>Ph·CO)<sub>2</sub>O and CH<sub>2</sub>Ph·CO<sub>2</sub>Ac, respectively. H. B.

**Condensation of *o*-nitrobenzaldehyde with *m*-nitroacetophenone.** Photochemical behaviour of the resulting *o*-nitro-derivatives. I. TANASESCU and E. TANASESCU (Bull. Soc. chim., 1936, [v], 3, 865–870).—*o*-NO<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>·CHO, *m*-NO<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>·COMe, and NaOEt–EtOH–Et<sub>2</sub>O yield 2 : 3'-dinitrochalcone (I), m.p. 163° (lit. 161°), and *m*-nitrophenyl  $\beta$ -hydroxy- $\beta$ -*o*-nitrophenylethyl ketone (II), m.p. 124° (Bz derivative, m.p. 142°), converted quantitatively by EtOH–alkalis into indigotin. (I) is not formed when the Et<sub>2</sub>O in the foregoing mixture is replaced by EtOH. (I) when boiled with NaOH–EtOH and then treated with HCl gives indigotin. Reduction of (I) and (II) with Zn–AcOH gives unidentified products, m.p. 159° and m.p. 178°, respectively. (II) when irradiated loses 1 mol. of H<sub>2</sub>O, giving a substance, m.p. about 300°, with acidic properties. H. G. M.

**Anthracene structure of dissociable organic oxides.** Properties of anthracene photo-oxide. C. DUFRAISSE and M. GÉRARD (Compt. rend., 1936, 202, 1859–1861).—Anthracene photo-oxide (I) (A., 1935, 1488) is shown to have the bond-structure of anthracene. It can be titrated with KI, which reduces it to anthranol or oxanthrol, but isomerisation and subsequent aerial oxidation to other products also occur. (I) resembles oxanthrone in state of oxidation and in giving with HCl and HBr 10-chloro- (II) and -bromo-anthrone, respectively. (II) melts on a block at 165° with loss of HCl and resolidification owing to immediate passage into 10-chloro-10 : 10'-dihydro-10 : 10'-dianthrone, m.p. 235°. The m.p., 225°, previously assigned to (II), is due to this transformation, which occurs appreciably even at 100°. 10-Halogenoanthrones are best identified by transformation into 10-methoxvanthrone, m.p. 103–104°. R. S. C.

**Synthesis of mixed benzoin.** II. R. T. ARNOLD and R. C. FUSON (J. Amer. Chem. Soc.,

1936, 58, 1295–1296; cf. A., 1935, 1499).—Condensation of arylglyoxals, COAr·CHO (Ar = *p*-C<sub>6</sub>H<sub>4</sub>Cl, b.p. 123–125°/17 mm., m.p. 40–42°; *p*-C<sub>6</sub>H<sub>4</sub>Br, b.p. 115°/7 mm., m.p. 51–52°), prepared by a slight modification of Riley and Gray's method (this vol., 471), with Ar'H by means of AlCl<sub>3</sub> (or, occasionally ZnCl<sub>2</sub>) in absence or (usually) presence of CS<sub>2</sub> gives benzoin, COAr·CHAr'·OH (I) (35–90% yields), oxidised (method: Corson and McAllister, A., 1929, 1301) to COAr·COAr'. The following (I) are described: benzoin; benzoyl-anisyl-, -naphthyl-, m.p. 128°, -chlorophenyl-, -bromophenyl-, m.p. 125–126°, -tolyl-, and -mesityl-carbinols; mesitoyl-mesityl-, m.p. 59–60°, and -phenyl-carbinols; *p*-bromobenzoylphenyl-carbinol, m.p. 108–109°; *p*-C<sub>6</sub>H<sub>4</sub>Cl·CO·CHPh·OH; C<sub>6</sub>H<sub>4</sub>Me·CO·CHPh·OH. Ph C<sub>10</sub>H<sub>7</sub> diketone, m.p. 87°, is new. H. B.

**Preparation of  $\alpha$ -mono-oximes of aryl aliphatic diketones.** C. PHILIPP (Annalen, 1936, 523, 285–289).—COMe·CH<sub>2</sub>N·OH and acid diazonium solutions, best in presence of CuSO<sub>4</sub>, give good yields of the  $\alpha$ -oximes, OH·N(CMe)·COR, in which R is Ph, *p*-C<sub>6</sub>H<sub>4</sub>Me, *p*-C<sub>6</sub>H<sub>4</sub>Cl, *p*-OMe·C<sub>6</sub>H<sub>4</sub>, *p*-OEt·C<sub>6</sub>H<sub>4</sub>, and  $\beta$ -C<sub>10</sub>H<sub>7</sub>. The  $\alpha$ -oximes of *p*-chlorophenyl and  $\beta$ -C<sub>10</sub>H<sub>7</sub> Me diketone melt at 174° and 152°, respectively. R. S. C.

**Preparation and properties of *o*-bromophenyl benzyl diketone.** Methylation of  $\alpha$ -diketones. R. P. BARNES and N. F. PAYTON (J. Amer. Chem. Soc., 1936, 58, 1300–1302).—*o*-C<sub>6</sub>H<sub>4</sub>Br·COMe and PhCHO in aq. EtOH–NaOH at 15–20° give *o*-bromophenyl styryl ketone (I), b.p. 183–185°/2 mm. [dibromide, m.p. 86°, converted by 10% KI in COMe<sub>2</sub> into (I)], oxidised (30% H<sub>2</sub>O<sub>2</sub>, aq. EtOH–NaOH) to *o*-bromophenyl benzyl diketone (II), b.p. 155°/2 mm. [quin-oxaline, m.p. 110°, from *o*-C<sub>6</sub>H<sub>4</sub>(NH<sub>2</sub>)<sub>2</sub>], which is 100% enolic in the solid state, m.p. 107° (III) [obtained by acidification of the red upper layer from (II) and aq. EtOH–NaOH]. (II) is cleaved by alkaline H<sub>2</sub>O<sub>2</sub> in MeOH to CH<sub>2</sub>Ph·CO<sub>2</sub>H and *o*-C<sub>6</sub>H<sub>4</sub>Br·CO<sub>2</sub>H. Methylation (Me<sub>2</sub>SO<sub>4</sub>, aq. KOH) of (III) gives *o*-bromophenyl  $\alpha$ -methoxystyryl ketone, b.p. 280–285°/2 mm. The amount of *O*-Me ether formed during methylation of an  $\alpha$ -diketone is considered to be  $\propto$  the acidity of the enol; COR·C(CHR)·OH can be regarded as a glyoxylic acid with :O replaced by :CHR.  $\beta$ -Diketones cannot give such derivatives. *o*-C<sub>6</sub>H<sub>4</sub>Br·CO·CO<sub>2</sub>H has  $k^{25}$  8.6  $\times 10^{-2}$ . H. B.

**Formation of cholestane-3 : 6-dione from cholestenone dibromide and from  $\Delta^4$ - and  $\Delta^5$ -cholestenone.** Y. URUSHIBARA and T. ANDO (Bull. Chem. Soc. Japan, 1936, 11, 434–436).—Cholestane-3 : 6-dione is formed by treatment of  $\Delta^4$ - or  $\Delta^5$ -cholestenone with an equiv. amount of Br in abs. EtOH. Cholesterol is regenerated from its dibromide in good yield by heating the latter in abs. EtOH. A. T.

**Testosterone.**—See this vol., 1156.

**Displacement of the anisoyl group in the nitration of dimethoxybenzophenones.** C. W. POHL-MANN (Rev. trav. chim., 1936, 55, 737–752).—Tetranitration of *oo'*- (I) or *pp'*-dimethoxybenzophenone (II) or of their NO<sub>2</sub>-derivatives is accompanied

by much replacement of the aroyl group by  $\text{NO}_2$ , forming dinitro-anisoles and -anisic acids. This does not occur with the *m*-OMe-compounds, since the aroyl is never *m*- to a  $\text{NO}_2$ . 10 g. of (II) with abs.  $\text{HNO}_3$  at  $-15^\circ$  (method A) give the 3:3':5:5'-( $\text{NO}_2$ )<sub>4</sub>-derivative (III) 6.5, dimorphous, m.p.  $182^\circ$  and  $197^\circ$ ; 2:4- $\text{C}_6\text{H}_3(\text{NO}_2)_2\text{OMe}$  (IV) 5.6, and 4:3:5-OMe- $\text{C}_6\text{H}_2(\text{NO}_2)_2\text{CO}_2\text{H}$  (V) 1.75 g., and with  $\text{HNO}_3$ - $\text{Ac}_2\text{O}$  at  $0^\circ$  (method B) 5 g. give (III) 0.3, (IV) 0.6, the 3:3'-( $\text{NO}_2$ )<sub>2</sub>-derivative (VI) of (II) 3.9, and 3:4- $\text{NO}_2\text{-C}_6\text{H}_3(\text{OMe})\text{-CO}_2\text{H}$  (VII) 0.55 g. (VI) (2 g.) gives (III) 1.1, (IV) 0.65, and (V) 0.74 g. 2 g. of 3-nitro-4:4'-dimethoxybenzophenone [from PhOMe, 3:4- $\text{NO}_2\text{-C}_6\text{H}_3(\text{OMe})\text{-COCl}$ , and  $\text{AlCl}_3$  in  $\text{CS}_2$ , not from *o*- $\text{NO}_2\text{-C}_6\text{H}_4\text{-OMe}$  and  $\text{OMe-C}_6\text{H}_4\text{-COCl}$ ], m.p.  $143^\circ$ , gives by (A) (III) 0.95, (IV) 0.59, and 4:3:5-OH- $\text{C}_6\text{H}_2(\text{NO}_2)_2\text{CO}_2\text{H}$  0.69 g., or by (B) (III) 1.28, (IV) 0.13, and (VII) 0.13 g. (I) and Br-AcOH yield much 3:3'-dibromo- (VIII), m.p.  $182^\circ$ , and a little 3-bromo-4:4'-dimethoxybenzophenone (IX), m.p.  $89^\circ$  (also obtained from 4:3-OMe- $\text{C}_6\text{H}_3\text{Br-COCl}$  and PhOMe). (VIII) with  $\text{HNO}_3\text{-H}_2\text{SO}_4$  gives only 2:4:6-( $\text{NO}_2$ )<sub>3</sub>- $\text{C}_6\text{H}_2\text{Br-OMe}$  (X) and by (A) 3:3'-dibromo-5:5'-dinitro-4:4'-dimethoxybenzophenone, m.p.  $177^\circ$ , and traces of (X) and 4:3:5-OMe- $\text{C}_6\text{H}_2\text{Br}(\text{NO}_2)_2\text{CO}_2\text{H}$  (XI). (IX) (2 g.) gives by (A) 3-bromo-3':5:5'-trinitro-4:4'-dimethoxybenzophenone (XII), m.p.  $175^\circ$  (1.24 g.), (XI) (0.83 g.), and (IV) (0.68 g.), or by (B) (1.5 g.) 3-bromo-3'-nitro-4:4'-dimethoxybenzophenone (XIII) (also obtained from the 3- $\text{NO}_2$ -derivative and Br-AcOH), m.p.  $166^\circ$  (1.35 g.), 4:3-OMe- $\text{C}_6\text{H}_3\text{Br-CO}_2\text{H}$  (0.19 g.), and (IV) (0.17 g.). 1.4 g. of (XIII) gives by (A) (XII) 1.1, (XI) 0.29, and (IV) 0.18 g. (I) (3.5 g.) gives by (B) 5:5'-dinitro-2:2'-dimethoxybenzophenone (XV), m.p.  $188^\circ$  (2.44 g.; gives 2:7-dinitroxanthone with 75%  $\text{H}_2\text{SO}_4$  at  $150^\circ$ ), 2:5-OMe- $\text{C}_6\text{H}_3(\text{NO}_2)_2\text{CO}_2\text{H}$  (1.11 g.; prep. from 5:2- $\text{NO}_2\text{-C}_6\text{H}_3\text{Cl-CO}_2\text{H}$  and MeOH), and *o*- $\text{NO}_2\text{-C}_6\text{H}_4\text{-OMe}$  (0.9 g.), and by (A) (2 g.) 3:3':5:5'-tetranitro-2:2'-dimethoxybenzophenone (XVI), m.p.  $175^\circ$  (1.76 g.), (IV) (0.4 g.), 2:3:5-OMe- $\text{C}_6\text{H}_2(\text{NO}_2)_2\text{CO}_2\text{H}$  (XVII) (0.64 g.), and 2:4:6- $\text{C}_6\text{H}_2(\text{NO}_2)_3\text{-OH}$  (a trace). 0.6 g. of (XV) gives by (A) (XVI) 0.33, (IV) 0.14, and (XVII) 0.24 g. 3:3'-Dimethoxybenzophenone gives by (A) only the 4:4':6:6'-( $\text{NO}_2$ )<sub>4</sub>-derivative, m.p.  $231^\circ$ , converted by  $\text{HNO}_3\text{-H}_2\text{SO}_4$  at  $100^\circ$  into the 2:4:4':6:6'-( $\text{NO}_2$ )<sub>5</sub>-derivative, m.p.  $209^\circ$ , and a trace of a substance, m.p.  $143^\circ$ . (XVI) with the appropriate base in EtOH at  $100^\circ$  gives 1:3:7:9-tetranitro-acridone, m.p.  $337^\circ$  (block), and its 10-Me, m.p.  $318^\circ$  (block), -Et, m.p.  $282^\circ$  (block), -Pr<sup>a</sup>, m.p.  $273^\circ$  (block), -Bu<sup>a</sup>, m.p.  $260^\circ$  (block), -n-amyl, m.p.  $195^\circ$ , -n-hexyl, m.p.  $174^\circ$ , and -n-heptyl, m.p.  $167^\circ$ , derivatives. R. S. C.

**Paprika dye. IX. Partial degradation of capsanthin.** L. ZECHMEISTER and L. VON CHOLNOKY (Annalen, 1936, 523, 101—108).—Oxidation of capsanthin diacetate (I) with  $\text{CrO}_3$  (= 2 O) gives unrecognised by-products, unchanged material, and capsanthinone diacetate, (II), m.p.  $123\text{--}124^\circ$  (corr.; block). Capsanthinone therefore contains 2 OH and 3 CO. Since it exactly resembles capsorubin in absorption spectrum it contains 2 CO in unbroken

conjugation with 9 C:C linkings and an isolated CO and hence is  $\text{COMe-CH}_2\text{-CH(OH)-CH}_2\text{-CMe}_2\text{-CO-[CH:CH-CMe:CH]}_2\text{-[CH:CH-CH:CMe]}_2\text{-CH:CH-CO-CMe}_2\text{-CH}_2\text{-CHPr}^a\text{-OH}$ . The presence of 2 CO in the  $\alpha\epsilon$  position is shown by the conversion of (II) by 10% KOH-MeOH at room temp. into anhydrocapsanthione,  $\text{C}_{40}\text{H}_{56}\text{O}_4$ , the spectrum of which is explained by the conjugation of the "isolated" CO with a newly-formed C:C. More drastic oxidation of (I) with  $\text{CrO}_3$  leads to capsanthylal, m.p.  $127^\circ$  (corr.) [oxime, m.p.  $184^\circ$  (corr.)], which is shown spectroscopically to contain an unbroken sequence of 11 conjugated linkings and hence to be  $\text{CHO-[CMe:CH-CH:CH]}_2\text{-[CH:CMe-CH:CH]}_2\text{-CO-CMe}_2\text{-CH}_2\text{-CHPr}^a\text{-OH}$ , capsyl aldehyde [oxime, m.p.  $172^\circ$  (corr.)], the absorption spectrum of which is identical with that of  $\beta$ -carotene aldehyde and which is therefore  $\text{CHO-CH:CH-CMe:CH-CH:CH-CH:CMe}_2\text{-CH:CH-CO-CMe}_2\text{-CH}_2\text{-CHPr}^a\text{-OH}$ , and  $\beta$ -hydroxycarotene aldehyde [oxime, m.p.  $189^\circ$  (corr.)] which is  $\text{COMe-CH}_2\text{-CH(OH)-CH}_2\text{-CMe}_2\text{-CO-[CH:CH-CMe:CH]}_2\text{-CH:CH-CH:CMe-CH:CH-CHO}$ .

The structure  $\text{OH-CH-CH-CH}_2\text{-CMe}_2\text{-CH}_2\text{-C-[CH:CH-CMe:CH]}_2\text{-[CH:CH-CH:CMe]}_2\text{-CH:CH-CO-CMe}_2\text{-CH}_2\text{-CHPr}^a\text{-OH}$  may therefore be ascribed to capsanthin (III) in which the cyclic system, the OH, 18 C atoms, and position of CO are assured. Treatment of (III) with KOH-EtOH-MeOH-H<sub>2</sub>O at  $70\text{--}80^\circ$  in absence of air is a practicable method for its degradation; a crvst. substance, m.p.  $112^\circ$  (corr.), has been isolated. H. W.

**Reaction between toluoquinone and cinnamaldehyde under the influence of light.** A. ANGELI (Atti R. Accad. Sci. Torino, Cl. Sci. fis., 1934—5, 70, I, 326—330; Chem. Zentr., 1935, ii, 2945).—Cinnamic acid, 2-methylquinol, and (probably) 4-hydroxy-3-methylphenyl cinnamate, m.p.  $163^\circ$ , are formed. H. N. R.

**Condensation of aldehydes with 2-hydroxy-1:4-naphthaquinone. Synthesis of hydrolapachol.** S. C. HOOKER (J. Amer. Chem. Soc., 1936, 58, 1163—1167; cf. J.C.S., 1896, 69, 1356).—The following 3-hydroxy-2- $\Delta^a$ -alkenyl-1:4-naphthaquinones (A) are obtained from 2-hydroxy-1:4-naphthaquinone and RCHO in AcOH-conc. HCl at  $75\text{--}80^\circ$ : propenyl (I), m.p.  $135.2\text{--}135.7^\circ$  (accompanied by a little of a compound, m.p.  $160\text{--}160.5^\circ$ ), butenyl (II), m.p.  $107.5^\circ$  (acetate, m.p.  $83.5\text{--}84^\circ$ ), pentenyl, m.p.  $98\text{--}98.5^\circ$ , heptenyl, m.p.  $86.5^\circ$ , styryl, m.p.  $166.5\text{--}167.5^\circ$  (acetate, m.p.  $138.7\text{--}139.2^\circ$ , red and orange-yellow forms), and  $\gamma$ -phenylpropenyl (III), m.p.  $140.5\text{--}141.5^\circ$  (decomp.). (A) could not be prepared from MeCHO and Pr<sup>a</sup>CHO. (I) heated in EtOH decomposes to a compound, m.p.  $197\text{--}198^\circ$  (decomp.); an EtOH-solution of (II) slowly deposits a substance, m.p.  $207\text{--}208^\circ$  (decomp.), whilst (III) undergoes autoxidation in  $\text{C}_6\text{H}_6$  to a compound,  $\text{C}_{19}\text{H}_{14}\text{O}_4$ , m.p.  $227\text{--}228^\circ$  (decomp.). Reduction ( $\text{H}_2$ ,  $\text{PtO}_2$ , EtOH) of (A) and, in some cases, the isomeric  $\Delta^b$ -alkenyl derivatives (Fieser, A., 1927, 155, 462) followed by atm. oxidation, gives the 3-hydroxy-2-alkyl-1:4-naphthaquinones: the Pr<sup>a</sup>, m.p.  $100.5\text{--}101.5^\circ$ , Bu<sup>a</sup>, m.p.  $101\text{--}101.5^\circ$ , n-amyl, m.p.  $104\text{--}104.3^\circ$ , n-heptyl, m.p.  $82.7\text{--}83.3^\circ$ ,  $\beta$ -

*phenylethyl*, m.p. 171.5—172.5°, and *γ-phenylpropyl*, m.p. 131.7—132.2°, derivatives are described. 3-Hydroxy-2-*γ*-methyl- $\Delta^2$ -butenyl-1:4-naphthaquinone (*isolapachol*) (cf. *loc. cit.*) is similarly reduced to the 2-*isoamyl* derivative (*hydrolapachol*), m.p. 93.5—94.5° (lit. 87—89°), identical with the reduction product of *lapachol*. H. B.

**Oxidation of 2-hydroxy-1:4-naphthaquinone derivatives with alkaline potassium permanganate.** [I. Mechanism.] S. C. HOOKER. II. Compounds with unsaturated side-chains. S. C. HOOKER and A. STEYERMARK (*J. Amer. Chem. Soc.*, 1936, 58, 1174—1179, 1179—1181).—I (cf. Fieser *et al.*, below). Oxidation of  $\text{o-C}_6\text{H}_4\text{C}(\text{CO-C-CH}_2\text{R})(\text{CO-C-OH})$  (I) (R=H, Me—hexyl, Ph,  $\text{CH}_2\text{Ph}$ , and  $\text{-CH}_2\text{-CH}_2\text{Ph}$ ) with  $\text{KMnO}_4$  ( $\Rightarrow 2\text{O}$ ) in aq. NaOH in absence or presence of air gives  $\text{o-C}_6\text{H}_4\text{C}(\text{CO-C-OH})(\text{CO-CR})$  (II) in (usually) 70—96% yield. Reaction probably occurs thus: (I)  $\rightarrow \text{o-CO}_2\text{H-CO-C}_6\text{H}_4\text{-CO-CH}_2\text{R} \rightarrow \text{CO}_2 + \text{o-C}_6\text{H}_4\text{C}(\text{CO-CO})(\text{CO-CHP})$  (II). The same reaction also occurs when R is unsaturated. 3-Hydroxy-2-ethyl-, m.p. 138.2—138.7°, and -2-*n*-hexyl-, m.p. 98—98.5°, -1:4-naphthaquinones are new. 2-Hydroxy-1:4-naphthaquinone and its saturated derivatives give a dark blue colour with conc.  $\text{H}_2\text{SO}_4$  and  $\text{C}_6\text{H}_6$  containing thiophen.

II. 3-Hydroxy-2-allyl-, -2-*γ*-methylallyl-, and -2-cinnamyl-1:4-naphthaquinones are similarly oxidised (usually in more dil. NaOH) to 3-hydroxy-2-vinyl-, m.p. 121.5—123.5°, -2- $\Delta^2$ -propenyl-, and -2-styryl-1:4-naphthaquinone, respectively.

H. B.

**Action of light on 2-hydroxy-1:4-naphthaquinone.** S. C. HOOKER (*J. Amer. Chem. Soc.*, 1936, 58, 1212—1216).—Exposure of dil. aq. solutions of 2-hydroxy-1:4-naphthaquinone (improved prep.) at 70° to light from a "Uviarc" lamp gives *isonaphthazarin* and (mainly) 3:3'-*dihydroxy*-2:2'-*dinaphthyl*-1:4:1':4'-*diquinone* (I), m.p. about 270—275° (decomp.) (sublimes from 250°), converted

the prep. (method: Thiele and Winter, A., 1900, i, 504) of 1:2:4- $\text{C}_{10}\text{H}_5(\text{OAc})_3$ . H. B.

**Wichelhaus' "di- $\beta$ -naphthaquinone oxide."** S. C. HOOKER and L. F. FIESER (*J. Amer. Chem. Soc.*, 1936, 58, 1216—1223).—1:2-Naphthaquinone is oxidised by aq.  $\text{FeCl}_3$  at 65—70° (bath) to 1:1'-*dinaphthyl*-3:4:3':4'-*diquinone* and (mainly) 3-hydroxy-2:2'-*dinaphthyl*-1:4:3':4'-*diquinone* (I), m.p. 253—254° (decomp.) (darkens about 240°) (*acetate*, m.p. 205—205.5°). (I) is the "di- $\beta$ -naphthaquinone oxide" of Wichelhaus (A., 1898, i, 33). Distillation of (I) with Zn dust gives 2:2'-*dinaphthyl*, whilst oxidation (evaporation of solution in 6% NaOH

at room temp. in air) affords the *lactonic acid* (II), m.p. 203—205° (decomp.) (softens about 201°) [ $\text{Me}_2$  derivative ( $\text{CH}_2\text{N}_2$ ), m.p. 225—226° (softens about 220°)], which is converted by boiling AcOH into the *lactonic acid* (III), m.p. 264° (decomp.; after loss of  $\text{H}_2\text{O}$ ) [ $\text{Me}_2$  ester, m.p. 249—250° (previous softening)], also formed from (I) and 30%  $\text{H}_2\text{O}_2$  in AcOH. (III) heated in xylene affords the corresponding *dilactone*, m.p. 264°, by loss of  $\text{H}_2\text{O}$  between \*\*. (II) is dehydrated by conc.  $\text{H}_2\text{SO}_4$  at room temp. to the *dilactone* (IV), m.p. 248—249.5°, hydrolysed (1% NaOH) to (III). (II) heated with EtOH gives (III) and the *lactone* (V), m.p. 177.5—178° [better obtained from (II) and Cu powder in  $\text{C}_5\text{H}_5\text{N}$ ] [ $\text{Me}_1$  derivative ( $\text{CH}_2\text{N}_2$ ), m.p. 165—166°], converted by cold conc.  $\text{H}_2\text{SO}_4$  into an *anhydro*-derivative,  $\text{C}_{19}\text{H}_{10}\text{O}_4$ , decomp. about 220—225°.

1:2'-*Dinaphthyl*, m.p. 72—73° [*dipicrate*, m.p. 127—127.5° (corr.)] (cf. Smith, J.C.S., 1879, 35, 227) is obtained by dehydrogenation (S at 230—250°) of the distilled product, b.p. 217—219°/3 mm., from  $\beta\text{-C}_{10}\text{H}_7\text{-MgBr}$  and 1-keto-1:2:3:4-tetrahydronaphthalene. H. B.

**Mechanism of the Hooker oxidation.** L. F. FIESER, J. L. HARTWELL, and A. M. SELIGMAN (*J. Amer. Chem. Soc.*, 1936, 58, 1223—1228).—The following results confirm Hooker's view (see above) that oxidation of 2-hydroxy-3-alkyl- (or aralkyl)-1:4-naphthaquinones involves fission of the quinone ring and subsequent ring closure in a different manner, so that the 2- and 3-substituents exchange positions. 6-Bromo-1:2:4-triacetoxynaphthalene, m.p. 162° (from 6-bromo-1:2-naphtha-

by AcOH—dil.  $\text{H}_2\text{SO}_4$  into the *anhydride* (II), m.p. 349—350° (Berl block), and a little of the *anhydride* (III), m.p. 317—318° (decomp.) (block) [*quinoxaline*, m.p. 329—330° (block)]. (I) and conc.  $\text{H}_2\text{SO}_4$  at room temp. give (III) and a little of the *anhydride* (IV), decomp. 335—345° (*diquinoxaline*, m.p. 409—410°), whilst (I) and  $\text{Ac}_2\text{O}$ — $\text{NaOAc}$  or  $\text{-H}_2\text{SO}_4$  afford (IV) only. Tetra-acetoxynaphthyl is a by-product in

quinone and  $\text{Ac}_2\text{O}-\text{H}_2\text{SO}_4$ , is hydrolysed ( $\text{EtOH}-\text{KOH}$ ) and oxidised (air) to 6-bromo-2-hydroxy-1:4-naphthaquinone (I), m.p. 204–205°, which with  $\text{CH}_2\text{Ph}\cdot\text{CHO}$  in  $\text{AcOH}-\text{conc. HCl}$  at 80° gives 6-bromo-2-hydroxy-3-styryl-1:4-naphthaquinone, m.p. 243–244° (corresponding quinol triacetate, m.p. 197–198°), reduced ( $\text{H}_2$ ,  $\text{PtO}_2$ ,  $\text{EtOH}$ ) to 6-bromo-2-hydroxy-3- $\beta$ -phenylethyl-1:4-naphthaquinone (II), m.p. 180–181° (quinol triacetate, m.p. 188–189°). (I) and  $\text{CH}_2\text{Ph}\cdot\text{CH}_2\cdot\text{CHO}$  similarly afford 6-bromo-2-hydroxy-3- $\gamma$ -phenyl- $\Delta^4$ -propenyl-1:4-naphthaquinone, m.p. 177–178°; the quinol triacetate, m.p. 170–171°, from this is reduced (Adams) to 6-bromo-1:2:4-triacetoxy-3- $\gamma$ -phenylpropylnaphthalene, m.p. 170–172°, which is hydrolysed ( $\text{EtOH}-\text{KOH}$  in air) to 6-bromo-2-hydroxy-3- $\gamma$ -phenylpropyl-1:4-naphthaquinone (III), m.p. 170–171°. The Ag salt of (I) with  $\text{CH}_2\text{PhBr}$  in  $\text{Et}_2\text{O}$  gives 6-bromo-4-benzoyloxy-1:2-naphthaquinone, m.p. 227–228°, 6-bromo-2-hydroxy-3-benzyl-1:4-naphthaquinone (IV), m.p. 192° (quinol triacetate, m.p. 202–203°), and 6-bromo-2-benzoyloxy-1:4-naphthaquinone, m.p. 201–202°. Oxidation (1%  $\text{KMnO}_4$ ) of (III) (in 1%  $\text{NaOH}+\text{C}_6\text{H}_6$ ) at 0° affords 6-bromo-3-hydroxy-2- $\beta$ -phenylethyl-1:4-naphthaquinone, m.p. 173–175° [which differs from (II)], further oxidised to (IV). Similar oxidation of (II) gives 6-bromo-3-hydroxy-2-benzyl-1:4-naphthaquinone, m.p. 158–159° (quinol triacetate, m.p. 196–197°), which differs from (IV). 3-Hydroxy-2-isobutyl-1:4-naphthaquinone (acetate, m.p. 53.5–54°) is similarly oxidised to the 2-isopropyl-derivative, m.p. 92–93°, and thence (by way of  $o\text{-CO}_2\text{H}\cdot\text{CO}\cdot\text{C}_6\text{H}_4\cdot\text{CO}\cdot\text{COPr}^t$ ) to  $o\text{-CO}_2\text{H}\cdot\text{C}_6\text{H}_4\cdot\text{CO}\cdot\text{CO}_2\text{H}$  and  $\text{Pr}^t\text{CO}_2\text{H}$ . 3-Hydroxy-2:6-dimethyl-1:4-naphthaquinone is oxidised in a more strongly alkaline medium to 2-hydroxy-6-methyl-1:4-naphthaquinone, m.p. 199° (decomp.) [*Me ether* (V), m.p. 167–167.5°; quinol triacetate, m.p. 157–158°]. Reduction ( $\text{Na}_2\text{S}_2\text{O}_4$ ) of the dye from diazotised  $p\text{-NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{SO}_3\text{H}$  and 6:2- $\text{C}_{10}\text{H}_7\text{Me}\cdot\text{OH}$  (VI) affords 1:6:2- $\text{NH}_2\cdot\text{C}_{10}\text{H}_7\text{Me}\cdot\text{OH}$ , which is oxidised ( $\text{K}_2\text{Cr}_2\text{O}_7$ , dil.  $\text{H}_2\text{SO}_4$ ) to 6-methyl-1:2-naphthaquinone, m.p. 126°. Successive treatment of this with  $\text{NaHSO}_3$ , boiling dil.  $\text{H}_2\text{SO}_4$ ,  $\text{K}_2\text{Cr}_2\text{O}_7$ -dil.  $\text{H}_2\text{SO}_4$ , and  $\text{KCl}$  gives *K* 6-methyl-1:2-naphthaquinone-4-sulphonate ( $+\text{H}_2\text{O}$ ), converted by  $\text{MeOH}-\text{conc. H}_2\text{SO}_4$  into (V).  $o\text{-C}_6\text{H}_4(\text{CO})_2\text{O}$ , (VI), and  $\text{AlCl}_3$  at 200° yield 1:8-phthaloyl-6-methyl- $\beta$ -naphthol (1-hydroxy-5-methylpleiadenedione), m.p. 194–194.5°, rearranged by 2:1 (vol.)  $\text{H}_2\text{SO}_4\text{-H}_2\text{O}$  at 170° into 2'-hydroxy-4-methyl-1:2-benzanthraquinone, m.p. 256–258° (decomp.) (acetate, m.p. 218–219°). H. B.

**Chrysene.** III. K. FUNKE and J. RISTIC (J. pr. Chem., 1936, [ii], 145, 309–312; cf. this vol., 472).—8-Benzoylchrysene-1:2-quinone gives a *phenazine* derivative, m.p. 207°, proving the structure of the quinone. 2-Acetylchrysene and  $\text{Na}_2\text{Cr}_2\text{O}_7\text{-AcOH}$  give chrysene-1:2-quinone-8-carboxylic acid, m.p. 297° (phenazine derivative, m.p. >330°). 2:8-Dibromochrysene with  $\text{CrO}_3\text{-AcOH}$  gives a small amount of a Br-free substance, m.p. 323–324°, but with  $\text{Na}_2\text{Cr}_2\text{O}_7\text{-AcOH}$  affords 8-bromochrysene-1:2-quinone, m.p. 249–250° (phenazine derivative, m.p. 252°), which proves the orientation. 1- or 2-Sub-

stituted chrysene derivatives afford by oxidation 8- or 7-substituted 1:2-quinones, and derivatives substituted in the 1 or 2 and 7 or 8 positions give similar quinones if one substituent is readily removed. 2:8-Dicyanochrysene is stable to oxidising agents and affords no quinone.

R. S. C.

**Anthanthrone and its derivatives.** VII. Halogenation, nitration, and sulphonation of anthanthrone. A. CORBELLINI and M. ATTI (Chim. e l'Ind., 1936, 18, 295–298).—Anthanthrone (I) is chlorinated by  $\text{SO}_2\text{Cl}_2$  in  $\text{PhNO}_2$ , and is brominated (cf. G.P. 458,598) to the Cl- and Br-derivatives,  $\text{C}_{22}\text{H}_8\text{O}_2\text{X}_2$ . Iodination (G.P. 495,367) yields an impure I-derivative, containing <1 atom of I per mol. of (I). Nitration (G.P. 492,446) yields nitro- and dinitro-, decomp. 360°, -anthanthrone, from which the  $\text{NH}_2$ - and  $(\text{NH}_2)_2$ -compounds are prepared. Sulphonation (oleum) gives anthanthrone-sulphonic acid, from which the -sulphonyl chloride, m.p. 306.5–307.5°, is prepared, with disulphonyl compounds.

E. W. W.

**Woolly aphis and white pine chermes.**—See this vol., 1137.

**Pinic acid.** M. GRANDPERRIN (Ann. Chim., 1936, [xi], 6, 5–52).—Evidence is adduced in favour of the view that pinic acid obtained by the oxidation of pinonic acid in alkaline solution has the *trans*-configuration. *d*- $\alpha$ -Pinene,  $[\alpha]_D +42^\circ$ , is oxidised by  $\text{KMnO}_4$  in  $\text{H}_2\text{O}$  containing  $(\text{NH}_4)_2\text{SO}_4$  at 0° to pinonic acid (I),  $[\alpha]_D +95^\circ$ ; oxidation by  $\text{KMnO}_4$  in  $\text{COMe}_2$  appears more suited to the formation of neutral products. Oxidation of (I) by Br in alkaline solution gives  $\text{CBr}_4$ ,  $\text{CHBr}_3$ , and an acid which only becomes partly cryst. after long keeping (oxidation with  $\text{H}_2\text{O}_2$  or  $\text{K}_2\text{Cr}_2\text{O}_7$  in  $\text{AcOH}$  gives less satisfactory results whereas treatment with  $\text{HNO}_3$  appears to give terebic acid). Crystallisation of the crude acid without distillation, which involves risk of racemisation, leads to pinic acid (II), m.p. 78–79°,  $[\alpha]_D +10.6^\circ$  in  $\text{Et}_2\text{O}$ ,  $-1.9^\circ$  in  $\text{CHCl}_3$ ,  $+5.1^\circ$  in  $\text{COMe}_2$ ,  $-4^\circ$  in  $\text{H}_2\text{O}$ . (II) is transformed by  $\text{SOCl}_2$  into the dichloride (III), b.p. 141–142°/15 mm.,  $[\alpha]_D -41.5^\circ$ , whence *Et*<sub>2</sub> pinate (IV), b.p. 148–149°/15 mm.,  $[\alpha]_D +3.36^\circ$  (also obtained from *Ag*<sub>2</sub> pinate and *EtI*), *Pr*<sup>*t*</sup> pinate (V), b.p. 161°/20 mm.,  $[\alpha] +1.36^\circ$ , and *Bu*<sup>*t*</sup> pinate, b.p. 181°/22 mm.,  $[\alpha] -0.48^\circ$ . (III) is converted by  $\text{NH}_3\text{-EtOH}$  into *pindiamide*, m.p. 190°, by  $\text{NH}_2\text{Ph}$  into the *dianilide*, m.p. 208°, by the requisite amount of  $\text{EtOH}$  followed by  $\text{NH}_2\text{Ph}$  into the *ester anilide*, m.p. 92° (with a non-identified product, m.p. 248°), and by *p*- $\text{OMe}\cdot\text{C}_6\text{H}_4\cdot\text{NH}_2$  into the *di-p-anisidine*, m.p. 202°. (IV) and (V) are converted by  $\text{MgEtBr}$  into the corresponding *di-tert.*-glycols which could not be isolated free from their products of dehydration. Attempts to prepare pinic anhydride from (II) and  $\text{AcCl}$ , from (III) and  $\text{Na}_2\text{O}$ , or from (III) and  $\text{Ag}_2\text{O}$  were unsuccessful. Similarly the imide, anil, or anisidil could not be obtained. A ketonic ester is not formed by the action of  $\text{NaNH}_2$  on (IV). Dehydration of the crude *di-tert.*-glycol by  $\text{H}_2\text{SO}_4$ -pumice or  $2\text{-C}_{10}\text{H}_7\cdot\text{SO}_3\text{H}$  and purification of the product with  $\text{H}_3\text{BO}_3$  leads to the hydrocarbon,  $\text{CET}_2\text{:C} \begin{smallmatrix} \text{CMe}_2 \\ \text{CH}_2 \end{smallmatrix} \text{CH:CH.CET}_2$ , b.p.

148—149°/22 mm. Isomerisation of (II) under the action of  $\text{Ac}_2\text{O}$  is not observed. H. W.

**Preparation and properties of pinonic acid.** M. DELÉPINE (Bull. Soc. chim., 1936, 3, [v], 1369—1382).—Optically active pinonic acid (I) (prep. described) in KOH or when heated shows a rapidly decreasing  $\alpha$  owing to a *cis-trans* unimol. change; in aq.  $\text{NH}_3$  the change is 1/600 times as fast. The change is not one of racemisation but of mutarotation (much lit. cited). The action of alkali affords the pure *trans*-acid,  $[\alpha]_D +95^\circ$  in  $\text{CHCl}_3$ , and an oil which is a *trans-cis* mixture with a lower  $[\alpha]_D$  increased by treatment with alkali. The semicarbazone (II),  $[\alpha]_D +90^\circ$ , of (I) gives an Ac derivative which when pptd. from alkaline solution yields (II); the mother-liquors contain a semicarbazone,  $[\alpha]_D -88^\circ$ , which when hydrolysed affords a *trans*-acid with  $[\alpha]_D -77^\circ$ . The *cis*- and *trans-d*-acids give oximes, m.p. 128° and 191°, respectively, whilst the *l*-acids give oximes, m.p. 191° and 128°, respectively. J. L. D.

**Preparation of monoalkyl and aryl derivatives of  $\beta$ -campholide and of the corresponding  $\delta$ -hydroxy-acids.** J. VÈNE (Compt. rend., 1936, 202, 1681—1683).—Me camphoceanaldehyde  $\text{CHO}(\beta)\cdot\text{C}_6\text{H}_{14}\cdot\text{CO}_2\text{Me}(\alpha)$  (cf. A., 1917, i, 560; 1932, 1037) with  $\text{MgRX}$  affords  $\beta$ -substituted campholides (I). The following are prepared:  $\beta$ -methyl-, m.p. 178°, -ethyl-, m.p. 78°, -propyl-, impure, -butyl-, b.p. 179—181°/16 mm., -phenyl-, m.p. 212°, and -benzylcampholide, m.p. 102°. In attempting to prepare the higher aliphatic homologues, (I) tends to be converted into  $\beta$ -campholide. (I) with  $\text{NaOH-EtOH}$  at 100° give OH-acids (II) of which the following are prepared: 2 : 2 : 3-trimethyl-3- $\alpha$ -hydroxyethyl-, m.p. 135°, -3- $\alpha$ -hydroxypropyl-, m.p. 73° (+x $\text{H}_2\text{O}$ , m.p. 86°), -3- $\alpha$ -hydroxybenzyl-, m.p. 166°, -3-( $\alpha$ -hydroxy- $\beta$ -phenylethyl)-cyclopentane-1-carboxylic acid, m.p. 154°. (II) with  $\text{Ac}_2\text{O}$  or when heated give (I). J. L. D.

**Action of selenium dioxide on camphene and pinene.** W. ZACHAREWICZ (Rocz. Chem., 1936, 16, 290—300).—Pinene and  $\text{SeO}_2$  in EtOH at 60° yield myrtenol (I) and myrtenal [identified wrongly as verbenol and verbenone by Schenk *et al.* (A., 1932, 1253) and Dupont *et al.* (A., 1933, 1166)], formed by decomp. of dimyrtanyl selenide (II), m.p. 64—65°. (II) and Br in  $\text{CHCl}_3$  at 0° yield myrtenyl iodide, identified by conversion into (I). Camphene and  $\text{SeO}_2$  yield camphenilone and isoborneol in small amount, but the chief product is di-3-camphenyl selenide, b.p. 220—225°/8 mm., m.p. 93—94°, from which camphene is regenerated by Walbaum's reaction. R. T.

(A) **Products of oxidation of hydrazones of camphorquinone and 4-methylcamphorquinone.** (B) **Nitrogenous derivatives of 4-methylcamphor.** L. BRIUSOVA (J. Gen. Chem. Russ., 1936, 6, 667—673, 674—680).—(A)  $\beta$ -pericycloCamphanone (I) is regenerated from its hydrazone, m.p. 76.5—77.5°, by heating at 50—70° with HgO in EtOH; when the reaction is performed in a  $\text{CO}_2$  atm. in presence of I the 2 : 2- $I_2$ -derivative, m.p. 160—162°, of (I) is also produced. The dihydrazone (impure), m.p. 101—104° (hydrochloride, m.p. 177—180°), of 4-methylcamphorquinone (II) yields 4-methylecylene when

oxidised with HgO, and the dihydrazone, m.p. 196—198°, of camphorquinone gives tricycylene with HgO.

(B) The reactions of 4-methylcamphor (III) are on the whole analogous to those of camphor. 3-Amino-4-methylcamphor, m.p. 164—167° (Ac derivative, m.p. 127—128°, + $\text{H}_2\text{O}$ , m.p. 84—86°; carbonate, m.p. 152—155°; hydrochloride), is prepared by reducing 3-oximino-4-methylcamphor ( $\text{Zn-AcOH}$ ), whilst oxidation with  $\text{KMnO}_4$  in  $\text{COMe}_2$  yields 3-nitro-4-methylcamphor, m.p. 152—153°. The oxime of (III) and  $\text{HNO}_2$  afford the nitroimine, m.p. 52—53.5°, which with  $\text{NH}_3$  at 50° yields the imine, m.p. 64—67°. The nitroimine, m.p. 57.4—58.4°, of (II), obtained analogously, yields (II) when treated with EtOH-KOH, and the dioxime, m.p. 181—182°, of (II) with  $\text{NH}_2\text{OH}$  (100°; 30 min.). R. T.

**Preparation of optically active *trans*--hydroxycamphor from optically active  $\alpha$ -*trans*-dihalogenocamphor.**—See B., 1936, 687.

**Optical superposition.** H. RUPE, F. HENKE, and F. BÜRKI (Helv. Chim. Acta, 1936, 19, 698—734).—[With H. HIRSCHMANN]. All except the first two pages of the paper by Rupe, Bürki, and Werdenberg (A., 1929, 529) are incorrect.

$[M]^{20}$  are determined for esters of *l*-, *d*-, and *dl*-hydroxymethylenecamphor (I) and -camphenylcarbinol (II) with *l*-, *d*-, and *dl*-bornylenecarboxylic (III) and -camphanecarboxylic acid (IV).  $[M]$  of the esters is not the sum of  $[M]$  of the free alcohols and acids. When both alcohols and acids are saturated,  $[M]$  of the esters is the sum of  $[M]$  of the alkyl and acyl radicals, but, when either is unsaturated or, more, so, if both are unsaturated, "polar" effects nullify this equality, so that the simple law of optical superposition no longer holds. Hydrogenation of the unsaturated esters gives only one stereoisomeride in each case; esters with different types of unsaturation give different stereoisomerides of the saturated esters owing to the formation of new asymmetric C.  $[M]$  of these forms conforms to the above-mentioned law when the contribution of each asymmetric centre is taken into account. It is shown how these contributions can be calc. from the  $[M]$  of the esters isolated. (I) is best obtained by the use of Na, since  $\text{NH}_2\text{Na}$  gives also much hydroxymethylenecamphorimide. The *dl*-form of (II) has b.p. 142°/11 mm. (benzoate, m.p. 73°); the *l*-form is also prepared. Esters of (I) are obtained by treating the dry Na salt (prep. by NaOMe) in  $\text{C}_6\text{H}_6$  with the chlorides, b.p. 110—111°/11 mm. and 107—108°/11 mm., of (III) and (IV), respectively. In most cases (I) gives only one ester (assumed to be the stable *trans*-form) under the conditions used; the *cis*-forms are the more readily reduced and have the higher m.p.; this leads to configurations in agreement with the calc. vals. of  $[M]$ . Esters of (II) are prepared by the acid chloride in  $\text{C}_5\text{H}_5\text{N}$  (1.5 parts). Hydrogenation of esters of (I) is effected by Pd- $\text{H}_2$  in EtOH at 1 or 60—80 atm., as Ni leads to much hydrolysis to camphor with or without further reduction to methylcamphor; esters of (II) are smoothly reduced by  $\text{H}_2$ -Ni. The following esters are prepared, indicated by their components, e.g., *d*-hydroxymethylenecamphor *d*-bornylenecarboxylate as *d*-(I)-*d*-(III), the angles

recorded being  $[\alpha]_D^{20}$  in  $C_6H_6$ . *d*-(I)-*d*-(III) (A), m.p. 119.5°, +215.54°; *d*-(I)-*dl*-(III), m.p. 131.5°, +104.31°; *l*-(I)-*d*-(III), trans-, m.p. 113.5°, -34.11°, and *cis*-form, m.p. 143.5°, -61.66°; *dl*-(I)-*d*-(III), m.p. 110.5°, +91.23°; *d*-(I)-*d*-(IV), trans-, m.p. 147.5°, +164.62°, and *cis*-form, m.p. 163.5°, +143.86°; *d*-(I)-*dl*-(IV), m.p. 155.5°, +100.5°; *l*-(I)-*d*-(IV), trans-, m.p. 147°, -36.6°, and *cis*-form, m.p. 164°, -45.11°; *dl*-(I)-*d*-(IV), m.p. 150.5°, +76.69°; *d*-(II)-*d*-(III), m.p. 110°, +88.93°; *d*-(II)-*dl*-(III), m.p. 114°, +28.63°; *l*-(II)-*d*-(III), m.p. 114°, +46.19°; *l*-(II)-*dl*-(III), m.p. 114°, -25.96°; *l*-(II)-*l*-(III), m.p. 110°, -90.08°; *dl*-(II)-*d*-(III), m.p. 110°, +72.15°; *dl*-(II)-*l*-(III), m.p. 112°, -70.93°; *d*-(II)-*d*-(IV) (B), m.p. 157.5°, +55.94°; *d*-(II)-*dl*-(IV), m.p. 158°, +25.84°; *l*-(II)-*d*-(IV), m.p. 160°, +3.64°; *dl*-(II)-*d*-(IV), m.p. 152°, +28.42°; *dl*-(II)-*l*-(IV), m.p. 158°, -31.22°. Esters, (III)-(IV), were obtained by hydrogenation as follows: from (A), m.p. 179°, +103.61°; from *trans*-, m.p. 182°, -68.38°, and *cis*-*l*-(I)-*d*-(III), m.p. 179.5°, -51.92°; from *dl*-(I)-*d*-(III), m.p. 180°, +30.55°; from *trans*-, m.p. 165°, +67.61°, and *cis*-*d*-(I)-*d*-(IV), m.p. 167°, +106.14°; from *trans*-, m.p. 142°, -30.34°, and *cis*-*l*-(I)-*d*-(IV), m.p. 168°, -39.04°; from *dl*-(I)-*d*-(IV), m.p. 161°, +43.07°; (C) from *d*-(II)-*d*-(III), m.p. 163.5°, +54.39°; from *d*-(II)-*dl*-(III), m.p. 167°, +24.28°; from *l*-(II)-*d*-(III), m.p. 164°, +16.78°; from *l*-(II)-*dl*-(III), m.p. 166.5°, -21.37°; from *l*-(II)-*l*-(III), m.p. 163.5°, -56.39°; from *dl*-(II)-*d*-(III), m.p. 172°, +38.37°; and from *dl*-(II)-*l*-(III), m.p. 162.5°, -37.39°. Mutarotation of *l*-(I) is much faster than that of *d*-(I), increasing in speed with time in both cases; no explanation can be offered. In spite of the difference in m.p. (B), obtained by direct esterification, is identical with (C), obtained by reduction, since both have the same  $[\alpha]$  and both, when hydrolysed, give the same (IV), m.p. 91°,  $[\alpha] +74^\circ$ . Hydrolysis of *d*-(II)-*dl*-(IV) gives *dl*-(IV), showing that no resolution takes place during esterification. Hydrolysis of the ester obtained by reduction of (A) gives a form of (IV), m.p. 91°,  $[\alpha] +54.66^\circ$ .  $\alpha$  is determined for the esters for six  $\lambda$ ; esters of (II), but remarkably not those of (I), show anomalous dispersion, particularly if  $\log [\alpha]\lambda^2$  is plotted against  $v^2$ . R. S. C.

**sec.- $\alpha$ -Nitro-4-methylcamphene and 4-methyl- $\alpha$ -camphenone.** S. S. NAMETKIN and A. S. ZABRODINA (Ber., 1936, 69, [B], 1789—1791).—4-Methylcyclohexene is converted by  $HNO_3$  (*d* 1.075) into  $\alpha$ -nitro-4-methylcamphene (I), b.p. 127—129°/16 mm., m.p.

40—40.5°, whence the  $\psi$ -nitrol, m.p. 91—92° (decomp.). (I) is transformed by cautious oxidation with  $KMnO_4$  in alkaline solution into 4-methyl- $\alpha$ -camphenone (II), m.p. 129—130° [semicarbazone, m.p. 211—212° (decomp.)], also obtained in small yield by Sn and fuming HCl. H. W.

**exo-2-o-Carboxybenzoylcamphane and endo-cyclophthaloylcamphane.** R. BOUSSET (Bull. Soc. chim., 1936, [v], 3, 871—875).—The acid, m.p. 154° (this vol., 206), may be separated by repeated crystall-

isation and by hydrolysis (cold) of its Me ester into two geometrical isomerides. The one, *exo*-2-o-carboxybenzoylcamphane, has m.p. 182° (corr.),  $[\alpha]_D^{20} +89.20^\circ$ , and the other, not yet obtained pure, readily cyclises in presence of alkalis to *endocyclophthaloylcamphane*, m.p. 216° (cf. *ibid.*, 475).

H. G. M.

**Use of 2:4-dinitrophenylhydrazine.** O. FERNANDEZ and M. CASTILLO (Anal. Fis. Quím., 1935, 33, 81—89).—A quant. study of the formation of the dinitrophenylhydrazones (I) of the following camphor derivatives:  $\alpha$ -carboxylic acid, m.p. 173°,  $\beta$ -sulphonic acid, yellow form, m.p. 215°,  $[\alpha]_D^{20} -130^\circ$  in dil. EtOH, red form, m.p. 193—195°,  $[\alpha]_D^{20} 0^\circ$ ,  $\alpha$ -cyano-, m.p. 225°,  $\alpha$ -hydroxy-, yellow form, m.p. 225°,  $[\alpha]_D^{20} +252^\circ$  in dil. EtOH, red form, m.p. 225°,  $[\alpha]_D^{20} +265^\circ$  in EtOH,  $\alpha$ -acetoxy-, m.p. 183°,  $\alpha$ -methoxy-, m.p. 171°,  $\alpha$ -acetamido-, m.p. 226.5°.  $\alpha$ -Acetamidocamphor, m.p. 121°, was obtained from the free base. Br,  $NO_2$ ,  $SO_3H$ , and  $NH_2$  in the  $\alpha$ -position prevent formation of (I). The difference between the red and yellow forms is discussed. F. R. G.

**Mechanism of diene synthesis.** E. R. LITTMANN (J. Amer. Chem. Soc., 1936, 58, 1316—1317).—Reaction between  $\alpha$ -phellandrene (I) and maleic anhydride (II) is more nearly unimol. in dil. (0.25*M*) than in conc. (*M*) solution in  $COMe_2$ . A reaction other than the formation of a coloured intermediate (cf. Diels and Alder, A., 1928, 1018) is involved (or side reactions occur). (I) and (II) react violently at 55—65° (no solvent) to give a non-volatile 3:4- or 4:5-polymeride of the type  $C_4H_2O_3(C_{10}H_6-C_4H_2O_3)_n C_4H_2O_3$ . H. B.

**Pyronenes.** G. DUPONT and R. DULOU (Compt. rend., 1936, 202, 1861—1863).—Conjugation of the ethylenic linkings of the pyronenes (A., 1935, 1127) is shown by the following reactions. The figures in parentheses are the frequencies of the lines of the Raman spectra.  $\alpha$ -(I) (nitrosochloride, m.p. 103°) and  $\beta$ -pyronene (II) show predominantly a line with frequency 1595 in the Raman spectra. Reduction of (I) by Na-EtOH gives a mixture of two hydrocarbons (1671, due to an intra-annular ethylenic linking attached to a *tert*-C). Hydrogenation of (I) in presence of Raney Ni leads to absorption of 2 H and disappearance of the characteristic line (1595), and formation of a mixture of three hydrocarbons (1673, 1658, and 1647, respectively). Absorption of 2 H in presence of Pt gives from (I) a  $H_2$ -derivative (630, 666, 841, 998, 1264, 1377, and 1674), also obtained with carvomenthene (1673) from (II) similarly or by  $H_2$ -Ni or Na-EtOH. *dl*-(II) (from *dl*-pinene) with  $CH_2 \cdot CH \cdot CHO$  at 110° gives an adduct,  $C_{12}H_{19} \cdot CHO$ , b.p. 123°/15 mm. (semicarbazone, m.p. 209—210°), and with maleic anhydride in boiling  $C_6H_6$  a product, hydrolysed to an acid,  $C_{12}H_{18}(CO_2H)_2$ , m.p. 154°. *dl*-(I) gives similarly an aldehyde (1116, 1184, 1270, 1627) and an acid, m.p. 195°.

R. S. C.

**Chemistry of the genus *Dacrydium*.** I. Resin of *D. Colensoi*. II. Diterpene alcohol from *D. biforme* wood. J. R. HOSKING and C. W. BRANDT (New Zealand J. Sci. Tech., 1936, 17, 750—755, 755—758).—I. The resin from *D. Colensoi*

gives 90% of neutral substances, which may be separated into manoyl oxide (I),  $C_{20}H_{34}O$ , m.p.  $29^\circ$ , a diterpene oxide, ketomanoyl oxide (II),  $C_{20}H_{32}O_2$ , m.p.  $76^\circ$ , a ketonic diterpene oxide, and a diterpene oxide (III),  $C_{20}H_{32}O_4$ , m.p.  $208^\circ$  (3 OH). (I) absorbs the equiv. of 1  $H_2$ , shows stability of O, is dehydrogenated (Se) to 1:5:6- $C_{10}H_5Me_3$  and 1:7:8-trimethylphenanthrene, and with  $HCO_2H$  gives isomanoene,  $C_{20}H_{32}$ , containing 2 double linkings. With HCl, (I) yields a stable trihydrochloride,  $C_{20}H_{35}Cl_3$ , from which the Cl could not be removed, and dihydromanoyl oxide similarly forms a dihydrochloride,  $C_{20}H_{36}Cl_2$ , dechlorinated to a dicyclic hydrocarbon,  $C_{20}H_{34}$ . The ozonide of (I) affords  $CH_2O$  and  $HCO_2H$  and oxidation ( $KMnO_4$ ) of (I) leads to a monocarboxylic acid,  $C_{19}H_{32}O_3$ , in which the oxide ring has remained intact. (I) is probably represented as shown. (II) is tricyclic; one O is ketonic and the other oxidic, and it differs only from (I) in the presence of CO which is adjacent to a  $CH_2$ . Dehydrogenation (Se) of the hydrocarbon obtained by treating (II) with HCl followed by  $NH_3Ph$ , gives some 1:3:5:6- $C_{10}H_4Me_4$ . (III) contains 3 OH, one oxide ring, 3 carbocyclic rings, and one ethylenic linking.

II. One of the fractions from the neutral oil from *D. biforme* is manool,  $C_{20}H_{34}O$ , m.p.  $56^\circ$ , which forms a trihydrochloride, m.p.  $119^\circ$ , identical with that from (I). It is a dicyclic diterpene alcohol, with 2 double linkings and a C skeleton identical with that of (I). Tetrahydromanool (IV) is converted into a monohydrochloride, which loses HCl to give tetrahydromanoene,  $C_{20}H_{36}$ . The hydrocarbon on ozonolysis gives a mixture of a ketone,  $C_{18}H_{32}O$  (semicarbazone, m.p.  $202^\circ$ ), and a monobasic acid,  $C_{16}H_{28}O_2$ , m.p.  $129^\circ$ . F. R. S.

**Behaviour of the apparent lignin during degradation of rye straw by hydrogen sulphite.** R. S. HILPERT and A. BOLLING (Ber., 1936, 69, [B], 1598—1601).—Treatment of rye straw with  $Ca(HSO_3)_2$  followed by NaOH or NaOCl shows the lignin to consist of 4 four chemically different components. About 67% of the lignin is dissolved by  $Ca(HSO_3)_2$  whilst the remaining 33% is unattacked. One half of the residue is stable towards NaOCl and 33% is insol. in NaOH. If the residue from treatment with NaOH is subjected to treatment with NaOCl a pure white cellulose with 4% of lignin is obtained. The results cannot be harmonised with the hypothesis that lignin is a chemically defined component but are readily explained if it is regarded as a reaction product of sensitive substances, presumably carbohydrates. H. W.

**Highly polymerised compounds.** CXLII. Lignin. H. STAUDINGER and E. DREHER (Ber., 1936, 69, [B], 1729—1737).—Determinations of the

sp. viscosity of phenol-, acetylphenol-, *o*-cresol-, and *o*-acetylcresol-lignin in  $COMe_2$ , of beech-lignin in  $COMe_2$  and  $HCO_2H$ , and of Na ligninsulphonate in  $HCO_2H$  show that lignin has a relatively low mol. wt. These and other properties prove that its structural principle differs from that of cellulose and similar highly polymerised compounds and that it is not formed of long chains. Conc.  $HCO_2H$  at  $100^\circ$  dissolves about 50% of the lignin of pine without addition of mineral acid; the product is a mixture of aromatic substances rich in OMe. Gradual addition of  $H_2O$  to its solution in dioxan ppts. fractions differing little in OMe content and having mol. wt. about 1000 in freezing dioxan. Their solutions in dioxan or  $HCO_2H$  are of low viscosity. The treatment of pine wood with  $HCO_2H$  produces also considerable amounts of sugar-like substances sol. in  $H_2O$  from the polysaccharides present. Cellulose is also attacked to some extent, but the products formed are exempt from OMe. Insol. lignin has not the same structural principle as cellulose. H. W.

**Resin.** IV. Sublimed *l*-abietic acid. D. LIPKIN and W. A. LA LANDE, jun. (J. Amer. Chem. Soc., 1936, 58, 1310—1311).—Sublimation (method essentially that of B., 1934, 726) of *l*-abietic acid (I) gives an acid (II), m.p.  $150^\circ$ ,  $[\alpha]_D^{25} -35.1^\circ$  in EtOH (cf. Steele, A., 1922, i, 739), which is unaffected by light and air in the solid state. In xylene, however, (I) and (II) absorb  $O_2$  at the same rate (method: Dupont and Levy, A., 1930, 86). H. B.

**Biochemistry of micro-organisms.** LI. Metabolic products of *Aspergillus terreus*, Thom. II. Two new chlorine-containing mould metabolic products, geodin and erdin. H. RAISTRICK and G. SMITH (Biochem. J., 1936, 30, 1315—1322; cf. A., 1935, 662).—When a strain of *A. terreus*, Thom, was grown on a glucose-Czapek-Dox solution containing KCl as the sole source of Cl, the amount of Cl in solution diminished approx. at the same rate as the glucose. Final acidification with  $H_2SO_4$  gave a heavy ppt. containing 50% of the Cl originally present, from which were isolated: *geodin*,  $C_{17}H_{12}O_7Cl_2$ , m.p.  $235^\circ$ ,  $[\alpha]_D^{20} +179^\circ$ ,  $[\alpha]_D^{30} +149^\circ$  (both in  $CHCl_3$ ), dibasic ( $Na_2$  salt,  $[\alpha]_{541}^{30} +72.4^\circ$ ), containing 2 OMe; giving with  $CH_3N_2$  a compound,  $C_{16}H_{10}O_4N_2Cl_2(OMe)_3$ , m.p.  $151^\circ$ ,  $[\alpha]_{541}^{23} -58^\circ$  in  $C_6H_6$ : a  $H_2$ -derivative, m.p.  $229^\circ$ , optically inactive; and *erdin*,  $C_{16}H_{10}O_4Cl_2 + 0.5EtOH$ , m.p.  $211^\circ$  (decomp.), optically inactive, dibasic, containing 1 OMe, giving with  $CH_3N_2$  a compound,  $C_{16}H_7O_4N_2Cl_2(OMe)_3$ , m.p.  $154^\circ$ , not identical with the corresponding isomeric compound from geodin ( $H_2$ -derivative,  $C_{16}H_{12}O_7Cl_2 + 0.5H_2O$ , m.p.  $240^\circ$ , giving on heating a cryst. sublimate). Substitution of KBr or KI for KCl in the medium did not affect growth but did not result in the isolation of brominated or iodinated metabolic products. P. W. C.

**Ouabain.** L. F. FIESER and M. S. NEWMAN (J. Biol. Chem., 1936, 114, 705—710).—Ouabain is probably (I). The positions of the OH are determined by the course of acetolysis of hepta-acetyl-deoxydihydro-ouabain and isouabain, indicated in the partial formulæ (A)—(D). Loss of the *tert*-

$O\cdot C_6H_{11}O_4$  gives the grouping  $C\cdot C\cdot C\cdot OAc$ ; the next two ethylenic linkings arise by the tendency to form conjugated linkings coercing the activated  $OAc$ . Expulsion of  $CH_2\cdot OAc$  (as  $CH_2O$  and  $Ac_2O$ ) is caused by the tendency to form an aromatic ring. The aromatic nature of ring  $B$  is not precluded by its slow hydrogenation and is confirmed by the similarity of the absorption spectra of the trianhydrolactone (II) from *isouabain*, dihydrotrianhydrostrophanthidin, and *neogosterol*. (II) slowly absorbs 1—1.8  $O$  from  $BzO\cdot H$ .

R. S. C.

#### Crystalline substances from the adrenal gland.

H. L. MASON, C. S. MYERS, and E. C. KENDALL (J. Biol. Chem., 1936, 114, 613—631).—Repeated partition of the crude extract of minced adrenal glands between  $H_2O$  and  $C_6H_6$  gives fractions, (I) more sol. in  $C_6H_6$ , (II) more sol. in  $H_2O$ , and (III) equally sol. in  $H_2O$  and  $C_6H_6$ , which are all mixtures. (I) yields substances (A),  $C_{26}H_{36}O_5$ , m.p. 177—179.5°,  $[\alpha]_{D}^{25} +347^\circ$  in  $C_6H_6$ , and (B),  $C_{24}H_{34(36)}O_5$ , m.p. 135—139°. With  $K_2Cr_2O_7$ , (A) gives the unsaturated acid-1,  $C_{20}H_{26}O_4$ , decomp. 245—260°,  $[\alpha]_{D}^{25} +290^\circ$  in 30% EtOH (contains 1 active H and 2 CO); crude (I) gives either this acid or the saturated acid-2,  $C_{20}H_{28}O_4$ , decomp. 240—260°,  $[\alpha]_{D}^{25} +267^\circ$  in 30% EtOH. (B) may be the precursor of acid-2. Acids-1 and -2 resist  $CrO_3$ , but are oxidised by alkaline  $Ag_2O$ . (I) gives sub-fractions, (a), (b), and (c). (a) yields a substance (C), m.p. 220—227°,  $[\alpha]_{D}^{25} +110^\circ$  in EtOH,  $+56^\circ$  in  $C_6H_6$ , probably impure  $C_{21}H_{34}O_5$  (contains 3 OH and 1 CO), which with alkaline  $Ag_2O$  gives 45% of a saturated acid-3,  $C_{21}H_{34}O_6$ , decomp. 240—242°, oxidised by  $K_2Cr_2O_7$  to a ketone-1,  $C_{20}H_{30}O_3$ , m.p. 159—160° after sintering at 156°. Oxidation of (b) with  $Ag_2O$  gives an unattacked mixture, m.p. 142—145° (decomp.), 10—20% of acid-3, and a mixture of acids; of the last-mentioned mixture part readily gives a lactone, stable to  $CrO_3$ , and the remainder is oxidised by  $CrO_3$  to ketone-2,  $C_{19}H_{28}O_3$ , m.p. 159—161° (semicarbazone, cryst.). (a) and (b) give acids with hot dil. NaOH; when the mixture (c) is thus treated, it gives a polyhydric alcohol, substance (D),  $C_{20}H_{36}O_5$ , m.p. 214—216° (usually softens at 170°),  $[\alpha]_{D}^{25} +29^\circ$  in  $COMe_2$ , very hygroscopic, which with HCl-EtOH gives an unsaturated substance,  $C_{20}H_{34}O_5$ ,  $+0.5H_2O$ , m.p. 150—155°, and with hot  $H_2SO_4$ -EtOH a substance,  $C_{20}H_{34(36)}O_5$ ,  $+0.5H_2O$ , m.p. 172—

178°. With  $CrO_3$ , (D) gives ketone-3,  $C_{18}H_{24}O_3$ , m.p. 160—161.5°,  $[\alpha]_{D}^{25} +229^\circ$  in  $C_6H_6$  [contains 1 OH and 1 CO; oxime, m.p. 205—232° (decomp.)]. (III) yields some (D) and substance (E),  $C_{21}H_{30}O_5$ , m.p. 201—208° (decomp.),  $[\alpha]_{D}^{25} +269^\circ$  in  $C_6H_6$  [absorption max. at 2370 Å.; 2:4-dinitrophenylhydrazones, m.p. 255—256° (decomp.)]. Unsaturation is detected by  $C(NO_2)_4$ , OH and CO by  $MgMeI$ . (C) is probably  $C_{19}H_{30}O(OH)_2 > C(OH)\cdot CHO$ , giving on oxidation  $C_{19}H_{30}O(OH)_2 > C(OH)\cdot CO_2H$  (acid-3) and then  $C_{19}H_{30}O(OH)_2CO$  (ketone-1). R. S. C.

Lactone group of the cardiac aglucones and the Grignard reagent. W. A. JACOBS and R. C. ELDERFIELD (J. Biol. Chem., 1936, 114, 597—599).—As expected from the presence of an active H in the  $\Delta^{\beta\gamma}$ -lactone group, the dianhydrolactone (I) from strophanthidin with  $MgMeI$  gives 1  $CH_4$ , digitoxigenin 3 and its acetate 2, but the  $H_4$ -derivative of (I) gives only 0.57 and the two anhydrodigitoxigenins only 1.4 mol. In general expectation is realised, but the exceptions in the lit. require explanation. R. S. C.

Action of mixed organo-magnesium compounds on the esters and N-disubstituted amides of  $\alpha$ -phenyl- $\beta$ -2-furylacrylic acid. N. MAXIM and N. STANCOVICI (Bull. Soc. chim., 1936, 3, [v], 1319—1328; cf. A., 1934, 1360).— $MgEtBr$  with  $\alpha$ -phenyl- $\beta$ -2-furylacryldiphenylamide (cf. A., 1935, 757) in boiling  $Et_2O$  affords  $\alpha$ -phenyl- $\beta$ -2-furylvalerdiphenylamide, b.p. 262°/11 mm., hydrolysed to  $\alpha$ -phenyl- $\beta$ -2-furylvaleric acid (I) (cf. A., 1935, 756). The following are prepared similarly: diphenylamide, b.p. 261°/10 mm., and diethylamide, b.p. 232°/14 mm., of  $\alpha\beta$ -diphenyl- $\beta$ -2-furylpropionic acid (II); diethylamide, b.p. 223°/12 mm., of (I); methylanilides, b.p. 244°/12 mm. and 262°/13 mm., of (I) and (II), respectively. Similarly from the appropriate esters of  $\alpha$ -phenyl- $\beta$ -2-furylacrylic acid (III) with  $MgEtBr$  are obtained exclusively the Et, Pr, b.p. 170°/8 mm., Bu, b.p. 179°/10 mm., and amyl ester, b.p. 192°/7 mm., of (I). With  $MgPhBr$ , the appropriate esters of (III) afford the Et, b.p. 210°/8 mm., Pr, b.p. 226°/9 mm., Bu, b.p. 230°/9 mm., and amyl ester, b.p. 236°/9 mm., of (II), together with  $\alpha\beta$ -triphenyl- $\gamma$ -2-furyl- $\Delta^{\beta}$ -propen- $\alpha$ -ol, m.p. 174°. J. L. D.

Action of mixed organo-magnesium compounds on  $\alpha$ -phenyl- $\beta$ -2-furylacrylonitrile. II. N. MAXIM and G. ALDEA (Bull. Soc. chim., 1936, 3, [v], 1329—1334; cf. A., 1935, 756).— $\alpha$ -Phenyl- $\beta$ -2-furylacrylic acid with  $MgMeI$  in boiling  $Et_2O$  affords  $\alpha$ -phenyl- $\beta$ -2-furylbutyronitrile, b.p. 167°/10 mm. (acid, b.p. 208°/18 mm.; acid chloride, b.p. 165°/12 mm.; amide, b.p. 221°/15 mm.; Et ester, b.p. 428°/15 mm.). The following are prepared similarly:  $\alpha\gamma$ -diphenyl- $\beta$ -2-furylbutyronitrile, b.p. 241°/18 mm. (acid, m.p. 118°; acid chloride, b.p. 184°/17 mm.; amide, m.p. 165°; Et ester, b.p. 230°/17 mm.);  $\alpha$ -phenyl- $\beta$ -2-furyl- $\epsilon$ -methylheptonitrile, b.p. 187°/13 mm. (acid, b.p. 215°/12 mm.; acid chloride, b.p. 187°/10 mm.; amide, m.p. 130°; Et ester, b.p. 192°/20 mm.); and  $\alpha$ -phenyl- $\beta$ -p-tolyl- $\beta$ -2-furylpropionitrile, b.p. 219°/20 mm. (acid, m.p. 163°). J. L. D.

Condensation of benzoin and thymol. II. Constitution of nitration products of 2:3-

**diphenyl-4-methyl-7-isopropylcoumarone.** O. DISCHENDORFER and A. VERDINO (Monatsh., 1936, 68, 81—91).—2:3-Diphenyl-4-methyl-7-isopropylcoumarone (I) with  $\text{HNO}_3$  in AcOH gives a substance which is the 6- $\text{NO}_2$ -derivative (II), m.p. 151°, since it is oxidised ( $\text{CrO}_3$ ) to 4-nitro-6-benzoyloxy-2-methyl-5-isopropylbenzophenone, m.p. 110°, which is hydrolysed to the 6-OH-compound [5-nitro-2-benzoylthymol], m.p. 130—131°, in which the  $\text{NO}_2$  is shown to be in the thymol nucleus by  $\text{KMnO}_4$  oxidation to BzOH. 3-Nitro-6-hydroxy-2-methyl-5-isopropylbenzophenone [4-nitro-2-benzoylthymol] (III), m.p. 124—125°, is prepared by nitration of 2-benzoylthymol (which with  $\text{KMnO}_4$  also gives BzOH), and this structure for (II) thereby excluded. With  $\text{NHPh}\cdot\text{NH}_2$  or  $\text{Na}_2\text{S}_2\text{O}_4$ , (II) yields the 6- $\text{NH}_2$ -derivative of (I), m.p. 146°, of which the  $\Delta\epsilon$  derivative, m.p. 231°, is nitrated to 5-nitro-6-acetamido-2:3-diphenyl-4-methyl-7-isopropylcoumarone, m.p. 281°. A second nitration product of (I) is 5-nitro-2:3-dihydroxy-2:3-diphenyl-4-methyl-7-isopropylcoumarone, m.p. 160°, which is oxidised ( $\text{CrO}_3$ ) to 3-nitro-6-benzoyloxy-2-methyl-5-isopropylcoumarone [4-nitro-2-benzoylthymol benzoate], m.p. 145°, which on hydrolysis yields (III). A third nitration product of (I) is also obtained, but not identified. E. W. W.

**Synthesis of 3-hydroxy-2-ketocoumaran and p-hydroxymandelic acid.** K. LADENBURG, K. FOLKERS, and R. T. MAJOR (J. Amer. Chem. Soc., 1936, 58, 1292—1294).— $o\text{-OH}\cdot\text{C}_6\text{H}_4\cdot\text{CHO}$  in 10% aq.  $\text{NaHSO}_3$  with aq.  $\text{NaCN} + \text{Et}_2\text{O}$  gives the unstable  $o$ -hydroxymandelonitrile, not distillable, converted by  $\text{Et}_2\text{O}\cdot\text{HCl}$  into the imino-ether hydrochloride, which is hydrolysed to 3-hydroxy-2-ketocoumaran (I), m.p. 107—108°. (I) is partly hydrolysed in aq. solution to  $o\text{-OH}\cdot\text{C}_6\text{H}_4\cdot\text{CH}(\text{OH})\cdot\text{CO}_2\text{H}$  (Ca salt).  $p\text{-OH}\cdot\text{C}_6\text{H}_4\cdot\text{CHO}$  is similarly converted into  $p\text{-OH}\cdot\text{C}_6\text{H}_4\cdot\text{CH}(\text{OH})\cdot\text{CN}$ , m.p. 99—102° (lit. 98°), and thence into  $p\text{-OH}\cdot\text{C}_6\text{H}_4\cdot\text{CH}(\text{OH})\cdot\text{CO}_2\text{H}$ , m.p. 109.5—110.5° (lit. 105—108°) (Et ester, m.p. 128.5—129°). Introduction of  $o$ - or  $p$ -OH into  $\text{OH}\cdot\text{CHPh}\cdot\text{CO}_2\text{H}$  does not increase the bactericidal activity towards *S. aureus* and *E. typhi*. H. B.

**isoFlavone series.** P. C. MITTER and S. S. MAITRA (J. Indian Chem. Soc., 1936, 13, 236—259).—The azlactone, m.p. 168°, from  $\beta$ -resorcyraldehyde  $\text{Me}_2$  ether with boiling 10% NaOH gives 2:4-dimethoxyphenylpyruvic acid, hygroscopic, m.p. 156°, the oxime, m.p. 145° (decomp.), of which with  $\text{Ac}_2\text{O}$  at 100° gives 2:4-dimethoxyphenylacetone, m.p. 76°. This affords (Hoesch) 2:4:6-trihydroxy-2':4'-dimethoxyphenylacetophenone (I), m.p. 175°, the  $\text{Ac}$  derivative, m.p. 204—205°, of which with hot 1% KOH-EtOH yields 5:7-dihydroxy-2':4'-dimethoxy-2-methylisoflavone, m.p. 213—214° (does not fluoresce in aq. alkali; pink colour with  $\text{H}_2\text{SO}_4$ , violet  $\rightarrow$  brown with  $\text{FeCl}_3$ ). The  $(\text{CH}_2\text{Ph})_2$  derivative, m.p. 135°, of (I) does not condense with  $\text{HCO}_2\text{Et}$  and "mol." Na. R. S. C.

**Synthesis of (A) di(coumarino-3-carboxyl)-methane (B) 7:7'-dihydroxydi(coumarino-3-carboxyl)methane.** M. TRENNKERNOWNA (Rocz. Chem., 1936, 16, 6—11, 12—18).—(A) The chloride of coumarin-3-carboxylic acid (I) and  $\text{CH}_2\text{Ac}\cdot\text{CO}_2\text{Et}$

(II) in boiling  $\text{CHCl}_3$  yield Et coumarinyl-3-carboxylacetate, m.p. 125—126°, converted into 3-acetoacetyl coumarin, m.p. 143—144°, the Cu salt, m.p. 280°, of which condenses with (I) (in boiling anisole; 3 hr.) to yield di(coumarino-3-carboxyl)methane, also prepared in the same way from (I) and Et (coumarinyl-3-carboxyl)acetate, or from Et di(coumarinyl-3-carboxyl)acetate (in boiling anisole; 20 min.).

(B) 2:4-(OH) $_2$  $\cdot\text{C}_6\text{H}_3\cdot\text{CHO}$  and  $\text{CO}(\text{CH}_2\cdot\text{CO}_2\text{Et})_2$ , in presence of piperidine, afford 7-hydroxy-3-carbethoxyacetyl coumarin, m.p. 146—148°, an aq. NaOH solution of which reacts with  $\text{OMe}\cdot\text{COCl}$  at 0° to yield 7-methoxyformyloxy-3-carbethoxyacetyl coumarin (III), m.p. 134° (Cu salt, m.p. 238—240°). 7-Methoxyformyloxy coumarin-3-carboxylic acid (IV), m.p. 210°, and (II) in boiling  $\text{CHCl}_3$  yield 7-methoxyformyloxy-3-acetyl carbethoxyacetyl coumarin, m.p. 131°, converted by autoclaving into 7-methoxyformyloxy-3-acetoacetyl coumarin (V), m.p. 204—205°. The Cu salt of (III) or (V) and the chloride of (IV) in boiling anisole yield 7:7'-dimethoxyformyloxy-3:3'-dicoumarinoylmethane, m.p. 254—255°, from which the 7:7'-(OH) $_2$ -compound, decomp. 335°, is prepared by hydrolysis ( $\text{NaOMe}\cdot\text{MeOH}$ ). R. T.

**Natural coumarins. XIX. Constitution of ammosesinol.** E. SPATH, A. F. J. SIMON, and J. LINTNER (Ber., 1936, 69, [B], 1656—1664).—Ammosiacum resin is shaken with  $\text{Et}_2\text{O}$  and the filtered solution is extracted with 5%  $\text{Na}_2\text{CO}_3$ . The extract is acidified with HCl, immediately extracted with  $\text{Et}_2\text{O}$ , and the residue left after removal of the solvent is converted by  $\text{Ac}_2\text{O}$  at 100° into diacetylammossesinol (I), b.p. 210—225° (bath)/0.02 mm., m.p. 101—102°. (I) is converted by cautious treatment with 2N- $\text{Na}_2\text{CO}_3$  in MeOH into acetylammossesinol (III), m.p. 128—129°, and by KOH-MeOH at 60° into ammosesinol (III), m.p. 107—108° (vac.). Analyses of (I), (II), and (III) confirm the formula  $\text{C}_{21}\text{H}_{30}\text{O}_4$  for (III). Treatment of (III) with  $\text{CH}_3\text{N}_2$  in MeOH- $\text{Et}_2\text{O}$  gives methylammossesinol (IV), b.p. 220—235° (bath)/0.005 mm., difficultly sol. in cold, readily in hot, dil. aq. alkali indicating that 2 O of (III) are present in a lactone group. Styphnic and  $\beta$ -resorcylic acid are formed by the degradation of (I). Oxidation of (IV) with  $\text{KMnO}_4$  yields 2-hydroxy-4-methoxy- and 2:4-dimethoxybenzoic acid. Repetition of Caspari's work shows that the oxidation of (I) leads to 2-hydroxy-4-acetoxybenzoic acid [whence the 2:4-(OMe) $_2$ -acid] and not  $\gamma$ -resorcylic acid, the residue of which is therefore not a component of (III). Catalytic hydrogenation (Pd-C in AcOH) of (I) affords diacetylhexahydroammossesinol, b.p. 210—220° (bath)/0.02 mm., m.p. 62—64°, oxidised by  $\text{KMnO}_4$  in alkaline solution to 80u-trimethyltetradecic acid (V), b.p. 135—145°/0.03 mm. [ $p$ -xenylamide, m.p. 98—99° (vac.)]. The constitution of (V) is established by its formation by the oxidation of  $\beta$ 5x-trimethylpentadecan- $\xi$ -one (VI) by Br in NaOH and by its conversion into (VI) by treatment with  $\text{SOCl}_2$  followed by Zn-Cu, MeI, and EtOAc in  $\text{C}_6\text{H}_6$ . (III) therefore contains a single carbocyclic 6-membered ring. Further insight into the structure of the side-chain is afforded by the ozonolysis of (I) to  $\beta$ -methyl- $\Delta^8$ -hepten- $\xi$ -one, indicating the presence

of isoprene units. Distillation of (III) at 200—230°/0.3 mm. affords resacetophenone and 7-hydroxy-3-methylbenzotetronic acid (VII), m.p. 304—305°. (III)

is therefore A. (VII) is obtained synthetically by the condensation of  $\text{CHMe}(\text{CO}_2\text{Et})_2$  with 2:4-diacetoxybenzoyl chloride and treatment of the product with 50%  $\text{H}_2\text{SO}_4$ . Its  $\text{Ac}_2$  derivative is only very slowly hydrogenated, thus explaining the apparent saturation of (I) after the absorption of 3  $\text{H}_2$ .

H. W.

**Lomatol. II. Occurrence, constitution, relation to and conversion into lapachol. Synthesis of lapachol.** S. C. HOOKER. **III. Oxidation with alkaline potassium permanganate. IV. Violet quinone from the oxidation product.** S. C. HOOKER and A. STEYERMARK (J. Amer. Chem. Soc., 1936, 58, 1181—1190, 1198—1201, 1207—1211). —II (cf. Rennie, J.C.S., 1895, 67, 784). Methods of isolation of lomatol (I) from the ripe and unripe fruits of various species (Australian) of *Lomatia* are given; (I) is absent from seeds of several species from Chile. (I) is now shown to be 3-hydroxy-2- $\beta$ -hydroxy- $\gamma$ -methyl- $\Delta^8$ -butenyl-1:4-naphthaquinone. Reduction ( $\text{H}_2$ ,  $\text{PtO}_2$ , EtOH) of (I) affords either (mainly) hydroxylomatol (the 2- $\beta$ -hydroxy- $\gamma$ -methylbutyl derivative), m.p. 101—102° [converted by conc.  $\text{H}_2\text{SO}_4$  into (VI) (below)], or hydroxylapachol (the 2-isoamyl derivative), m.p. 93.5—94°, probably owing to variations in the catalyst. *iso*Lomatol (II) (the 2- $\beta$ -hydroxy- $\gamma$ -methyl- $\Delta^7$ -butenyl derivative) and hydroxylapachol (J.C.S., 1896, 69, 1355) are both similarly reduced to 3-hydroxy-2- $\beta$ -hydroxy-isoamyl-1:4-naphthaquinone (=hydroxylomatol- $\beta$ -hydroxyhydroxylapachol) (III), m.p. 120.5—121.5°; (I) and (II) are not, therefore, stereoisomerides (cf. *loc. cit.*). (I) is converted by cold aq.  $\text{H}_2\text{SO}_4$  into dehydro-*iso*- $\beta$ -lapachone (5:6-benzo-1-isopropenylcoumaran-3:4-quinone) (IV), m.p. 116—116.5° [quinoxaline, m.p. 157.5—158°, from  $\text{o-C}_6\text{H}_4(\text{NH}_2)_2$ ], hydrolysed (1% NaOH) to (II). (II) and dil.  $\text{H}_2\text{SO}_4$  also give (IV); conc.  $\text{H}_2\text{SO}_4$  affords hydroxy- $\beta$ -lapachone (3-hydroxy-2:2-dimethyl-3:4-dihydro- $\alpha\beta$ -naphthopyran-5:6-quinone), m.p. 203—205°. (IV) is reduced ( $\text{H}_2$ ,  $\text{PtO}_2$ , EtOH-AcOH) to *iso*- $\beta$ -lapachone (the 1- $\text{Pr}^{\beta}$  derivative) (V), m.p. 124.5—125.5°, which could not be prepared by reduction of the corresponding coumarone (*loc. cit.*). (V) is hydrolysed (1% NaOH) to (III), which is converted by conc.  $\text{H}_2\text{SO}_4$  into  $\beta$ -lapachone (VI). The above work also constitutes a synthesis of lapachol.

**III.** Lomatol is oxidised (1%  $\text{KMnO}_4$ , 1% NaOH) to 3-hydroxy-2- $\gamma$ -hydroxy- $\beta$ -methyl- $\Delta^8$ -propenyl-1:4-naphthaquinone (VII) and a little 1-methyl-4:5-benzocoumarone-3:6-quinone, m.p. 246—247° (largely unaffected by dil. alkali). (VII) heated alone or with dil. HCl passes into the red 3-methyl- $\beta\beta$ -naphthopyran-5:10-quinone (VIII), m.p. 196.5—197.5°, reduced (Adams) to the 3:4- $\text{H}_2$ -derivative (IX),

m.p. 170.5—171°, which is hydrolysed (1% NaOH) to 3-hydroxy-2- $\gamma$ -hydroxyisobutyl-1:4-naphthaquinone (X), m.p. 147.5—148.5°, also obtained with the 2-Bu $^{\beta}$  derivative by reduction of (VII). (X) and conc.  $\text{H}_2\text{SO}_4$  give 3-methyl-3:4-dihydro- $\alpha\beta$ -naphthopyran-5:6-quinone (XI), m.p. 148—148.5° (quinoxaline, m.p. 163—163.5°), hydrolysed (boiling alkali) to (X) and converted by conc. HCl at 55—65° into (IX).

**IV.** Hydrolysis (1% NaOH) of (VIII) gives an unstable OH-compound which passes readily into the violet 3-methyl- $\alpha\beta$ -naphthopyran-5:6-quinone (XII), m.p. 156—158° (decomp.) (quinoxaline, m.p. 163—163.5°); a little of a compound, m.p. 239—240° (decomp.), is also isolated. (XII) is converted into (VIII) by boiling EtOH,  $\text{H}_2\text{O}$ , or very dil. HCl; hydrolysis (conc.  $\text{H}_2\text{SO}_4$  or, better, 0.25% NaOH in air) affords 3-hydroxy-2- $\beta$ -formyl- $\Delta^8$ -propenyl-1:4-naphthaquinone, m.p. 229—230° (decomp.) [*Me*, 160—161°, *Et*, m.p. 184.5—185.5° ( $\text{H}_2$ -derivative, m.p. 185—186°), and *Bu* $^{\alpha}$ , m.p. 121.5—122°, *semiacetals*, formed by the action of AlkOH, which may be 2-alkoxy-3-methyl- $\beta\beta$ -naphthopyran-5:10-quinones], which is converted by aq.  $\text{NH}_3$  into a compound, m.p. 136—137°, and by boiling AcOH into an anhydride,  $\text{C}_{28}\text{H}_{18}\text{O}_7$ , m.p. 243—244° (decomp.). (XII) is reduced (Adams) to (XI). H. B.

#### Constitution of lapachol and its derivatives.

**IV. Oxidation with potassium permanganate. V. Structure of Paterno's "isolapachone."** S. C. HOOKER (J. Amer. Chem. Soc., 1936, 58, 1168—1173, 1190—1197). —IV. Oxidation (1%  $\text{KMnO}_4$ ) of lapachol (3-hydroxy-2- $\gamma$ -methyl- $\Delta^8$ -butenyl-1:4-naphthaquinone) in 1% NaOH at about 0° gives 3-hydroxy-2- $\beta$ -methyl- $\Delta^8$ -propenyl-1:4-naphthaquinone (I), m.p. 119—120° [acetate, m.p. 85.5—86°; compound,  $\text{C}_{20}\text{H}_{16}\text{ON}_2$ , m.p. 226—227° (decomp.), with  $\text{o-C}_6\text{H}_4(\text{NH}_2)_2$ ], which is further oxidised to 2-hydroxy-1:4-naphthaquinone and is reduced ( $\text{H}_2$ ,  $\text{PtO}_2$ , EtOH) to 3-hydroxy-2-isobutyl-1:4-naphthaquinone (II), m.p. 132.5—133.5°. Similar oxidation of hydroxylapachol affords (II), whilst hydroxyhydroxylapachol (J.C.S., 1892, 61, 611; 1896, 69, 1356) yields 3-hydroxy-2- $\beta$ -hydroxyisobutyl-1:4-naphthaquinone (III), m.p. 121—122°. 3-Hydroxy-2-sec-butyl-1:4-naphthaquinone, m.p. 92.5—93°, is obtained by reduction of the 2- $\alpha$ -methylallyl derivative (Fieser, A., 1927, 462). (I) and (III) are converted by short treatment with cold conc.  $\text{H}_2\text{SO}_4$  into 5:6-benzo-1:1-dimethylcoumaran-3:4-quinone, m.p. 187—188° [quinoxaline, m.p. 154—155°, from  $\text{o-C}_6\text{H}_4(\text{NH}_2)_2$ ], which is hydrolysed (1% NaOH) to (III), is converted by aq. HCl at 50—65° into 3-hydroxy-2- $\beta$ -chloroisobutyl-1:4-naphthaquinone, m.p. 147—148° (decomp.), and is isomerised by HBr (*d* 1.49) at 65—69° to 4:5-benzo-1:1-dimethylcoumaran-3:6-quinone, m.p. 183—184° [also obtained from (III) and boiling dil. HCl or  $\text{H}_2\text{SO}_4$ ], also hydrolysed (1% NaOH) to (III). Lapachol and 3-hydroxy-2-*n*-amyl-1:4-naphthaquinone with  $\text{PbO}_2$  in AcOH give peroxides, m.p. 154—155° and 117—118°, respectively.

**V.** Acetylation ( $\text{Ac}_2\text{O}$ -NaOAc) of lapachol affords 5:10-diacetoxy-2:2-dimethyl- $\beta\beta$ -naphthopyran (I), m.p. 131—132° [identical with the Ac $_2$  derivative described

by Paterno (A., 1883, 210)], and 5:6-diacetoxy-2:2-dimethyl- $\alpha$ - $\beta$ -naphthpyran (II), m.p. 128—129°,

which give different colours with conc.  $\text{H}_2\text{SO}_4$ . Successive reduction ( $\text{H}_2$ ,  $\text{PtO}_2$ ,  $\text{EtOH}$ ) [whereby the 3:4- $\text{H}_2$ -derivatives, m.p. 169.8—170° and 162—162.6°, respectively (cf. Monti, A., 1915, i, 824), are produced] and hydrolysis ( $\text{AcOH}$ — $\text{H}_2\text{SO}_4$  in air) of (I) and (II) gives  $\alpha$ -lapachone (2:2-dimethyl-3:4-dihydro- $\beta$ - $\beta$ -naphthpyran-5:10-quinone) (III) and  $\beta$ -lapachone (2:2-dimethyl-3:4-dihydro- $\alpha$ - $\beta$ -naphthpyran-5:6-quinone) (IV), respectively. Hydrolysis ( $\text{AcOH}$ —dil.  $\text{H}_2\text{SO}_4$ , aq.  $\text{NaOH}$ , or  $\text{EtOH}$ — $\text{KOH}$  in air) of both (I) and (II) affords *dehydrolapachone* (most probably 2:2-dimethyl- $\beta$ - $\beta$ -naphthpyran-5:10-quinone) (V), m.p. 142.5—143°, reduced (Adams) to (III) and converted by  $\text{Zn}$ — $\text{Ac}_2\text{O}$  into (I). Paterno's *isolapachone* (*loc. cit.*) is (V). Reductive acetylation of "isopropylfuran-1:2- and -1:4-naphthaquinones" (J.C.S., 1896, 69, 1353), which are isomeric with (V), gives the corresponding *quinol diacetates*, m.p. 135.5—136.5° and 167—168°, respectively. The above formulation of (V) as a 1:4-quinone is uncertain in view of the following results.  $o$ - $\text{C}_6\text{H}_4(\text{NH}_2)_2$ , and (V) in  $\text{AcOH}$  yield *dehydrolapazine* (VI), m.p. 156.5—157°, which is formulated as the quinoxaline from 2:2-dimethyl- $\alpha$ - $\beta$ -naphthpyran-5:6-quinone; lapachol similarly furnishes *lapaurhodone* (VII), m.p.

161.5—162.5°, which is oxidised (air in aq.  $\text{NaOH}$  +  $\text{Et}_2\text{O}$ ) to (VI). Reduction (Adams) of (VI) gives *lapazine*, two forms, m.p. 130.5—131.5° and 121.5—122.5°, also obtained from (VII) and cold conc.  $\text{H}_2\text{SO}_4$  and from (IV) and  $o$ - $\text{C}_6\text{H}_4(\text{NH}_2)_2$ . Methyl-lapaurhodone [from lapachol and  $o$ -tolylenediamine (VIII)] is oxidised [as (VII)] to *methyldehydrolapazine*, two forms, m.p. 149—151.5° and 169.5—171.5°, also formed from (V) and (VIII). Bromo- $\beta$ -lapachone [the 3-Br-derivative of (IV)] (J.C.S., 1892, 61, 611) is hydrolysed by 1%  $\text{NaOH}$  at room temp. to dihydroxyhydrolapachol (IX) (*loc. cit.*) and a little (V); 5%  $\text{NaOH}$  affords (IX) and 3-hydroxy-2- $\beta$ -methyl- $\Delta^5$ -propenyl-1:4-naphthaquinone, m.p. 119—120° [also obtained from (V) and 10%  $\text{NaOH}$  alone or in presence of  $\text{Zn}$  dust (with subsequent atm. oxidation)]. Acetylation ( $\text{Ac}_2\text{O}$ — $\text{NaOAc}$ ) of 3-hydroxy-2-allyl-1:4-naphthaquinone gives a *diacetate*,  $\text{C}_{17}\text{H}_{14}\text{O}_5$ , m.p. 178.5—179.5°, in addition to that [new m.p. 223.5—224.5° (decomp.)] described by Fieser (A., 1927, 155).

H. B.

**Pyrenium compounds. XXV. Dehydrenium dyes;** new class of carbenium salts. W. DILTHEY and F. QUINT [in part with R. KNIPP] (Ber., 1936, 69, [B], 1575—1591).—Treatment of *ms*-phenyldibenzoxanthanol with  $\text{AlCl}_3$  at 175—200° affords *dehydro-ms-phenyldibenzoxanthenium*

*chloride* (I) (A;  $\text{X}=\text{Cl}$ ) (corresponding *picrate* and *perchlorate*). The one-sided ring-closure is established

by analysis of the salts and by the similarity of the reaction with the corresponding *o*-tolyl compounds (see below). With carbinols the change is effected with certainty by  $\text{AlCl}_3$ , but with the salts irradiation or treatment with  $\text{ZnCl}_2$  is requisite. Thus *ms*-phenyldibenzoxanthenium perchlorate and  $\text{ZnCl}_2$  at 400—500° yield (I), whence the corresponding *bromide* ( $\text{X}=\text{Br}+0.5\text{HBr}$ ) and *iodide*,  $\text{C}_{27}\text{H}_{16}\text{O}_2$ . Reduction of (I) by  $\text{Zn}$  dust in boiling  $\text{AcOH}$  affords *dehydro-ms-phenyldibenzoxanthane* (B), m.p. 250—252° (decomp.), immediately re-oxidised to A by  $\text{PbO}_2$  in  $\text{AcOH}$ . *ms*-*o*-Chlorophenyldibenzoxanthanol and  $\text{AlCl}_3$  eliminate  $\text{HCl}$  with production of (I). *p*- $\text{C}_6\text{H}_4\text{Me}\cdot\text{CHO}$  and  $\beta$ - $\text{C}_{10}\text{H}_7\cdot\text{OH}$  in  $\text{AcOH}$ —12*N*- $\text{HCl}$  at 100° afford *ms-p-tolyldibenzoxanthane*, m.p. 228—229°, oxidised by  $\text{PbO}_2$  in  $\text{AcOH}$  to *ms-p-tolyldibenzoxanthanol*, m.p. 265—266° (decomp.) after softening at 255°. Treatment of this with  $\text{AlCl}_3$  at 200° or exposure of its *perchlorate*, m.p. 286—287°, in  $\text{AcOH}$  to sunlight leads to *dehydro-ms-p-tolyldibenzoxanthenium chloride* (corresponding *picrate*), reduced to *dehydro-ms-p-tolyldibenzoxanthane*, m.p. 229—230° (decomp.) after softening.  $o$ - $\text{C}_6\text{H}_4\text{Me}\cdot\text{COCl}$ , ( $\beta$ - $\text{C}_{10}\text{H}_7$ ) $_2\text{O}$ , and  $\text{AlCl}_3$  at 120—150° give *ms-o-tolyldibenzoxanthanol*, decomp. 245—246° after softening, transformed by  $\text{AlCl}_3$  into *dehydro-ms-o-tolyldibenzoxanthenium chloride*, which could not be reduced to a cryst. xanthane. *Dehydro-ms-o-tolyldibenzoxanthenium perchlorate* is obtained by irradiation of *ms-o-tolyldibenzoxanthenium perchlorate*, m.p. 293—294° (decomp.) after softening. Irradiation of *ms-o-chlorophenyldibenzoxanthenium perchlorate* is accompanied by loss of  $\text{HCl}$ . Dehydrogenation of *ms-o-chlorophenyldibenzoxanthane* cannot be effected with  $\text{AlCl}_3$  and only with difficulty by irradiation in  $\text{AcOH}$  in presence of  $\text{O}_2$  which can be replaced by methylene-blue or *p*-benzoquinone. *p*- $\text{C}_6\text{H}_4\text{Cl}\cdot\text{COCl}$ , ( $\beta$ - $\text{C}_{10}\text{H}_7$ ) $_2\text{O}$ , and  $\text{AlCl}_3$  in  $\text{CS}_2$  yield *p-chlorophenyldibenzoxanthanol* (III), m.p. 275—276° (decomp.) after softening (*perchlorate*, m.p. 291°); it is transformed by  $\text{AlCl}_3$  into (I). *Dehydro-ms-p-chlorophenyldibenzoxanthenium perchlorate* is obtained slowly by exposure to sunlight and  $\text{O}_2$  of a solution of *ms-p-chlorophenyldibenzoxanthenium perchlorate* in boiling  $\text{AcOH}$  whereas the corresponding *picrate* is obtained similarly from (III) and picric acid in the same solvent.  $\beta$ - $\text{C}_{10}\text{H}_7\cdot\text{OH}$  and  $\beta$ - $\text{C}_{10}\text{H}_7\cdot\text{CHO}$  in  $\text{HBr}$ — $\text{AcOH}$  give *ms-l'-naphthyldibenzoxanthane*, m.p. 245° and, after re-solidification, m.p. 253—254.5°, oxidised by  $\text{PbO}_2$  in boiling  $\text{AcOH}$  to *ms-l'-naphthyldibenzoxanthanol*, decomp. 280—281° when placed in bath preheated to 270°. *l'-Naphthyldibenzoxanthenium perchlorate*, m.p. 325° (decomp.) after softening at 315°, is dehydrogenated in sunlight by

O, in boiling AcOH to *dehydro-ms-1'-naphthylidibenzo-xanthenium perchlorate*.

H. W.

**Biochemistry of micro-organisms.** L. RAVENELIN (1:4:8-trihydroxy-3-methylxanthone), a new metabolic product of *Helminthosporium Ravenelii*, Curtis, and of *H. Turcicum*, Passerini. H. RAISTRICK, R. ROBINSON, and D. E. WHITE (Biochem. J., 1936, 30, 1303—1314).—The yellow pigment, *ravenelin* (I),  $C_{14}H_{10}O_5$ , m.p. 267—268° (corr.), a metabolism product of the plant pathogens *H. Ravenelii*, Curtis, and *H. Turcicum*, Passerini, is optically inactive, has pseudo-acidic characters, contains 1 side-chain Me as shown by the Roth-Kuhn micro-method, gives an O-triacetate, m.p. 204—205° (corr.), O-tribenzoate, m.p. 255° (corr.), O-trianisoyl derivative, m.p. 216—218° (corr.), a  $Br_3$ -derivative, resorcinol by KOH fusion, a  $Me_2$  ether, m.p. 285—287° (corr.), and a  $Me_3$  ether (II), m.p. 178—179°. (II) was inert to alkalis and  $Ac_2O$ , was basic, and gave a ferrichloride,  $C_{17}H_{17}O_5FeCl_4$ , m.p. 174—175° (corr.), with  $HNO_3$  gave a nitrodimethylravenelin, m.p. 224—226°, with  $MgPhBr$  gave the Et ether of phenyltrimethoxyxanthanol, m.p. 166°, and with  $NaNH_2$  gave an oil identical with synthetic 2:5:3'-trimethoxy-3-methylidiphenyl ether since both gave the same  $Br_4$ -derivative, m.p. 152°. The above facts limit the structure to 1:4:8-(or 1:4:6)-trihydroxy-3-methylxanthone. The synthesis of 1:4:6-trimethoxy-3-methylxanthone, m.p. 157°, is described and as this is not identical with (II), (I) must be 1:4:8-trihydroxy-3-methylxanthone. The following compounds were synthesised in the preps. above: 4-bromo-2:5-dimethoxytoluene, m.p. 90—91° (corr.); 2:5:3'-trimethoxy-4-methylidiphenyl ether, b.p. 192—195°/2.5 mm., m.p. 72—74° (corr.) ( $Br_3$ -derivative, m.p. 130°); 2:5:3'-trimethoxy-3-methylidiphenyl ether, b.p. 165—166°/0.5 mm. [ $Br_3$ -derivative, m.p. 133° (corr.)]; 4:5:3'-trimethoxy-2-methylidiphenyl ether, b.p. 160—162°/0.2 mm., m.p. 68—69° (corr.) ( $Br_4$ -derivative, m.p. 115°). The optimum cultural conditions for the production of (I) by *H. Ravenelii* were determined and the relationship of (I) to the polyhydroxyanthraquinones also produced by *Helminthosporia* is discussed. Only two other naturally occurring hydroxyxanthenes—euxanthone and gentsin—have been previously isolated.

P. W. C.

**Colouring matter of the flowers of *Lantana camara*, Linn.**—See this vol., 1166.

**Components of leaves of *Ficus carica*.** K. OKAHARA (Bull. Chem. Soc. Japan, 1936, 11, 389—394).—The aq. extract of the leaves yields crystals of *ficusin* (I),  $C_{11}H_8O_3$ , m.p. 161—162°, which is sol. in warm alkali and contains a lactone ring, the third O being inert. Catalytic reduction affords tetrahydroficusin,  $C_{11}H_{10}O_3$ , m.p. 154°, methylation methylficusinic acid,  $OMe \cdot C_{10}H_6 \cdot CO_2H$ , m.p. 161—162°, and nitration in AcOH nitroficusin,  $C_{11}H_8O_3 \cdot NO_2$ , m.p. 254°. Oxidation of (I) with  $H_2O_2$  in alkaline solution yields furan-2:3-dicarboxylic acid and alkali fusion 4:6-dimethoxyisophthalic acid. (I) is therefore as shown. The  $COMe_2$  extract of the leaves contained bergapten which with  $Me_2SO_4$

and alkali gave methylbergaptenic acid,  $C_{14}H_{12}O_6$ , m.p. 138.

A. T.

**Arsenic and iodine compounds of the pyridine series.** A. BINZ and H. MATER-BODE (Angew. Chem., 1936, 49, 486—489; cf. A., 1935, 1156).—Details are given of the prep. of the As compounds described previously. 3-Iodo-2-hydroxypyridine and 3-iodo-2-pyridone-*N*-acetic acid have been prepared by diazotisation of 3-amino-2- and -4-hydroxypyridine, respectively. 5-Bromo-3-amino-4-hydroxypyridine has been prepared by reduction of 5-bromo-3-nitro-4-hydroxypyridine. Action of I in KI on 3-hydroxypyridine in the cold yields 2-iodo-3-hydroxypyridine, and warm yields (? 2:5-)di-iodo-3-hydroxypyridine. The stability of I-compounds of  $C_5H_5N$ , as examined by heating under pressure with  $H_2O$  at 170°, decomp. with  $HNO_3$ , and pptg. with  $AgNO_3$ , is that of the  $C_6H_6$  series, thus explaining why Selectan compounds can pass into the organism by intravenous application without eliminating I, and so can be used as harmless X-ray contrast media.

J. W. S.

**Reduction products of nicotinamide methiodide.** P. KARRER, G. SCHWARZENBACH, F. BENZ, and U. SOLMSEN (Helv. Chim. Acta, 1936, 19, 811—828).—Nicotinamide [from Et nicotinate (I) and  $NH_3 \cdot MeOH$  at 150°], m.p. 151° (methochloride, m.p. about 240°), gives a methiodide, m.p. 204°, which with  $Na_2S_2O_4$  yields a yellow, oily 1-methyldihydronicotinamide (II), which resembles Warburg's co-enzyme in that it is a very powerful reducing agent [cold  $AgNO_3$  instantaneously, methylene-blue, indigotin-di-, -tri-, and -tetra-sulphonate; can be titrated potentiometrically with  $K_3Fe(CN)_6$ ], gives a very high negative potential to Pt, and has an absorption band at 360 mμ, changed to 295—300 mμ by acid (which also causes much loss of reducing power). On these accounts and because it has no blue fluorescence (II) is a 1:2- or 1:6- $H_2$ -derivative. Acidification gives a colourless, cryst. isomeride, decomp. about 236° (darkening from 200°), which has an intense blue fluorescence, reduces  $AgNO_3$  only when heated, is stable to  $K_3Fe(CN)_6$ , and is thus the 1:4- $H_2$ -compound. 1-Methyl-2- or -6-butyl-1:2- or -1:6-dihydronicotine and *NN'*-dibenzyltetrahydrodipyridyl, but no 1:4- $H_2$ -compounds, can be titrated with  $K_3Fe(CN)_6$ . Nicotinmethylamide [from (I)], m.p. 102°, ω-ethoxynicotinimide dihydrochloride (III) (from nicotinonitrile and  $HCl \cdot EtOH$ ), m.p. about 233°, nicotinmethylamidine dihydrochloride [from (III) and  $NH_2Me$ ], m.p. about 240°, nicotinamide methoxymethochloride, and pyridine glucosidobromide do not give similar  $H_2$ -compounds.

R. S. C.

**Synthesis of *dl*-proline from pyrrole.** F. K. SIGNAIGO and H. ADKINS (J. Amer. Chem. Soc., 1936, 58, 1122—1124).—Alternate addition (in portions) of 1 mol. each of  $ClCO_2Et$  and  $MgEtBr$  to pyrrole +  $MgEtBr$  (1:1) followed by a further mol. of  $ClCO_2Et$  gives Et pyrrole-1- (26.4) and -2-carboxylate (1.5), and -1:2-dicarboxylate (65%). The last is reduced (method: this vol., 861) to Et pyrrolidine-1:2-dicarboxylate, hydrolysed (conc.  $HCl$ ) to *dl*-proline (over-all yield 57%).

H. B.

**Pyrrole series. I. Preparation of *N*-methylpyrroles.** A. H. CORWIN and W. M. QUATTLE-

BAUM, jun. II. Mechanism of aldehyde synthesis of pyrromethenes. A. H. CORWIN and J. S. ANDREWS (J. Amer. Chem. Soc., 1936, 58, 1081—1085, 1086—1090).—I. The question of *N*-isomerism (i.e., position of NH groups in porphin nucleus) is discussed briefly (cf. Fischer and Loy, A., 1923, i, 718; Conant and Bailey, A., 1933, 403). Et 2:4-dimethylpyrrole-3:5-dicarboxylate (I) (improved prep.) with Na in PhMe followed by  $\text{Me}_2\text{SO}_4$  gives the 1:2:4-*Me*<sub>3</sub> ester (II), m.p. 113—114°, converted by  $\text{SO}_2\text{Cl}_2$  in AcOH at 60° into Et 2-formyl-1:4-dimethylpyrrole-3:5-dicarboxylate, m.p. 94°, also prepared by methylation ( $\text{Me}_2\text{SO}_4$ , MeOH-KOH) of (VI) (below). (II) is hydrolysed (conc.  $\text{H}_2\text{SO}_4$  at <30°) to the 5-Et 3-*H* ester, decomp. 192°, decarboxylated in glycerol to Et 1:2:4-trimethylpyrrole-5-carboxylate, m.p. 47°, the 3-*Ac* derivative (III), m.p. 62°, of which, best prepared by methylation [as for (I)] of the 3-acetyl-2:4-dimethyl derivative, is reduced (method: Fischer *et al.*, A., 1929, 1463) to 1:2:4-trimethyl-3-ethylpyrrole (IV), b.p. 93°/23 mm. (IV) and 40%  $\text{CH}_2\text{O}$  in 95% EtOH give (provided mineral acid is absent) 1:3:5:1':3':5'-hexamethyl-4:4'-diethyl-2:2'-dipyrrylmethane (V), m.p. 106°, which could not be oxidised to a methene. (IV) and (V) are both oxidised (aq.  $\text{CrO}_3$ , 20%  $\text{H}_2\text{SO}_4$ ) to the *N*-Me derivative, b.p. 215—220°, of methylethylmaleimide. Reduction [ $\text{H}_2$  (2500 lb.), Raney Ni, EtOH, 150°] of (III) affords Et 1:2:4-trimethyl-3-ethylpyrrole-5-carboxylate, b.p. 124°/2 mm., also obtained by methylation ( $\text{Me}_2\text{SO}_4$ , *tert*-amyl alcoholic Na *tert*-amyloxide) of the 2:4-*Me*<sub>2</sub> ester. Et 2-formyl-4-methylpyrrole-3:5-dicarboxylate (VI) and Et 2:4-dimethylpyrrole-3-carboxylate with dry HCl in Et<sub>2</sub>O (other methods unsuccessful) give 3:5:4'-tricarboethoxy-4:3':5'-trimethylpyrromethene hydrochloride, sinters >120°, decomposed by boiling EtOH to (VI) and unidentified material. Hydrolysis (EtOH-KOH) of (II) yields the 3-Et 5-*H* ester, decarboxylated to Et 1:2:4-trimethylpyrrole-3-carboxylate, m.p. 62°, which with 40%  $\text{CH}_2\text{O}$  and EtOH-HCl affords 4:4'-dicarboethoxy-1:3:5:1':3':5'-hexamethyl-2:2'-dipyrrylmethane, m.p. 151—152°, which could not be oxidised (Br) to the methene. Attempts to prepare 1-methyl- and 1:1-dimethyl-pyrromethenes from some of the above *N*-Me derivatives were unsuccessful. 4:4'-Dicarboethoxy-3:5:3':5'-tetramethylpyrromethene (VII) could not be methylated [as for (I)]; decomp. occurs.

II. The (anomalous) production of (VII) from Et 2:4-dimethylpyrrole-3-carboxylate (VIII) and Et 2-formyl-4-methyl-3-ethylpyrrole-5-carboxylate (Fischer and Ernst, A., 1926, 621) is best explained by the intermediate formation (and subsequent fission) of a tripyrrylmethane (4). It is now shown that (4) can be intermediates in the Piloty synthesis of pyrromethenes. 4:4':4''-Tricarboethoxy-3:5:3':5':3''-5''-hexamethyltri-2-pyrrylmethane, new m.p. 220—225° (decomp.) (sinters at 195°) (prep. Fischer and Heyse, A., 1925, i, 76), with Et 5-formyl-2:4-dimethylpyrrole-3-carboxylate (IX) (improved prep.) in aq. MeOH-HBr give the hydrobromide of 4:4'-dicarboethoxy-3:5:3':5'-tetramethylpyrromethene (X) [best identified by reduction ( $\text{H}_2$ ,  $\text{PtO}_2$ , EtOH) to the methane, m.p. 230°], also obtained similarly from (IX) and (VIII). Et 5-

formyl-1:2:4-trimethylpyrrole-3-carboxylate (XI), m.p. 97° [from (IX) and  $\text{Na}_2\text{O}$  in  $\text{C}_6\text{H}_6$  followed by  $\text{Me}_2\text{SO}_4$ ], with (VIII) (2 mols.) and dry HCl in  $\text{C}_6\text{H}_{14}$  affords (X) (as hydrochloride) and Et 1:2:4-trimethylpyrrole-3-carboxylate (XII); with equimol. quantities, (X), (XI), and (XII) are isolated. 4:4':4''-Tricarboethoxy-1:3:5:3':5':3''-5''-heptamethyltri-2-pyrrylmethane, m.p. 177° (prep. *as loc. cit.*), is also cleaved by aq. MeOH-HBr to (X). Short treatment of (IX) and (XII) with aq. MeOH-HBr gives 4:4':4''-tricarboethoxy-1:3:5:1':3':5':3''-5''-octamethyltri-2-pyrrylmethane, m.p. 147—148° [also prepared from (IX), (XII), and  $\text{KHSO}_4$  at >150°], which is then cleaved to (X). (X) is also formed (cf. Fischer and Zerweck, A., 1922, i, 758; 1923, i, 364) from (IX) and aq. MeOH-HBr, but in presence of (XII) reaction occurs at a lower temp. and gives a better yield. Cryst. compounds could not be obtained from (XI) and (XII). H. B.

Oxindole-amines from isatin. W. R. CONN and H. G. LINDWALL (J. Amer. Chem. Soc., 1936, 58, 1236—1239; cf. A., 1935, 501).—Isatin and  $\text{MeNO}_2$  in EtOH-NHET<sub>2</sub> give 3-hydroxy-3-nitromethyl-oxindole (I), m.p. 135—140° (decomp. to original components); EtNO<sub>2</sub> similarly affords 3-hydroxy-3-*α*-nitroethyl-oxindole, m.p. 145—150° (red at 140°). 5-Bromo-3-hydroxy-1-ethyl-, m.p. 123—125° (decomp.), and 3-hydroxy-1-methyl-, m.p. 98—99° (decomp.), and -1-ethyl-, m.p. 84—85° (decomp.), -3-nitromethyl-oxindoles are obtained from the appropriate *N*-alkylisatin. These NO<sub>2</sub>-compounds gradually decompose into the original components when heated in neutral solvents; decomp. is retarded by a little AcOH and accelerated by inorg. or org. bases. Benzoylformanilide,  $\text{MeNO}_2$ , and EtOH-NHET<sub>2</sub> afford *α*-hydroxy-*α*-nitromethylphenylacetanilide, m.p. 143—144° (decomp.), reduced (Sn, conc. HCl) to a compound, m.p. 208—210°. Reduction ( $\text{H}_2$ ,  $\text{PtO}_2$ , AcOH) of (I) gives 3-hydroxy-3-aminomethyl-oxindole (II) [hydrochloride, m.p. 195—197° (decomp.); picrate, m.p. 165—166° (decomp.); *N*-Bz derivative, m.p. 177°], which with MeI in EtOH+Ba(OH)<sub>2</sub> affords 3-hydroxy-1-methyl-3-oxindolyltrimethylammonium iodide, m.p. 227° (decomp.). Reduction of (I) with mossy Sn and conc. HCl also gives (II), but in one case some 3-hydroxy-3-hydroxylaminomethyl-oxindole (hydrochloride, m.p. 194°; picrate, m.p. 174°) was also produced. 5-Bromo-3-hydroxy-1-ethyl-3-aminomethyl-oxindole (III) [hydrochloride, m.p. 192—194° (decomp.); picrate, m.p. 182—183°; ON-Bz<sub>2</sub> derivative, m.p. 204°] and 3-hydroxy-1-ethyl-3-aminomethyl-oxindole (IV) [hydrochloride, m.p. 180—182° (decomp.); picrate, m.p. 168—169°; ON-Bz<sub>2</sub> derivative, m.p. 191° (decomp.); *N*-CO<sub>2</sub>Et derivative, m.p. 166°] are also obtained by reduction with Sn and HCl. 3-Hydroxy-, m.p. 208—209° (decomp.), 3-hydroxy-1-ethyl-, m.p. 216—217° (decomp.), and 5-bromo-3-hydroxy-1-ethyl-, m.p. 218—220° (decomp.), -3-carbamidomethyl-oxindole are prepared from (II)—(IV) (as hydrochlorides) and aq. KCNO. H. B.

Supposed "acetoneanil" of Knoevenagel. P. KALNIN [with W. GRINSTEIN] (Annalen, 1936, 523, 118—129).—Oxidation of "acetoneanil" (I) with  $\text{KMnO}_4$  gives AcOH in large amount and a substance

$C_{38}H_{39}O_3N_3$ , m.p. (indef.) 142—190°. The observations are not in harmony with Reddelien's formulation of (I), which appears to be 3-methyl-2-isopropenylindoline (II), passing into 2:4-dimethylquinoline (III) not by simple elimination of  $CH_4$  but by a complex mol. transformation,

hypothesis, a yellow intermediate product has been isolated which has the same composition as (II) and passes into (III) when treated with dry HCl. A mode of passage of  $\text{CMe}_2\text{NPh}$  into (II) is given. The methiodide, m.p. 251—252°, of (III) is converted by  $\text{MgMeI}$  in  $\text{Et}_2\text{O}$  into 1:2:2:4-tetramethyl-1:2-dihydroquinoline, m.p. 157—158° (corr.), the odour of which resembles that of (I) and which yields a picrate, m.p. 147°, identical with that of (I). Since (I) is not a dihydroquinoline derivative, a mol. rearrangement must occur either during the methylation of (I) or during the formation of the picrate.

H. W.

**Syntheses of a new heterocyclic type formed from two condensed pyrrolidine rings.** G. MENSCHIKOV (Ber., 1936, 69, [B], 1802—1804).—2-isoButylpyrrolidine is treated with Br in 5% NaOH at -5° and the oily bromoamine is treated with conc.  $\text{H}_2\text{SO}_4$  thus giving 2-methylpyrrolizidine (I), b.p.

162—163°/atm. pressure (picrate, m.p. 182—184°), which does not decolorise  $\text{KMnO}_4$  in 10%  $\text{H}_2\text{SO}_4$  and is inert towards  $\text{HNO}_3$ . The corresponding methiodide, m.p. 225—226°, passes when treated with  $\text{Ag}_2\text{O}$

and then heated into de- $\Delta$ -methyl-2-methylpyrrolizidine, b.p. 164—166°/atm. pressure, hydrogenated ( $\text{PtO}_2$  in 1% HCl) to dihydrode- $\Delta$ -methyl-2-methylpyrrolizidine (II), b.p. 165—167°/atm. pressure (picrate, m.p. 174—175°), which does not reduce acid  $\text{KMnO}_4$ . Since (II) is not identical with 1-methyl-2-isobutylpyrrolidine it is probably 1:4-dimethyl-2-n-propylpyrrolidine. Since (II) is not identical with the corresponding degradation product of heliotridane, the latter is certainly not (I).

H. W.

**Benzoylation of quinoline oxide.** M. HENZE (Ber., 1936, 69, [B], 1566—1568).—Quinoline oxide forms a picrate,  $(C_9H_7ON)_2 \cdot C_6H_5O_7N_3$ , m.p. 158°, which passes into the normal picrate, m.p. 143°, when treated with excess of picric acid. The corresponding hydrochloride is converted by  $\text{BzCl}$  and NaOH into 2-hydroxyquinoline [picrate, m.p. 132°; hydrochloride (+1H $_2$ O), m.p. 192° (decomp.)]. Addition of  $\text{BzCl}$  to 2-methylquinoline oxide hydrochloride and excess of KCN in  $\text{H}_2\text{O}$  affords 2-cyanoquinoline, m.p. 93°, transformed by cold, conc. HCl into the corresponding amide, m.p. 123°, and by the boiling reagent into the acid, m.p. 156° [ $\text{Cu}$  (+2H $_2$ O) salt].

H. W.

**Derivatives of 8-hydroxyquinoline.** E. MONESS and W. G. CHRISTIANSEN (J. Amer. Pharm. Assoc.,

1936, 25, 501—504).—2-Amino-p-propylphenol, m.p. 140—142° (from 2-nitro-p-propylphenol, b.p. 110°/4 mm.), by the Skraup reaction affords 8-hydroxy-5-propylquinoline, m.p. 52—52.5° (explosive; characterized by the 7-Cl-derivative [hydrochloride, m.p. 242° (decomp.)]). 5-Chloro-8-hydroxyquinoline in  $\text{PhNO}_2$  with  $\text{Me}_2\text{SO}_4$  affords a mixture of the methochloride and -sulphate. 8-Dimethylaminoethoxyquinoline dihydrochloride is prepared from 8-hydroxyquinoline (Na salt) and  $\text{NEt}_2 \cdot C_2H_4Br$ , HBr in EtOH whilst 5-amino-8-hydroxyquinoline refluxed with  $\text{NEt}_2 \cdot C_2H_4Cl$  in  $C_6H_6$  gives 5-( $\beta$ -diethylaminoethoxyamino)-8-hydroxyquinoline dihydrochloride. The Skraup reaction with Me 3-amino-4-ethoxybenzoate affords 8-ethoxyquinoline-5-carboxylic acid [diethylaminoethyl ester (impure), m.p. 86°]. 5-Chloro- and 5-nitro-8-hydroxyquinoline with  $\text{Hg}(\text{OAc})_2$  in aq. EtOH afford the corresponding anhydro-mercuric derivatives. None of the above compounds possesses significant trypanocidal or anaesthetic activity.

F. O. H.

**Optically active silver-hydroxyquinoline complexes.** F. HEIN and H. REGLER (Ber., 1936, 69, [B], 1692—1702; cf. A., 1935, 868).—Treatment of 8-hydroxyquinoline with  $\text{AgNO}_3$  in EtOH or  $C_5H_5N$  gives Ag di-8-hydroxyquinoline nitrate,  $[\text{Ag}(C_9H_6N \cdot OH)_2]NO_3$ , converted by  $NH_3$  into the corresponding base,  $OAg \cdot C_9H_6N \cdot OH \cdot C_9H_6N$ , and by  $C_5H_5N$  into the compound,  $[\text{Ag}(C_9H_6N \cdot OH)_2]C_5H_5N$ . The base is transformed by the requisite acid into the trichloroacetate, d-mandelate, and d-camphorsulphonate. Fractional treatment of it with  $\alpha$ -bromo-d-camphor- $\pi$ -sulphonic acid gives salts with extreme vals. of  $[\alpha]_D^{25} +37.4 \pm 0.5^\circ$  and  $+47.8 \pm 0.5^\circ$ , thus establishing the existence of salts of differing optical activity and probably of the tetrahedral configuration of the complex. Attempts to obtain an optically active base from the salt fractions were unsuccessful.

H. W.

**5:7-Di-iodo-8-hydroxyquinoline.** V. PAPESCH and R. R. BURTNER (J. Amer. Chem. Soc., 1936, 58, 1314).—8-Hydroxyquinoline in 15% HCl added slowly to ICl in 15% HCl at room temp. gives 83.5—92.5% of nearly pure 5:7-I $_2$ -derivative.

H. B.

**Preparation of 8-aminoquinoline from 8-chloroquinoline.** N. N. VOROSHOV, jun., and S. P. MITZENGENDLER (J. Gen. Chem. Russ., 1936, 6, 681—684).—8-Chloroquinoline (I) and aq.  $NH_3$  (20 mols.) in presence of  $\text{CuCl}$  (200°/49—55 atm.; 2.5 hr.) give 8-aminoquinoline in 69.3% yield. (I) undergoes partial decomp. to quinoline hydrochloride during distillation.

R. T.

**Organic nitrogen bases from pyrolysis of cotton-seed meal.** I. PARKER, C. L. GUTZEIT, A. C. BRATTON, and J. R. BAILEY (J. Amer. Chem. Soc., 1936, 58, 1097—1104).—The bases formed by pyrolysis of the meal consist of light petroleum-sol. (A) and -insol. (B) substances. The higher fractions of (B) have abnormally high N contents and tend to decompose to tars. The following are isolated from the lower fractions of (A):  $C_5H_5N$ ; 2-, 3-, and 4-methyl-, 3-ethyl-, 2:4-, 2:6-, and 3:5- [picrate, m.p. 242—243.5° (lit. 228—230° and 244°)]-dimethyl-, and 2:4:6-trimethyl-pyridine; quinoline; iso-

quinoline; 2- and 4-methyl- and 2:3:8-trimethyl-quinoline; a base, b.p. 283°/750 mm. [picrate, m.p. 261—263° (decomp.) (darkens at 259°); hydrochloride mercurichloride, m.p. 173—174° (sinters at 150°)], which is probably a dihydroquinazoline.

H. B.

**Quinoline derivatives.** IV. K. S. NARANG, J. N. RAY, and T. D. SACHDEVA (J. Indian Chem. Soc., 1936, 13, 260—263).—The azlactone from veratraldehyde with hot 3% KOH gives  $\alpha$ -benzamido-3:4-dimethoxycinnamic acid, m.p. 208°, reduced by 2.5% Na-Hg to  $\alpha$ -benzamido- $\beta$ -3:4-dimethoxyphenylpropionic acid, m.p. 158°, which with HNO<sub>3</sub>-H<sub>2</sub>SO<sub>4</sub>-AcOH at 50° affords the 6-NO<sub>2</sub>-acid, m.p. 208°; by reduction [Fe(OH)<sub>2</sub>] and spontaneous ring-closure this yields 3-benzamido-2-keto-6:7-dimethoxy-1:2:3:4-tetrahydroquinoline, m.p. 225°. Piperonal leads similarly to  $\alpha$ -benzamido-3:4-methylenedioxy-cinnamic acid, m.p. 224°,  $\alpha$ -benzamido- $\beta$ -3:4-methylenedioxypropionic acid (I), m.p. 122°, its 6-NO<sub>2</sub>-derivative (II), m.p. 210°, and 3-benzamido-2-keto-6:7-methylenedioxy-1:2:3:4-tetrahydroquinoline, m.p. 254°. Hydrolysis of (I) gives 3:4-methylenedioxyphenylalanine dihydrochloride, +H<sub>2</sub>O, m.p. 278—280°. Reduction [Fe(OH)<sub>2</sub>] of the anilide, m.p. 205°, of 6-nitro-3:4-methylenedioxy-cinnamic acid (III) does not give an amide, but affords by hydrolysis 6:7-methylenedioxy-2-quinolone, m.p. 205°, also obtained by direct reduction of (III). Similarly, reduction of (II) or of N- $\beta$ -6-nitro-3:4-methylenedioxyphenylpropionylantranilic acid [from the acid chloride of (II) and NH<sub>2</sub>·C<sub>6</sub>H<sub>4</sub>·CO<sub>2</sub>H in C<sub>5</sub>H<sub>5</sub>N], m.p. 208°, affords 2-keto-3:4-methylenedioxy-1:2:3:4-tetrahydroquinoline, m.p. 232°.

R. S. C.

**Quaternary derivatives of heterocyclic compounds.**—See B., 1936, 716.

**3:4:6-Triaminoquinolines.**—See B., 1936, 716.

**Synthesis of derivatives of 3-methylisoquinoline.** V. BRUCKNER and A. KRAMLI (J. pr. Chem., 1936, [ii], 145, 291—300).—The large-scale prep. of isosafrole  $\psi$ -nitrosite (78% yield) and thence of  $\beta$ -nitro- $\alpha$ -3:4-methylenedioxyphenyl-*n*-propyl acetate (68%) is described.  $\beta$ -Acetamido- $\alpha$ -3:4-methylenedioxyphenyl-*n*-propyl alcohol, prepared therefrom by reduction, is hydrolysed by hot 10% H<sub>2</sub>SO<sub>4</sub> and the base converted without isolation into other acylamino-derivatives. With POCl<sub>3</sub> in PhMe or xylene at 110—120° these give isoquinoline derivatives, the aralkoyl more readily than the aroyl compounds. The following are described:  $\beta$ -Phenylacetyl-, m.p. 136—138°, -homopiperonyl-, m.p. 152—153°, -homoveratroyl-, m.p. 139°, -benzoyl-, m.p. 135°, and piperonyl- $\alpha$ -3:4-methylenedioxyphenyl-*n*-propyl alcohol, m.p. 159°. 6:7-Methylenedioxy-1-benzyl-, m.p. 119° [hydrochloride, m.p. 264° (decomp.)], -piperonyl-, -veratryl-, m.p. 133° (lit. 125°) [hydrochloride, m.p. 219° (lit. 225°)], -phenyl-, and -3':4'-methylenedioxyphenyl-3-methylisoquinoline (I). (I) is accompanied by a substance, C<sub>18</sub>H<sub>15</sub>O<sub>5</sub>N, m.p. 107—108°.

R. S. C.

**Homoneurine series.** I. Bromo-derivatives of isoquinolinehomoneurine. C. CANDEA, E. MACOVSKI, and J. KUHN (Bull. Soc. chim., 1936, [v],

3, 1309—1318).—Allylisoquinolinium bromide (I) with 2 Br in MeOH affords  $\beta\gamma$ -dibromopropylisoquinolinium bromide (II), m.p. 190—192° [corresponding iodide, m.p. 145—146° (decomp.)], but with excess of Br affords a Br<sub>2</sub>-derivative, m.p. 86—87°, with 3 ionisable Br, which is reconverted into (II) by boiling EtOH. Allylisoquinolinium iodide (III) with Br in MeOH gives allylisoquinolinium dibromiodide (IV), m.p. 75—77°, stable in boiling EtOH. (I), (III), and (IV) with picric acid afford allylisoquinolinium picrate, m.p. 163—164°, and the  $\beta\gamma$ -Br<sub>2</sub>-derivatives yield  $\beta\gamma$ -dibromopropylisoquinolinium picrate, m.p. 153—154°.

J. L. D.

**Synthesis of isoquinoline derivatives.** W. KRABBE (Ber., 1936, 69, [B], 1569—1572).—OH·CPh<sub>2</sub>·CH<sub>2</sub>·NHBz is converted by MgPhBr in Et<sub>2</sub>O and finally at 200—205° into benz- $\beta\beta$ -diphenylvinylamide, m.p. 132—134°, converted by P<sub>2</sub>O<sub>5</sub> in boiling PhMe into 1:4-diphenylisoquinoline (I), m.p. 132—5° (picrate, m.p. 152°). Similarly benz- $\beta\beta$ -diphenylethylamide affords 1:4-diphenyl-3:4-dihydroisoquinoline, m.p. 122°, dehydrogenated (Pd-sponge at 230—240°) to (I).

H. W.

**Structural problems in the indole group.** 5- and 7-Nitrotetrahydrocarbazoles. S. G. P. PLANT (J.C.S., 1936, 899—902).—Reduction (Sn-HCl; 15 hr.) of 8-chloro-5-nitrotetrahydrocarbazole yields  $\alpha$ -amino-tetra-, m.p. 183° (Ac derivative, m.p. 198°), and -hexa-hydrocarbazole (Ac<sub>2</sub> derivative, m.p. 264°; Bz derivative, m.p. 245°). Elimination of NH<sub>3</sub> from cyclohexanone-*m*-nitrophenylhydrazone [aq. H<sub>2</sub>SO<sub>4</sub> (1:9)] affords principally 5-nitrotetrahydrocarbazole and not the 7-NO<sub>2</sub>-compound (I) (cf. Borsche *et al.*, A., 1908, 367). Reduction (Sn-HCl) of 7-nitro-9-methyltetrahydrocarbazole, m.p. 162° [from MeSO<sub>4</sub> and (I)], affords 7-amino-9-methylhexahydrocarbazole, m.p. 87—89° (Ac<sub>2</sub> derivative, m.p. 106°), identical with that obtained by electrolytic reduction of the 7-NO<sub>2</sub>-compound. Chlorination of the Bz<sub>2</sub> derivative, m.p. 199°, of 7-aminohexahydrocarbazole yields 6-chloro-7-benzamido-9-benzoylhexahydrocarbazole, m.p. 182°.

F. N. W.

**Manufacture of condensation products containing sulphur and organic sulphur compounds.**—See B., 1936, 686.

**Preparation of dihydroacridines by the Grignard reaction.** W. L. SEMON and D. CRAIG (J. Amer. Chem. Soc., 1936, 58, 1278—1282).—It is now shown (cf. A., 1935, 482) that *o*-NHPh·C<sub>6</sub>H<sub>4</sub>·CO<sub>2</sub>Me (I) and MgMeI give *o*-NHPh·C<sub>6</sub>H<sub>4</sub>·Bu<sup>+</sup> and 5:5-dimethyl-5:10-dihydroacridine (II), m.p. 125—126° [Ac, m.p. 153—154°, Bz, m.p. 294—297°, and N-Ph, m.p. 123°, derivatives; 1:1 compounds, m.p. 135—136° and 124°, with acridine and 5-methylacridine (III), respectively]; (II) is probably formed by dehydration of the intermediate *o*-NHPh·C<sub>6</sub>H<sub>4</sub>·CMe<sub>2</sub>·OH. (II) is also obtained from (III) or acridone (IV) and MgMeI in Bu<sup>+</sup>O. (II) heated with NaNH<sub>2</sub> gives the N-Na derivative (V), which with MeI in PhMe affords 5:5:10-trimethyl-5:10-dihydroacridine, m.p. 100—102°; the compound described by Stevens *et al.* (A., 1931, 1404) is a mixture of this and 5:10-dimethyl-5:10-dihydro-

acridine (VI), m.p. 140—141°. (V) heated further with (II) gives (III), which is also formed from (II) (0.3 mol.),  $\text{NHPh}$ , (0.45 mol.), and  $\text{HCl}$  (0.15 mol.) at 250°. Acridine methiodide and  $\text{MgMeI}$  yield (VI) and 10:10'-dimethyl-5:10:5':10'-tetrahydro-5:5'-diacridyl, m.p. about 280° (decomp.), which when heated to 350° decomposes to acridine and 10-methyl-5:10-dihydroacridine, m.p. 91—93°. (I) and  $\text{MgEtI}$  afford (probably) *o*-anilinophenyldiethylcarbinol, b.p. 175°/2 mm., dehydrated (conc.  $\text{H}_2\text{SO}_4$ ) to 5:5'-diethyl-5:10-dihydroacridine, m.p. 90—91° [also obtained from (IV) and  $\text{MgEtBr}$  in  $\text{Bu}^n\text{O}$ ], and (probably) an *o*-pentenyldiphenylamine, b.p. 150—155°/2 mm. 5:5-Di-*n*-butyl-5:10-dihydroacridine, m.p. 87—88°, is prepared from (IV) and  $\text{MgBu}^n\text{Br}$ . H. B.

**Phenanthrene series. X. Naphthquinolines.** E. MOSETTIG and J. W. KRUEGER (J. Amer. Chem. Soc., 1936, 58, 1311—1312).—3-Aminophenanthrene (*N*-Me, m.p. 69—70° (all m.p. are corr.) [hydrochloride, m.p. 190—200° (decomp.)], and *NN*-Me<sub>2</sub> derivative, m.p. 75—76° [hydrochloride, m.p. 210—213° (decomp.)], formed by methylation ( $\text{Me}_2\text{SO}_4$ , aq.  $\text{KOH}$ ) and separated by Hinsberg's method, glycerol,  $\text{H}_3\text{BO}_3$ ,  $\text{PhNO}_2$ ,  $\text{FeSO}_4$ , and conc.  $\text{H}_2\text{SO}_4$  give a naphthquinoline, m.p. 106—107° (hydrochloride, m.p. 239—243°), reduced ( $\text{H}_2$ , Cu chromite,  $\text{EtOH}$ , 135°) to a  $\text{H}_4$ -derivative, m.p. 72—74° (hydrochloride, m.p. 255—260°), which is further reduced ( $\text{H}_2$ ,  $\text{PtO}_2$ ,  $\text{AcOH}$ ) to an  $\text{H}_8$ -derivative, m.p. 111—112° (hydrochloride, m.p. 305—307°). 3- $\alpha$ -Aminoethylphenanthrene (hydrochloride, m.p. 265—266°) is prepared by reduction (2.5%  $\text{Na-Hg}$ ,  $\text{EtOH-AcOH}$ ) of 3-acetylphenanthrene oxime (the 2-isomeride has m.p. 196—198°). 2- $\alpha$ -Chloro- $\gamma$ -dimethylaminopropyl- [hydrochloride, m.p. 248—252° (decomp.)] (from the  $\alpha$ -OH-derivative and  $\text{PCl}_5$  in  $\text{CHCl}_3$ ) is reduced ( $\text{H}_2$ ,  $\text{Pd-CaCO}_3$ ,  $\text{EtOH}$ ) to 2- $\gamma$ -dimethylaminopropylphenanthrene (hydrochloride, m.p. 222—227°). H. B.

**Condensation of esters of unsaturated acids with carbamide.** III. Z. JERZMANOWSKA-SIENKIEWICZOWA (Rocz. Chem., 1936, 16, 172—180).— $\text{Et}_4$  ethylenetetracarboxylate,  $\text{CO}(\text{NH}_2)_2$ , and  $\text{NaOEt}$  in  $\text{EtOH}$ , at the b.p., yield  $\text{Et}_3$  hydantoinoethanetricarboxylate, m.p. 132—133°, which condenses with a further mol. of  $\text{CO}(\text{NH}_2)_2$ , and eliminates  $\text{CH}_2(\text{CO}_2\text{Et})_2$ , to yield spirohydantoin. R. T.

**Preparation of pyridinium iodides.**—See B., 1936, 687.

**Synthesis of 1-phenyl-2-methyl-4-ethyl-5-pyrazolone.** Y. F. CHI and M. C. H. YANG (J. Amer. Chem. Soc., 1936, 58, 1152—1153).—formylbutyrate (I), b.p. 37—38°/2 mm. (semicarbazone, m.p. 108—108.5°), obtained by acidification ( $\text{AcOH}$ ) of the Na salt (A., 1935, 358), and the appropriate  $\text{NHAr-NH}_2$  give 1-phenyl- (II), m.p. 99—99.5°, 1-p-nitrophenyl-, m.p. 212—214° (slight decomp.), and 1-p-bromophenyl-, m.p. 170—171°, 4-ethyl-5-pyrazolone. (II) is methylated ( $\text{MeOH-MeI}$  at 100—110°) to the 2-Me derivative, m.p. 121—121.5°. (I) and aq.  $\text{NH}_4\text{OH}$  afford 4-ethyl-5-isooxazolone, b.p. 113—114°/2 mm. H. B.

**Sodium 1-phenyl-2:3-dimethylpyrazolonyl-4-aminomethylene sulfoxylate and dimethylpyrazolonyldiphenyl.** 4:4'-Di-(1-phenyl-3-methyl)pyrazolonyl.—See B., 1936, 762.

**Glyoxaline series.** R. WEIDENHAGEN and R. HERRMANN [with H. WEGNER, and (FRL.) D. WISCHNEVSKY, E. SEURIG, and G. RADNIK] (Z. Wirts. Zuckerind., 1935, 85, 762—778).—4-Nitro-5-methylglyoxaline and  $\text{SnCl}_2$  give a 67% yield of 4-amino-5-methylglyoxaline [not isolated free; dihydrochloride, m.p. 186° (decomp.); picrate, m.p. 193°;  $\text{CHPh}$ , m.p. 216°, *Ac*, m.p. 216°, *Bz*, m.p. 262°, *Bz*<sub>2</sub>, m.p. 176°, and phenylcarbamide derivative, m.p. 283°]. 4-Nitroglyoxaline gives similarly a 20% yield of  $\text{NH}_2$ -derivative. Glyoxalines are obtained, usually in good yield, from ammoniacal  $\text{CuO}$  (1 mol.) and  $\alpha$ -OH-aldehydes or  $\alpha$ -acetoxyaldehydes, which are readily oxidised to  $\alpha\beta$ -diketones; some  $\alpha$ -chloroketones, e.g.,  $\text{CH}_2\text{Cl-COMe}$ , are sufficiently reactive to give glyoxalines in one step; others can be used by preliminary hydrolysis without isolation of the OH-ketone. Thus are obtained glyoxaline and the following derivatives: 4-Ph; 4-phenyl-2-methyl, m.p. 161—162° (lit. 158—159°); 4-phenyl-2-ethyl, m.p. 133°, and 2-isopropyl, m.p. 180°; 2:4-Ph<sub>2</sub>, m.p. 193° (hydrochloride, + $\text{H}_2\text{O}$ , m.p. 273°); 4-*o*-OH- $\text{C}_6\text{H}_4$ , m.p. 181°, 4-4'-hydroxy-*m*-tolyl, m.p. 136—137°, 4-*p*-anisyl, m.p. 136—137°, 4-*p*-NHAc- $\text{C}_6\text{H}_4$ , m.p. 250—251°, 4-*p*-NH<sub>2</sub>- $\text{C}_6\text{H}_4$ , +0.5 $\text{H}_2\text{O}$  and + $\text{H}_2\text{O}$ , m.p. 97°, 4-*p*-CO<sub>2</sub>H- $\text{C}_6\text{H}_4$ , m.p. 308° (hydrochloride, + $\text{H}_2\text{O}$ , m.p. 338°), 4-Me, 2:4-Me<sub>2</sub> (from acetoxy- or chloro-acetone), and 4-OH-CH<sub>3</sub> [from  $\text{CO}(\text{CH}_2\cdot\text{OH})$ ], m.p. 93—94°, derivatives.  $\omega$ -Chloro-*o*-hydroxyacetophenone and hot  $\text{H}_2\text{O}$  give much coumaranone and 20% of  $\omega\omega$ -dihydroxyacetophenone, m.p. 65°.  $\omega$ -Chloro-2-hydroxy-5-methylacetophenone gives similarly 40% of  $\omega\omega$ -dihydroxy-5-methylacetophenone, m.p. 76—77°. R. S. C.

**Thiobarbiturates.** II. E. MILLER, J. C. MUNCH, F. S. CROSSLEY, and W. H. HARTUNG (J. Amer. Chem. Soc., 1936, 58, 1090—1091).—The following 5:5-dialkyl-2-thiobarbituric acids are prepared from  $\text{CS}(\text{NH}_2)_2$  and  $\text{CAlkAlk}'(\text{CO}_2\text{Et})_2$  in  $\text{EtOH-NaOEt}$ : 5-ethyl-5-*n*-propyl-, m.p. 174.5°, and 5-isobutyl-, m.p. 170.5°; 5-*n*-propyl-5-isopropyl-, m.p. 168.5°, 5-allyl-, m.p. 138°, 5-*n*-, -iso-, and -sec-butyl, m.p. 135.5°, 132°, and 165°, respectively, and 5-*n*-hexyl-, m.p. 114.4°; 5-isopropyl-5-allyl-, m.p. 176.5°, 5-isobutyl-, m.p. 115—117°, and 5-*n*-amyl-, m.p. 98.5°; 5-*n*-amyl-, m.p. 112.5°, and 5-*n*-, m.p. 120—121°, and -iso-, m.p. 147°, -butyl-5-allyl-. H. B.

**$\text{N-Arylbarbituric acids}$ .** J. S. BUCK (J. Amer. Chem. Soc., 1936, 58, 1284—1286).—The following are prepared from  $\text{NH}_2\cdot\text{CO-NHAr}$  and  $\text{CEt}_2(\text{CO}_2\text{Et})_2$  or  $\text{CEtBu}^n(\text{CO}_2\text{Et})_2$  in  $\text{EtOH-NaOEt}$ : 1-phenyl-, m.p. 178°, 1-*p*-tolyl-, m.p. 155.5° (lit. 152—153°), 1-*o*-, m.p. 182°, and -*m*-, m.p. 133°, -tolyl-, 1-*o*-, m.p. 176.5°, and -*m*-, m.p. 115—116°, -anisyl-, 1-*p*-anisyl-, m.p. 129° (lit. 126—127°), 1-*o*-, m.p. 159°, and -*m*-, m.p. 114°, -phenetyl-, 1-*p*-phenetyl-, m.p. 160° (lit. 152—153°), and 1- $\alpha$ -, m.p. 207°, and m.p. 146°, -naphthyl-5:5-diethylbarbituric acids; 1-phenyl-, b.p. 203°/0.5 mm., m.p. about 70°, 1-*o*-, m.p. 135°, -*m*-, b.p. 212°/0.6 mm., m.p. about 89°, and -*p*-, m.p.

142°, -tolyl-, 1-o-, m.p. 139.5°, -m-, m.p. 102.5°, and -p-, m.p. 124°, -anisyl-, 1-o-, m.p. 131°, -m-, b.p. 216°/0.5 mm., m.p. 84–85°, and -p-, m.p. 100°, -phenetyl-, and 1- $\alpha$ -, m.p. 182°, and - $\beta$ -, m.p. 126°, -naphthyl- $\alpha$ -ethyl-5-n-butylbarbituric acids. H. B.

**Condensations of cyanoacetic esters with carbamide by magnesium methoxide.** H. LUND (Ber., 1936, 69, [B], 1621–1627).—Mg(OMe)<sub>2</sub> is a less powerful catalyst than NaOMe for the condensation of cyanoacetic esters with CO(NH<sub>2</sub>)<sub>2</sub> to cyanoacetylcarbamides and thence to 4-imidobarbituric acids. Reaction usually ceases at the conclusion of the first phase and is accompanied by the formation of much by-product. CN·CH<sub>2</sub>·CO<sub>2</sub>Et, Mg(OMe)<sub>2</sub>, and CO(NH<sub>2</sub>)<sub>2</sub> afford CN·CH<sub>2</sub>·CO·NH·CO·NH<sub>2</sub> in moderate yield when reaction is curtailed and 4-imidobarbituric acid when the change is prolonged. CN·CHPr<sup>o</sup>·CO<sub>2</sub>Et gives 4-imidoisopropylbarbituric acid, whence isopropylbarbituric acid, m.p. 216°. The prep. of 4-imidoethylbarbituric acid is described. Et cyclohexenylcyanoacetate (I) appears to be transformed by Mg(OMe)<sub>2</sub> or NaOEt in Et cyclohexylidenecyanoacetate, m.p. 274–275° (decomp.). Et benzylidenecyanoacetate gives benzylidenecyanoacetylcarbamide, m.p. 220° (decomp.), but no benzylidenobarbituric acid, which is obtained in 75% yield from CHPh·CH(CO<sub>2</sub>Et)<sub>2</sub>. 4-Imidodiallylbarbituric acid, decomp. 280–284°, whence diallylbarbituric acid, is derived from (CHMe·CH<sub>2</sub>)<sub>2</sub>C(CN)·CO<sub>2</sub>Et, whereas (CH<sub>2</sub>Ph)<sub>2</sub>C(CN)·CO<sub>2</sub>Et yields dibenzylcyanoacetylcarbamide, m.p. 188°. Et cyclohexenylethylcyanoacetate (II), b.p. 150–151°/15 mm., gives under varied conditions 4-imidocyclohexenylethylbarbituric acid, decomp. about 265°, cyclohexenylethylcyanoacetylcarbamide, m.p. 161°, and acetamide, m.p. 103°. (I) and guanidine afford cyclohexylidenecyanoacetylguanidine, whilst (II) yields cyclohexenylethylcyanoacetylguanidine, m.p. 256–258° (decomp.). H. W.

**4-N-Piperazylbenzenesulphonic acid.** V. PRELOG (Coll. Czech. Chem. Comm., 1936, 8, 288–290).—Sulphonation of N-phenylpiperazine gives 1-phenylpiperazine-p-sulphonic acid (Na salt; hydrochloride; Bz derivative). F. R. S.

**Reactions of aryl alkyl ketones with thiocarbamide.** K. DZIEWONSKI, K. BERNAKIEWICZ, and L. GIZLER (Bull. Acad. Polonaise, 1935, A, 564–571).—CS(NH<sub>2</sub>)<sub>2</sub> and CPhMe at 170° give 4 : 6-diphenyl-6-methyl-1 : 2 : 3 : 6-tetrahydro-2-thiopyrimidine (I), m.p. 172–174° (acetate, m.p. 140°; Ag salt, m.p. 190–195°; Bz<sub>2</sub> derivative, m.p. 152–153°). (I) is transformed by MeI–MeOH at 100° into 2-methylthiol-4 : 6-diphenyl-6-methyl-5 : 6-dihydropyrimidine, m.p. 82–84° (hydriodide, m.p. 88–90°; picrate, m.p. 165–167°), and by EtOH–conc. HCl into 2-ethylthiol-4 : 6-diphenyl-6-methyl-3 : 6-dihydropyrimidine hydrochloride, m.p. 206–208° (decomp.). (I) and HgO in boiling AcOH afford 2-keto-4 : 6-diphenyl-6-methyl-1 : 2 : 3 : 6-tetrahydropyrimidine, m.p. 179–181°. Similarly CS(NH<sub>2</sub>)<sub>2</sub> and COMe·C<sub>6</sub>H<sub>4</sub>Me-p give 4 : 6-di-p-tolyl-6-methyl-1 : 2 : 3 : 6-tetrahydropyrimidine, m.p. 170–171° (Ag salt, m.p. 193–194°; acetate, m.p. 129–130°; methiodide, m.p. 188–189°), transformed by BzCl and Na<sub>2</sub>CO<sub>3</sub> in boiling Et<sub>2</sub>O into 2-benzoylthiol-4 : 6-

di-p-tolyl-6-methyl-5 : 6-dihydropyrimidine, m.p. 152–153°. H. W.

**Pyrimidines. CLIII. Structure of vitamin-B<sub>1</sub>.** T. B. JOHNSON and A. LITZINGER (Science, 1936, 84, 25–26).—Thyminyllamine, OH·C<NH·CO>N=CH>C·CH<sub>2</sub>·NH<sub>2</sub>, has been synthesised. On heating, it gives uracil, CH<sub>2</sub>O, and NH<sub>3</sub>.

L. S. T.

**Pyrimidines. Synthesis of 4-methyl-5-n-butylcytosine.** Y. F. CHU (J. Amer. Chem. Soc., 1936, 58, 1150–1151).—CHAcBu<sup>o</sup>·CO<sub>2</sub>Et and CS(NH<sub>2</sub>)<sub>2</sub> in EtOH–NaOEt give 6-hydroxy-4-methyl-5-n-butyl-2-thiopyrimidine (I), m.p. 197–198°, which with EtBr, MeI, and CH<sub>2</sub>Cl·CO<sub>2</sub>Et in EtOH–NaOEt affords 6-hydroxy-2-ethylthiol- (II), m.p. 92–93°, -2-methylthiol-, m.p. 158–159°, and -2-carbethoxymethylthiol-, m.p. 110–111° (and thence -2-carboxymethylthiol-, m.p. 117–118°), -4-methyl-5-n-butylpyrimidine, respectively. (II) is hydrolysed (conc. HBr) to 4-methyl-5-n-butyluracil, m.p. 245°, also obtained from (I) and aq. CH<sub>2</sub>Cl·CO<sub>2</sub>H. 6-Chloro-2-ethylthiol-4-methyl-5-n-butylpyrimidine, b.p. 160°/2 mm. [from (II) and POCl<sub>3</sub> at 110–120°], with EtOH–NH<sub>3</sub> at 170–180° gives the 6-NH<sub>2</sub>-derivative, m.p. 104–105°, hydrolysed (48% HBr) to 4-methyl-5-n-butylcytosine (+0.75H<sub>2</sub>O), m.p. 299–300° (decomp.) [hydrobromide, m.p. 222° (decomp.); hydrochloride, m.p. 235°]. H. B.

**Quinazolines. IV.** S. S. BEDI and K. S. NARANG (J. Indian Chem. Soc., 1936, 13, 252–254).—Veratraldehyde is quantitatively nitrated at 5–10°. 6-Nitropiperonal and KMnO<sub>4</sub> at 40–60° give 6-nitropiperonylic acid, m.p. 175°, the amide, m.p. 191–193°, of which is reduced (SnCl<sub>2</sub>) to the NH<sub>2</sub>-amide, m.p. 172–174°; the Ac derivative, m.p. 212°, thereof in 1% NaOH at 40–50° gives 6 : 7-methylenedioxy-2-methyl-4-quinazoline, m.p. 346°. 6- $\beta$ -Carboxypropionyl-, m.p. 219°, and 6-butyrylaminopiperonylamide, m.p. 271°, and 6 : 7-methylenedioxy-2- $\beta$ -carboxyethyl-, m.p. 184°, and -2-n-propyl-4-quinazoline, m.p. 280°, are similarly prepared.

R. S. C.

**Heteropolar compounds. I. Complex halogenomeric salts of 4-hydroxy-2-thion-3-phenyl-1 : 2 : 3 : 4-tetrahydroquinazoline.** C. V. GHEORGHIU and (MLLE.) L. MANOLESCU (Bull. Soc. chim., 1936, [v], 3, 1353–1368; cf. A., 1934, 1011; 1935, 630, 1253).—2-Thion-4-ethoxy-3-phenyl-1 : 2 : 3 : 4-tetrahydroquinazoline (I) with HgCl<sub>2</sub> in EtOH affords a yellow compound, m.p. 119–121°, and the Hg<sup>II</sup> chloride, m.p. 121–126°, of (I), an internal salt, which with hot xylene or with HCl in Ac<sub>2</sub>O (through the intermediate red carbonium compound) affords the HgCl<sub>2</sub> internal salt of 2-thion-1 : 4-anhydro-3-phenyl-2 : 3-dihydroquinazoline (II), m.p. 290–292°. Similarly, (I) with HgBr<sub>2</sub> affords a compound, m.p. 138–144° (decomp.), and a colourless Hg<sup>II</sup> bromide, m.p. 116–121°, which when heated with xylene or EtOBz affords the Hg<sup>II</sup> bromide (III) of (II), m.p. 276°, which with cold Ac<sub>2</sub>O containing HCl affords mercurybis-(2-thiol-4-hydroxy-3-phenyl-3 : 4-dihydroquinazoline) dihydrochloride (red), m.p. 230–232°. With HgI<sub>2</sub>, (I) affords a similar series

of compounds, m.p. 126—128°, 137—138° (decomp.) (IV) (converted into the former in hot EtOH), and 252—253°, respectively, which with HCl in Ac<sub>2</sub>O affords a red carbonium chloride, m.p. 106—108°. (II) in cold Ac<sub>2</sub>O with HClO<sub>4</sub> affords a carbonium perchlorate, m.p. 252—257°, whilst with warm Ac<sub>2</sub>O, mercurylbis-(2-thiol-3-phenyl-2 : 3-dihydroquinazoline) diperchlorate, m.p. 279—282°, is formed, identical with the perchlorate of (II). The Hg<sup>II</sup> bromide of (II) similarly affords, in the cold, the perchlorate, m.p. 190—191°, of 2-thiol-4-hydroxy-3-phenyl-3 : 4-dihydroquinazoline mercuric dibromide, converted when warmed with Ac<sub>2</sub>O into the perchlorate, m.p. 233°, of (III), which with COMe<sub>2</sub> affords (III). (IV) in the cold similarly yields a carbonium perchlorate, m.p. 207—208° (decomp.), which when heated gives the monoperchlorate, m.p. 219—221° (decomp.), of the bimol. form. The results are discussed in the light of recent work. J. L. D.

**Action of phenols on quinoxalinic and acridinic anhydrides.** P. PIUTTI [in part with G. B. MARINI] (Gazzetta, 1936, 66, 270—276).—Quinoxaline-2 : 3-dicarboxylic anhydride (I), when heated with PhOH or hydroxyphenols at 170°, gives Ph, m.p. 104°, and o-, m.p. 167°, m-, m.p. 175°, and p-hydroxyphenyl quinoxaline-2-carboxylate, m.p. 184°. At 110°, the reaction stops at the stage of Ph, m.p. 157°, and o-, m.p. 162°, m-, m.p. 202°, and p-hydroxyphenyl quinoxaline-3-carboxylate-2-carboxylic acid, m.p. 168°, all of which on further heating give the monocarboxylic esters. As a by-product, quinoxaline-2-carboxylic acid, m.p. 215° [also obtained by heating (I) alone], is formed. With N<sub>2</sub>H<sub>4</sub>·H<sub>2</sub>O or NHPh·NH<sub>2</sub>, the monocarboxylic esters give quinoxaline-2-carbohydrazide, m.p. 204°, or -phenylhydrazide, m.p. 186°; PhOBz similarly gives NHBz·NH<sub>2</sub>. In none of these reactions was a phthalein obtained. Acridinic anhydride with phenols similarly gives no phthalein, but only decomp. products. E. W. W.

**Action of selenium dioxide on β-diketones.** P. PIUTTI (Gazzetta, 1936, 66, 276—277).—CH<sub>3</sub>(COMe)<sub>2</sub> and SeO<sub>2</sub> in EtOH give triketopentane, which with o-C<sub>6</sub>H<sub>4</sub>(NH<sub>2</sub>)<sub>2</sub> yields 3-acetyl-2-methyl quinoxaline, m.p. 87—88°. COMe·CH<sub>2</sub>·COPh gives a product which is not Ph Me triketone. E. W. W.

**Conversion of ortho- into para- and of para- into ortho-quinone derivatives.** IV. Synthesis of furan derivatives of α- and β-naphthaquinones. S. C. HOOKER and A. STEYERMARK (J. Amer. Chem. Soc., 1936, 58, 1202—1207; cf. J.C.S., 1894, 65, 17).—3-Hydroxy-2-α-dibromoethyl-, -2-α-dibromo-n-propyl-, m.p. 156—157° (decomp.), -2-α-dibromo-n-butyl-, m.p. 133—134°, and -2-α-dibromo-β-phenylethyl- (I), m.p. 172·5—173·5° (decomp.), -1 : 4-naphthaquinones, prepared from the 2-Δ<sup>2</sup>-alkenyl derivatives and Br in CHCl<sub>3</sub>, are converted by EtOH (usually boiling) into 5 : 6-benzcoumarone-3 : 4-quinone, m.p. 209·5—210° (quinoxaline, m.p. 195—196°), and its 1-Me, m.p. 164—164·5° (quinoxaline, m.p. 209·5—210·5°), 1-Et, m.p. 143·5—144° (quinoxaline, m.p. 159—160°), and 1-Ph (II), m.p. 219·5—220·5° (quinoxaline, m.p. 237—238°), derivatives, respectively. (I) is accompanied by a little 2-bromo-1-phenyl-5 : 6-benzcoumaran-3 : 4-quinone, m.p. 218—

219° (quinoxaline, m.p. 237—238°), whilst small amounts of (III) (below) and a hydroxyphenylbenzcoumarone-3 : 4-quinone, m.p. about 275° (decomp.), are formed with (II). 1-Methyl-, m.p. 246—247°, 1-ethyl-, m.p. 145—145·5°, and 1-phenyl- (III), 2 forms, both m.p. 246·5—247·5°, -4 : 5-benzcoumarone-3 : 6-quinone are obtained when the isomeric 3 : 4-quinones (above) are treated with cold conc. H<sub>2</sub>SO<sub>4</sub>. Both series are cleaved by boiling 1% NaOH; 3-hydroxy-2-acetonyl-, m.p. 176·5—177·5° (IV), -2-propionylmethyl-, m.p. 165—165·5°, and -2-phenacyl-, m.p. 182·5—183·5°, -1 : 4-naphthaquinone are thus obtained. These are converted by conc. H<sub>2</sub>SO<sub>4</sub> into the above 3 : 4- and then into the 3 : 6-quinones. (IV) is reduced (Adams) to 3-hydroxy-2-β-hydroxypropyl-1 : 4-naphthaquinone, m.p. 115·5—116·5° (cf. Fieser, A., 1927, 155). H. B.

**Micro-hydrogenation by hyposulphite.** E. HAAS (Biochem. Z., 1936, 285, 368—371).—A method is described, using methylene-blue, indigotindisulphonic acid, and Me-orange as test substances, which indicates the extent of reduction by Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> from pressure changes when the substance is mixed with a NaHCO<sub>3</sub>-Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> solution in equilibrium with a CO<sub>2</sub>-A atm. P. W. C.

**Synthesis of sulphur derivatives of 1 : 2 : 4-triazole.** I. MATZUREVITSCH (Bull. Sci. Univ. Kiev, 1935, 1, 9—83).—NH<sub>2</sub>Ph and thiosemicarbazide (I) or (NH<sub>2</sub>·CS·NH<sub>2</sub>)<sub>2</sub> (II) at 180° afford 3 : 5-dianilino-4-thiol-1 : 2-diazole and 3-amino-5-thiol-4-phenyl-1 : 2 : 4-triazole (III) (dibenzyl derivative, m.p. 189—190°). NH<sub>2</sub>Ph and (NHPh·CS·NH<sub>2</sub>)<sub>2</sub> (at the b.p.) yield 3-anilino-5-thiol-4-phenyl-1 : 2 : 4-triazole (IV). NH<sub>2</sub>Ph and (o-C<sub>6</sub>H<sub>4</sub>Me·NH·CS·NH<sub>2</sub>)<sub>2</sub>, m.p. 168—170° (decomp.) [from (I) and o-C<sub>6</sub>H<sub>4</sub>Me·NCS], give (III) and (IV). o-Toluidine (V) and (I) or (II) afford 3-amino-5-thiol-4-o-tolyl-1 : 2 : 4-triazole, +H<sub>2</sub>O, m.p. 228—229° (Ag salt; platinichloride; 3-N·Ac, m.p. 190—191°, and 3-N·5-S-dibenzyl derivative, an oil), together with 3-amino-5-thiol-1 : 2-dihydro-1 : 2 : 4-triazole, its polymeride, not melting at 370°, and a no. of unidentified products; the corresponding 4-m-tolyl-, +H<sub>2</sub>O, m.p. 259—260° (Ac derivative, m.p. 188—189°), and 4-p-tolyl compound, +H<sub>2</sub>O, m.p. 271—272° (dibenzyl derivative, m.p. 237—238°), are obtained similarly. (V) and NH<sub>2</sub>·CS·NH·NH·CS·NHPh yield 3-o-toluidino-5-thiol-1 : 2 : 4-triazole, +H<sub>2</sub>O, m.p. 219—222° (Ac derivative, m.p. 184—185°); the corresponding 3-m-, +H<sub>2</sub>O, m.p. 247—248·5° (decomp.), 3-p-toluidino-, m.p. 263—264° (decomp.) (Ac derivative, m.p. 191—192°), and 3-xylylidino-compound, +H<sub>2</sub>O, m.p. 203—204°, were prepared analogously. NH<sub>2</sub>·CH<sub>2</sub>Ph and (I) (1·5 hr. at the b.p.) yield dibenzylthiocarbamide and an unidentified substance, m.p. 161—162°. The triazoles described give characteristic colorations with HNO<sub>2</sub> or with aq. K<sub>3</sub>Fe(CN)<sub>6</sub>. R. T.

**Relations between reduction-oxidation potential and chemical constitution of flavins.** R. KUHN and P. BOULANGER (Ber., 1936, 69, [B], 1557—1566).—Lumiflavin is slightly more negative than lactoflavin (I) in the complete region, p<sub>H</sub> 0·4—12·8. At p<sub>H</sub> 7·0, (I) has E<sub>0</sub> 0·185 volt. Investigation of 9-methyl-, 3 : 9-dimethyl-, 9-phenyl-, and 3-phenyl-

9-methylflavin and of 6:7-dimethyl- and 3:6:7-trimethyl-9-*d*-glucoflavin shows that methylation in position 3 has no appreciable influence. Me situated in the  $C_6H_6$  nucleus has a marked effect. Displacement of Me from position 7 to 8 causes an increase of 0.113 volt in potential. Me groups at 6 and 7 occasion the most negative potentials observed among synthetic flavins. The influence of the pentitol chain is very slight. Replacement of 9-1'-ribityl by hydroxyethyl, dihydroxypropyl, 1-1'-arabityl, *d*-1'-xylityl, or *d*-1'-sorbityl causes very slight positive increase in potential. An influence of the constitution and configuration of pentitol and hexitol chains could not be observed but differences are caused by the introduction of quite dissimilar groups, e.g., Ph,  $\cdot CH_2 \cdot CO_2H$ ,  $\cdot CH_2Ph$ , and cyclohexyl. Esterification of the vitamins with  $H_3PO_4$  has as little effect on the redox potential as on the absorption spectrum. The yellow enzyme is 0.12 volt more positive than its pigment component. The sp. protein substance is therefore united not only to the phosphoric residue but also to the flavin nucleus. The probability that NH at 3 is concerned in the union is strengthened by the observations that the enzyme, in contrast with (1) and lactoflavinphosphoric acid, does not exhibit fluorescence and that 3-methyl-lactoflavin, in contrast with (I), does not promote the growth of rats on a vitamin- $B_2$ -free diet.

H. W.

**Porphyryns. XXXVI. Vinyl- and amino-porphyrins.** H. FISCHER, E. HAARER, and F. STADLER (Z. physiol. Chem., 1936, 241, 201—219; cf. A., 1935, 362; this vol., 87).—The  $Me_2$  ester of mesoporphyrin-IX in MeOH with  $NH_2OH$  at 135° for 12 hr. gives the *dihydrazide* (I), m.p. >300° (*Cu* salt; compound with 2PhCHO, m.p. 275°), which with  $HNO_2$  at 0° yields the corresponding *diazide* (II). (II) with MeOH gives the corresponding *diurethane* (III), m.p. 252° (*Cu* salt, m.p. 270°), which with 10% HCl at 130—140° gives the *dihydrochloride*, m.p. >300°, of the corresponding diamine *dihydrochloride* [tetra-acetate (IV), m.p. 276°; *Cu* salt of (IV), m.p. 260°; compound (V) with  $Me_2SO_4$ , m.p. >300°]. (V) boiled for 3 hr. with 10% KOH in MeOH gives *isopropatoetioporphyrin* (VI), m.p. >300° [*Cu* salt, m.p. >300°; *Fe* salt (VII), m.p. >300°]. (VII) with  $Na+C_5H_{11}OH$  in  $H_2$  gives the corresponding *chlorin*. (VI) reacts successively with  $2CHN_2 \cdot CO_2Et$  and  $CH_2N_2$  to give a substance, m.p. 265°, with HI in AcOH to give *etioporphyrin-III*, m.p. >300°, and with HBr in AcOH to give a Br-compound which yields *hematoporphyrin* on alkaline hydrolysis and a  $(OMe)_2$ -derivative, decomp. about 180°, with MeOH. The *Fe* salt of tetramethyl-hematoporphyrin with HI in AcOH and subsequent esterification with  $CH_2N_2$  gives a *porphyrin*, m.p. 240° (*oxime*, m.p. 261°). (III) with 10% HCl gives the *hydrochloride* (VIII) of the corresponding amine. (VIII) after methylation with  $Me_2SO_4$  yields (VI) on boiling with 10% KOH in MeOH. (I) in dil.  $H_2SO_4$  oxidised with  $KMnO_4$  and esterified with  $CH_2N_2$  gives the ester (IX) of mesorhodin and (IX) on boiling with AcOH and esterifying with  $CH_2N_2$  gives the ester, m.p. 252°, of mesoverdin. The *Me* ester of rhodoporphyrin-XV with  $NH_2OH$  gives the

*monohydrazide* (X), m.p. 285°, and the  $Me_2$  ester gives the *dihydrazide*, m.p. >360°, and (X). Similarly the  $Me_8$  ester of uroporphyrin yields the *octahydrazide*, m.p. >360°, and the  $Me_8$  ester of isouroporphyrin-I yields the *octahydrazide*. The hydrazide of pyrroporphyrin-XV with PhCHO gives a compound, m.p. 290°. Phaeophorbide and phaeophytin heated with 30% KOH in MeOH at 180° for 6 hr. give a *K* salt which with  $Me_2SO_4$  yields the *Me* ester of pyrroporphyrin. The  $Me_4$  ester of coproporphyrin-I with  $NH_2OH$  gives the acid hydrazide, which with  $HNO_2$  yields the acid azide (XI). (XI) boiled with 50% AcOH gives the *hexahydrochloride* (XII) of the corresponding amine [octa-acetate (XIII), m.p. 287°; *Cu* salt of (XIII), m.p. 278°]. (XII) with  $Me_2SO_4$  and KOH in MeOH gives 1:3:5:7-tetramethyl-2:4:6:8-tetraynylporphyrin (XIV), m.p. >360° (*Cu* salt, m.p. >360°), with elimination of  $NMe_3$ . (XIV) in AcOH with Pd+H, gives *etioporphyrin-I*. W. McC.

**Imidoporphyrins. II. Synthesis of mono-imidoæti- and monoimido-copro-porphyrin.** H. FISCHER and W. FRIEDRICH (Annalen, 1936, 523, 154—164).—5:5'-Dibromo-4:4'-dimethyl-3:3'-diethylpyrromethene hydrobromide is converted by NaOH in  $H_2O-C_5H_5N$  at 130—140° into *mono-imidoætioporphyrin* (I), m.p. >300° (*Cu* salt), and a

(?) *di-imidoætioporphyrin*. Similarly 5:5'-dibromo-4:4'-dimethylpyrromethene-3:3'-dipropionic acid hydrobromide affords monoimido-copro-porphyrin, transformed by  $CH_2N_2$  into the  $Me_4$  ester, which sinters from 240°. Under like conditions 5-bromo-4:3':5'-trimethyl-3-ethylpyrromethene-4'-propionic acid hydrobromide passes into mesoporphyrin and *monoimido-mesoporphyrin*, and 5:5'-dibromo-3:3':4:4'-tetramethylpyrrometheno hydrobromide into *monoimido-octamethylporphyrin*. H. W.

**Chlorophyll. LXVIII. Ketophylloporphyrins and their transition into deoxophyllerythrin derivatives.** H. FISCHER, K. MÜLLER, and O. LESCHHORN (Annalen, 1936, 523, 164—198).—The *Fe* salt of phylloporphyrin *Me* ester (I) is converted by  $SnBr_4$  in  $(C_2H_5Cl)_2O$  into formylphylloporphyrin *Me* ester (II), m.p. 236° (*Fe*, m.p. 245°, and *Cu*, m.p. 208°, salts), the *oxime*, m.p. 257°, of which is transformed by boiling  $Ac_2O$  containing KOAc into 6-cyanophylloporphyrin *Me* ester, m.p. 255° (*Cu* salt, m.p. 256—257°), which could not be hydrolysed satisfactorily. (II) and anhyd. HCN in  $C_5H_5N$  containing  $K_2CO_3$  give 6-formylphylloporphyrin-cyanohydrin *Me* ester, m.p. 236°. Condensation of (II) with  $CH_2(CO_2H)_2$  in  $C_5H_5N$  containing piperidine under mild conditions gives the tricarboxylic acid (*Me* ester, m.p. 255°), whereas under more drastic circumstances deoxophyllerythrin-9-acetic acid (*Me* ester, m.p. 233°) is obtained. (II)

and MeOH—conc. HCl at 60° afford 9-methoxydeoxyphyllerythrin Me ester (III), m.p. 222—223°. Boiling  $C_5H_5N$  containing  $Na_2CO_3$  converts (II) into 9-hydroxydeoxyphyllerythrin Me ester (IV), m.p. 276° (Cu salt, m.p. 228°; Bz derivative, m.p. 253°; acetate, m.p. 234°). Treatment of (IV) with boiling  $CHCl_3$ —MeOH containing I affords 9:10-dimethoxydeoxyphyllerythrin ester, m.p. 220°, and 10-methoxyphyllerythrin ester, m.p. 268° (oxime). (III) and  $CH_3Ph \cdot OH$  containing I at 100° yield benzoyloxydeoxyphyllerythrin ester, m.p. 228°. HI (d 1.96) in AcOH at 65—70° converts (III) or (IV) into deoxyphyllerythrin, m.p. 276—277°. (I),  $Bz_2O$ , and  $SnBr_4$  at 70° yield 6-benzoylphyllerythrin Me ester (V), m.p. 303° (Cu, m.p. 258°, and Fe, m.p. 262°, salts). 9-Hydroxy-9-phenyldeoxyphyllerythrin Me ester, m.p. 278°, from (V) and boiling KOH—MeOH, is converted by HI (d 1.96) in AcOH at room temp. into 9-phenyldeoxyphyllerythrin Me ester, m.p. 258°. (II) and  $CH_3(CN)_2$  in  $C_5H_5N$  containing piperidine at 100° afford 9-dicyanomethyldeoxyphyllerythrin Me ester, m.p. 222°. The Fe salt of (II) is reduced by Na and boiling  $iso-C_4H_9 \cdot OH$  to deoxyphyllerythrin.

[With O. LESCHORN.] Chlorophyllin  $l_4$  Me<sub>2</sub> ester is converted by NaOEt in boiling  $C_5H_5N$ —xylene and treatment of the product with  $CH_3N_2$  into phylloerythrin. 3-Carbethoxy-5-formyl-4-methylpyrrole-2-propionic acid and hæmopyrrole in AcOH at 0° yield 4-carbethoxy-4':5':3-trimethyl-3'-ethylpyrromethene-5-propionic acid (VI), m.p. 61° [Me ester (VII), m.p. 165° (decomp.); hydrobromide, m.p. 204° (decomp.)]. Bromination of (VI) and (VII) gives products, m.p. 202° (decomp.) and m.p. 112°, respectively, but the action is accompanied by partial decarboxylation. Hæmopyrrolealdehyde, 3-carbethoxy-4-methylpyrrole-2-propionic acid, and HBr afford 4:5:4':5'-tetramethyl-3:3'-diethylpyrromethene hydrobromide, m.p. 218°. H. W.

**Derivatives of blood-pigments.** A. HANSIK (Z. physiol. Chem., 1936, 241, 156—167; cf. A., 1930, 1304; 1931, 745; Langenbeck, A., 1932, 412, 757).—Amorphous and cryst. hæmatin (I) with cold 80%  $HCO_2H$  gives formyl- and with AcOH acetyl-hæmin whilst the anhydride (II) and the half anhydride (III) do not react. Probably (II) and (III) are produced by loss of the OH attached to Fe. (I), (II), and (III) differ in solubility in  $C_5H_5N$  and 5% aq.  $NaHCO_3$ . The properties of (I) and the prep. of (III), glyoxaline-, histidine-, and pyridine-hæmatin, and the following derivatives of hæmin: glyoxaline-chloro- and -formyl-, pyridine-, pyridine-formyl-, -acetyl-, and -chloro-, and the K salt of protoporphyrin are described. W. McC.

**Fluorescence of the chlorophyll series.** Reversible reduction of chlorophyll-a and -b. V. M. ALBERS, H. V. KNORR, and P. ROTHMUND (Physical Rev., 1935, [ii], 47, 198; cf. A., 1935, 12).—Chlorophyll-a and -b were reduced in  $C_5H_5N$  under an atm. of  $N_2$  or  $CO_2$ , and reoxidised in air. The reduced chlorophyll (I) showed no characteristic absorption in the visible region. The absorption spectra of the original and reoxidised (I) were identical in the visible region. The fluorescence spectra of the reduced, re-oxidised, and original (I) were all

different, and fluorescence was more intense in the original (I). The fluorescence spectra for the reduced and reoxidised (I)-a and -b are different according as  $CO_2$  or  $N_2$  is used. L. S. T.

**Spectroscopic studies of simpler porphyrins.**—See this vol., 1048.

**Fluorescence of the porphyrins.**—See this vol., 1048.

**Compounds of pyrrole with furfuraldehyde.**

**I. Furfurylidene-pyrroles.** P. PRUTTI (Gazzetta, 1936, 66, 265—270).—2:4-Dimethyl-3-ethylpyrrole (I) with furfuraldehyde, AcOH, and a trace of HBr gives the 5-furfurylidene derivative (II), m.p. 185°, of (I). With a larger proportion of HBr, the hydrobromide, m.p. 83—84°, of (II) is formed, and is converted into the picrate, decomp. 154°, and the perchlorate, m.p. 217° (decomp.). 3-Acetyl-5-furfurylidene-2:4-dimethylpyrrole perchlorate, 2-furfurylidene-tetrahydrokatole picrate [both of which decompose without melting (up to 280°)], and 5-furfurylidene-2:4-dimethylpyrrole hydrobromide, m.p. <250°, are prepared similarly. E. W. W.

**isoOxazole group.** Action of nitric acid on unsaturated compounds. XIII—XV. Products of the reaction of nitric acid with citraconic acid. A. QUILICO and R. FUSCO (Gazzetta, 1936, 66, 278—286, 287—293, 293—299).—XIII. Eulite (I) (cf. this vol., 617), of which the prep. is modified, when dissolved in MeOH—NaOMe and treated with  $HgCl_2$  gives a mercurichloride,  $C_6H_5O_8N_4Cl_2Hg_2$ . The base A,  $C_6H_9O_2N_3$ , m.p. 136—137°, obtained by  $SnCl_2$  reduction of (I) (loc. cit.) is identified as 3-methyl-5-( $\beta$ -amino- $\alpha$ -oximinoethyl)isooxazole (II) (Ac derivative, m.p. 152°), which on prolonged boiling with HCl yields  $NH_4OH$  and 5-glycyl-3-methylisooxazole hydrochloride (III) [p-nitrophenylhydrazone, m.p. 215—216° (decomp.)]. The last is converted by NaOH into a yellow base, 2:5-(3':3'-dimethyl-5':5''-diisooxazolyl)dihydropyrazine (IV), m.p. 173—174° (Ac derivative, m.p. 220°). The second base, B,  $C_6H_{11}ON_3$  (loc. cit.), from (I) is identified as 3-methyl-5-( $\alpha\beta$ -diaminoethyl)isooxazole (Ac. derivative, m.p. 184°). A third base, C,  $C_6H_9O_2N_3$ , m.p. 165—166° (Ac derivative, m.p. 239°), is also isolated, and with  $HNO_3$  gives a diazo-acid,  $C_6H_5O_3N_3$ . It is concluded that (I) is 3-methyl-5-( $\alpha\beta$ -trinitroethyl)isooxazole.

XIV, XV. Thermal decomp. of (I) mixed with powdered glass gives, with  $N_2O_3$ , HCN, AcOH, MeCN, and  $MeNO_2$ , 5-nitroacetyl-3-methylisooxazole (V), m.p. 37°, b.p. 132—133°/25 mm. [phenylhydrazone, m.p. 111° (decomp.); p-nitrophenylhydrazone, m.p. 165° (decomp.); semicarbazone, m.p. 197—198° (decomp.)]. The oxime, m.p. 98° [Bz derivative, m.p. 185—190° (decomp.)], of (V) is reduced ( $SnCl_2$ ) to (II) (above); (V) is similarly reduced to (III). (V) condenses with aldehydes in presence of  $NH_2Me$ , thus giving 5- $\alpha$ -nitro-cinnamoyl-, m.p. 120° [p-nitrophenylhydrazone, m.p. 225° (decomp.)], and -p-methoxycinnamoyl-3-methylisooxazole, m.p. 130° (decomp.) [p-nitrophenylhydrazone, m.p. 227° (decomp.)]. Diphenyldihydropyrazine forms an Ac derivative, m.p. 190°. E. W. W.

**Preparation of morpholine.** L. MEDARD (Bull. Soc. chim., 1936, [v], 3, 1338—1343; cf. A., 1897, i, 314; 1898, i, 601).— $\text{NH}(\text{CH}_2\text{CH}_2\text{OH})_2$  with 0.55 part of conc.  $\text{H}_2\text{SO}_4$  at 175—180° affords morpholine, isolated as the hydrochloride, in nearly theoretical yield. The free base is difficult to obtain anhyd. J. L. D.

**Amides and urethanes derived from morpholine.** L. MEDARD (Bull. Soc. chim., 1936, [v], 3, 1343—1347).— $\text{HCO}_2\text{H}$  with aq. morpholine (I) affords *N*-formylmorpholine, b.p. 234°/760 mm. The following are also prepared: *N*-acetyl-, b.p. 242.2—242.6°/759 mm., *N*-propionyl-, b.p. 249°/760 mm., *N*-butyryl-, m.p. 27°, and *N*-hexoyl-morpholine, b.p. 293°/760 mm. (I) with  $\text{ClCO}_2\text{Me}$  in aq.  $\text{Na}_2\text{CO}_3$  affords morpholine methylcarbamate, b.p. 212.3—212.8°/759 mm. Et (A., 1898, i, 601), *Pr*, b.p. 238°/760 mm., and morpholine butylcarbamate, b.p. 252—252.3°/760 mm., are also prepared.

J. L. D.

**N-Hydroxyaryl-substituted morpholines.**—See B., 1936, 716.

**3 : 4 : 5 : 6-Tetrahalogeno-2-amino-1-hydroxybenzenes.**—See B., 1936, 685.

**Synthesis of thiazologlyoxaline and thiazolopurine derivatives.** E. OCHIAI (Ber., 1936, 69, [B], 1650—1655).—Treatment of Et 2-thiol-4-methylglyoxaline-5-carboxylate with  $\text{CH}_2\text{ClAc}$  in EtOH in presence or absence of  $\text{NaOEt}$  affords Et 2-acetonylthiol-4-methylglyoxaline-5-carboxylate, m.p. 108—109° (hydrochloride, decomp. 171°; semicarbazone, decomp. 140°), which is converted by boiling  $\text{POCl}_3$  into Et 4'-methyl-2' : 3'-thiazolo-2 : 1-4-methylglyoxaline-5-carboxylate,  $\text{C}(\text{CO}_2\text{Et})\text{N}(\text{CMe})\text{C}(\text{CMe})\text{N}(\text{C})\text{S} \rightarrow \text{CR}$  m.p. 146—147°,

and by boiling  $\text{Ac}_2\text{O}$  containing anhyd.  $\text{NaOAc}$  into Et 5'-acetyl-4'-methyl-2' : 3'-thiazolo-2 : 1-4-methylglyoxaline-5-carboxylate, m.p. 205° (p-nitrophenylhydrazone; oxime, decomp. 256°). 8-Chlorotheophylline and  $\text{NaHS}$  in  $\text{H}_2\text{O}$  at 150—155° give 8-thioltheophylline, decomp. 320—321°, transformed by  $\text{NaOEt}$  and  $\text{CH}_2\text{ClAc}$  into 8-acetonylthioltheophylline (I), m.p. 204—205° (oxime, decomp. 244° after blackening at about 230°), which is converted by  $\text{POCl}_3$  into 4'-methyl-2' : 3'-thiazolo-8 : 7-theophylline, m.p. 263°. The attachment of  $\text{CH}_2\text{Ac}$  to S in (I) is established by the observation that 8-thioltheophylline is converted by EtBr in boiling EtOH into 8-ethylthioltheophylline, m.p. 249°, which is not desulphurised by  $\text{NaNO}_2$  and requires treatment with 20%  $\text{NaOH}$  to cause loss of EtSH. Et 2-ethylthiol-4-methylglyoxaline-5-carboxylate, m.p. 144—145°, is described. H. W.

**Anthraquinone derivatives. Anthrazazole-anthraquinonecarboxylimides.**—See B., 1936, 686.

**Structure of vitamin-B<sub>1</sub>.**—See this vol., 1159.

**Structure of cyanine dyes, and their optical and photographic properties II. Thiocyanines with sulphur-containing substituents.** A. I. KIPRIANOV, Z. P. SITNIKOV, and E. D. SITSCH (J. Gen. Chem. Russ., 1936, 6, 576—583).—*p*-Methylthiolacetanilide and  $\text{P}_2\text{S}_5$  at 115° yield *p*-methylthiolthioacetanilide, m.p. 114—115°, from which the expected benzthiazole derivative was not obtained

by oxidation with  $\text{K}_3\text{Fe}(\text{CN})_6$ . 1-Methylbenzthiazole and  $\text{HNO}_3\text{--H}_2\text{SO}_4$  afford 5-nitro-1-methylbenzthiazole, m.p. 164—165°, reduced by  $\text{SnCl}_2$  in  $\text{HCl}$  to the 5-NH<sub>2</sub>-compound, m.p. 122°, which is diazotised and treated at 70° with aq.  $\text{K}_2\text{CS}_3$ , the xanthate obtained is boiled with EtOH-KOH, and the product is treated with  $\text{Me}_2\text{SO}_4$ , to yield 5-methylthiol-1-methylbenzthiazole, the ethiodide, m.p. 215°, of which yields 5 : 5'-dimethylthiol-2 : 2'-diethylthiocarbocyanine iodide (I) with Et orthoformate and  $\text{C}_6\text{H}_5\text{N}$  (1.5 hr. at the b.p.), and the 8-Me derivative of (I) when treated with Et orthoacetate and  $\text{C}_6\text{H}_5\text{N}$  (1.5 hr. at the b.p.).  $\text{NaSMe}$  in EtOH yields methylthiolpyruvonnitrile,  $\text{SMe}\cdot\text{CH}_2\cdot\text{CO}\cdot\text{CN}$  (II), b.p. 74.5°/20 mm., with  $\text{CH}_2\text{Cl}\cdot\text{CO}\cdot\text{CN}$ , and Et ethylthiolpyruvate, b.p. 174—176°, with  $\text{CH}_2\text{Cl}\cdot\text{CO}_2\text{Et}$ . (II) and EtOH-HCl yield β-methylthioethyliminoether hydrochloride,  $\text{SMe}\cdot\text{CH}_2\cdot\text{C}(\text{OEt})\cdot\text{NH}\cdot\text{HCl}$ , readily decomp. in EtOH to afford Et methylthiolorthoacetate,  $\text{SMe}\cdot\text{CH}_2\cdot\text{C}(\text{OEt})_2$ , b.p. 78—80°/30 mm., which condenses with 1-methylbenzthiazole ethiodide (III) in  $\text{C}_6\text{H}_5\text{N}$  or EtOH to yield 2 : 2'-diethyl-8-methylthiolmethylcarbothiocyanine iodide. The corresponding 8-SEt derivative is prepared from (III) and β-ethylthioethyliminoether,  $\text{SEt}\cdot\text{CH}_2\cdot\text{C}(\text{OEt})\cdot\text{NH}$ , b.p. 103—104° (prepared as above from ethylthiolpyruvonnitrile, b.p. 104—105°). Introduction of S-containing groups into carbothiocyanine dyes does not affect their sensitising and stabilising properties. R. T.

**Alkaloids of Heliotropium lasiocarpum. VI. Synthesis of pyrrolidine derivatives.** G. MENSCHIKOV and J. SCHDANOVITSCH (Ber., 1936, 69, [B], 1799—1802).—Addition of  $\text{Pr}^n\text{CN}$  to a solution of Mg and  $\text{OMe}[\text{CH}_2]_3\text{I}$  in  $\text{Et}_2\text{O}$  gives γ-methoxy-β-methylheptan-δ-one, b.p. 198—199°/1 atm., the oxime, b.p. 124—125°/12 mm., of which is reduced by Na and  $\text{Bu}^n\text{OH}$  to δ-amino-γ-methoxy-β-methylheptane (I), b.p. 200.5—201°/1 atm. (I) is converted by 50% HBr at 150—155° into 2-isobutylpyrrolidine, b.p. 163—164°/1 atm., which with  $\text{CH}_2\text{O}$  and  $\text{HCO}_2\text{H}$  affords 1-methyl-2-isobutylpyrrolidine (I), b.p. 163.5—165°/1 atm. (picrate, m.p. 138—139°; platini-chloride, m.p. 138—140°). 1-Methyl-2-*n*-butylpyrrolidine (II) is obtained similarly from  $\text{Pr}^n\text{CN}$ . Neither (I) nor (II) is identical with *dl*-dihydrode-N-methylheliotridane. H. W.

**Lupin alkaloids. X. Synthesis of *dl*-oxy-sparteine.** G. R. CLEMO, W. MCG. MORGAN, and R. RAPER (J.C.S., 1936, 1025—1028; cf. A., 1933, 841).—Attempted Claisen condensation of 2 mols. of Me pyridyl-2-acetate under varying conditions yields complexes, m.p. 177° and 295°, only. Et piperidyl-2-acetate (I),  $\text{ClCO}_2\text{Et}$ , and  $\text{Na}_2\text{CO}_3$  (18 hr.; room temp.) afford Et 1-carbethoxypiperidyl-2-acetate, b.p. 148—150°/9 mm., converted into the acid, m.p. 65°, by refluxing with  $\text{C}_6\text{H}_6\text{--NaOEt}$  (6 hr.) followed by conc.  $\text{HCl}$  (12 hr.; 100°). (I) with  $\text{CH}(\text{OEt})_2$  and  $\text{Ac}_2\text{O}$  (2 hr.; reflux) yields 1-carbethoxy-4-keto-3-(2'-pyridyl)pyridocoline, b.p. 250—255°/1 mm., m.p. 126° (picrate, m.p. 216°), reduced ( $\text{Pt--AcOH--H}_2$  at 100 lb. per sq. in.) to impure 1-carbethoxy-4-keto-3-(2'-piperidyl)octahydropyridocoline, b.p. 200—210°/1 mm.; this on Bouveault reduction forms the corresponding 1-carbinol, which with  $\text{PBr}_3$  gives

1-bromomethyl-4-keto-3-(2'-piperidyl)octahydropyridocoline, converted by heating with  $K_2CO_3$  (18 hr.;  $100^\circ$ ) into *dl*-oxysparteine (II) [methiodide, m.p. 203—204°; hydriodide, m.p. 275° (decomp. 345°)], identical with that obtained by oxidation [ $NaOH \cdot K_3Fe(CN)_6$ ] of *dl*-sparteine (A., 1928, 1030). The structure of (II) is hence as shown.

F. N. W.

Lupin. XI. Alkaloids of *Lupinus barbariger*, S. Wats. J. F. COTCH (J. Amer. Chem. Soc., 1936, 58, 1296—1299).—Sparteine [dihydrobromide (+ $H_2O$ ), m.p. 197°; methiodide, m.p. 239—240°; zincchloride, m.p. 316—317°], *dilupine* (I), provisionally  $C_{16}H_{26}O_2N_2$ , an oil,  $[\alpha]_D^{20} + 65.59^\circ$  in  $H_2O$  (hydrobromide, m.p. 233—234°), *trilupine* (II),  $C_{15}H_{23}O_3N_2 \cdot 2H_2O$ , m.p. (anhyd.) 252°,  $[\alpha]_D^{20} + 63.76^\circ$  in  $H_2O$  [platnichloride (+ $4H_2O$ ), m.p. 224° (decomp.); aurichloride (+ $4H_2O$ ), m.p. 188—189° (decomp.)], and basic and much resinous material are isolated (method: A., 1935, 97) from the dry plant. (I) and MeI give a methiodide,  $C_{16}H_{26}ON_2 \cdot MeI$ , m.p. 253°, suggesting that (I) is a *C*-methyl-lupanine *N*-oxide. (II) is probably *d*-lupanine 1:9-dioxide (for nomenclature, see this vol., 741). Thus, (II) heated with acids affords the salts of *d*-lupanine (III) [dihydrochloride (+ $H_2O$ ), m.p. 163—164°; aurichloride, m.p. 206°], whilst (III) is oxidised ( $CaO_2 \cdot H_2O$ ) to (II). (II) and MeI give (probably) the 9-methiodide, m.p. 127°, of *d*-lupanine 1-oxide.

H. B.

Cocaine syntheses from hyoscyamine. I. Preparation of tropinonecarboxylic esters. N. A. PREOBRAZHENSKI, M. N. SCHTSCHUKINA, and R. A. LAPINA (Ber., 1936, 69, [B], 1615—1618).—Tropinone and  $Et_2CO_3$  condense readily in the presence of molten Na to Et tropinonecarboxylate (+ $2H_2O$ ), m.p. 64—65° (corresponding picrate, m.p. 151°). With  $Me_2CO_3$  the production of Me tropinonecarboxylate (+ $2.5H_2O$ ), m.p. 96—98° (corresponding picrate, m.p. 163—164°), is better achieved with the more readily fusible K. Both condensations are preferably performed in an inert solvent of suitable, high b.p., e.g., xylene.

H. W.

Amine oxides of alkaloids. X. Action of hydrogen peroxide on hydrastinine and hydrohydrastinine. XI. *NN'*-Dioxide of *NN'*-dimethylpiperazine. XII. *N*-Oxide of sparteine. MAX and MICHEL POLOXOVSKI (Bull. Soc. chim., 1936, [v], 3, 885—888, 888—891, 891—898).—X. Hydrastinine (I) with  $COMe_2 \cdot H_2O_2$  gives dehydrohydrastinine and hydrastinine anhydride, whilst hydrohydrastinine (II) yields its *N*-oxide (hydrochloride, m.p. 199—200°; hydrobromide, m.p. 174—175°), converted by  $SO_2$  into a *N*-sulphonic ester, (I), and (II). The formation of (I) is interpreted by means of a mol. transposition.

XI. Dimethylpiperazine with  $H_2O_2 \cdot COMe_2$  gives its *NN*-dioxide, m.p. 269° from  $CHCl_3$  and m.p. 239° from EtOH (dihydrochloride, m.p. 208—209°), from which the base is regenerated by  $SO_2$  and by Zn-HCl.

It is acid to litmus and slightly alkaline to Me-orange, and may be determined by silicotungstic acid.

XII. Dioxysparteine (III) (A., 1887, 1056; 1897, 231), obtained from sparteine and  $H_2O_2 \cdot COMe_2$ , and previously considered to be an *NN*-dioxide (cf. A., 1919, i, 414), is shown to be sparteine *N*-monoxide hydrate, m.p. 129° [hydrobromide, m.p. 138°; hydriodide (IV), m.p. 147°; dihydrochloride, m.p. 153°; dihydrobromide, m.p. 155°; dinitrate, m.p. 97—98°; dipicrate, m.p. 150°], which with KI gives (IV). The alleged methiodide of (III) (cf. *loc. cit.*) is shown to be (IV). The above di-salts lose some acid at 100° [cf. the alleged product,  $C_{15}H_{26}O_2N_2 \cdot 1.5HBr \cdot H_2O$  (*loc. cit.*)].

H. G. M.

Alkaloids of Chinese *Corydalis* tubers. (*Corydalis ambigua*, "Yen-Hu-So"). M. HUANG (Ber., 1936, 69, [B], 1737—1745).—The drug is moistened with  $Al_2(SO_4)_3$  solution and extracted with  $C_6H_6$ , thus yielding corydaline, m.p. 134—135°, and unidentified bases and considerable amounts of a volatile oil containing small amounts of crystals, m.p. 84—86°, which are not identical with cedrol and are possibly dimyristyl alcohol. Renewed extraction of the residue with  $C_6H_6$  after saturation of it with  $NH_3$  gives protopine, corybulbine, *r*-tetrahydropalmatine (identical with the corydalis *B* of Chou), *r*-tetrahydrocoptisine (corydalis *E*), and *l*-tetrahydrocoptisine (corydalis *D*). Extraction of the residue with EtOH yields coptisine and mesocorydaline.

H. W.

New alkaloids of ergot: ergosine and ergosinine. S. SMITH and G. M. TITMUS (Nature, 1936, 137, 1075).—By treatment with acids  $C_{30}H_{35}O_5N_5$  (this vol., 351) ("ergosinine") is converted into an isomeride, ergosine, decomp. 228°,  $[\alpha]_D^{20} -194^\circ$  in  $CHCl_3$ .

L. S. T.

Alkaloids of *Fritillaria roylei*. I. Isolation of peimine. Y. F. CHI, Y. S. KAO, and K. J. CHANG (J. Amer. Chem. Soc., 1936, 58, 1306—1307).—Details are given for the isolation of peimine (I),  $C_{26}H_{43}O_3N$  (not  $C_{19}H_{30}O_2N$ ; cf. Chou and Chen, A., 1932, 1178), m.p. 224° [hydrochloride, m.p. 295° (decomp.); hydrobromide, m.p. 293.5—294°; *H* sulphate, m.p. 278—280°; platnichloride, m.p. 233—235° (decomp.); aurichloride, m.p. 164—165°], from the corms. Verticin (*loc. cit.*) is probably (I).

H. B.

New derivatives of *p*-arsanilic acid. VII. *p*-Arsonoazelanilic and *p*-arsonozebacanilic acids and related compounds. G. T. MORGAN and E. WALTON (J.C.S., 1936, 902—905; cf. A., 1935, 768).—With  $SOCl_2$  Me H azelate yields its acid chloride, b.p. 150—155°/15 mm., which with Na *p*-arsanilate yields Me *p*-arsonoazelanilate (I) (*Na* salt). The Et compound (II) was similarly obtained through the acid chloride; b.p. 156—160°/20 mm. (I) and (II) are hydrolysed to the corresponding acid, which with  $SO_2 \cdot HCl$  affords crude *p*-dichloroarsinoazelanilic acid, hydrolysed to *p*-oxyarsinoazelanilic acid. The following amides, *p*-AsO $\cdot H_2 \cdot C_6H_4 \cdot NH \cdot CO \cdot [CH_2]_7 \cdot COR$ , were prepared from (I) and the corresponding amine: R=NH, [*Na* salt (+ $H_2O$ )], NHMe (*Na* salt), NH $Et$  [*Na* salt (+ $3H_2O$ )]. Azelayl dichloride and Na *p*-arsanilate afford azelanilide-*pp'*-diarsonic acid (*Na*<sub>2</sub>

salt). With  $\text{SOCl}_2$  Me H sebacate (modified prep.) yields its acid chloride (III), b.p.  $177^\circ/23$  mm., which with Na *p*-arsanilate forms Me *p*-arsonosebacanilate (Na salt). The Et compound (Na salt) was similarly prepared. These esters are hydrolysed to the acid [Na salt (+ $\text{H}_2\text{O}$ )], which affords *p*-dichloroarsinosebacanilic acid, m.p.  $130-135^\circ$ , hydrolysed to *p*-oxyarsinosebacanilic acid. The following amides,  $\text{AsO}_3\text{H}_2\cdot\text{C}_8\text{H}_7\cdot\text{NH}\cdot\text{CO}\cdot[\text{CH}_2]_8\cdot\text{COR}$ , are described:  $\text{R}=\text{NH}_2$  [Na salt (+ $\text{H}_2\text{O}$ )],  $\text{NHMe}$  [Na salt (+ $\text{H}_2\text{O}$ )],  $\text{NMe}_2$  (Na salt). (III) with  $\text{NH}_2\text{Ph}$  gives Me sebacanilate, m.p.  $67-68^\circ$  (free acid, m.p.  $121-122^\circ$ ). The corresponding acid chloride with *p*-arsanilic acid (at  $150^\circ$ ) forms sebacanilide-*p*-arsonic acid (Na salt). Sebacyl dichloride with Na-*p*-arsanilate and  $\text{Na}_2\text{CO}_3$  affords sebacanilide-*pp'*-diarsonic acid (Na salt). The Na salts of these compounds have a higher toxicity than those of the earlier series (A., 1931, 636; 1933, 290) but there is no increase in curative action.

F. N. W.

Organic compounds of mercury. XIII. Preparation of a new type of asymmetric organic mercury compounds as proof of the structure of alkanol- and  $\beta$ -alkyloxyalkyl-mercuri-salts. A. N. NESMEJANOV and R. C. FRIEDLINA (Ber., 1936, 69, [B], 1631-1635).—Confirmation of Hofmann's formulation of alkanol- and  $\beta$ -alkyloxyalkyl-mercuri-salts is found in their reaction with Sn aryl halides thus:  $2\text{OH}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{HgX} + \text{SnAr}_2\text{X}_2 + 4\text{NaOH} = 2\text{OH}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{HgAr} + \text{H}_2\text{SnO}_3 + 4\text{NaX} + \text{H}_2\text{O}$ . Thus Sn *p*-ditolyl dichloride and  $\text{OH}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{HgBr}$  in boiling EtOH containing KOH afford Hg *p*-tolyl  $\beta$ -hydroxyethyl, m.p.  $52.5-53.5^\circ$ , quantitatively converted by 15% HCl into  $\text{C}_6\text{H}_5$  and *p*- $\text{C}_6\text{H}_4\text{Me}\cdot\text{HgCl}$ . cycloHexene (I) and  $\text{Hg}(\text{OAc})_2$  in  $\text{H}_2\text{O}$  give *o*-hydroxyacetomercuricyclohexane, m.p.  $112.5-113^\circ$ , transformed by  $\text{SnPh}_2\text{Cl}_2$  into Hg Ph *o*-hydroxycyclohexyl, m.p.  $101-102^\circ$ . (I) and  $\text{Hg}(\text{OAc})_2$  in EtOH yield *o*-ethoxyacetomercuricyclohexane, m.p.  $79^\circ$  after softening at  $76^\circ$ , whence Hg Ph *o*-ethoxycyclohexyl. Chloromercurimethyldihydrobenzofuran and  $\text{SnPh}_2\text{Cl}_2$  yield 1-phenylmercurimethyl-1:2-dihydrobenzofuran, m.p.  $60-61^\circ$ .  $\text{PhNCO}$  and  $\text{OH}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{HgBr}$  in boiling  $\text{C}_6\text{H}_6$  afford bromomercuriethyl phenylcarbamate, m.p.  $124-126^\circ$ .

H. W.

Mercury derivatives of azo-dyes. W. BRAKER and W. G. CHRISTIANSEN (J. Amer. Pharm. Assoc., 1936, 25, 499-501).—*p*-Aminophenylmercuriacetate, diazotised and coupled with *m*- $\text{NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{OH}$  in dil. NaOH affords 4-hydroxymercuri-2'-amino-4'-hydroxyazobenzene; similarly *o*- $\text{NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{OH}$  yields 4-hydroxymercuri-3'-nitro-4'-hydroxyazobenzene. These substances are too insol. for therapeutic use.

F. O. H.

Reactions of hexaethyldistannane and diethylstannane with organic mercury compounds as a method of preparing organic compounds of tin with substituents in the benzene nucleus. K. A. KOZESCHKOV, A. N. NESMEJANOV, and V. P. PUSIREVA (Ber., 1936, 69, [B], 1639-1642).—Reactions are described which proceed according to the schemes:  $\text{Sn}_2\text{R}_6 + \text{HgAr}_2 = 2\text{SnR}_3\text{Ar} + \text{Hg}$ ;  $\text{Sn}_2\text{R}_6 + \text{HgArCl} = \text{SnR}_3\text{Ar} + \text{Hg} + \text{SnR}_3\text{Cl}$  (where  $\text{Ar} = \text{Ph}$ ,  $\text{OH}\cdot\text{C}_6\text{H}_4$ , or  $\text{NMe}_2\cdot\text{C}_6\text{H}_4$  and  $\text{R} = \text{Et}$ ) and

$\text{Sn}_2\text{R}_6 + \text{HgCl}_2 = 2\text{SnR}_3\text{Cl} + \text{Hg}$  or  $\text{SnR}_2 + \text{HgCl}_2 = \text{SnR}_2\text{Cl}_2 + \text{Hg}$ . The compounds,  $\text{SnR}_3\text{Ar}$ , are heavy, colourless liquids which first lose Ar under the action of Br or  $\text{Hg}^{++}$  solutions. They reduce  $\text{AgNO}_3\text{-EtOH}$  or  $\text{PtCl}_4$ . The following are new: Sn *p*-dimethylaminophenyl  $\text{Et}_3$ , b.p.  $172-173^\circ/3$  mm. (complex compound with  $\text{AuCl}_3$ ); substance  $\text{SnEt}_3\text{Br}\cdot 2\text{NH}_3$ ; Sn *p*-hydroxyphenyl  $\text{Et}_3$ , b.p.  $197-200^\circ/3$  mm.

H. W.

Structure of native, denatured, and coagulated proteins. A. E. MIRSKEY and L. PAULING (Proc. Nat. Acad. Sci., 1936, 22, 439-447).—The changes which occur in proteins on denaturation are reviewed. The native protein mol. is assumed to consist of a polypeptide chain, folded into a uniquely defined configuration in which it is held by H-linkings between the peptide N and O atoms, and between the free  $\text{NH}_2$  and  $\text{CO}_2\text{H}$  of the diamino- and dicarboxyl amino-acid residues. The denatured protein mol. is characterised by the absence of a uniquely defined configuration, and thus lacks sp. properties. This view is supported by the difference of entropy between native and denatured proteins, and the heat change and activation energy of denaturation. Reagents causing denaturation [*e.g.*,  $\text{EtOH}$ ,  $\text{CO}(\text{NH}_2)_2$ ] are substances which affect H-linking formation. The action of ultra-violet light on the native protein mol. is to cause a break in the mol. so that it can be denatured at a lower temp. after illumination than before. Dehydration consists primarily in the coagulation of the protein mols. without loss of their special configurations.

A. J. M.

Glucoproteins. II. Polysaccharides of vitreous humour and of umbilical cord.—See this vol., 1138.

Apparatus for the microhydrogenation of organic compounds. H. JACKSON and R. N. JONES (J.C.S., 1936, 895-899).—An improvement of the apparatus of Smith (A., 1932, 619), the method of shaking being modified, the means of introducing the substance improved, and complete compensation for temp. changes made.

F. R. S.

Application of Andrews' iodine monochloride method to the iodine bromide process.—See this vol., 1081.

Recent advances in micro-analysis. II. Functional analysis. (MLLE.) A. LACOURT (Bull. Soc. chim. Belg., 1936, 45, 313-333; cf. this vol., 1080).—A review of methods for determining various org. groups.

R. C. M.

Determination of hydroxyl groups in organic compounds. M. FREED and A. M. WYNNE (Ind. Eng. Chem. [Anal.], 1936, 8, 278-279).—The substance is heated to the b.p. with 2 c.c. of 20%  $\text{C}_5\text{H}_5\text{N-Ac}_2\text{O}$  reagent, cooled, boiled with  $\text{H}_2\text{O}$  for 5 min., and the AcOH titrated with NaOH (cresolphthalein), if necessary after adding EtOH to facilitate dissolution. Accurate results are obtained with most substances except sugar alcohols (2-5% low) and *tert*-alcohols (no reaction).

S. C.

Micro-determination of acetyl groups. A. ELEK and R. A. HARTE (Ind. Eng. Chem. [Anal.], 1936, 8, 267-269).—4-10 mg. of substance are hydrolysed with *p*- $\text{C}_6\text{H}_4\text{Me}\cdot\text{SO}_3\text{H}$ , the resultant solution is

evaporated to dryness in vac., and AcOH and SO<sub>2</sub> determined in the distillate iodometrically. A suitable apparatus is described. The method is relatively simple and accurate. S. C.

**Determination of the concentration of vaporised carbon tetrachloride.** J. C. OLSEN, H. F. SMYTH, G. E. FERGUSON, and L. SCHEFLAU (Ind. Eng. Chem. [Anal.], 1936, 8, 260—263).—CCl<sub>4</sub> vapour in air (>10 p.p.m.) can be determined by passing the gas through a SiO<sub>2</sub> tube at 1000—1100° and absorbing the HCl produced in H<sub>2</sub>O or NaOH. The R.H. of the air stream must be <70% otherwise Cl<sub>2</sub> is formed. Absorption is facilitated by using a sintered glass disc and by adding EtOH (5%) or 1% of a 0.1% saponin solution to the absorbent. S. C.

**Determination of volatile fatty acids by the partition method.** O. L. OSBURN, H. G. WOOD, and C. H. WERKMAN (Ind. Eng. Chem. [Anal.], 1936, 8, 270—275).—The method described previously (A., 1933, 933) has been applied to fermentation liquors containing AcOH, EtCO<sub>2</sub>H, and PrCO<sub>2</sub>H. Mixtures of two acids may be analysed by using one partition coeff. between H<sub>2</sub>O and Et<sub>2</sub>O; mixtures of three acids require two coeffs. Nomographic methods are used. HCO<sub>2</sub>H is determined separately.

S. C.

**Reagent [mercuric chloride+sodium ethoxide] for determination of structure [of organic compounds].** R. CONNOR and J. H. VAN CAMPEN (J. Amer. Chem. Soc., 1936, 58, 1131—1134).—Treatment of CHR'R''COR and CHRY.CO<sub>2</sub>R' (Y=labilising group; R=H, Alk, or Ar) dissolved in EtOH-NaOEt with EtOH-HgCl<sub>2</sub> gives a colourless (or nearly so) ppt. (+ test). The test is limited to neutral compounds containing C, H, and O only. The behaviour of >200 compounds is investigated.

H. B.

**Acidity determination in non-aqueous solutions.** O. TOMIČEK and J. FELDMANN (Časopis českoslov. Lek., 1935, 15, 127—137; Chem. Zentr., 1935, ii, 2980).—Potentiometric titrations of H<sub>2</sub>C<sub>2</sub>O<sub>4</sub>, BzOH, and salicylic acid in a wide range of solvents are described. A Te electrode (prep. described in detail) is useful in such titrations.

H. N. R.

**Differentiation between aldehydes and ketones.** E. GRAF (Anal. Fis. Quim., 1936, 34, 91—94).—Ketoximes and aldioximes with nascent Cl (freshly prepared solution of KMnO<sub>4</sub> in dil. HCl) give respectively a bluish-green coloration due to chloro-nitroso-compounds, and chloro-oximino-compounds which give a red colour with FeCl<sub>3</sub>. The reaction is not given by certain aromatic aldehydes.

F. R. G.

**Scheme for investigation of compounds containing the carbonyl group.** E. GRAF (Anal. Fis. Quim., 1936, 34, 95—99).—The reaction between compounds containing ·CO· and NH<sub>2</sub>OH.HCl is made the basis of a scheme for the recognition of acid chlorides, anhydrides, ketones, aldehydes, amides,

esters, lactones, and org. acids (cf. Feigl, A., 1934, 790, and preceding abstract). F. R. G.

**Analytical uses of Nessler's reagent. Determination of monosaccharides and disaccharides. Determination of furfuraldehyde.** II. M. GOSWAMI and B. C. DAS-PURKAYSTHA (J. Indian Chem. Soc., 1936, 13, 315—322).—Arabinose (2), glucose (4), fructose (5), sucrose (9), lactose (5), and maltose (5) may be determined by adding K<sub>2</sub>HgI<sub>4</sub> and Na<sub>2</sub>CO<sub>3</sub>, and dissolving the ppt. of Hg in excess of I, which is then determined volumetrically; for furfuraldehyde (2), Na<sub>2</sub>CO<sub>3</sub> is replaced by NaOH. The figures in parenthesis indicate the no. of O atoms utilised by 2 mols. of the sugar for oxidation. The method may be used for blood-sugar. F. R. S.

**Oxidation of amino-acids. Determination of the keto-acids and [detection of the] hydrogen peroxide produced.** F. BERNHEIM, L. C. BERNHEIM, and A. G. GILLASPIE (J. Biol. Chem., 1936, 114, 657—663).—When *dl*-alanine, *l*-valine, *d*-serine, *d*-leucine, *l*-isoleucine, *d*-phenylalanine, *dl*-methionine, *dl*- or *l*-proline, or *d*-histidine is oxidised by purified kidney enzymes, 54—98% of keto-acids are formed [as detected by H sulphite compounds or 2:4-dinitrophenylhydrazones (I), which do not give identical results]. H<sub>2</sub>O<sub>2</sub> is also formed, being detected by formation of methemoglobin. (I) are determined by reaction with I (2 I consumed) and back-titration with Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>.

R. S. C.

**Precision combustion of natural products.** L. F. FIESER and R. P. JACOBSEN (J. Amer. Chem. Soc., 1936, 58, 943—947).—Baxter and Hale's method (this vol., 540) is adapted for use of about 1 g. of material. The following are analysed (the results agree with the theoretical vals. within about 0.02% for C and 0.01% for H): BzOH; C<sub>6</sub>H<sub>5</sub>Ph<sub>3</sub>; dihydro-cholesterol; dehydrodeoxycholic acid; chlorogenin, whence C<sub>27</sub>H<sub>44</sub>O<sub>4</sub> (cf. Liang and Noller, A., 1935, 673); sarsasapogenin, whence C<sub>27</sub>H<sub>44</sub>O<sub>3</sub> (cf. Simpson and Jacobs, *ibid.*, 864, 1248); fichtelite, whence C<sub>19</sub>H<sub>34</sub> (cf. Ruzicka and Waldmann, *ibid.*, 741).

**Determination of 5-methylfurfural[dehyde].** H. A. IDDLIS and K. S. FRENCH (Ind. Eng. Chem. [anal.], 1936, 8, 283—285).—5-Methylfurfuraldehyde is quantitatively pptd. with either 2:4-dinitrophenylhydrazine or thiobarbituric acid. It may also be determined by pptn. with phloroglucinol if a factor is introduced for the solubility of the ppt. Absorption of Br is erratic (varies from 2 to 5 mols.) and the volumetric KBrO<sub>3</sub>-KBr method is not therefore satisfactory.

S. C.

**Salting-out and salting-in microchemical reactions.** B. V. J. CUVELIER (Natuurwetensch. Tijds., 1936, 18, 73—74).—ZnHg(SCN)<sub>4</sub> is best prepared from Zn(NO<sub>3</sub>)<sub>2</sub> and NaHg(SCN)<sub>3</sub>. (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> is the best salt for salting-out nicotine. Antipyrine can be salted-out from H<sub>2</sub>O solution with Na<sub>2</sub>SO<sub>4</sub> or NaCl either in crystals, or in oily droplets.

S. C.

## Biochemistry.

Gaseous exchange in the human lung. I. Oxygen content and tension in arterial and venous blood. II. Equilibrium between oxygen tensions in alveoli and blood. K. MATTHES. III. Circulation and respiration during bodily work. K. MATTHES and W. HAUSS. IV. Gaseous exchange in the lungs during bodily work. K. MATTHES, M. BÖHME, and K. TIETZE (Arch. exp. Path. Pharm., 1936, **181**, 630—639, 640—654, 655—665, 666—673; cf. this vol., 91).—I. The degree of  $O_2$  saturation of a few drops of blood (from the capillaries) is determined photometrically, using a modified form of Kramer's apparatus (A., 1935, 371). Changes in the amount of light transmitted through the ear (after injection of histamine) registered by means of a photo-electric cell are a logarithmic function of the degree of arterial  $O_2$  saturation. When other vals. for arterial and venous blood are determined and calc. all the essential factors determining gaseous exchange in the lungs are known. The resting and (moderate) working vals. for degree of  $O_2$  saturation and tension of venous blood are 66 and 52% and 35 and 29 mm. of Hg respectively.

II. The difference between the  $O_2$  tensions in alveoli and blood when the inspired air has reduced  $[O_2]$  is  $<$  the val. calc. on the basis of the theory of incomplete equilibrium. This may be due to increase in the no. of all the alveolar capillaries.

III. The increased diffusion const. of gaseous exchange in the lungs during moderate exercise is explained similarly.

IV. Little reduction in the difference between the  $O_2$  tensions in alveoli and blood is caused by inspiring air of reduced  $O_2$  content when bodily work is performed and the rule of incomplete equilibrium holds apparently because the increase in the no. of alveolar capillaries reaches its limit as a result of the work alone. W. McC.

Effect of the composition of inspired air on the circulation through the brain. L. IRVING and M. S. WELCH (Quart. J. Exp. Physiol., 1935, **25**, 121—129).—Inhalation of 10%  $CO_2$  in  $O_2$  increased the blood-flow in the brain but decreased that in the hind leg. Alveolar  $O_2$  deficiency did not cause these changes. The  $CO_2$  pressure changed more rapidly in brain than in the leg. CH. ABS. (p)

Reflex regulation of respiration from the carotid sinus. G. STELLA (Quart. J. Exp. Physiol., 1935, **25**, 145—153).—Effects were more marked during respiration in air than in an atm. containing  $CO_2$  (3—5%) and air. CH. ABS. (p)

Breath odours from alliaceous substance. Cause and remedy. H. W. HAGGARD and L. A. GREENBERG (J. Amer. Med. Assoc., 1935, **104**, 2160—2163).—Odour comes entirely from particles of garlic or onions retained in the mouth. Expired air showed 0.0028—0.0035 mg. of diallyl sulphide per litre. Rinsing with 3%  $NH_4Cl$  destroyed all odour. CH. ABS. (p)

Oxygen dissociation curve of hæmoglobin in dilute solution. R. HILL and H. P. WOLFEKAMP

(Proc. Roy. Soc., 1936, **B**, **120**, 484—495).—Dil. suspensions of human blood corpuscles and whole blood show similar  $O_2$ -dissociation curves, but dil. solutions of human hæmoglobin have a three-fold increased affinity for  $O_2$ . The blood of other animals shows similar effects, to varying extents. F. A. A.

Gaseous nitrogen content of the blood. G. LEINER (Z. klin. Med., 1935, **128**, 560—567; Chem. Zentr., 1935, ii, 2837).—The mean normal  $N_2$  content is 1.2 vol.-%. It is increased in severe emphysema, bronchitis, and hypoxæmia. R. N. C.

Formation of hæmatoidin *in vitro* from mammalian erythrocytes. J. S. F. NIVEN (J. Path. Bact., 1935, **41**, 183—197).—Cryst. hæmatoidin was formed within macrophages from added erythrocytes in cultures of mammalian tissues. In some cases a diffuse yellow pigment, giving a diffuse Fe reaction, preceded the appearance of formed pigment. CH. ABS. (p)

Local formation of blood-pigments. R. MUIR and J. S. F. NIVEN (J. Path. Bact., 1935, **41**, 183—197).—In mice and rats formation of granular and cryst. pigment from subcutaneously injected erythrocytes is intracellular. Phagocytosis of erythrocytes is followed by production of diffuse and granular forms of hæmosiderin. Hæmatoidin (I) is formed subsequently (cf. preceding abstract). Similar effects are produced by injection of hæmoglobin. (I) is not produced in rabbits by this treatment. CH. ABS. (p)

Delicate test for blood-pigments. C. B. JENSEN and W. M. URBAIN (Food Res., 1936, **1**, 275—276).—The pigment is converted into nitrosohæmoglobin or nitrosohæmochromogen and then, by treatment with  $H_2O_2$ , into a green compound. E. C. S.

Derivatives of blood-pigments.—See this vol., 1129.

Ultra-violet spectrum of normal and leucæmic blood. I. MAGAT and M. MAGAT (Compt. rend., 1936, **202**, 2181—2184).—The ultra-violet absorption curve of the blood of leucæmic fowls lies slightly above that of the normal fowl between 200 and 450 m $\mu$ , especially between 240 and 290 m $\mu$ . Absorption bands at 411, 343, 280, and 240 m $\mu$  found by Suhrmann and Kollath (A., 1927, 688) are confirmed: a further max. occurs at 289.5 m $\mu$  (possibly due to material accompanying cancerous growths). F. N. W.

Absorption spectra of some modified snake venoms. H. F. HOLDEN (Austral. J. Exp. Biol., 1936, **14**, 121—130).—The hæmolysins were fairly resistant to dil. acid at 60° and very little change in the absorption spectra was observed, even when most of the hæmolysin was inactivated. In alkaline solution, inactivation was rapid and the absorption bands were rapidly obliterated. With  $CH_3O$  the hæmolysins were inactivated but changes in the spectra were irregular. H. G. R.

Blood-sugar of the bee (*Apis mellifica*). R. BEUTLER (Naturwiss., 1936, **24**, 486—491).—The blood-sugar of bees varies from 0 to 4% (and in a few

cases up to 7%; average 2%), is partly fermentable, and, together with the high serum-P, is probably related to muscular activity of flight. F. O. H.

**Glycerol content of the organism.** E. TRABUCHI (Boll. Soc. ital. Biol. sperim., 1932, 7, 916—921).—The glycerol (I) content of the blood of rabbits after injection  $\propto$  the amount of (I) injected, and is related to the amount fixed in the organs; the last two are independent of one another. The amount of (I) recoverable from the blood 5 min. after injection often reaches double the amount calc. on the basis of a uniform distribution throughout the organism. The concn. curve of (I) does not fall below this val. but stabilises itself. Injection of insulin immediately following (I) causes a fall of blood-(I). R. N. C.

**Protein and urea in the blood of rabbits infected with *Trypanosoma annamense*.** H. LAUNOY and H. LAGODSKY (Compt. rend. Soc. Biol., 1936, 122, 1055—1058).—During the first 15 days the albumin:globulin ratio decreased, there being an increase in globulin and a decrease in albumin. Total and urea-N do not vary, but hypercholesterolemia occurs. H. G. R.

**Blood [changes in anaemia and other diseases].** R. ISAACS, C. C. STURGIS, F. H. BETHELL, and S. M. GOLDHAMER (Arch. Int. Med., 1936, 57, 1186—1246).—A review of recent literature. E. D. Y.

**Extracting morphine from organ tissues, especially blood.** F. SUZUKI (Japan. J. Med. Sci., IV, 7, No. 1; Proc. Japan. Pharm. Soc., 1933, 50—51).—The sample is incubated with papain, digested with 0.2 vol. of EtOH, and repeatedly shaken with  $\text{CHCl}_3$ . Morphine in the  $\text{CHCl}_3$  extract is adsorbed on fuller's earth, re-extracted with  $\text{CHCl}_3$ , and titrated by Gordin's method with alizarin-red. CH. ABS. (p)

**Two mechanisms for the formation of hexose diphosphate from glucose in intact human erythrocytes.** Z. DISCHE (Naturwiss., 1936, 24, 462).—Phosphorylation of glucose in erythrocytes takes place by the transference of  $\text{PO}_4'''$  from adenosinetriphosphoric acid. In erythrocytes kept at 0° for some time, a second method involving intermediate formation of adenosinediphosphoric acid occurs. The latter process only is prevented by 0.004N- $\text{CH}_2\text{I}-\text{CO}_2\text{H}$ . A. L.

**Transfer of inorganic phosphorus across the red blood-cell membrane.** L. HALPERN (J. Biol. Chem., 1936, 114, 747—770).—In 29 out of 33 analyses of inorg. P in red blood cells and in serum, more inorg. P was present per unit of  $\text{H}_2\text{O}$  in serum than in cells, the differences ranging from 0.42 to 9.81 mg. per 100 c.c. of  $\text{H}_2\text{O}$ . At 3° there was no diffusion of inorg. P across the cells, and at 23° the process was very slow, but at 37.5° there was a large increase in diffusion, possibly related to the metabolism of glucose in the cell rather than to the temp. When carbohydrate metabolism *in vivo* was accelerated by injection of glucose and insulin, the concn. of inorg. P in cells and serum decreased. Addition of glucose and NaF *in vitro* at incubator temp. caused inorg. P to enter the cell during glycolysis, but this diffused out again when glycolysis was complete even though the concn.

in the serum was already > that in the cells. The simple laws of diffusion cannot explain the transfer of inorg. P, which seems to depend mainly on the metabolic processes in the cell. J. N. A.

**Oligolytic concentrations of saline with respect to the erythrocytes of the blood of various animal species.** S. MATUZAKI (Keijo J. Med., 1936, 7, 113—155).—Haemolysis curves and oligolytic concns. were determined. The curves are sp. for each species, but there is a similarity between those of related species. J. N. A.

**Somatic phenomenon of the weaning of children with respect to the water content of the blood.** T. RYÖ (Keijo J. Med., 1936, 7, 1—19).—Methods for determining  $\text{H}_2\text{O}$  content are discussed, and that of Kuroda (A., 1933, 1094) is recommended. The amount of  $\text{H}_2\text{O}$  decreases with age, but there is a sharp rise in  $\text{H}_2\text{O}$  content in boys from 250 to 400 days, and in girls from 400 to 500 days old, and then a decrease, corresponding with the period of weaning. In animals the  $\text{H}_2\text{O}$  content is high at birth, then falls to a lower level, and then rises at weaning and falls again, whilst with children the  $\text{H}_2\text{O}$  content is rather less at birth, and there is not the preliminary fall before weaning. J. N. A.

**Content of bromine in blood.** G. MORUZZI and P. GUARESCHI (Arch. Ist. Biochim. Ital., 1936, 8, 229—248).—Br' is determined in presence of I' and high [Cl'] by a modified Palmer-Clarke method (A., 1933, 312) with an error of approx.  $2 \times 10^{-5}$  g. Blood-Br of man and various animals is  $35 \pm 25 \times 10^{-5}\%$ . Approx. 40—80% of serum-Br is diffusible, whilst the distribution of Br between serum and corpuscles is uniform relative to their  $\text{H}_2\text{O}$  content. F. O. H.

**Blood-forming action of copper.** G. DOLFINI and S. CASUCCIO (Rass. Clin. Terap., 1933, 32, 291—318; Chem. Zentr., 1935, ii, 2837). R. N. C.

**Blood-iodine in clinical practice.** E. P. McCULLAGH and D. R. McCULLAGH (Arch. Int. Med., 1936, 57, 1061—1066). E. D. Y.

**Influence of diuretics on the alkali reserve of blood.** G. GOTTSEGEN (Wien. klin. Woch., 1935, 48, 1116—1118; Chem. Zentr., 1935, ii, 2840).—In general, the alkali reserve is increased by diuretics. H. N. R.

**Effect of bleeding on distribution of ions between erythrocytes and plasma in health and in hypertony and nephritis.** I. F. SCHMITT and W. BASSE (Arch. exp. Path. Pharm., 1936, 181, 584—597).—Removal of 500 c.c. of venous blood causes reduction (followed, in healthy persons, by a rise above the initial val.) in the  $\text{CO}_2$ -binding capacity of the blood in healthy and diseased persons. [Cl'], [Na'], and [K'] fall in the erythrocytes and rise in the plasma, but the increase in the plasma is only partly at the expense of the erythrocytes. [Ca'] rises in the plasma and erythrocytes. The effects in disease are < in health. W. McC.

**Porphyrin in the serum of foetuses and newborn children.** R. FIKENTSCHER (Klin. Woch., 1935, 14, 569—571).—The sera contain an  $\text{Et}_2\text{O}$ -sol. porphyrin spectroscopically different from proto-

porphyrin, and resembling most closely coproporphyrin. It is not present in the maternal serum.

R. N. C.

#### Blood-serum-lipins in cancer and other cases.

**I. Mean mol. wt. of the free and combined acids.** H. H. BARBER. **II. Ultra-violet absorption measurements.** L. A. WOODWARD (Biochem. J., 1936, 30, 1463—1467, 1467—1471).—I. No variation was observed in the sap. val. of the serum-lipins of normal and cancerous blood.

**II.** The shape of the absorption curve of an extract from blood-serum cannot be used as a diagnostic test for cancer.

H. G. R.

**Alexic properties of protein-C.** M. DOLADILHE and M. MICHEL (Compt. rend., 1936, 202, 1950—1952; cf. this vol., 875).—The capacity for hæmolysis possessed by alexic guinea-pig or human serum is enhanced or diminished as the concn. of protein-C derived from a foreign or homologous serum is increased. The effect is complementary when C is derived from fresh serum, but if C is heated for 15 min. at 57°, it is without effect on the hæmolysis. Serum deprived of its globulins (cf. this vol., 495) has no hæmolytic power until fresh C is added and is the greater the more C is present.

J. L. D.

**Modifications in the protein fractions of serum during periods of rest and crisis in anaphylaxis.** AUBRY, THIODET, and RIBERE (Compt. rend. Soc. Biol., 1936, 122, 947—950).—In a crisis the equilibrium is normal or low and is increased during periods of rest.

H. G. R.

**Hæmolysis and cholesterologeneses.** V. DE LAVERGNE and P. KISSEL (Ann. Inst. Pasteur, 1936, 57, 56—78).—The hypercholesterolaemia produced by inoculation with hæmolytic bacteria can be simulated by the use of saponin and solanine, if the surrounding medium is not sufficiently acid to ppt. the cholesterol.

P. G. M.

**Mechanism of hæmolysis from the point of view of active mass in heterogeneous systems.** H. NAKAMURA and K. KURODA (Keijo J. Med., 1936, 7, 20—97).—The active mass in the hæmolytic system can be distinguished from that in the ordinary heterogeneous system, for in the erythrocyte the system is not only heterogeneous, but is restricted by the cell wall. The "mechanical active mass," the kinetic active mass given to erythrocytes by mechanical agitation, is an important factor in hæmolysis. With const. temp., proportion of erythrocytes, and "mechanical active mass," the degree of hæmolysis is high in dil. saline; increase of [NaCl] causes a sudden fall to a min. val., and then, as the concn. increases, it slowly rises again. The concn. for min. hæmolysis differs markedly from the isotonic concn. and is 1—2% NaCl for ox, and 3% for hen, erythrocytes. It is called the "oligolytic concn.," and is sp. for each animal species. If the "mechanical active mass" be taken into account, hæmolysis occurs in isotonic saline, as well as in more conc. solutions. Washing erythrocytes with isotonic saline affects cell resistance. High and low temp. accelerate hæmolysis, but a medium temp. is almost without effect, and that temp. which causes

a min. hæmolysis is called the "oligolytic temp." Hæmolysis instantly reaches a max. when erythrocytes are placed in hypo-oligolytic saline, whilst action is very slow in iso- or hyper-oligolytic solutions. The  $\eta$  of the system retards hæmolysis because it diminishes the mechanical active mass. Hæmolysis increases with an increase of erythrocytes up to a certain val., but it decreases with high concns. of erythrocytes.

J. N. A.

**Classical theory of blood coagulation and its modern development.** E. WOHLISCH (Naturwiss., 1936, 24, 513—517).—A review.

**Clotting of blood and milk. I. Physical and chemical influences.** M. F. VON DUNGERN and G. NELZ (Z. Biol., 1936, 97, 277—296).—The clotting times of (human) blood ( $t_1$ ) and (cow's) milk ( $t_0$ ) are logarithmically related to the temp. Removal of CO<sub>2</sub> in a vac. lowers  $t_1$  to 3.5 min. at 25°, but does not affect  $t_2$ , whilst saturation with CO<sub>2</sub> raises  $t_1$  to 6 min. but diminishes  $t_2$ ; air, O<sub>2</sub>, N<sub>2</sub>O, and coal gas have no effect on either  $t_1$  or  $t_2$ . The vals. of  $t_1$  and  $t_2$  vary considerably according to the nature of the interface, those with glass and quartz (which are more easily wetted) being < those with paraffin wax etc.

P. G. M.

**Anti-complex of fibrin.** S. S. PEROV (Trud. Lab. Izuch. Belka Belkovogo Obmen. Organ., 1934, No. 6, 3—22).—Blood-fibrin consists of the proto-acid (this vol., 1037), combined with another protein, the "anticomplex." Isolation of the latter is described. In 1% solution, unlike the complex (fibrinic acid), it has very low  $\eta$ .

CH. ABS. (p)

**Tests for innocuity and antigenic potency of staphylococcus toxoid.** C. E. DOLMAN and J. S. KITCHING (J. Path. Bact., 1935, 41, 137—162).—Standardisation and formalinisation of toxins are examined.

CH. ABS. (p)

**Haptens and inhibition of the hæmolytic power of certain immuno-sera.** R. D. DE LA RIVIERE, N. KOSSOVITCH, and S. ISHII (Compt. rend. Soc. Biol., 1936, 122, 1045—1048).—Inoculation with hapten results in formation of the corresponding antibody only if protein is injected at the same time.

H. G. R.

**Nature of the tubercular antibody. Existence of protein-fat antibodies.** K. MEYER (Compt. rend. Soc. Biol., 1936, 122, 1037—1038).—In certain anti-tubercular sera, antibodies which react equally well with the protein- or fat-antigen of *B. tuberculosis* are present.

H. G. R.

**Size of antibodies.** J. BISCOE, F. HERÖIK, and R. W. G. WYCKOFF (Science, 1936, 83, 602—603).—The sedimentation consts. of several conc. antibody preps. are of the same order of magnitude as those of the globulins of normal sera. Antibody properties are not necessarily associated with exceptionally large mol. size.

L. S. T.

**Purification of antibodies in type I antipneumococcus serum; nature of the type-specific precipitin reaction.** B. F. CHOW and W. F. GOEBEL (J. Exp. Med., 1935, 62, 179—202).—Fractionation of the antibody protein by (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>

and dialysis yields a relatively inert euglobin and an active pseudoglobulin. The immune globulin contains 14.85% N; the antibody protein has approx. 2.75% of lipin and a prosthetic carbohydrate grouping. The distribution of basic  $\text{NH}_2$ -acids in globulins of normal and immune horse serum is similar except for a slight difference in lysine content. Replacement of one H in the primary  $\text{NH}_2$  by Ac largely decreases the capacity of the immune protein to ppt. the type-sp. polysaccharide. The specificity of the antibody protein is lost on treatment with  $\text{CH}_2\text{O}$ . Esterification shows the  $\text{CO}_2\text{H}$  to be of primary importance in rendering the type I polysaccharide serologically reactive; replacement of the  $\text{NH}_2$  or OH has a less pronounced effect. CH. ABS. (p)

**Ultracentrifugal and electrophoretic studies on antibodies.** M. HEIDELBERGER, K. O. PEDERSEN, and A. TISELIUS (Nature, 1936, 138, 165).—A horse-serum prep. of type I pneumococcus anti-carbohydrate showed almost homogeneous sedimentation with the const.  $S_{20}=17.2 \times 10^{-13}$ . The electrophoresis was homogeneous with an isoelectric point at  $p_H$  4.8. With horse antibodies the antibody function is connected with a heavy, and otherwise minor, component. With rabbit sera homogeneous sedimentation was obtained with no appreciable difference between the consts. of the globulin fractions of normal serum and immune serum, or of normal globulin and immune globulin containing up to 50% of anti-ovalbumin, or antibody to type III pneumococcus polysaccharide containing 90% of precipitin. The rabbit appears to produce antibody from the principal globulin component. L. S. T.

**Auto-antibody production for bone-marrow.** V. BURKE, C. F. BRADLEY and N. P. SULLIVAN (Res. Stud. State Coll. Washington, 1935, 3, 1—11).—Complement-binding iso- and auto-antibodies develop in rabbits following injection of rabbit bone-marrow antigen. Changes in the blood picture resemble anaemia and are less marked after subsequent injections. Anti-bone-marrow serum is non-haemolytic. Auto-agglutinins active at room temp. occur in some rabbits after bone-marrow injections. A. G. P.

**Hydrogen-ion concentration of Hortegea cells.** S. TAKEUCHI (Z. Klin. Path. Hamatol. [Japan], 1933, 2, 341).—Vals. obtained were very close to those of reticulo-endothelial cells and differed from those of oligodendroglia and astrocytes. CH. ABS. (p)

**Iodometric determination of small amounts of morphine in viscera.** S. IKESHIMA (Japan. J. Med. Sci., IV, 7, No. 1; Proc. Japan. Pharm. Soc., 1933, 51—52).—With 0.005N-I morphine (I) gives a const. ppt. [1 mol. of (I) with 2.55 atoms of I]. By this means 1 mg. of (I) is determined with an accuracy of 90%. CH. ABS. (p)

**Nitroprusside reaction as a test for reduced glutathione.** N. S. R. MALOEUF (Nature, 1936, 138, 75—76).—This test is sp. for reduced glutathione in normal living tissues when aq.  $\text{NH}_3$  is used as the alkali and no heat is applied. L. S. T.

**Microscopy of powdered, desiccated endocrine glands.** P. A. MATTIS (Amer. J. Pharm., 1936,

108, 276—302).—Methods for the identification of characteristic histological elements in powdered ovary, corpus luteum, thyroid, and pituitary preps. are described. F. O. H.

**Unsaponifiable matter of chrysalis oil.** J. OZAKI and B. KASAI (J. Agric. Chem. Soc. Japan, 1936, 12, 425—456).—Chrysalis oil from *Bombyx mori* contains 2.93% of unsaponifiable matter which consists of 18.07% of hydrocarbons ( $\text{C}_{23}\text{H}_{46}$ ,  $\text{C}_{24}\text{H}_{50}$ ,  $\text{C}_{26}\text{H}_{54}$ , and  $\text{C}_{28}\text{H}_{58}$ ) and 81.93% of sterols (cholesterol and sitosterol). J. N. A.

**Chemistry of insects. II. Woolly aphis and white pine chermes.** B. K. BLOUNT (J.C.S., 1936, 1034—1036).—The woolly aphis, *Eriosoma lanigerum*, Hausmann, gives a wax and a cryst. orange pigment, *lanigerin* (I),  $\text{C}_{17}\text{H}_{14}\text{O}_5$ , with 3 active H. (I) is probably a substituted polyhydroxy-anthraquinone. The white pine chermes, *Adelges (Pineus) strobi*, Börner, affords in addition to a wax, m.p. 106.1—106.4°, a dark purple-brown pigment, *strobilin* (II),  $\text{C}_{30}\text{H}_{24}\text{O}_8$ , with 3 active H. (II) gives the colour reactions of a substituted 2-hydroxy-phenanthraquinone. J. H. B.

**Coccids produced in Japan. IX. Carbohydrates and waxy substances of *Icerya purchasi*, Mask.** M. KONO and R. MARUYAMA (J. Agric. Chem. Soc. Japan, 1933, 11, 647—658).—The insect contained lignin 10.7, cellulose 0.7, pentosan 0.9, and mannan 1.9%. *l*-Arabinose was present in aq. extracts.  $\text{C}_6\text{H}_6$  extracts yield a wax ( $d_{15}^{20}$  0.914, m.p. 78°, sap. val. 157.5) of which ceryl alcohol, cerotic and palmitic acids and a resin acid,  $\text{C}_{10}\text{H}_{16}\text{O}_4$ , were the principal constituents, together with 31% of unsaponifiable matter. CH. ABS. (p)

**Growth and water content of the bones of newly born pups and kittens.** C. M. BURNS and N. HENDERSON (Biochem. J., 1936, 30, 1202—1206).—The  $\text{H}_2\text{O}$  content of very young bone, which depends mainly on the size and  $\text{H}_2\text{O}$  content of the epiphysis and marrow cavity, increases in the long bones shortly after birth chiefly because of increase in the  $\text{H}_2\text{O}$  content of the diaphysis. The  $\text{H}_2\text{O}$  contents of the femora, humeri, and tibiae exhibit no consistent differences. W. McC.

**Mineral constituents of bone. II. Effect of age on mineral constituents of bones from kittens and pups.** C. M. BURNS and N. HENDERSON (Biochem. J., 1936, 30, 1207—1214; cf. A., 1935, 1396).—The salt content of the diaphysis (especially cancellous tissue) decreases immediately after birth. Later, the Ca content of the cortex increases slowly whilst that of the cancellous tissue remains low in the kitten and increases slowly in the pup. In temporary tissues (e.g., calcified cartilage) the ratio  $\text{CO}_3^{2-}/\text{Ca}$  is low but it increases in tissues which are more slowly destroyed. In the bones of the adult dog and cat the ratio approaches that in dahlite. W. McC.

**apoCholic and dehydroapocholic acid.** D. ADLERSBERG and B. LUSTIG (Arch. exp. Path. Pharm., 1936, 181, 610—616).—Compared with apocholic acid, dehydroapocholic acid has less reducing effect on the surface tension of  $\text{H}_2\text{O}$ , less haemolytic action,

and lower toxicity but it has greater stimulating effect on bile secretion. Hence dehydrogenation of bile acids leads to reduction of toxicity and increased stimulating effect on bile secretion. W. McC.

**Nucleic acids of the pancreas. II. *allo*-Nucleic acid.** H. STEUDEL (Z. physiol. Chem., 1936, 241, 84—92; cf. A., 1935, 646).—*allo*Nucleic acid (I), the chief nucleic acid of the nucleoprotein (II) of the pancreas, contains guanylic (III) and adenylic acid in the ratio 4 : 1, cytosylic and possibly uracylic acid. (III) is eliminated from (II) by alkaline hydrolysis, which also removes one half of (III) from (I) more easily than the other. Partly purified (I) (P : N ratio of Cu salt 1 : 1.9) is obtained from (II) by treatment with Ba(OAc)<sub>2</sub> followed by pptn. with Cu(OAc)<sub>2</sub>. W. McC.

**Crystalline substances from the adrenal gland.**—See this vol., 1117.

**X-Ray analyses of keratins.** A. GEROUD and G. CHAMPETIER (Bull. Soc. Chim. biol., 1936, 18, 656—664).—The mucous body of malpighi (the epidermis giving rise to keratins) and several schizokeratins and sclerokeratins give the same X-ray diagram, indicating that they all possess the  $\alpha$ -keratin structure. The longitudinal unit spacing of the polypeptide skeleton is therefore unchanged during the process of keratin formation. A. L.

**Constituents of unsaponifiable matter of sperm blubber oil.**—See this vol., 1091.

**Absorption spectrum of bilirubin.**—See this vol., 1048.

**Absorption spectra of cerebrospinal fluid.** M. PAIC (Compt. rend. Soc. Biol., 1936, 122, 1029—1031).—The course of the absorption curve and the optical density of the max. (280 m $\mu$ )  $\propto$  the protein content. No difference was observed between serologically positive or negative fluids. H. G. R.

**Histospectrography of the corneal ring of Kayser and Fleischer.** A. POLICARD, P. BONNET, and G. BONAMOUR (Compt. rend. Soc. Biol., 1936, 122, 1120—1122).—Traces of Cu in the region of the ring only were found; Ag, Fe, and Zn were absent. H. G. R.

**Action of alkaline persulphate on amino-acids.** K. LANG (Z. physiol. Chem., 1936, 241, 68—70).—NH<sub>3</sub>, frequently in almost theoretical yield, is eliminated from NH<sub>2</sub>-acids by boiling with alkaline aq. K<sub>2</sub>S<sub>2</sub>O<sub>8</sub>. With aliphatic (NH<sub>2</sub>)<sub>1</sub>-acids CO<sub>2</sub> is also eliminated and the corresponding aldehydes are produced in yields which are poor but increase as the mol. wt. of the acid increases. With monoamino-dicarboxylic acids, serine, and cystine extensive decomp. accompanies NH<sub>3</sub> liberation. With diamino-monocarboxylic acids and arginine >1 but <2 mols. of NH<sub>3</sub> are liberated and with phenylalanine, tyrosine, and tryptophan the NH<sub>3</sub> yields are < theoretical. Proline loses CO<sub>2</sub> and yields an unstable pyrroline (*reineckate*, m.p. 195—210°). Alkaline K<sub>2</sub>S<sub>2</sub>O<sub>8</sub> also attacks urea, creatine, and creatinine, with liberation of < the theoretical amount of NH<sub>3</sub>. W. McC.

**Effect of denaturation on colloidal behaviour of ovalbumin.**—See this vol., 1068.

**Spreading properties of azoproteins in the dermis.** A. CLAUDE (J. Exp. Med., 1935, 62, 229—244).—The spreading property of azoproteins when introduced intradermally is not specifically influenced by the aromatic component or the type of protein but is derived from the presence of the azo-group. It is controlled by the no. of diazo-groups in the protein mol. and  $\propto$  the concn. of the solution. Azo-compounds of low mol. wt. have no significant effect on skin permeability. CH. ABS. (p)

**Mechanism of coagulation of proteins by tannic acid.** S. S. PEROV (Trud. Lab. Izuch. Belka Belkovogo Obmen. Organ., 1935, No. 7, 26—38).—Tannic acid (I) ppts. protein, not by chemical combination with it but by increasing the [H<sup>+</sup>] to approach the isoelectric point. (I) may be adsorbed by pptd. protein. CH. ABS. (p)

**Glucoproteins. II. Polysaccharides of vitreous humour and of umbilical cord.** K. MEYER and J. W. PALMER [with E. M. SMYTH] (J. Biol. Chem., 1936, 114, 689—703; cf. A., 1935, 232).—Hyaluronic acid (I), from vitreous humour, is obtained substantially free from N-contaminants by means of Zn(OH)<sub>2</sub>; hydrolysis gives 1 mol. each of glucosamine and (?) glycuronic acid. Aq. extraction of umbilical cord gives a substance similar to (I) (probably derived from Wharton's jelly), and alkaline extraction of the residue gives a sulphuric ester (probably derived from the connective tissue) which yields chondrosamine. The viscosity of polyuronic acids depends on their source and treatment. Artificial mucoids are obtained from polyuronic acids and proteins. R. S. C.

**Nitrogen and phosphorus compounds of the muscles of thyroidectomised animals.** E. KRATINOVA (Ukrain. Biochem. J., 1932, 5, 58—70).—In the muscles of thyroidectomised rabbits and dogs, the H<sub>2</sub>O content was definitely and the creatine content but slightly increased, the creatinephosphoric acid was markedly decreased, whilst the residual N underwent no regular change. W. O. K.

**Oxygen dissociation curves of muscle-haemoglobin.** R. HILL (Proc. Roy. Soc., 1936, B, 120, 472—483).—Dissociation curves, determined spectroscopically, of heart muscle-haemoglobin (I) of ox, sheep, dog, and goose differ from those of blood-(I) in being hyperbolic and depending little on  $p_{H_2}$ , as recently found for horse heart muscle-(I) (Millikan, this vol., 1012). Muscle-(I) has a much higher O<sub>2</sub> affinity than blood-(I). The physiological function of muscle-(I) is discussed. F. A. A.

**Creatine derivatives. I. Presence of creatinine in muscular tissue. II. Supposed creatine of the residue of nervous and muscular tissues extracted with acids.** I. CIACCIO (Boll. Soc. ital. Biol. sperim., 1934, 9, 227—229, 229—231).—I. Extracts of frog muscle give a positive Jaffe reaction, which, however, is not sp. for creatinine.

II. The residue always gives a positive Jaffe reaction, the substance responsible, determined as creatine (I), representing approx. 1/3 of the amount of (I) extracted by CCl<sub>3</sub>·CO<sub>2</sub>H. It probably originates from the hydrolysis of acid-insol. protein-like material;

the amount is increased by heating for 2 hr. It is not adsorbed on kaolin, and is therefore not (I).

R. N. C.

**Cholesterol content of muscle.** W. R. BLOOR (J. Biol. Chem., 1936, 114, 639—648; cf. A., 1935, 109).—The cholesterol (I) contents of the different types of muscle were sharply differentiated and in the order: unstriped > cardiac > striped; it is suggested that a high phospholipin content, as in striped muscle, is associated with muscular activity and a high (I) content, as in unstriped muscle, with a more extensive nerve supply.

H. D.

**Rapid production of cholesterol from brain.** I. REMESOV and N. LEVASCHIOVA (Z. physiol. Chem., 1936, 241, 81—83).—Pure cholesterol (I) in 83% yield is obtained in 24 hr. by grinding 1 kg. of pulped brain in portions for 3—4 hr. with 4.5 vols. of liquid air, shaking the moist powder thus obtained twice with 2.5-litre portions of cold anhyd.  $\text{COMe}_2$ , filtering, evaporating the solvent under reduced pressure, and crystallising the residue from  $\text{EtOH-Et}_2\text{O}$ . A further amount of crude (I) is obtained by extracting the dried residue from the  $\text{COMe}_2$  treatment with hot  $\text{COMe}_2$ .

W. McC.

**Milk sera for refractometric studies.** R. TURNAU (Oesterr. Chem.-Ztg., 1936, 39, 121—124).—The refractive properties of two  $\text{CCl}_4$  sera of milk containing milk 50 c.c.,  $\text{CCl}_4$  5 c.c., and 20%  $\text{AcOH}$  1 c.c., one being prepared from heated (20 min. at  $100^\circ$ ) and subsequently cooled milk, are described. The heated milk serum shows the same  $n$  as Cu, Pb, and Ca acetate sera.

W. L. D.

**Determination of urine in milk.** L. BURUIANA (Lait, 1936, 16, 698—705).—Normal cow's urine [0.26% creatinine (I) content] contains 120 times as much (I) as does milk. The serum obtained by  $\text{CaO-Cu}$  pptn. of the milk-proteins uniformly contains 35% of the (I) of the milk. (I) in the serum is determined photometrically by the picrate method, which detects 1% of urine.

W. L. D.

**Differential reactions of human and cows' milk.** II. M. POLONOVSKI and F. MORENO MARTÍN (Anal. Fis. Quím., 1935, 33, 887—904; cf. A., 1935, 1267).—Three new methods are proposed to determine the amount of cows' milk or  $\text{H}_2\text{O}$  added to human milk. (a) 1 c.c. of milk is neutralised (phenolphthalein with 0.01N-NaOH, and the "buffer index" (c.c. of 0.01N- $\text{H}_2\text{SO}_4$  required for neutralisation in presence of Me-orange) is determined. This index varies with composition, from 2.5 for cows' to 10 for human milk. (b) 0.1 g. of the butter is saponified and distilled. The "volatile acid index" (c.c. of 0.01N-NaOH required to neutralise the acids using phenolphthalein)  $\propto$  the composition, from 0.3 for human to 6.5 for cows' milk. This method cannot give accurate vals. with separated milks. (c) Total carbohydrates, determined by the dichromate method of Polonovski *et al.* (A., 1931, 251),  $\propto$  the composition from 5 g. for cows' to 8 g. per litre for human milk.

F. R. G.

**Nitrogenous constituents of milk and their separate determination in human milk.** F. MORENO MARTÍN (Anal. Fis. Quím., 1935, 33, 905—

930).—In 2 c.c. of human milk total N is determined by the micro-Kjeldahl method, casein by pptn. with  $\text{NaOAc}$  and  $\text{AcOH}$  at  $p_H$  4.2, and albumin by pptn. with tannic acid.

F. R. G.

**Heat-coagulation of caseinogen. II. Rate of phosphorus cleavage.** G. R. HOWAT and N. C. WRIGHT (Biochem. J., 1936, 30, 1413—1415; cf. A., 1934, 1119).—When aq. solutions of Ca caseinogenate were heated at  $90$ — $115^\circ$  for 1—45 hr. the degree of coagulation varied directly with the liberation of acid-sol. P;  $Q_{10}$  was approx. 3.

H. D.

**Agglutinins in human milk.** S. AMAGASA (Z. Klin. Path. Hamatol. [Japan], 1932, 1, 99).—Colostrum, ripe milk, and final milk each contains one of the corresponding blood-group agglutinins. Colostrum and final milk have higher agglutination titres than has blood serum, and frequently show a non-sp. group agglutination.

CH. ABS. (p)

**Disturbing colorations in the lactic acid limit reaction for the stomach content.** G. SANT (Pharm. Tijds. Nederl.-Indie, 1935, 12, 223; Chem. Zentr., 1935, ii, 2854).—Addition of 3%  $\text{H}_2\text{O}$ , prevents disturbing side-colorations.

H. N. R.

**Effect of Schiff's zwieback on secretion of gastric glands.** S. D. FRUMIN (Problems of Nutrition [Russia], 1933, 2, No. 3, 56—60).—Administration of zwieback to dogs is followed by a type of gastric secretion intermediate between those produced by a meat and a bread diet. The amount and acidity of the secretion are greater when the dry product is used. Continuous feeding lowers the secretory function in 6 days.

CH. ABS. (p)

**Influence of soya beans on gastric secretion.** A. R. STRIGANOVA (Problems of Nutrition [Russia], 1933, 2, No. 4, 33—44).—The effect of soya-bean diet on gastric secretion is intermediate in character between those of bread and of meat diets. Soya-bean protein may serve, to some extent, as a substitute for meat protein.

CH. ABS. (p)

**Effect of hydrolysates of casein and those from the intestine on the secretion of gastric glands.** P. N. KURDJUMOV (Problems of Nutrition [Russia], 1933, 2, No. 5, 61—68).—Addition of the hydrolysate to a bread and  $\text{H}_2\text{O}$  diet for dogs increased gastric secretion. The latter was lowered by additions of milk and not appreciably affected by additions of meat.

CH. ABS. (p)

**Reactions of the contents of the jejunum and experimental production of peptic ulcer.** P. P. T. WU (Arch. Surg., 1935, 30, 557—562).

CH. ABS. (p)

**Determination of the hydrogen-ion concentration of the intestinal juice of the larvae of clothes- and wax-moths by means of the glass electrode.** F. DUSERVA (Z. physiol. Chem., 1936, 241, 168—176).—The  $p_H$  of a few drops of the juice (also of alkaline liquids in absence of  $\text{CO}_2$  and suspensions) is determined with a special type of glass electrode. The average  $p_H$  of juice from clothes- and wax-moths are 9.9 and 8.4, respectively. The val. is probably not affected by the quality of the food consumed.

W McC

**Origin of choline in semen.** E. KAHANE and J. LÉVY (Compt. rend., 1936, 202, 2186—2188).—The existence of free choline in semen is due to the action of an enzyme on a precursor. F. N. W.

**Urinary ammonia.** S. MIKAËLOFF (Bull. Soc. chim., 1936, [v], 3, 1048—1052).—The results of standard methods of determination are compared. The advantages of Sahli's method are discussed.

E. S. H.

**Determination of meconic acid in urine of opium addicts.** I. S. To and K. Yo (Japan. J. Med. Sci., IV, No. 1; Proc. Japan. Pharm. Soc., 1933, 6—9).—The sample is made alkaline with NaOH, treated with  $\text{CaCl}_2$ , filtered after 1 hr., and the ppt. dissolved in AcOH. A few drops of dil. HCl are added together with  $\text{FeCl}_3$ . The intensity of the red colour is measured. Samples showing colour with HCl but no  $\text{FeCl}_3$  are discarded. Tests on opium addicts are recorded. Positive reactions are obtained in most cases. Non-addicts all showed negative tests. Administration of meconic acid to man and animals caused a positive test in urine for 1—3 days.

CH. ABS. (p)

**Determination of morphine in urine of opium and of morphine addicts: practical application of the reaction.** S. To and A. RIN (Japan. J. Med. Sci., IV, 7, No. 2—3; Proc. Japan. Pharm. Soc., 1933, 11—15).—The acidified (HCl) urine is conc., filtered, made alkaline with aq.  $\text{NH}_3$ , and extracted with  $\text{CHCl}_3$ . After evaporation of the  $\text{CHCl}_3$  the residue is dissolved in aq.  $\text{NH}_3$  and morphine (I) is extracted with  $\text{H}_2\text{SO}_4$ . After further treatment with aq.  $\text{NH}_3$ , (I) is extracted by  $\text{CHCl}_3$  and determined by customary methods. (I) is eliminated in urine of opium and (I) addicts. Applied in conjunction with the meconic acid test (preceding abstract) the test serves to distinguish the two classes of addicts. CH. ABS. (p)

**Acetoacetic acid in urine.** Constitution of the coloured compounds formed in the reaction of acetoacetic acid and its ester with sodium nitroprusside in presence of ammonia (with or without ammonium sulphate) and certain amines. F. E. RAURICH SAS (Anal. Fís. Quím., 1935, 33, 247—278).—The use of Lange's test for  $\text{CH}_3\text{Ac}\cdot\text{CO}_2\text{H}$  and  $\text{COMe}$ , in urine (cf. Fischer, A., 1934, 546) has been shown to be valueless by Bohrisch (Pharm. Zentr., 1907, 48, 181 *et seq.*). The test proposed by the author (A., 1935, 513) produces the complex  $\text{Na}_2[\text{Fe}''(\text{CN})_4(\text{CH}_3\text{Ac}\cdot\text{CO}\cdot\text{NH}_2)_2]\cdot 2\text{H}_2\text{O}$ , or, with  $\text{NH}_2\text{Me}$  instead of  $\text{NH}_3$ ,  $\text{Na}_2[\text{Fe}''(\text{CN})_4(\text{NHMe}\cdot\text{CMe}\cdot\text{CH}\cdot\text{CO}_2\cdot)\text{NH}_2\text{Me}]\cdot 2\text{H}_2\text{O}$ .

F. R. G.

**Determination and excretion of flavins in normal human urine.** A. EMMERIE (Nature, 1936, 138, 164).—Flavins are determined colorimetrically in urine after addition of PbS, elution with  $\text{H}_2\text{O}$ ,  $\text{C}_5\text{H}_5\text{N}$ -AcOH, and oxidation with  $\text{KMnO}_4$  in AcOH solution. Normal male urine gives a daily output of  $819\text{--}1250 \times 10^{-6}$  g., and the hourly excretion varies between  $30 \times 10^{-6}$  and  $50 \times 10^{-6}$  g. After consumption of cooked ox liver an increased excretion of flavins occurs.

L. S. T.

**Uro- and copro-porphyrin-I in acute porphyrinuria.** H. FISCHER and H. LIBOWITZKY

(Z. physiol. Chem., 1936, 241, 220—222).—Uroporphyrin-I (I) and the ester of uroporphyrin-III have been isolated from the urine of acute porphyrinuria. Uroporphyrin ester has m.p.  $311^\circ$  (corr.). In chronic porphyrinuria, (I) is probably the chief porphyrin produced. The Cu reaction indicates that urobilin frequently occurs in urine and faeces. W. McC.

**Determination of fat in faeces.** P. MULLER (Nederl. Tijds. Geneesk., 1935, 79, 3960—3962; Chem. Zentr., 1935, ii, 2712).—Extraction with acid  $\text{COMe}_2$  is followed by evaporation and extraction of the residue with light petroleum. H. N. R.

**Acetonæmia in goats.** A. T. GILYARD and R. T. GILYARD (Cornell Veter., 1935, 25, 201—202).—The  $\text{COMe}_2$  content of a goat in late twin pregnancy in a state of paresis was lowered by injection of glucose.

CH. ABS. (p)

**Mineral exchange between plasma and erythrocytes in Addison's disease.** F. SCHMITT and W. BASSE (Arch. exp. Path. Pharm., 1936, 181, 581—583).—In a case  $[\text{Cl}']$  was low in the plasma and  $[\text{Cl}']$ ,  $[\text{Na}']$ , and  $[\text{Ca}']$  low and  $[\text{K}']$  high in the erythrocytes. Administration of cortin, NaCl, and  $\text{NaHCO}_3$  had favourable results and partly restored normal vals. for the ionic contents.

W. McC.

**Chemical changes in the blood in Addison's disease and their alteration in response to treatment.** E. N. ALLOTT (Lancet, 1936, 230, 1406—1411).—Cases of Addison's disease show low Na and Cl in the serum with high K and urea. Cortical extract appears to reduce K and urea to normal with little effect on Na and Cl. L. S. T.

**Role of sodium in adrenal insufficiency.** R. F. LOEB, D. W. ATCHLEY, and J. STAHL (J. Amer. Med. Assoc., 1935, 104, 2149—2154).—The decreased blood-Na observed in adrenal insufficiency results from increased excretion. Salt therapy mitigates symptoms of Addison's disease until destruction of adrenals is complete.

CH. ABS. (p)

**Release of a histamine-like substance from lungs of guinea-pigs during anaphylactic shock.** I. DE B. DALY, S. PEAT, and H. SCHILD (Quart. J. Exp. Physiol., 1935, 25, 33—59).—The reported increase in intestine-contracting substance in lungs of sensitised guinea-pigs and decrease after anaphylactic shock (Watanabe, 1932) is not confirmed. A histamine-like substance appears in the perfusate of isolated lungs during shock. CH. ABS. (p)

**Soil, iron, and copper and iron in the prevention and treatment of anaemia in suckling pigs.** H. C. H. KERNKAMP (J. Amer. Vet. Med. Assoc., 1935, 40, 37—58).—Development of anaemia was prevented by ingestion of powdered loamy soil in appropriate amounts. Use of Fe instead of soil was not effective, and addition of Cu to Fe had no additional beneficial effect.

CH. ABS. (p)

**Determination of the biologically potent element (cobalt) in limonite.** E. J. UNDERWOOD and J. F. FILMER (Austral. Vet. J., 1935, 11, 84—92).—The active element is Co, deficiency of which in foods causes enzootic marasmus. CH. ABS. (p)

Castle's intrinsic factor in pernicious anaemia. C. C. UNGLEY and R. MOFFETT (Lancet, 1936, 230, 1232—1235). L. S. T.

Spontaneous appearance of beri-beri symptoms in the mandarin duck (*Aix galericulata*, L.) kept in captivity. K. LI-PIN (Compt. rend. Soc. Biol., 1935, 119, 1114—1115). R. N. C.

Renal changes in biliary stasis and decompression in cats. H. L. STEWART, A. CANTAROW, and D. R. MORGAN (Arch. Path., 1935, 19, 807—818).—Changes in the distribution of stainable lipins are examined. CH. ABS. (p)

Nitrogen and sulphur metabolism in Bright's disease. G. B. GRABFIELD and B. PRESCOTT (Arch. Int. Med., 1936, 57, 1081—1084).—The N:S ratio of urinary protein in nephrosis is 30:1, in glomerular nephritis and other syndromes 20:1, and normally 250:1. E. D. Y.

Histological changes in the enamel and dentine of the rat incisor in acute and chronic experimental fluorosis. I. SCHOUR and M. C. SMITH (Arizona Agric. Exp. Sta. Tech. Bull., 1934, No. 52, 69—91).—F probably exerts a direct local action on the enamel-forming cells. Changes observed in enamel and dentine are not produced primarily by changes in blood-Ca and -P or by disturbances of the parathyroid. A. G. P.

Distribution of ions between plasma and erythrocytes. (A) In normal and hypochloræmic diabetics. (B) In nephritis. (C) In intestinal diseases. F. SCHMITT (Arch. exp. Path. Pharm., 1936, 181, 563—569, 570—574, 575—580).—(A) Sharp separation of erythrocytes from plasma is attained by using a special type of centrifuge tube. In the erythrocytes of hypochloræmic diabetics [Cl'] is very high and [Na'] (frequently), H<sub>2</sub>O, and cations are low. In the plasma [Na'] is low and [K'] and [Ca''] are high.

(B) In the erythrocytes of nephritis (hypochloræmic) [Cl'] is high and [Na'] normal. In the plasma [Na'] is low. When hyperchloræmia occurs [Na'] is normal in the plasma but [Cl'] and (frequently) [Na'] are high in the erythrocytes. In eclamptic uræmia the concn. of all electrolytes in the erythrocytes is high and plasma-Na is normal. Acidosis occurs in all cases.

(c) In stenosis of the pylorus there is genuine hypochloræmia. In carcinoma of the stomach and in cases of operable tumours there are no changes in the distribution of the ions. In cases of inoperable tumours [Cl'] in the erythrocytes is low (lower limit 92 mg. per 100 c.c.). W. McC.

Citric acid in blood and urine. O. OESTBERG (Z. ges. exp. Med., 1934, 94, 442—452; Chem. Zentr., 1935, ii, 3256).—Citric acid (I) is > normal in the blood in decompensation of the heart and diabetes mellitus, and less in inflammatory diseases, particularly pleurisy; the changes are associated with metabolic disturbances. (I) excretion can be altered by administration of acid or alkali without affecting blood-(I), with which it is unrelated. R. N. C.

Sodium chloride in diphtheria. A. MACLEAN (Lancet, 1936, 231, 129—131).—Administration of NaCl has a beneficial effect. There is probably a deficiency of Na and Cl in the blood-serum in the acute stage of diphtheria. L. S. T.

Muscular dystrophies. Presence of simple guanidine derivatives in the urine. M. X. SULLIVAN, W. C. HESS, and F. IRREVERRE (J. Biol. Chem., 1936, 114, 633—637).—From the urine of 70% of the cases of muscular dystrophy studied, guanidine (I) was isolated after treatment with AgNO<sub>3</sub> and Ba(OH)<sub>2</sub>. Aq. solutions of gluco-cyamidine and -cyamidine, but not of creatine, creatinine, or arginine, yield (I) by this treatment. Normal individuals do not excrete (I). H. D.

Prevention of nutritional encephalomalacia in chicks by vegetable oils and their fractions. M. GOETTSCH and A. M. PAPPENHEIMER [with A. HART] (J. Biol. Chem., 1936, 114, 673—687).—The protective factor against nutritional encephalomalacia of chicks in certain edible oils is EtOH-sol., stable to heat, ultra-violet irradiation, and aeration, and is present in the unsaponifiable fraction. H. D.

Lipin exchange in the post-encephalitic syndrome. L. BARGI (Minerva med., 1935, II, 71—78).—An average increase of 42% in neutral fats, 30% in free cholesterol, and 14% in phosphatides in blood is recorded. CH. ABS. (p)

Influence of  $p_H$  and of the alkaline reserve on the production and regression of experimental exophthalmia. J. LÉVY, L. JUSTIN-BESANÇON, and D. KOHLER (Compt. rend. Soc. Biol., 1936, 122, 1058—1060).—Exophthalmia in ephedrinised dogs is diminished by acidosis and its regression augmented, whereas alkalosis has a contrary effect. H. G. R.

Gout. Changes in symptoms and purine metabolism produced by high-fat diets in four gouty patients. L. M. LOCKIE and R. S. HUBBARD (J. Amer. Med. Assoc., 1935, 104, 2072—2075).—High-fat diet increased blood-uric acid, the effect persisting after changing to a high-carbohydrate, low-fat diet. CH. ABS. (p)

Paroxysmal hæmoglobinurias. L. J. WITTS (Lancet, 1936, 231, 115—120).—A lecture. L. S. T.

Hyperglycæmia in fasted rabbits following injury in the pituitary region. D. J. DAWSON and A. MILNE (Quart. J. Exp. Physiol., 1935, 25, 69—76). CH. ABS. (p)

Iodine metabolism in goitre. L. SCHEFFER and L. VON MEGAY (Klin. Woch., 1935, 14, 1360—1362).—I is retained, excretion falling to about half the normal val. Blood-I oscillates considerably. R. N. C.

Metabolism of inorganic salts and water in hepatic disturbances. I, II. H. SHIGEMI (Japan. J. Gastroenterol., 1935, 7, 12—18, 19—22).—I. In various hepatic infections, blood-K and -Ca tended to decrease, -Na to increase, and -Mg to remain unchanged. Hepatic injury in rabbits induced by CHCl<sub>3</sub>, CCl<sub>4</sub>, P, hepatotoxin, or ligation of the bile duct produced variable results.

II. Following liver injury by  $\text{CCl}_4$  or ligation of the bile duct, the Ca, Mg, K, and Na contents of the heart, liver, spleen, and kidney of rabbits tended to decrease, the change being most marked in the liver.

CH. ABS. (p)

**Spontaneous ketonuria from a ketogenic diet in hepatic patients.** L. CANNAVO and I. CAPIZZI (Diagnostica tec. lab. [Napoli], 1935, 6, 197—211).—Changes in ketonuria after feeding stearic acid are used in the diagnosis of parenchymal hepatic deficiency.  $\beta$ -Hydroxybutyric acid is the principal urinary product. The resulting increase in total org. acids in urine is not  $\propto$  the increase in "keto-acids."

CH. ABS. (p)

**Evidence for placental origin of the excessive prolan of late pregnancy toxæmia and eclampsia.** G. V. S. SMITH and O. W. SMITH (Surg. Gynecol. Obstet., 1935, 61, 175—183).—Sera of toxæmic and eclamptic patients have the same action on hypophysectomised rats as do sera of normal women. Placentas from such patients contain excessive prolan (I) and low levels of œstrin. Excessive (I) originates in the placenta and probably causes toxæmia and eclampsia.

CH. ABS. (p)

**Physiology of pregnancy in rats. Mechanism of parturition. Effect on female rats of antenatal administration of œstrin to the mother.** A. M. HAIN (Quart. J. Exp. Physiol., 1935, 25, 131—143).—Injection of œstrin (I) frequently prolonged the gestation period and modified the corpus urethræ of surviving female foetuses. Synergism between (I) and oxytocin observed in mice does not exist in rats. Administration to pregnant rats of placenta, pituitary, uterus, and blood of parturient rats did not cause abortion.

CH. ABS. (p)

**Protection of mice against streptococcal and other infections by *p*-aminobenzenesulphonamide and related substances.** G. A. H. BUTTLE, W. H. GRAY, and D. STEPHENSON (Lancet, 1936, 230, 1286—1290).— $p\text{-NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{SO}_2\cdot\text{NH}_2$  (I) protects mice against infection by streptococci of different serological types, but not by staphylococci or pneumococci. There is some protection against meningococcal infection. Streptococcidal action disappears when the no. of  $\text{SO}_2\text{NH}_2$  groups attached to the  $\text{C}_6$  is increased to 3.  $p\text{-NH}_2\cdot\text{C}_6\text{H}_4\cdot\text{SO}_2\cdot\text{NHPh}$  is as active as (I), but the acid itself has a smaller protective action. Azo-compounds derived from (I) and phenolic cinchona alkaloids are inferior to prontosil.

L. S. T.

**Chemical nature of tetany.** D. E. BABCOCK (J. Chem. Educ., 1936, 13, 317—319).—A discussion.

L. S. T.

**Pathophysiology of fat metabolism in thyroid diseases.** S. LETES, E. SORKIN, and A. AGALETZKAJA (Z. klin. Med., 1935, 128, 407—416; Chem. Zentr., 1935, ii, 2836—2837).—Blood-fat is not affected in hyperthyroidism by feeding with butter, but is increased in hypothyroidism, being restored to normal by thyroxine or thyroidin. Blood-ketones are increased in both cases.

R. N. C.

**Action of 3:5-di-iodotyrosine in the treatment of hyperthyroidism.** E. DELCOURT-BERNARD (Rev.

Belge Sci. méd., 1934, 6, 1—28; Chem. Zentr., 1935, ii, 3255).—The action is similar to that of Lugol's solution.

R. N. C.

**Selective absorption of ascorbic acid by tumour tissue from the guinea-pig.** E. BOYLAND (Biochem. J., 1936, 30, 1221—1224).—The indophenol-reducing material [probably mainly ascorbic acid (I)] of guinea-pig sarcoma (Dael and Biltris) is greatly reduced in amount when the animal is kept on a scorbutic diet; injected (I) is then selectively absorbed by the tumour and by those tissues which normally contain (I). The (I) content of the tumour is about the same as that of liver.

W. McC.

**Relation between tumour-lipins and length of life of persons suffering from tumours.** R. BIERICH and A. LANG (Fette u. Seifen, 1936, 43, 105—106).—The higher is the cholesterol content of a tumour the shorter is the expectation of life of the patient after removal of the tumour by operation. Active cancer cells may contain 0.9—5% of cholesterol.

F. C. B. M.

**Indophenol-reducing substance in Jensen rat sarcoma.** A. E. KELLIE and S. S. ZILVA (Biochem. J., 1936, 30, 1216—1220).—Spectrographic and biological examination of sarcoma extracts indicate that almost all the indophenol-reducing material which it contains is *l*-ascorbic acid.

W. McC.

**Factors from normal tissues influencing the growth of transplanted cancer.** D. A. MACFADYEN and E. STURM (Science, 1936, 84, 67—68).—A tumour-inhibiting action of the  $\text{H}_2\text{O}$  extract of the  $\text{Et}_2\text{O}$ -insol. fraction of the rabbit, mouse, and cow mammary gland, and a tumour-stimulating property of the  $\text{Et}_2\text{O}$ -sol. fraction of the same tissues, have been established. There appears to be a partial neutralisation of the two forces in the aq. extract of the unfractionated mammary tissue. Further support is thus given to the view that active normal tissues contain two factors, one inhibiting and the other augmenting the multiplication of cells.

L. S. T.

**Thioglycerol: a more stable thiol compound for use in healing wounds.** L. E. SUTTON (J. Amer. Med. Assoc., 1935, 104, 2168—2171).—Rapid healing follows use of  $\text{C}_3\text{H}_5(\text{OH})_2\cdot\text{SH}$  in glycerol or tragacanth (1 in 5000).

CH. ABS. (p)

**Silver manganite (simanite) in wound treatment.** A. SCHWEITZER (Med. Klinik, 1935, 31, 1175—1176; Chem. Zentr., 1935, ii, 2974).

R. N. C.

**Growth in relation to nutrition.** H. VON HOESSLIN (Z. Biol., 1936, 97, 229—243).—Four male dogs of the same litter were given diets in which (a) carbohydrate, (b) protein, (c) fat and starch, and (d) fat alone predominated. The first grew less quickly than the second but ultimately attained an equal size. The third, which received a diet containing only 10.45% of protein, still attained a size equal to that of the others although hair-growth was deficient. The rate of growth depended on the relative availability of the calorific val. of the diet.

P. G. M.

**Influence of intermittent supply on growth of albino rats.** R. SASAKI and N. ANDO (J. Agric.

Chem. Soc. Japan, 1935, **11**, 316—320).—Rats receiving intermittent supplies of protein required a longer time to attain standard growth. The wt. of organs was unaffected. CH. ABS. (p)

**Chimpanzee metabolism.** F. G. BENEDICT and J. M. BRUHN (Proc. Nat. Acad. Sci., 1936, **22**, 394—397).—Data for fasting R.Q. and basal heat production are recorded. A. G. P.

**Biochemistry of hibernation.** D. FERDMAN and O. FAINSCHMIDT (Ukrain. Biochem. J., 1932, **5**, 20—57).—During the hibernation of *Citellus gutatus*, the creatinephosphoric acid, adenosine pyrophosphate, hexose monophosphate, the total acid-sol. P, and the total P of the voluntary muscle decrease, but the inorg. P rises. Similar results are obtained for the heart-muscle and blood. The reducing substances of the blood decrease. W. O. K.

**Changes in the physicochemical constants of hen-egg plasma on incubation.** S. S. PEROV and K. DOLINOV (Trud. Lab. Izuch. Belka Belkovogo Obmen. Organ., 1932, No. 3, 3—20).—Data for  $\kappa$  and  $\eta$  are given. CH. ABS. (p)

**Infection of *Treponema pallidum* on metabolism of rabbit testis.** R. M. KRAFT, C. S. ROBINSON, and S. HARRIS (Amer. J. Syphilis Neurol., 1935, **19**, 354—363).—The rate of metabolism was decreased without change in type. CH. ABS. (p)

**Humidity and insect metabolism.** K. MELLANBY (Nature, 1936, **138**, 124—125).—The rate of metabolism and respiration of many insects are controlled by temp. and unaffected by changes in humidity. L. S. T.

**Destruction of oak by the death-watch beetle.** A. G. NORMAN (Biochem. J., 1936, **30**, 1135—1137).—Analyses of the frass in oak timber attacked by the larvæ of the beetle (*Xestobium rufovillosum*) indicate that the carbohydrate and especially the cellulose is predominantly utilised as food (cf. A., 1930, 262). W. O. K.

**Metabolism of cartilage.** E. G. L. BYWATERS (Nature, 1936, **138**, 30—31).—The metabolism of cartilage is anaerobic. Lactic acid is formed from glucose at a rate of approx. 0.2 cu. mm. of CO<sub>2</sub> (from H carbonate solution) per mg. dry wt. per hr. In presence of methylene-blue an immediate, large increase in O<sub>2</sub> uptake occurs. L. S. T.

**Metabolism of cartilage.** F. DICKENS and H. WEIL-MALHERBE (Nature, 1936, **138**, 125—126; cf. preceding abstract).—As with medulla of kidney (this vol., 629), the same association of anaerobic type of metabolism and poor O<sub>2</sub> supply has been found for the rib cartilage of the rat. For medulla of kidney, cartilage, and tumours the ratios of respiration, aerobic and anaerobic glycolysis are similarly related. L. S. T.

**Protein, fat, and carbohydrate metabolism in the white rat. II. Effect of fasting.** R. WETZEL, H. WOLLSCHITT, H. RUSKA, and T. OESTREICHER (Arch. exp. Path. Pharm., 1936, **181**, 703—738; cf. A., 1935, 1152).—The effect of fasting for various periods on the fat, protein, and carbo-

hydrate contents of the organs of adult males and on the wt. of the organs, the I val. of the fats, and the tissue respiration has been determined. W. McC.

**Effect of feeding (A) white mice, (B) young foxes, with the proto-acid of peas.** I. LEONTEV (Trud. Lab. Izuch. Belka Belkovogo Obmen. Organ., 1931, No. 1, 93—94; 1935, No. 7, 95—100).—(A) White mice thrive equally well when the proto-acid (I) is substituted for casein in the diet.

(B) Young foxes thrive on a diet in which (I) is the sole protein constituent. CH. ABS. (p)

**Effect of parenteral injection of amino-acids and related substances on creatine formation and storage in the rat.** H. H. BEARD and T. S. BOGGESS (J. Biol. Chem., 1936, **114**, 771—782).—100 mg. of creatine (I), glycocyamine, arginine (II), histidine (III), glycine (IV), alanine, serine, and valine for 1 day gave 6—32% increases in muscle-(I). At the end of 2 days the increase for the first four varied from 16 to 40%, but that due to (IV) had disappeared. 200-mg. doses of (II) and (III) for 1 or 2 days gave an increase of 30—40% in muscle (I), whilst 200 mg. of (IV) caused <10% increase. Injection of 100 mg. of (II) with 100 mg. of (IV) for 2 days gave a 41% increase, which was due to (II) alone. 200 mg. of (II) for 1 day caused a 43% and 22% increase, respectively, in stomach- and liver-(I), whilst 100 mg. of (III) increased stomach-(I) by 19%. Formation of (I) from its precursors occurs chiefly in the muscles and its origin and storage are discussed. J. N. A.

**Compounds of serum-proteins with polysaccharides.** J. JANICKI and K. KASPRZYK (Biochem. J., 1936, **30**, 1526—1531).—H<sub>3</sub>PO<sub>4</sub>-free amylose combines with proteins. Euglobulin is the only serum-globulin which combines with non-ionised polysaccharides; pseudoglobulin has practically no binding power, whilst albumins combine to only a small extent. Albumin coagulated by boiling or by change of p<sub>H</sub> does not bind amylose. Fats do not affect combination between serum-euglobulins and amylose. J. N. A.

**Biological behaviour of clover- and potato-proteins in metabolism.** A. BICKEL, R. SANDER, and J. SCHILLING (Munch. med. Woch., 1935, **82**, 1482—1485; Chem. Zentr., 1935, ii, 2693).—Data for changes in the N balance, based on tests with rats, are discussed. The biological behaviour of these proteins is different from that of animal proteins. H. J. E.

**Loss of protein from working heart muscle.** K. LISSAK and J. HOYOS (Arch. exp. Path. Pharm., 1936, **181**, 607—609; cf. *ibid.*, 233).—Ringer's solution takes up from beating hearts protein (I) which, in low concn. (1 : 10<sup>3</sup>—10<sup>5</sup>), inhibits the action of Na oleate on the frog's heart. The amount of (I) given up to the solution is increased by electrical stimulation of the vagosympathic nerve. W. McC.

**Role of carnosine in muscle activity. Influence of training on the content of the muscle in chromogenic substance.** P. NORMARK and E. SAVRON (Ukrain. Biochem. J., 1932, **5**, 17—19).—The chromogenic material in the biceps femoris of

the rabbit determined in protein-free extracts by the method of Hanke and Koessler is increased after training by electrical stimulation. W. O. K.

**Renal function tests. Modern methods of investigation. III. Phenolsulphonaphthalein and other dyes.** M. FIORENTINO, E. MACCHIA, and N. SANGUIGNO (Diagnostic tec. lab. [Napoli], 1935, 6, 89—115).—A review. Of various dyes considered, phenolsulphonaphthalein is best.

CH. ABS. (p)

**Uric acid-excreting function of the liver in renal disturbances. I—III.** S. MATSUMOTO (Japan. J. Gastroenterol., 1935, 7, 1—6, 7—8, 9—11).—I. Injection of uric acid (I) into the bloodstream of rabbits after extirpation of one or both kidneys or ligation of renal vessels or ureters caused an increased output of (I) in bile, as compared with injection into normal rabbits.

II. In kidney disturbance caused by injection of U nitrate, cantharidin, or *Trimeresurus riukuuanus*, elimination of (I) in bile is increased.

III. Extirpation of the kidneys accelerates the (I)-excreting function of the liver. CH. ABS. (p)

**Disturbance and regulation of cholesterol metabolism. I. Effect of liver extract on the disturbed cholesterol metabolism. II. Thyroid and cholesterol metabolism.** A. O. SCHALLY (Z. klin. Med., 1935, 128, 365—375, 376—385; Chem. Zentr., 1935, ii, 2690).—I. Liver extracts restore increased or diminished serum-cholesterol (I) to normal.

II. (I) is reduced in hyperthyroidism, the fall  $\propto$  the extent of the disease; it is increased by therapy, particularly strumectomy. (I) is also depressed in other diseases of the thyroid, which has an inhibiting effect on (I) metabolism.

R. N. C.

**Chemistry of fatigue.** A. PALLADIN, L. PALLADINA, and E. PERSOVA (Ukrain. Biochem. J., 1932, 5, 7—16).—The lactic acid content of the biceps femoris of rabbits is increased after electrical stimulation for 5 min., but with trained muscle a decrease occurs.

W. O. K.

**Metabolism of organic salts.** G. SURANYI (Nourissn, 1934, Nov., 7 pp. [Sep.]).—The role of glutathione and cysteine in intermediate metabolism is examined.

CH. ABS. (p)

**Metabolism of sulphur. Determination of cystine in normal urine.** G. MEDES (Biochem. J., 1936, 30, 1293—1297).—The method for the determination of cystine (I) (this vol., 881) is applied to urine and compared with other methods. Glutathione, ergothioneine, and uric acid do not interfere. About 70% of the total S·S in urine consists of (I).

H. D.

**Recent researches on fat metabolism.** P. E. VERKADE (Bull. Soc. Chim. biol., 1936, 18, 989—1013).—A lecture.

**Distribution of fats introduced into the organism.** G. PERETTI, L. REALE, and L. CIOGLIA (Arch. Ital. Biol., 90, 59—70; Chem. Zentr., 1935, ii, 2693).—Fats administered intravenously or orally cause a rise in the fatty acid (I) content of the blood,

followed by a const. period and a fall. The (I) in the liver increases steadily (44 hr.) and then falls.

H. J. E.

**Glycogen and carbohydrate content of the fatty tissue of rats given unbalanced diets after fasting.** R. WETZEL and T. HEID (Arch. exp. Path. Pharm., 1936, 181, 689—702).—The effects of feeding unbalanced (all carbohydrate, protein-rich, fat-rich) diets on the contents of glycogen and reducing substances in the fatty tissues of rats after fasting have been examined.

W. McC.

**Correlation between rates of intestinal absorption of some simple sugars.** H. G. K. WESTENBRINK and A. MIDDELBEEK (Arch. Neerland. Physiol., 1936, 21, 283—293).—The rate and course of intestinal absorption of galactose (I) in rats approximates to that of glucose (II) but not to that of xylose; for each sugar variations occur with different rats. The absorptions of dietary constituents are generally independent of each other but with substances such as (I), (II), and fructose some degree of inter-relationship is evident.

F. O. H.

**Relative velocities of the absorption of different sugars from the intestine of rat and pigeon.** H. G. K. WESTENBRINK (Nature, 1936, 138, 203—204).—The ratios of the absorption velocities of *d*-galactose, *d*-glucose, *d*-fructose, *d*-mannose, *l*-xylose, and *l*-arabinose are fundamentally the same for rats and pigeons fed on the same diet.

L. S. T.

**Carbohydrate metabolism of the mammary gland *in vitro*.** C. ANTONIANI and A. S. CLERICI (Atti R. Accad. Lincei, 1936, [vi], 23, 73—76; cf. A., 1932, 1059; 1933, 83).—Finely-divided mammary gland (lactating cow) transforms phosphoglyceric acid into  $\text{AcCO}_2\text{H}$  with liberation of inorg. P (cf. A., 1934, 1261). Non-lactating (virginal) gland merely hydrolyses the ester.

E. W. W.

**Lactacidogen and lactic acid in the surviving pigeon brain.** H. GORODISSKI and S. EPELBAUM (Ukrain. Biochem. J., 1932, 5, 87—100).—During 2 hr. in isotonic NaCl solution, the lactacidogen (I) content of surviving pigeon brain decreases. The addition of starch or glucose is without effect. Lack of  $\text{O}_2$  accelerates and electrical stimulation retards the disappearance of (I).

W. O. K.

**Carbohydrate catabolism in cerebral cortex.** K. C. DIXON (Biochem. J., 1936, 30, 1479—1482).—The rates of anaerobic and aerobic carbohydrate catabolism have been calc. from the rates of respiration and glycolysis. The former is the greater, and the Pasteur effect is in operation in slices of cerebral cortex acting on glucose *in vitro*. Addition of KCl raises the aerobic val. to the anaerobic.

H. G. R.

**Effect of rise in temperature on the carbohydrate catabolism of cerebral cortex.** K. C. DIXON (Biochem. J., 1936, 30, 1483—1488).—The rates of respiration and of aerobic glycolysis at 42° are slightly > those at 37°, but are considerably increased at 45°. An abrupt rise in anaerobic glycolysis is observed above 42° but there is a rapid fall at 45°. The Meyerhof quotient being normal, there is no sp. inhibition in the Pasteur effect with

temp., and the rates of carbohydrate catabolism at various temp. do not follow Arrhenius' law.

H. G. R.

**Ossification by means of tissue culture.** R. SASAKI (Z. Klin. Path. Hamatol. [Japan], 1933, 2, 1246).—In tissue cultures of the surfaces of frontal bones of chick embryos, oxidase (I) and Fe appeared simultaneously in the tissue, followed by Ca deposition in 1–2 days. A close relationship between (I), Fe, and Ca is established.

CH. ABS. (p)

**Cortico-adrenal insufficiency and potassium metabolism.** I. Determination of potassium in small amounts of blood and tissues. II. Blood-potassium of normal and adrenalectomised cats. III. Potassium content of skeletal and cardiac muscle in cortico-adrenal insufficiency. R. TRUSZKOWSKI and R. L. ZWEMER (Biochem. J., 1936, 30, 1345–1353).—Methods for determination of K in 0.2 ml. of blood and in small amounts of muscle are described. Normal vals. (19 cats) were: plasma 19.3, serum 20.2, and whole blood 21.4 mg. of K per 100 ml. The vals. for blood-K in 18 bilaterally adrenalectomised cats varied within wide limits (11 to 46 mg. per 100 ml.) for different animals at different times after the operation. The most consistent effect was a rapid rise in blood-K to a max. val. on the 3rd or 4th day. An average of 0.415% wet wt. or 1.9% dry wt. was found for skeletal muscle of animals in the terminal stage of adrenal insufficiency and of 275 and 1277 mg. per 100 g., respectively, for myocardium. The vals. for wet wt. are < and for dry wt. > for normal cats. The syndrome of cortico-adrenal insufficiency is intimately associated with a disturbance of K metabolism.

P. W. C.

**Role of non-electrolytes in imbibition.** D. KOHLER (Compt. rend. Soc. Biol., 1936, 122, 1050–1052).—Imbibition of desiccated *Laminaria flexicaulis* is decreased by non-electrolytes in the early stages, but later is increased.

H. G. R.

**Influence of reaction of the external medium on the survival and the  $p_H$  of the hæmolymph of oysters.** A. JULLIEN and J. G. RICHARD (Compt. rend. Soc. Biol., 1936, 122, 1106–1108).—The optimum  $p_H$  for the Portuguese oyster is 7.5, but it will survive for some time at a  $p_H$  between 4.5 and 9.2. The  $p_H$  of the internal medium (6.1–8.3) is 0.3–0.4 < that of the external medium.

H. G. R.

(A) Relation between natural tolerance to heroin and the partition coefficient of the drug for the central nervous system. (B) Changes in partition coefficient in heroin habituation. (C) Changes in partition coefficient of morphine by heroin habituation. (D) Changes in partition coefficient of heroin by morphine habituation. (E) Change in partition coefficient of morphine by cocaine habituation. M. WATANABE (Japan. J. Med. Sci., IV, 7, No. 2–3; Proc. Japan. Pharmacol. Soc., 1933, 32–34, 34–35, 36, 36–37, 37–38).

CH. ABS. (p)

**Action of nymphalin on the heart and blood-vessels.** M. RYSZKOWSKA (Wiad. farm., 1935, 62, 249–251, 263–266; Chem. Zentr., 1935, ii, 2695).—

Nymphalin, a glucoside from *Nymphaea alba* and *Nuphar luteum*, has cardiac activity but does not cause constriction of the blood-vessels in therapeutic doses.

H. N. R.

**Contradictory actions of caffeine, coramine, and metrazole.** A. H. MALONEY (Quart. J. Exp. Physiol., 1935, 25, 155–166).—The depressant action of barbital was accentuated by caffeine, coramine (I), or metrazole (II) under certain conditions. Transitory reverse effects occurred with certain dosages of (II) and (I).

CH. ABS. (p)

(A) Resting metabolism of the frog ventricle.

(B) Influence of depressants on rate of asphyxiation of frog ventricle. A. J. CLARK (Quart. J. Exp. Physiol., 1935, 25, 167–180).—(A) Examination of ventricles poisoned with  $\text{CH}_2\text{I}\cdot\text{CO}_2\text{H}$  indicates that phosphagen is utilised by the resting as well as by the contracting ventricle.

(B) Data for resting and contracting ventricles at different temp. are given. Acetylcholine reduces the metabolism of arrested ventricles by 50%.

CH. ABS. (p)

**Observations on perfused lungs of guinea-pigs.**

A. S. DALE and B. NARAYANA (Quart. J. Exp. Physiol., 1935, 25, 85–97).—Effects of acetylcholine (I), atropine (II), and eserine (III) on broncho- and vaso-constriction are examined. The action of (I) was counteracted by (II) but not by (III).

CH. ABS. (p)

**Barbiturates. XV. Excretion of barbital in normal and nephritic subjects.** W. P. ARGY, C. R. LINEGAR, and J. M. DILLE (J. Pharm. Exp. Ther., 1936, 57, 258–263).—In men, kidney disease (arteriosclerosis or nephritis) causes a marked reduction in the urinary output of barbital administered orally.

A. L.

**Diuretic action of the digitalis group.** I. MATSUYAMA (Japan. J. Med. Sci., IV, 7, No. 2–3; Proc. Japan. Pharmacol. Soc., 1933, 166–167).—Effects of digalen, diagfolin, pangital, digitoxin, scillaren, and strophanthin are compared in different animals.

CH. ABS. (p)

**Mechanism of uric acid excretion of cinchophen.** H. OKA (Japan. J. Med. Sci., IV, 7, No. 2–3; Proc. Japan. Pharmacol. Soc., 1933, 170–171).—Cinchophen lowers the excretion threshold in the kidney, thereby decreasing the uric acid concn. in blood.

CH. ABS. (p)

**Influence of *o*-, *m*-, and *p*-hydroxybenzoic acid on the gaseous metabolism of the kidney in relation to urine formation.** K. TAMURA and G. KIHARA (Japan. J. Med. Sci., IV, 7, No. 2–3; Proc. Japan. Pharmacol. Soc., 1933, 171–175).—The *m*-acid is more, and the *p*-acid less, irritant than salicylic acid. The theobromine Na salts of *p*- and *m*-acids are not less diuretic but more irritant than the corresponding *o*-acid salt.

CH. ABS. (p)

**Phenylurethane anaesthetics. II.**—See this vol., 1103.

**Intensity of action of anaesthetics as a function of their emulsified state or solution in the blood.** N. LAZAREV (Compt. rend. Soc. Biol., 1936, 122, 891–893).—With increasing partition coeff. (oil–

H<sub>2</sub>O), the hæmoglobin-fixation and anæsthetic activity increase. H. G. R.

**Local anæsthetic actions of certain pyrazoline and quinoline compounds.** H. K. SINHA (J. Pharm. Exp. Ther., 1936, 57, 199—220).—Using 1-phenyl-5-(4'-methoxy-3'-ethoxyphenyl)-3-(β-N-piperidinoethyl)pyrazoline hydrochloride (I), di-(quinolyl-8'-methyl)-1:4-piperazine tetrahydrobromide (II), and 8-(diethylaminoethylethylaminomethyl)quinoline trihydrobromide (III), a comparison of the three methods of determining anæsthetic activity, viz., (a) the rate of paralysis of the frog's sciatic nerve, (b) the rabbit's cornea, and (c) the human wheal methods, indicates that the simplest method is to determine the concn. of the drug which produces anæsthesia for a standard time and this method is applied to methods (b) and (c). With method (a) results are variable. (I) and (II) may be of val. for clinical application to mucosæ and for infiltration anæsthesia, whilst (III) is equal to novocaine for nerve-trunk anæsthesia. A. L.

**Sensitivity of various animals towards anæsthetics.** A. BRUSILOVSKA (Compt. rend. Soc. Biol., 1936, 122, 983—995).—The concns. in the blood of various anæsthetics lethal to frogs and mice are given. H. G. R.

**Galvano-narcosis as a means of investigating the action of hypnotics and narcotics on the frog.** P. ADLER and C. HRADECKY (Arch. exp. Path. Pharm., 1936, 181, 541—552).—The min. current required to produce narcosis is reduced following administration of hypnotics and narcotics but is restored to the initial val. as the effect of these passes off, the strength of current required being (within limits) inversely ∝ the depth of narcosis produced by the substances. 17—36% reduction of the min. effective dose corresponds with 50% reduction in the current strength. W. McC.

**Chemical transmission of the nervous influx at the level of the central synapses.** G. BENETATO and N. MUNTEANU (Compt. rend. Soc. Biol., 1936, 122, 1128—1132).—A substance similar to acetylcholine is formed in the venous blood of the bulb during stimulation of the vagus. H. G. R.

**Role of acetylcholine in transmission of nervous stimulation in striated muscle.** L. LAPIOQUE (Compt. rend. Soc. Biol., 1936, 122, 990—993).—It is suggested that acetylcholine is formed not between the nerve and the muscle but in the muscle itself and serves to generalise the stimulations. H. G. R.

**Gel formation in hen egg plasma.** K. DOLINOV (Trud. Lab. Izuch. Belka Belkovogo Obmen. Organ., 1931, No. 2, 21—27).—Na salicylate (5—35% solution) gelatinises white plasma and in concns. >4.9% gelatinises yolk plasma. CH. ABS. (p)

**Action of ethylene on cell processes.** F. F. NORD (Austral. J. Exp. Biol., 1936, 14, 131—133).—Polemic (cf. A., 1935, 1165). H. G. R.

**Effect of pyocyanine on the animalisation of the sea-urchin caused by calcium-free seawater and sodium thiocyanate.** J. RUNNSTROM and D. THORNBLOM (Naturwiss., 1936, 24, 447).—

Eggs of the sea-urchin were treated with a mixture of 90 parts of Ca-free sea-H<sub>2</sub>O and 10 parts of 0.54M-NaCNS, and with this mixture together with 2.15 × 10<sup>-4</sup>% of pyocyanine (I). They were then fertilised and hatched. After 12 hr. treatment with the solution containing (I), 80% of the eggs were animalised, whereas in a solution without (I) only 10% were animalised. The curves expressing animalisation against time of treatment are S-shaped and agree with the formula of Rahn (this vol., 506). (I) accelerates the respiration of the unfertilised egg. A. J. M.

**Food allergy.** H. STEVENS (Oil and Soap, 1936, 13, 162—165).—Clinical evidence concerning the allergic effects attributed to ingested cottonseed products is often incomplete, and the conclusions are therefore invalidated. E. L.

**Effect of the epithelial cell and colloid substance on the thyroid gland, and of alcoholic hydrochloric acid extracts of the thyroid and of residues from such extracts on tissue respiration.** K. MUNE (Folia Endocrinol. Japon., 1933, 9, 27—28).—The O<sub>2</sub> consumption of living extirpated tissues of rats was increased by treatment with aq. extract of epithelial cell substance or EtOH-HCl extract of thyroid gland, but was decreased by aq. or EtOH-HCl extract of the colloid substance. CH. ABS. (p)

**Tyramine: its moderating effect on basal metabolism.** P. JACCHIA (Boll. Soc. ital. Biol. sperim., 1934, 9, 276—279).—Tyramine administered orally to patients with normal basal metabolism causes a fall, a steady min. being reached in 3 hr. R. N. C.

**Existence in blood and urine of substances promoting liver function.** I. N. MIZUTA and T. MATSUURA (Japan. J. Gastroenterol., 1935, 7, 23—35).—After extirpation of kidneys or in drug-induced nephritis rabbit's blood contains a substance promoting pigment excretion in the liver; it is sol. in H<sub>2</sub>O and Et<sub>2</sub>O, fairly stable in neutral and slightly acid media, but rapidly destroyed by alkalis. It also occurs in blood in cases of kidney malfunction. CH. ABS. (p)

**Influence of cations and carbohydrate on the formation of inorganic phosphoric acid during the autolysis of brain extracts.** H. GORODISSKI and S. EPSCHTEIN (Ukrain. Biochem. J., 1932, 5, 101—112).—In autolysing extracts of pigeon's and cat's brains, "summarisches" H<sub>3</sub>PO<sub>4</sub> (I) (inorg. H<sub>3</sub>PO<sub>4</sub>+creatinephosphoric acid) is formed, but at a constantly diminishing rate. K<sup>+</sup>, Na<sup>+</sup>, NH<sub>4</sub><sup>+</sup>, and Ca<sup>++</sup> retard but Mg<sup>++</sup> accelerates production of (I). Addition of glucose, galactose, glycogen, dextrin, and starch to the autolysing extract of cat's brain retards the reaction but maltose first retards and then accelerates it. W. O. K.

**Influence of oral administration of saponin with adrenaline, ephedrine, and insulin on blood-sugar and -inorganic phosphorus contents.** T. ICHJO (Japan. J. Med. Sci., IV, 7, No. 1; Proc. Japan. Pharmacol. Soc., 1933, 54—56).—Saponin tended to increase the action of the three substances. CH. ABS. (p)

**3-Diethylaminomethyl- and 3-piperidomethylbenzodioxan do not enhance the hypoglycæmic**

action of insulin in the dog. E. ZUNZ, J. PERLA, and F. JOURDAN (*Arch. int. Pharmacodyn.*, 1935, 49, 470—474).  
R. N. C.

Site of action of barium, strychnine, and veratrine in the striated muscle of the toad. G. RUSSO (*Arch. ital. Biol.*, 1934, 91, 60—74; *Chem. Zentr.*, 1935, ii, 3126).  
R. N. C.

Effect of adrenalone, ephedrine, and adrenaline on rabbit blood-sugar. K. AKIMOTO (*Japan. J. Med. Sci.*, IV, 7, No. 1; *Proc. Japan. Pharmacol. Soc.*, 1933, 34—35).—Max. changes occur 30 min. after administration. Threshold doses for oral, rectal, and subcutaneous administration are compared.  
CH. ABS. (p)

Biological identification of proteins. I, III—V, VII. I. LEONTEV. VIII. I. LEONTEV and Z. GRAFSKAJA, IX, X, XII. I. LEONTEV (*Trud. Lab. Izuch. Belka Belkovogo Obmen. Organ.*, 1931, No. 1, 61—65; No. 2, 69—71; 1932, No. 3, 51—55, 56—58; 1933, No. 3, 55—60; No. 4, 62—65, 60—61; No. 5, 61; 1935, No. 7, 65—66).—I. The proto-acid of peas produces no anaphylactic shock in rabbits. III, IV. Injection of protein into cold-blooded animals produced no shock.

V. Neither "fibrin acid" nor ovalbumin produced shock in guinea-pigs.

VII. Proteins of seed of watermelons, muskmelons, and pumpkins, tested biologically, were identical.

VIII. Proto-acid extracted from sunflower seed by NaOH produces no shock. That extracted by 10% aq. NaCl causes typical shock.

IX. Proto-acid from field nut, unlike the protein obtained by Osborne's method, causes no shock.

X. Proto-acid from yellow acacia (15% N) has the same immunological effect on guinea-pigs as does that of peas, beans, etc. and differs from the protein (Osborne's method) in producing no shock.

XII. The Me ester hydrochloride of glycine (I) contained no lysine or tryptophan. Both (I) and the Me derivative produced shock. Guinea-pigs sensitised to (I) suffered shock when re-injected with methylglycine and vice versa.  
CH. ABS. (p)

Parenteral injection of proto-acid ("caseinic acid"). M. N. TSCHUKITSHEVA-FEDOROVA, V. A. DALMATOV, and I. P. TSCHUKITSHEV (*Trud. Lab. Izuch. Belka Belkovogo Obmen. Organ.*, 1931, No. 1, 68—74).—Effects of injected protein are due to the degree of dispersion of the protein and not to the fact that it is foreign to the organism. Rabbits tolerate large injections of proto-acid without pathological changes and retain the substance.  
CH. ABS. (p)

Action of extremely minute amounts of protein ("caseinic acid") on blood pressure. I. P. TSCHUKITSHEV and B. JORDANSKI (*Trud. Lab. Izuch. Belka Belkovogo Obmen. Organ.*, 1932, No. 3, 21—22).—Increased blood pressure observed persists for a longer period than that produced by adrenaline.  
CH. ABS. (p)

Artificial protein plasma. M. N. TSCHUKITSHEVA and I. P. TSCHUKITSHEV (*Trud. Lab. Izuch. Belka Belkovogo Obmen. Organ.*, 1933, No. 5, 35—38).—Injection of casein (I) into rabbits and dogs

produced no ill-effects. (I) cannot be regarded as foreign to the organism (cf. Perov, this vol., 1038).

CH. ABS. (p)

Histochemical study of gold depots in cells. R. COHEN (*Compt. rend. Soc. Biol.*, 1936, 122, 1123—1124).  
H. G. R.

Role of the reticulo-endothelial system in the chemotherapeutic action of arsenobenzene derivatives. I, II. M. ZOLOG and O. COMSIA (*Compt. rend. Soc. Biol.*, 1936, 122, 1135—1137, 1138—1140).—I. Blockage or destruction of the reticulo-endothelial system increases the quantity of therapeutic agent available and the apparent activity is increased.

II. Blockage or destruction of the system prior to infection is without action on the course of the latter. Blockage before infection and 3 days before treatment has a favourable effect, whilst destruction slightly reduces the parasitocidal effect.  
H. G. R.

Action of arsenobenzene derivatives on experimental trypanosomiasis. M. ZOLOG and O. COMSIA (*Compt. rend. Soc. Biol.*, 1936, 122, 1132—1134).—The active principle is dialysable and cannot be a toxalbumin. It is not necessary for the therapeutic substance to be reduced in the organism for it to acquire therapeutic properties.  
H. G. R.

Composition of food poor in heavy metals and its influence on rats. J. A. F. KOK [with C. WAAL] (*Arch. Neerland. Physiol.*, 1936, 21, 247—265).—The prep. of a synthetic diet containing only traces of Cu and Fe is described. Rats on such a diet have a low haemoglobin val., which is increased to normal levels by addition of Fe alone to the diet; growth is approx. normal but fatty degeneration of liver and kidney occurs.  
F. O. H.

High-potassium diet and the survival of adrenalectomised rats. R. A. CLEGHORN and G. A. McVICAR (*Nature*, 1936, 138, 124).—These rats lived longer when the diet (Purina Dog Chow) containing cereals, meat, molasses, and vitamins was supplemented by bread. The low K content of the bread may have favoured survival.  
L. S. T.

Effect of weaning on the excretion of calcium in the urine of lactating rats. L. I. PUGSLEY (*Biochem. J.*, 1936, 30, 1271—1273).—The urinary Ca of lactating rats increases on weaning; the greatest effect is obtained by weaning 15 days after parturition. Removal of the mammary glands after 10 days' lactation causes no increased excretion of Ca over the pre-parturition rate.  
H. D.

Action of magnesium dithiosalicylate on the experimental elimination of cystine. J. DELPHAUT and S. FLEURENT (*Compt. rend. Soc. Biol.*, 1936, 122, 957—958).—Excretion of cystine in the urine increases.  
H. G. R.

Action of intravenous and intramuscular injections of callicrein in man. E. K. FREY, E. WERLE, and E. SACKERS (*Z. ges. exp. Med.*, 1935, 96, 404—413; *Chem. Zentr.*, 1935, ii, 3256).  
R. N. C.

Effect of intravenously-given callicrein on cerebrospinal fluid pressure. T. REEKE and E. WERLE (*Z. ges. exp. Med.*, 1935, 96, 398—403; *Chem. Zentr.*, 1935, ii, 3256).  
R. N. C.

**Callicrein in the saliva and its intervention during the chemical transmission of the nervous influx.** G. UNGAR and J. L. PARROT (Compt. rend. Soc. Biol., 1936, **122**, 1052—1055).—Callicrein is the hypotensive substance in saliva and it may be the cause of vasodilation following stimulation of the lingual nerve. H. G. R.

**Pharmacology of aromatic selenium compounds.** S. KONDO (Japan. J. Med. Sci., IV, 7, No. 2—3; Proc. Japan. Pharmacol. Soc., 1933, 132—135).—Effects of  $\text{OH}^-$ ,  $(\text{OH})_2$ , and carboxy-derivatives of  $\text{Ph}_2\text{Se}$  and  $\text{Ph}_3\text{Se}_2$  are recorded. CH. ABS. (p)

**Pharmacological action [of drugs] in hypervitaminosis-B.** A. ALLEGRI (Boll. Soc. ital. Biol. sperim., 1934, **9**, 236—240). R. N. C.

**Oestrogenic activity of certain phenanthrene and hydrophenanthrene derivatives.** G. PINCUS and N. T. WERTHESSEN (Science, 1936, **84**, 45—46).—The activities in mice of the derivatives prepared by Fieser *et al* (this vol., 203) are recorded. The effect of constitution on activity is discussed. L. S. T.

**Pharmacology of methylglyoxal.** I. G. ARAKI (Japan. J. Med. Sci., IV, 7, No. 2—3; Proc. Japan. Pharmacol. Soc., 1933, 44—47).—Lethal dosages are determined. In alkalosis the val. was  $>$  that in acidosis.  $\text{AcCHO}$  rapidly disappears from blood, producing a marked decrease in alkali reserve.  $\text{HCO}_2\text{H}$  is among the decomp. products. CH. ABS. (p)

**Convulsants of the picrotoxin group.** H. KUSUMOTO (Japan. J. Med. Sci., IV, 7, No. 1; Proc. Japan. Pharmacol. Soc., 1933, 89—90).—Physiological data for coriamyrtin, tutin, picrotoxin, and picrotoxinine are given. CH. ABS. (p)

**Pharmacological action of tannic acid. VI. Minimum lethal dose by intravenous injection.** U. SAMMARTINO (Arch. Farm. sperim., 1936, **61**, 156—159).—The min. lethal dose in rabbits is 0.16 g. per kg. E. P.

**Variations in blood-cholesterol and -sugar after slow, continuous, mesenteric injection of chlorinated arsenical water containing sodium hydrogen carbonate.** E. CHABROL, J. COTTET, and J. SALLET (Compt. rend. Soc. Biol., 1936, **122**, 905—907).—A decrease in cholesterol and sugar occurs. H. G. R.

**Pharmacology of sodium furfuralacrylate. I. Effect on the frog heart.** M. NODA (Aichi Igak. Zasshi, 1933, **40**, 1503).—The depressive effect of Na furfuralacrylate (I) on the heart action was unaffected by previous administration of Gynergen, but was reinforced by adrenaline. The weakened contractions were not improved by  $\text{BaCl}_2$ . (I) affects the heart muscle directly. CH. ABS. (p)

**Anhidrotic action of agaric acid.** K. HATTORI (Japan. J. Med. Sci., IV, 7, No. 2—3; Proc. Japan. Pharmacol. Soc., 1933, 157—160).—Agaric acid acts on the parenchyma of sweat glands. CH. ABS. (p)

**Influence of phosphorus poisoning on the synthesis of menthologlycuronic acid. II.** B. NAZARJANZ (Ukrain. Biochem. J., 1932, **5**, 129—

132; cf. A., 1935, 1533).—The impaired ability of rabbits poisoned with P and injected with menthol to synthesise menthologlycuronic acid is accompanied by pathological changes in the liver, involving fatty degeneration. Lesions of the kidney do not effect the synthesis of conjugated glycuronic acids.

W. O. K.

**Action of sulphur in experimental carbon monoxide poisoning.** K. VOIT and H. H. SCHMIDT (Munch. med. Woch., 1935, **82**, 1393—1395; Chem. Zentr., 1935, ii, 2842).—Injection of S prevents the erythrocytosis and hyperglycaemia arising from CO poisoning. H. N. R.

**Bismuth poisoning.** H. C. LUETH, D. C. SUTTON, C. J. McMULLEN, and C. W. MUEHLBERGER (Arch. Int. Med., 1936, **57**, 1115—1124).—A case report of a permanent blue discoloration of the skin as in argyria after prolonged treatment with Bi subnitrate (4 g. per day). E. D. Y.

**Influence of chronic thallium poisoning on the function of the female sex organs of rats.** T. ARASHIMA (Japan. J. Med. Sci., IV, 7, No. 2—3; Proc. Japan. Pharmacol. Soc., 1933, 135—136).—In rats treated with  $\text{TlCl}$  solutions, sex functions are affected only in association with nutritive changes. CH. ABS. (p)

**Effect of injection of potassium cyanide on hydrogen-ion concentration of blood plasma especially in relation to certain hormones. I. Effect of potassium on plasma- $p_{\text{H}}$ . II. Relation to thyroid. III. Relation to insulin.** N. NAKATSUGAWA (Folia Endocrinol. Japon., 1934, **9**, 99—100).—I. Injection of 0.2—0.8 c.c. of 0.5% aq. KCN produced an initial increase in  $p_{\text{H}}$ , followed by a decline to  $<$  normal vals.

II. Fluctuations in  $p_{\text{H}}$  following injection are intensified by feeding small doses of thyroid gland. Large doses accelerated the second (declining) phase.

III. Injection of insulin, alone or with glucose, decreased the variations due to injection of KCN. CH. ABS. (p)

**Fluorides in Foochow waters and dental defects.** T. H. WANG (J. Chinese Chem. Soc., 1936, **4**, 172—177).—The occurrence of mottled dental enamel is related to the high F content of drinking  $\text{H}_2\text{O}$ . R. S.

**Effect of age on sensitivity to metabolic poisons.** H. YAMAGATA (Japan. J. Med. Sci., IV, 7, No. 2—3; Proc. Japan. Pharmacol. Soc., 1933, 142—150).—The  $\text{O}_2$  intake of liver, kidney, and muscle tissues was decreased by  $\text{As}_2\text{O}_3$  and increased by thyroxine to approx. the same extent in young and old rabbits in each case. CH. ABS. (p)

**Effect of age on sensitivity to blood poisons.** T. ISOBE (Japan. J. Med. Sci., IV, 7, No. 2—3; Proc. Japan. Pharmacol. Soc., 1933, 150—154).—Resistance of young rats to CO, HCN,  $\text{H}_2\text{S}$ ,  $\text{NHPh}\cdot\text{NH}_2$ , and  $\text{NH}_2\text{Ph}$  was  $>$  that of adults. Splenectomy did not influence susceptibility. CH. ABS. (p)

**Mechanism of iodoacetate poisoning of muscle.** A. GHAFFAR (Quart. J. Exp. Physiol., 1935, **25**, 61—67).—The effect of  $\text{CH}_2\text{I}\cdot\text{CO}_2\text{Na}$  (0.001N) on the glycolytic activity and lactic acid production of frog

muscle is examined in relation to I liberation, time, and temp. CH. ABS. (*p*)

**Toxicity of some cations to *Saprolegnia*.** F. MOREAU and (MME.) F. MOREAU (Compt. rend., 1936, 202, 2175—2177).—The inhibitory effect of the following cations (as 0.3—1.0% aq. chlorides) on the growth of *Achyla colorata* gives the series:  $\text{Li} > \text{Na} > \text{K}$ ;  $\text{Ba} > \text{Sr} > \text{Ca}$ ;  $\text{Mg} > \text{Ca}$ . F. N. W.

**Pathological effects of poisons used for rodents.** J. G. WRIGHT (Vet. Rec., 1936, 16, 599—602).—A review of the pharmacological actions of HCN,  $\text{As}_2\text{O}_3$ , P,  $\text{BaCO}_3$ , red squill (I), and strychnine. Of these,  $\text{BaCO}_3$  and (I) are the most suitable for poisoning rodents, but from a humane point of view a combination of one of these poisons with an appropriate narcotic is recommended. J. N. A.

**Toxicity of flavins.** R. KUHN and P. BOULANGER (Z. physiol. Chem., 1936, 241, 233—238).—The following isoxalloxazines are toxic to mice (rats on vitamin- $B_2$ -free diet were also used) in the doses given (mg. per kg.): 9-Me- 125 (60 with rats and irradiated mice), 9-Ph- (I) 17, 9- $\text{CH}_2\text{Ph}$ - 50, 9-cyclohexyl- 50, 9-hydroxyethyl- 280, 9-dihydroxypropyl- 200, 6 : 8 : 9-Me $_3$ - 300—310, 9-OAc- 130: the following are less toxic: 6 : 9-Me $_2$ - 350, 6 : 7 : 9-Me $_3$ - 330, 9-acetyl-6 : 7-dimethyl- 775, and lactollavin 340. Hence Me in the 6 : 7-positions reduces the toxicity. (I) loses its toxicity when heated with dil. aq. NaOH, being converted into a ketocarboxylic acid with loss of urea. The toxic doses of alloxazine and its 6 : 7-Me $_2$  derivative are 305 and 250, respectively. In some cases the toxicity is increased by irradiation of the animals. W. McC.

**Pharmacological and toxicological properties of vinyl ether.** H. MOLITOR (J. Pharm. Exp. Ther., 1936, 57, 274—288).—For a 3-hr. anaesthesia, the toxicity of vinyl ether (I) to mice is 0.19 c.c. per litre of air. The corresponding vals. for  $\text{Et}_2\text{O}$  and  $\text{CHCl}_3$  are 0.18 and 0.026 c.c., respectively. Decomp. of (I) is accompanied by loss in anaesthetic power, although there is no decomp. when it is circulated through the body. In low concn.,  $\text{Et}_2\text{O}$  has a quicker action; (I), however, acts more rapidly at high concn., and recovery is always more rapid. A. L.

**Value of sodium formaldehydesulphoxylate in mercury poisoning.** W. E. ROBERTSON and V. L. TUCK (J. Chemother., 1935, 12, 226—231).

CH. ABS. (*p*)

**Unsuccessful attempts to treat and prevent cyanide poisoning by dinitrophenol.** R. HAZARD and P. HAUTEVILLE (J. Pharm. Chim., 1936, [viii], 24, 5—8). H. D.

**Biological action of metals irradiated by the quartz lamp.** III. I. M. GOLDBERG and V. G. BOUDYLINE. IV. I. M. GOLDBERG (Acta med. scand., 1935, 85, 136—146, 147—153).—III. Solutions of Cu salts irradiated with ultra-violet light stimulate haematopoiesis in normal rabbits. Irradiated Cu and Fe salt solutions administered parenterally accelerate regeneration of blood after experimental hemorrhagic anaemia.

IV. Irradiated Cu and Fe solutions depress the

local anaphylactic reactions but apparently do not affect the course of anaphylaxis. R. N. C.

**Effects of  $\beta$ -rays from radium on the agent of the Rous sarcoma, on bacteriophage, on tetanus toxin, and on certain bacteria, antibodies, and enzymes.** S. L. BAKER (Brit. J. Exp. Path., 1934, 16, 148—155).—The relative susceptibility to destruction by  $\beta$ -rays is examined. The agent of Rous sarcoma is not of an enzymic character.

CH. ABS. (*p*)

**Effect of ultra-violet light irradiation on carbohydrate metabolism. I. Changes of blood-sugar and blood-diastase after total irradiation from the noonday sun.** A. MARCHIONINI and C. HOVELBORN (Klin. Woch., 1935, 14, 1387—1392).—The fasting blood-sugar val. in man is sometimes depressed and blood-diastase raised by total ultra-violet irradiation, suggesting a relation between skin-function and insulin output. R. N. C.

**Reduction and oxidation by ultra-violet irradiated sugar.**—See this vol., 1094.

**Heliotropism of cholesterol.** A. H. ROFFO (Strahlenther., 1935, 53, 317—325; Chem. Zentr., 1935, ii, 2828).—The appearance of tumours as a result of irradiation with light of  $\lambda$  180—340 m $\mu$  is preceded by local increase of blood-cholesterol.

R. N. C.

**Biological assay of hydrastine, berberine, and their mixtures by the isolated intestine.** F. MERCIER (Compt. rend. Soc. Biol., 1936, 122, 965—968). H. G. R.

**Biological assay of liquid extracts of *Hydrastis*.** F. MERCIER and L. VIGNOLI (Compt. rend. Soc. Biol., 1936, 122, 968—970). H. G. R.

**Recent advances in enzyme chemistry.** E. WALDSCHMIDT-LEITZ (Chem. and Ind., 1936, 620—626).—A lecture.

**Borders of physics and biology.** C. E. GUYE (Arch. Sci. phys. nat., 1936, [v], 18, 154—171).—Probability considerations are discussed in relation to mol. theories of life. Thermal agitation alone is insufficient to account for the appearance of high degrees of asymmetry in mols. of high mol. wt.

F. A. A.

**Reversible enzymic oxidation of *d*-gluco-ascorbic acid.** S. S. ZILVA (Biochem. J., 1936, 30, 1215; cf. A., 1934, 707).—The enzyme from apples which dehydrogenates *l*-ascorbic acid also reversibly dehydrogenates *d*-glucoascorbic acid at  $p_H$  4.4 and room temp. W. McC.

**Lactic dehydrogenase of animal tissues.** D. E. GREEN and J. BROSTEAUX (Biochem. J., 1936, 30, 1489—1508).—With enzyme-co-enzyme-lactate-carrier systems, the product of oxidation,  $\text{AcCO}_2\text{H}$ , inhibits almost completely the oxidation of lactate, but in presence of KCN or  $\text{NH}_2\text{OH}$  the oxidation proceeds linearly for a long time. The enzyme is very sensitive to  $p_H$ , and is associated with the enzymes oxidising malate, fumarate, and  $\beta$ -hydroxy-propionate and -butyrate. It catalyses the oxidation of *l*-lactate, whilst *d*-lactate, lactamide, and isoserine are not oxidised. It can be determined in the tissues of pigeons, rabbits, and rats, and  $\text{H}_2\text{O}$ -clear solutions can

be prepared with  $Q_{10}$  of 400—500. Very small amounts of lactate are not oxidised with an appreciable velocity, and there is no crit. concn. of co-enzyme below which the rate of oxidation of lactate falls sharply. The co-enzyme is reduced by  $\text{Na}_2\text{S}_2\text{O}_4$  or by the enzyme system, and when reduced is unstable in acid, but not in alkaline solution. The co-enzyme is a sp. carrier between lactic acid and the O carrier, and cannot be replaced by the co-enzyme of hexose monophosphate dehydrogenase. Flavin, adrenaline, and, to a slight extent, yellow pigment can act as carriers, but ascorbic acid, cytochrome, and glutathione are inactive. A new classification of dehydrogenase systems is given. J. N. A.

**Components of dehydrogenase systems. XII. Mechanism of dehydrogenation of alcohol and of triose phosphates. Mechanism of oxidation-reduction.** H. VON EULER, E. ADLER, and H. HELLSTROM (Z. physiol. Chem., 1936, 241, 239—272; cf. this vol., 519).—EtOH in presence of its sp. apodehydrogenase reversibly converts cozymase (I) into dihydrocozymase (II), an equiv. amount of EtOH being converted into MeCHO. (II) exhibits an absorption max. at 340 m $\mu$ , is stable in alkaline and slightly acid media (rapidly destroyed at  $p_{\text{H}}$  3) and to heat at  $p_{\text{H}}$  7.6, and is re-oxidised by flavin enzyme. The point of equilibrium in the reaction  $(\text{I}) \rightleftharpoons (\text{II})$  favours formation of (I) and  $K$  increases as  $p_{\text{H}}$  decreases. Reversible reduction of (I) with  $\text{Na}_2\text{S}_2\text{O}_4$  at  $p_{\text{H}} > 8$  and with Zn in 0.1N-NaOH at 0° yields a yellow product exhibiting absorption max. at 360 m $\mu$ . This product reduces methylene-blue and  $\text{AgNO}_3$ , is not inactivated by acid, but loses its colour on neutralising, and is rapidly inactivated by heat. Dihydroxyacetonephosphoric acid is dehydrogenated by a dehydrogenase from yeast with (I) acting as sp. co-enzyme. Since the H donor in the oxidation-reduction process of alcoholic fermentation is probably a triosephosphoric acid it follows that (I) acts as a H carrier, transferring H to MeCHO. W. McC.

**Dehydrogenase systems in seeds of various plants.** T. THUNBERG (Lunds. Univ. Arsskr., 1934, II, 30, No. 13, 44 pp.).—The enzyme occurs in widely varying amounts in certain seeds.

CH. ABS. (p)

**Allantoinase in insects.** M. L. ROCCO (Compt. rend., 1936, 202, 1947—1948).—Aq. extracts of many winged insects when incubated at 39—40° contain allantoin acid enzymically derived from allantoin.

J. L. D.

**Reduction of biliverdin to bilirubin in tissues.** R. LEMBERG and R. WYNDHAM (Biochem. J., 1936, 30, 1147—1170).—Biliverdin (I) is reduced anaerobically by guinea-pig's tissues (liver, kidney, spleen, brain, lung, muscle, blood, and heart, but not skin) and aerobically by the liver, spleen, kidney, and brain. The liver of man, horse, cat, rat, mouse, fowl, pigeon, *Echidna*, and (less powerfully) frog also reduce (I). Dehydrogenase systems and ascorbic acid in guinea-pig's liver reduce (I). Aldehydes (II), lactate, EtOH, citrate, formate, and (less effectively) succinate act as H donors in presence of liver enzymes. Glucose (III) dehydrogenase also reduces (I) slightly

but most of the activity of (III) is due to glycolysis. (II) are activated by proteins and by an aldehyde dehydrogenase (probably not xanthine oxidase), and the other substrates by their sp. dehydrogenases. With MeCHO activated by protein the system is stable to heat and acts much more rapidly on (I) than on methylene-blue. (I) and mesobiliverdin are reduced in a few min. to the corresponding rubins by Zn in aq.  $\text{NH}_3$  in absence of  $\text{O}_2$ .

W. McC.

**Enzymic degradation of starch.**—See this vol., 1096.

**Amylase during the growth and ripening of grains.** T. CHRZĄSZCZ and J. JANICKI (Biochem. J., 1936, 30, 1298—1302).—All three amylolytic functions (liquefying, dextrinising, and saccharifying) appear in the forming grain of barley, wheat, and oats immediately after flowering. The subsequent decrease in activity is antagonised by peptone or dil. NaCl solutions. H. D.

**Amylosynthase. XXV. Zymogen of yeast amylosynthase. XXVI. Zymogen of higher plant amylosynthase. Distribution in higher plants which accumulate starch. XXVII. Amylosynthase of higher plants which accumulate starch. XXVIII. Reaction velocity of amylosynthase.** T. MINAGAWA (J. Agric. Chem. Soc. Japan, 1935, 11, 370—373; cf. A., 1935, 1162).—XXV. Yeast extract, after treatment with papain and filtration, contained amylosynthase (I). The latter was originally present as zymogen (II). Aq.  $\text{Na}_2\text{SO}_4$ ,  $\text{K}_2\text{SO}_4$ , KCl, and NaCl extract (II) but not (I).

XXVI. (I) was extracted from higher plants by means of papain. It occurs in many seeds (notably rice) and in tubers of potato and *Sagittaria sagittifolia*.

XXVII. (I) occurs mainly in the endosperm of rice. The embryo contains amylase (III). Samples from glutinous rice differed from yeast-(I) in being sol. in glycerol but not in  $\text{COMe}_2$  and inactivated by  $\text{H}_2\text{S}$ ,  $\text{HgCl}_2$ , and  $\text{Pb}(\text{OAc})_2$ .

XXVIII. (I) from rice showed optimum activity at 35—46° and  $p_{\text{H}}$  6.0—6.4 according to the substrate used. (I)-(III) mixtures showed antagonistic actions.

CH. ABS. (p)

(A) **Mechanism of production of a specific bacterial enzyme which decomposes the capsular polysaccharide of type III pneumococcus.** R. DUBOS. (B) **Use of graded collodion membranes for the concentration of the enzyme.** R. DUBOS and J. H. BAUER (J. Exp. Med., 1935, 62, 259—269, 271—279).—(A) The micro-organism effecting decomp. of the polysaccharide produces the enzyme when grown on the sp. substrate, but not when grown on a casein hydrolysate medium. The yield of enzyme is dependent on the concn. of polysaccharide present and on the no. of cells used as inoculum. The enzyme is not produced in the absence of cellular multiplication.

(B) The enzyme is associated with a protein, the separation of which by membrane filtration is described.

CH. ABS. (p)

**Effect of hæmolytic substances on blood-catalase.** A. LEVI (Arch. Farm. sperim., 1936, 61,

121—142).—The contents of red corpuscles, haemoglobin (I), and catalase (II) in blood (rabbit) are diminished by intravenous injection of  $\text{KClO}_3$  or  $\text{Na}_2\text{TeO}_3$ . Solanine and the venom of *Vipera aspis* decrease erythrocytes and, to a greater extent, (I) and (II). The level of (II) is related to the content of erythrocytes and pigments derived from (I).

E. P.

**Role of cozymase in phosphorylation in yeast systems.** Å. LENNERSTRAND (Naturwiss., 1936, 24, 462—463).—The cessation of  $\text{O}_2$  uptake after a time in the system apozymase+glucose+hexose diphosphate (I)+cozymase (II)+pyrocyanine (III)+phosphate buffer ( $p_{\text{H}}$  6.2), its renewal on the addition of (II) or (I)+(II), and the fact that no inactivation of (II) takes place in the absence of F' and (III) are explained by the view that (II) is present in a higher and a lower and less stable phosphorylated condition. During fermentation the higher phosphorylated substance is formed from the lower with the  $\text{PO}_4'''$  set free from phosphorylated  $\text{C}_3$  compounds. In presence of F', however, the additional  $\text{PO}_4'''$  can only come from (I), and this reaction, being slower than the preceding one, leads to inactivation of (II). A. L.

**Cozymase. X. Phosphatase and cozymase.** K. MYRBACK and B. ÖRTENBLAD. **XI. Reducing group of cozymase.** K. MYRBACK (Z. physiol. Chem., 1936, 241, 148—155, 223—232; cf. A., 1935, 1278).—X. The inactivating effect of ordinary kidney- and bone-phosphatase (I) on cozymase (II) is not due to (I) itself but to an accompanying enzyme. The purity of (II) cannot be satisfactorily determined with apozymase (III) because of alterations in (III) on keeping.

XI. In its behaviour towards  $\text{HOI}$ , Hagedorn and Jensen's reagent, and  $\text{Mg}+\text{H}_2\text{SO}_4$ , (II) closely resembles ouabain and the lactone of angelic acid (cf. Thiele *et al.*, A., 1902, i, 155). W. McC.

**Composition of cozymase.** H. VON EULER and F. SCHLENK (Svensk Kem. Tidskr., 1936, 48, 135—137).—The empirical formula of highly purified cozymase is  $\text{C}_{21}\text{H}_{27}\text{O}_{14}\text{N}_7\text{P}_2$ , in agreement with its being made up of 1 mol. each of adenine and nicotinamide and 2 mols. of pentose phosphate. Its chemical properties can be interpreted in terms of this structure.

E. A. H. R.

**Inhibition of the action of Schardinger's enzyme by co-enzymes containing adenine.** B. ANDERSSON (Z. physiol. Chem., 1936, 241, 11—16; cf. A., 1935, 1414).—Adenine and substances of which it is a constituent [adenosine > adenylic acid (I) > adenosinediphosphoric acid (II) and adenylyl pyrophosphate, cozymase (III), and Warburg's co-enzyme] restrict in varying degrees the action of the enzyme. The effect produced by (I) and (II) is not altered following treatment with dil. aq.  $\text{NaOH}$  but that of (III) is greatly increased, the increase not being due to liberation of (I) or of  $\text{H}_4\text{P}_2\text{O}_7$ .  $\text{Na}_4\text{P}_2\text{O}_7$  has no inhibitory effect and nicotinamide only a slight effect.  $\text{NaOH}$  probably causes rearrangement of the (III) mol. and since no acid  $\text{OH}$  is thus liberated a formula for (III) similar to that of Barrenscheen is to be preferred to that of Lohmann. W. McC.

4 F

**Intermediate metabolism and oxidation processes. I. Co-enzyme and intermediate carbohydrate metabolism.** A. UTEVSKI (Ukrain. Biochem. J., 1932, 5, 71—86).—In presence of washed muscle tissue, glycogen, glucose, fructose, and glycerol do not yield  $\text{MeCHO}$  (I) but pyruvate (II) is decarboxylated. The addition of boiled muscle juice (III) restores the power to produce (I) and also to oxidise (II). The conversion of fumaric into malic acid is effected by washed muscle tissue, but the further metabolism of malic acid proceeds normally only when (III) is added. Probably a co-enzyme essential in intermediate metabolism is present in (III). W. O. K.

**Action of dyes on enzymes. Nature of the union between yeast invertase and sucrose.** J. H. QUASTEL and E. D. YATES (Enzymologia, 1936, 1, 60—80).—The reversible inactivation of invertase by acid (I) and basic dyes (II) has been interpreted quantitatively in terms of the mass action law. Variation of dye, sucrose, and  $[\text{H}^+]$  indicates a reaction between (I) ion and (II) ion and positive and negative ions of the enzyme, respectively. Glucose competes mainly with (II), fructose with (I), and sucrose with both (I) and (II). Reduced dyes are usually less toxic. E. D. Y.

**Swedish top yeast: carboxylase.** K. WULFERT (Tids. Kjemi, 1936, 16, 77—79, 82—86).—To obtain high carboxylase (I) activity, the yeast to be dried must be very fresh. Extracts of the dried yeast give vals. for Neuberg's const. <1, in agreement with theory. The effects on the (I) activity of dried yeast of warming, addition of sugars, autolysis, plasmolysis, and poisoning with  $\text{PhMe}$  or  $\text{CHCl}_3$  have been studied.

M. H. M. A.

**$\beta$ -Glucosidase from *Sorghum saccharatum*.** C. ANTONIANI (R. Ist. lombardo Sci. Lett. Rend., 1935, 68, 355—362; Chem. Zentr., 1935, ii, 2683—2684).—The enzyme from ungerminated seed shows optimum activity at  $p_{\text{H}}$  4.6 and, unlike the  $\beta$ -glucosidase from bitter almonds and malt, decomposes cellobiose and salicin at approx. the same rates. Hydrolysis of salicin is inhibited by glucose but not by galactose. The enzyme does not decompose lactose and contains no  $\beta$ -galactosidase. A. G. P.

**Synthetic action of  $\beta$ -glucosidase on glucose.** I. VINTILESCO, C. N. IONESCO, and A. KIZYK (Bul. Soc. Chim. Romania, 1935, 17, 283—292).—The amount of  $\alpha$ -glucose in the  $\alpha$ - $\beta$  equilibrium mixture is increased by increasing the concn. or by adding  $\text{COMe}_2$ . Changes in  $[\alpha]$  of glucose (I) treated with emulsin in  $\text{H}_2\text{O}$  and aq.  $\text{COMe}_2$  and the further change on destruction of the (I) by yeast show that the synthesis of gentiobiose from 2 mols. of  $\beta$ - and of cellobiose from 1 mol. of  $\beta$ - and 1 mol. of  $\alpha$ -glucose follow the law of mass action. Increase in the amount of  $\alpha$ -form favours the formation of cellobiose, in accordance with expectation.

R. S. C.

**Biochemical synthesis of  $\beta$ -glucosides derived from alcohols immiscible with water.** I. VINTILESCO, C. N. IONESCO, and M. SOLOMON (Bul. Soc. Chim. Romania, 1935, 17, 267—281).—A solution containing  $n\text{-C}_6\text{H}_{13}\cdot\text{OH}$  (30),  $\text{H}_2\text{O}$  (19.2),  $\text{COMe}_2$  (51.9), and glucose (1.5%) with emulsin (I) (0.5 g. per

100 c.c.) gives  $\beta$ -n-hexylglucoside, m.p. 87—89°,  $[\alpha]_D^{20}$  —33.28° in H<sub>2</sub>O, hydrolysed by (I) or dil. acid. The above proportions are shown to be the optimum by a study of the solubility relations of the quaternary system.

R. S. C.

**Serum-lipase during naphthalene ocular lesions in rabbits and its probable role in the pathogenesis of senile cataract.** D. MICHAEL and I. PACURARIU (Compt. rend. Soc. Biol., 1936, **122**, 1125—1128).—Serum-lipase is lowered during C<sub>10</sub>H<sub>8</sub> intoxication with the appearance of ocular symptoms, reaching a min. when the opacity becomes total. The val. then slowly (4—5 months) returns to normal.

H. G. R.

**Deaminating enzyme of flesh-fly larvae.** A. W. A. BROWN and L. FARBER (Biochem. J., 1936, **30**, 1107—1118).—The deaminase activity of extracts of the larvae of *Lucilia sericata* and *Calliphora erythrocephala* is max. at  $p_H$  7.6, is greater under anaerobic than under aerobic conditions, and increases linearly with temp over the range 10—37.5°. The extracts do not deaminate NH<sub>2</sub>-acids or di- or tri-peptides but attack the higher hydrolytic products of protein; they possess proteinase, poly- and di-peptidase, uricase, and slight deaminase activities.

W. O. K.

**Proteolytic enzymes. IX. Inactivation of papain with iodine.** M. BERGMANN and L. ZERVAS. **X. Enzymes of papain and their activation.** M. BERGMANN and W. F. ROSS (J. Biol. Chem., 1936, **114**, 711—715, 717—726).—IX. HCN does not affect the specificity of papain towards benzoylisoglutamine (I), but it increases the amount of active enzyme, and thus accelerates the cleavage of (I). Inactivation of papain with I extends not only to cleavage of gelatin and acylated peptides, but also to free peptides. Reactivity can be regenerated by HCN, but it is always < that of the original papain. The loss of activity is more pronounced in the case of substrates with a small cleavage rate.

**X. Hydrolysis of (I) by HCN—papain is completely suppressed by small amounts of NHPh·NH<sub>2</sub> (II), but (II) has no effect on the hydrolysis of peptone from albumin. HCN-activated papain consists of two distinct enzymes, papain peptidases I and II. Peptidase I is inhibited by (II) and very probably contains a CHO group, whilst peptidase II is unaffected by (II) and is reversibly inactivated by I. Peptidase I is the first proteolytic enzyme of known specificity which requires neither terminal NH<sub>2</sub> nor CO<sub>2</sub>H, and is thus an endopeptidase, in distinction to an exopeptidase which requires a terminal peptide linking. It is influenced by the nature of the NH<sub>2</sub>-acid forming or lying near the ·CO·NH<sub>2</sub> group which is hydrolysed. It is suggested that in natural papain there is an equilibrium between the peptidases I and II and a compound of these.**

J. N. A.

**Enzymic histochemistry. XXI. Proteolytic enzymes of the larvae of clothes- and wax-moths.** F. DUSPIVA (Z. physiol. Chem., 1936, **241**, 177—200; cf. this vol., 244, 759).—Larvae of *Galleria mellonella* cannot digest keratin (I). In the intestinal juice the proteinase (II), which is the most active enzyme present, exhibits optimal action [on caseinogen (III)] at  $p_H$  9.6. In *Tineola biselliella* the val. is 9.3 and the

amount of (III) digested  $\propto$  the amount of (II). In both species the optimal  $p_H$  for the aminopoly-peptidase action (on alanyl-glycylglycine) is 8.1 and those for the dipeptidase action (on alanylglycine) are 7.5 (*Tineola*) and approx. 7.8 (*Galleria*). The peptidases are equally sensitive to the action of ·SH compounds [e.g., thioglycolic acid (IV)], but whereas (II) of *Tineola* is unaffected by low concns. of (IV), the action of (II) of *Galleria* is restricted. The ability of insects to utilise (I) is due entirely to the existence of a negative oxidation-reduction potential in their intestinal juice.

W. McC.

**Proteases of acid proteolytes.** M. E. C. GORINI and L. GORINI (R. Ist. lombardo Sci. Lett. Rend., 1935, **68**, 115—125; Chem. Zentr., 1935, ii, 2964).—Enzymic activity in filtered solutions increases with the age of the culture from which it is obtained. Best results were obtained with 24-hr. cultures. Citrate additions have a favourable effect. Activity is max. at  $p_H$  7.0 and ceases at 4.3.

A. G. P.

**Digestive enzymes in marine invertebrates. II. Proteolytic enzymes in the starfish, *Diosasterias nipon*, Doderlein.** E. SAWANO (Sci. Rep. Tokyo Bunrika Daigaku, 1936, **2**, B, 179—199; cf. this vol., 521).—Extracts of the stomach of *D. nipon* hydrolyse glycylglycine (I) but not gelatin; those of the pyloric caecum hydrolyse proteins, peptones, and (I) and contain (as does the rectal gland) a cathepsin-like enzyme and a trypsin-like carboxy-polypeptidase accelerated by cystine and inhibited by cysteine. Optimum  $p_H$  vals. are given for various substrates.

F. O. H.

**Location of the anti-enzyme in egg-white.** J. S. HUGHES, H. M. SCOTT, and J. ANTILYES (Ind. Eng. Chem. [Anal.], 1936, **8**, 310—311).—The anti-proteolytic enzyme in new-laid eggs is chiefly located in the inner thin white.

S. C.

**Alcohol and peptic digestion.** E. TRABUCCHI (Arch. Farm. speriment., 1936, **61**, 186—208).—The inhibition by EtOH of *in-vitro* proteolysis by pepsin is due not merely to inactivation of the enzyme but to modifications of the physico-chemical properties of the substrate, e.g., diminution of dissociation and of enzyme-substrate adsorption, increase in  $\eta$ , and, particularly, inhibition of preliminary swelling (due to dehydration by EtOH) of substrate necessary for subsequent hydrolysis.

F. O. H.

**Inactivation of crystalline pepsin.** J. STEINHARDT (Nature, 1936, **138**, 74—75).—At  $p_H$  vals. > 6.45, cryst. pepsin inactivates unimolecularly at a rate  $\propto 1/[H^+]^5$ . Equilibria governing the concn. of an unstable species of pepsin ion, formed by dissociation of five acidic groups, probably determine the rate. Between ionic strengths of 0.012 and 0.10, the velocity at const.  $p_H$  increases by > 30 times. On agitation, a heterogeneous reaction, independent of  $p_H$  and ionic strength over wide limits, obscures the results.

L. S. T.

**Phosphatase distribution in higher plants.** V. IGNATIEFF and H. WASTENEYS (Biochem. J., 1936, **30**, 1171—1182).—The phosphatase contents of various parts of bean, potato, radish, and wheat plants

at different stages of development have been determined. W. McC.

**Phosphatase of potato and sugar-beet.** E. PFANKUCH (Z. physiol. Chem., 1936, 241, 34—46; cf. A., 1935, 1181).—The phosphatase (I) content of the press-juice from potatoes is that of any other vegetable material. (I) is non-sp. but hydrolyses substrates at different rates (Na inositol hexaphosphate : Na hexose diphosphate : Na  $\alpha$ -glycerophosphate : Na phosphoglycerate : Na  $\beta$ -glycerophosphate as 23 : 52 : 61 : 66 : 100). The action of (I) (optimal at  $p_H$  5.8—5.9) is easily inhibited by  $PO_4^{4-}$  and very easily by NaF, which acts more powerfully with high substrate concn. Inhibition is also caused by org. and inorg. anions and cations,  $Cu^{++}$  being especially powerful. The effect of  $Cu^{++}$  is counteracted by  $CN'$  and glutathione (II) and partly counteracted by ascorbic acid (III) although (II) and (III) alone have no effect on (I).  $Mg^{++}$  does not activate (I).

W. McC.

**Serum-phosphatase in the domestic fowl.** R. H. COMMON (J. Agric. Sci., 1936, 26, 492—508).—The serum-phosphatase (I) of laying hens was > that of cocks and pullets. Vals. for hens altered very little during periods of suspended egg-production. In chicks, (I) increased rapidly until 10—12 days after hatching, and subsequently fell sharply to a lower level at 3 weeks. Thereafter vals. for male birds declined steadily until maturity, those for females being of a similar order until increasing again at the onset of laying. Variations for laying birds were not decreased in range by administration of Radiostol (3000 international units of vitamin-D per ml.). In pullets the increase in (I) vals. on a low-Ca ration was  $\gg$  when  $CaCO_3$  supplements were fed.

A. G. P.

**Brain phosphatase.** K. V. GIRI and N. C. DATTA (Biochem. J., 1936, 30, 1089—1096).—The phosphatase activity of aq. extracts of  $COMe_2$ -treated brain tissue is max. at  $p_H$  5.0 and 9.4—9.6, indicating that two distinct phosphatases are present. Their ratio is approx. const. for brains of animals of the same species. Both hydrolyse hexose diphosphate more rapidly than  $\beta$ -glycerophosphate. Purification of the enzymes may be effected by isoelectric pptn. of the inert material at  $p_H$  4.8, dialysis, ultrafiltration through Cellophane membranes, and  $COMe_2$  pptn.  $Mg^{++}$  activates the enzyme in alkaline but not in acid solution, the activation being enhanced when preps. are purified by dialysis. The rate of hydrolysis by either phosphatase is initially linear irrespective of the purity of the enzyme and presence or absence of  $Mg$ , but depends on the concn. of substrate.

W. O. K.

**Enzymes in cancer. II. Glycerophosphatases of human erythrocytes.** J. W. SCHOONOVER (Biochem. J., 1936, 30, 1097—1106).—Hæmolysates of normal and cancerous erythrocytes hydrolyse  $\alpha$  and  $\beta$ -glycerophosphate optimally at  $p_H$  5.6, the rate being about 6 times as great for  $\alpha$  as for  $\beta$ . Hydrolysis is more rapid in presence of  $Mg^{++}$ , but the effect with  $\beta$  is relatively > that with  $\alpha$  and less evident with cancerous than with normal erythrocytes. The  $\beta$ -glycerophosphatase activity of

erythrocytes is relatively const. in normal but often increased in cancerous individuals. The  $\alpha$ -glycerophosphatase activity is less const. in normals and is not significantly increased in cases of cancer.

W. O. K.

**Effects of activators, inhibitors, and destructive agents on urease.** T. BERSIN and H. KOSTER (Z. ges. Naturwiss., 1935, 1, 230—242; Chem. Zentr., 1935, ii, 2965).—Active urease (I) is a  $\cdot SH$  compound. Glutathione and  $K_2S_2O_8$  at  $p_H$  7.16 increase the activity of soya-bean preps. The latter are hydrogenated by succino-dehydrogenase. In plants the dehydrogenase regulates the activity of (I). Effects of various As and Se compounds and of  $CH_2I \cdot CO_2'$  are examined. Ascorbic acid alone has no effect on (I), but in presence of Fe is injurious.

A. G. P.

**Reaction of iodoacetate and of iodoacetamide with various thiol groups, with urease, and with yeast preparations.**—See this vol., 1074.

**Diastase determination in blood. II.** F. BALTZER (Klin. Woch., 1935, 14, 1395—1397; Chem. Zentr., 1935, ii, 2854; cf. this vol., 747).

H. N. R.

**Yeast grown in cyanide. II.** L. B. PETT (Biochem. J., 1936, 30, 1438—1445; cf. A., 1935, 1165).—Yeast cultured in the presence of  $CN'$  differed from top and bottom yeast in its respiration and fermentation properties, having a high flavin (I) content, exhibiting no Pasteur reaction or  $CN'$  inhibition. Prolonged sub-culturing in  $CN'$  media gave a yeast with no (I) but containing a blue fluorescing pigment.

H. D.

**Comparative effects of the elements on the growth of *Aspergillus niger* (stimulation and toxicity).** K. PIIRSCHLE (Planta, 1935, 24, 649—710).—The toxicity of  $Fe^{III}$ ,  $Ce^{IV}$ , and  $Hg^{II}$  salts is > that of the corresponding  $Fe^{II}$ ,  $Ce^{III}$ , and  $Hg^I$  salts, respectively. The very toxic action of  $Fe(CN)_6^{4-}$  and  $Fe(CN)_6^{3-}$  is not due to the formation of  $CN'$ .  $Ni^{II}$  exhibits greater toxicity and stimulative effects than  $Co^{II}$ . Metals of the Pt group show progressively varying effects according to their position in vertical or horizontal series. The indispensability of Mn is questioned, although its stimulative action is very marked. In general elements in anionic forms are usually more toxic than in cationic forms (exception, uranyl salts more toxic than uranates). The following relative toxicities are established:  $S_2O_4^{2-} > S^{2-} > SO_3^{2-} = S_2O_8^{2-} > SO_4^{2-}$ ;  $TeO_3^{2-} > TeO_4^{2-}$ ;  $SeO_3^{2-} > SeO_4^{2-}$ ;  $AsO_3^{3-} > AsO_4^{3-}$ ;  $SeO_4^{2-} > TeO_4^{2-} > SO_4^{2-}$ ;  $SeO_3^{2-} > TeO_3^{2-} > SO_3^{2-}$ ;  $CrO_4^{2-} > MoO_4^{2-} > SO_4^{2-}$ ;  $AsO_4^{3-} > SbO_4^{3-} > PO_4^{3-}$ . Stimulative effects are in the relative order  $Zn > Cd > Hg$ ;  $Ge > Sn > Pb$ ;  $Al > Y > La$ ;  $Si > Ti$ ;  $P > As$ ;  $P > V$ ;  $S > Se$ ;  $S > Cr$ .

A. G. P.

**Effect of zinc on the metabolism of *Aspergillus niger*.** G. M. VASSILIEV (Arch. Mikrobiol., 1935, 6, 250—275).—Zn affects the growth of *A. niger* and also its metabolism. In the latter respect Zn acts principally on the course of formation and consumption of intermediate products of sugar metabolism and of gluconic (I) and citric (II) acids. With strains producing (I), or (I) and (II), Zn decreases the production of the acids, but with (II)-producing

strains, acid accumulation is favoured. Zn affects metabolism not by direct action on the protoplasm, but indirectly as a result of its influence on vegetative growth. It does not modify the respiration of the mould. A. G. P.

**Acids and alcohols as nutrients for *Monascus*.** K. SATO and I. NAITO (J. Agric. Chem. Soc. Japan, 1935, 11, 473—479).—*M. anka* assimilated citric, fumaric, gluconic, lactic, malic, and succinic acids, but not AcOH,  $\text{H}_2\text{C}_2\text{O}_4$ , kojic or tartaric acids. Suitable acids and alcohols were as effective as glucose as C sources. CH. ABS. (p)

**Fermentation of arabinose and fucose by *Aspergillus oryzae*.** II. T. TADOKORO (J. Agric. Chem. Soc. Japan, 1935, 11, 365—369; cf. this vol., 639).—Arabinose yielded  $\text{CO}_2$ ,  $\text{HCO}_2\text{H}$  (I), citric and glycollic (II) acids with smaller amounts of  $\text{H}_2\text{C}_2\text{O}_4$  and kojic acid and glyceraldehyde. From fucose, (I), (II), and lactic acid were produced.  $\text{MeCHO}$ ,  $\text{COMe}_2$ , EtOH, and AcOH were not obtained from either sugar. CH. ABS. (p)

**Formation of *d*-fructose from mannitol by means of *Penicillia*.** A. ANGELETTI (Annali Chim. Appl., 1936, 26, 234—236).—*d*-Fructose is produced from mannitol by the action of *P. crustaceum* (L.), Fries, and *P. luteum purpurogenum* after 20 days' fermentation. L. A. O'N.

***Rhizopus*.** I. Production of *d*-lactic acid. G. E. WARD, L. B. LOCKWOOD, O. E. MAY, and H. T. HERRICK (J. Amer. Chem. Soc., 1936, 58, 1286—1288).—*R. oryzae*, *arrhizus*, and *tritici* produced 19—62% of lactic acid (I) on a medium containing glucose, nutrient salts, and  $\text{CaCO}_3$ . Some strains produced little (I). In absence of  $\text{CaCO}_3$  and with urea as N-source, *R. nigricans* (1 strain) and *chinensis* formed appreciable quantities of EtOH. H. B.

**Assimilation of nitrites by fungi.** Ia, II. K. SAKAGUCHI and Y. WANG (Bull. Agric. Chem. Soc. Japan, 1936, 12, 59—62, 63—69; cf. A., 1934, 1405).—Ia. Using  $\text{NaNO}_2$  in place of  $\text{NaNO}_3$  in the Czapek medium, the classification of black *Aspergilli* has been studied. They can be divided into three groups.

II. *A. oryzae*, *A. aureus*, and *A. batatae* (but not *A. oryzae*, Takahashi) convert  $\text{NaNO}_2$  into  $\text{NaNO}_3$ , but neither is produced from  $\text{NH}_4\text{Cl}$  by *A. oryzae*.  $\text{NaNO}_2$  is assimilated selectively by all three species in presence of  $\text{NaNO}_3$ , which is attacked only after complete utilisation of  $\text{NaNO}_2$ .  $\text{NaNO}_3$  and  $\text{NH}_4\text{Cl}$  are used up nearly at the same rate, and  $\text{NaNO}_2$  is regarded as an intermediate in the resorption of  $\text{NaNO}_3$  by moulds. A method for the determination of  $\text{NO}_2^-$  in presence of  $\text{NO}_3^-$  is described. J. N. A.

**Chemistry of growth substance B.** N. NIELSEN and V. HARTELUS (Nature, 1936, 138, 203).—The growth substance previously described (A., 1933, 638) is produced when sucrose is inverted by means of org. or inorg. acids. Glycollic (I) + pyruvic acid (II) together act as growth substances for *Aspergillus niger*, but alone have little or no effect. Glyoxylic acid (III) alone, and (III) or ascorbic acid added to (I) + (II), have a similar effect. Oxidation with

$\text{KMnO}_4$  or  $\text{H}_2\text{O}_2$  destroys the growth substances which act on yeast, but not those which act on moulds. L. S. T.

**Metabolic products of *Aspergillus terreus*.** Thom. Geodin and erdin.—See this vol., 1116.

**Ravelenin, a metabolic product of *Helminthosporium Ravenelii*, Curtis, and of *H. Turcicum*, Passerini.**—See this vol., 1121.

**Reactions of *Helvella*.** II. G. REIF (Z. Unters. Lebensm., 1936, 71, 435—442; cf. A., 1935, 1181).—The substance present in *H. esculenta* which reduces  $\text{SeO}_3$  to Se is removed from aq. alkaline solution by distillation or by extraction with  $\text{Et}_2\text{O}$  or  $\text{CHCl}_3$ . The distillate gives a violet colour with a phosphotungstic-phosphomolybdic acid reagent, and, in acid solution, with fuchsin- $\text{SO}_2$  reagent. With the exception of that from *H. crispa*, no other fungus distillate gives these reactions. The  $\text{SeO}_3$ - $\text{H}_2\text{SO}_4$  reagent may be used to differentiate aldoses and ketoses. E. C. S.

**"Tryptone" medium for detection of flat-sour spores.** O. B. WILLIAMS (Food Res., 1936, 1, 217—221).—Plate counts with a casein digest medium give better results than with other solid media or dilution methods with liquid media. Low-resistant spores are destroyed by 5 min. boiling, but resistant forms are not destroyed by 30 min. boiling. E. C. S.

**Growth-promoting activity of certain sterols on *Trichomonas columbae*.** R. CAILLEAU (Compt. rend. Soc. Biol., 1936, 122, 1027—1028).—The activity of cholesterol, modified in either the cyclic portion or the side-chain, is described. H. G. R.

**Effect of emetine on *Endamoeba histolytica* in culture.** J. H. ST. JOHN (Amer. J. Hyg., 1933, 18, 414—432).—Lethal dosages are examined in relation to lethal time. CH. ABS. (p)

**Chemotherapy of experimental trichiniasis.** D. N. GREENWOOD (J. Chemother., 1935, 12, 232—234).—Tartar emetic, acetarsone, emetine, parathormone, Ca gluconate, and viosterol were without parasitocidal action and did not increase calcification of the cyst wall or of trichinellae. CH. ABS. (p)

**Function of protohæmin in protozoa and parametotropic bacteria.** A. LWOFF (Compt. rend. Soc. Biol., 1936, 122, 1041—1042).—In presence of cytochrome-c, only 2/3 of the protohæmin is transformed into hæmin-c. H. G. R.

**Acetic bacteria produced in Formosa.** VI. S. TANAKA (J. Agric. Chem. Soc. Japan, 1935, 11, 435—455).—Organisms from fruit, sake, etc. are examined. CH. ABS. (p)

**Relation between iron and oxidase reaction. *Bacillus* occurring in mussels at the bottom of a mussel-hill of the later stone age.** R. KATSUNUMA (Z. Klin. Path. Hamatol. Japan, 1933, 2, 1).—Bacteria which could be cultivated repeatedly on an Fe-free medium are described. A slow decline occurs in oxidase activity of successive generations. CH. ABS. (p)

**Bacteriological and biochemical relationships in the *pyocyaneus-fluorescens* group.** I. Chro-

mogenic function in relation to classifications. G. E. TURFITT (Biochem. J., 1936, 30, 1323—1328).—Media are elaborated on which the *pyocyaneus-fluorescens* group of bacteria exhibit a marked constancy in pigment production, and evidence is obtained for the classification of these organisms into a single genus on the basis of their chromogenic function.

P. W. C.

Pigments of purple bacteria. I. Spirilloxanthin, a component of the pigment complex of *Spirillum rubrum*. C. B. VAN NIEL and J. H. C. SMITH (Arch. Mikrobiol., 1935, 6, 219—229).—The isolation of spirilloxanthin,  $C_{48}H_{66}O_3$ , is described. It is a purple pigment, highly unsaturated (15 double linkings), contains  $\geq$  one OH, and no free  $\cdot CO_2H$ . Other carotenoid pigments are also present in the organism.

A. G. P.

Nodule bacteria. IX. Electrical properties of the accessory substance. A. ITANO and A. MATSUURA (J. Agric. Chem. Soc. Japan, 1936, 12, 457—466; cf. this vol., 899).—Extracts of bean nodules in hot and cold  $H_2O$ , and  $EtOH$ +hot  $H_2O$ , were dialysed and compared with a yeast extract. The accessory substance was found mainly in the cathode chamber. The yeast extract was inert towards electrodialysis. There was no relation between the accessory substance and N content.

J. N. A.

Anaerobic bacteria. VI. Nature and systematic position of a new chromogenic *Clostridium*. E. MCCOY and L. S. MCCLUNG. VII. Serological relations of *Cl. acetobutylicum*, *Cl. felsineum*, and *Cl. roseum*. L. S. MCCLUNG and E. MCCOY (Arch. Mikrobiol., 1935, 6, 231—238, 239—249; cf. B., 1935, 476).—VI. The pigmentation, biochemical, and agglutination activities are recorded.

VII. Antigenic differences and relationships are examined.

A. G. P.

Effect of concentration of sorbitol on production of sorbose by the action of *Acetobacter suboxydans*. E. I. FULMER, J. W. DUNNING, J. F. GUYMON, and L. A. UNDERKOFER (J. Amer. Chem. Soc., 1936, 58, 1012—1013).—The rate of production and the final yield of sorbose (I) from sorbitol (II) and *A. suboxydans* (which is much superior to *A. xylinum*) increase with rise in the surface-vol. ratio. For a given ratio the yield of (I) is a linear function of  $\log t$  up to 80%. With concns. of (II)  $<40\%$ , rate of production is decreased by increased concn. of (II), but the final yield is little affected. Little or no action occurs with concns.  $>40\%$ .

H. B.

Paracolon group of bacteria. B. R. SANDIFORD (J. Path. Bact., 1935, 41, 77—78).—The organisms are coliform, but ferment lactose either atypically or not at all. They produce indole. Fermentation of rhamnose follows a course different from that commonly found in bacterial fermentations. Gases other than  $H_2$  and  $CO_2$  are probably produced.

CH. ABS. (p)

Growth of bacteria in media containing previously-heated ovalbumin as the source of nitrogen. E. POZERSKI (Compt. rend. Soc. Biol., 1936, 122, 909—911).—*B. coli* cannot utilise oval-

bumin (deprived of peptone and coagulated at various temp.) as a sole source of N.

H. G. R.

Hydrogen donators for *Proteus vulgaris*. D. BACH (Compt. rend. Soc. Biol., 1936, 122, 1065—1067).—Alcohols, saturated aldehydes, and some org. acids (including  $NH_2$ - and unsaturated acids), but not unsaturated aldehydes, act as donators.

H. G. R.

Development of the dehydrogenases of *Proteus vulgaris*. D. BACH (Compt. rend. Soc. Biol., 1936, 122, 1068—1070).—The dehydrogenase activity decreases with the age of the culture; this is independent of the media, but in some cases this decrease is retarded.

H. G. R.

Independence of the production of proteases and of the development of the cell of *B. prodigiosum*. W. MOYCHO (Compt. rend., 1936, 202, 2007—2009; cf., A., 1928, 1402; this vol., 245).—Cultures in buffered 1% peptone media grow best at  $p_H$  7.5. The proteolytic capacity increases with increasing acidity, allowance being made for diminished reproductive capacity, and is nil in feebly alkaline media. As  $[PO_4^{''}]$  decreases from  $N/8$  to  $N/15$ , proteolysis increases but growth diminishes.

J. L. D.

Streptococci producing a substance inhibiting growth of lactic streptococci. G. A. COX and H. R. WHITEHEAD (New Zealand J. Agric., 1936, 52, 38—43).—The irregular occurrence in milk of streptococci, originating in dung, fodder, or the udder, which produce a substance inhibiting the growth of lactic streptococci is described.

W. L. D.

Growth and metabolism of cells of *Streptococcus lactis* in sterilised milk (logarithmic phase). T. MATUSZEWSKI (Polish Agric. Forest. Ann., 1935, 34, 403—455).—Lactic acid production per cell per hr. is determined for *S. lactis* and *S. cremoris*.

CH. ABS. (p)

Nutritive medium for the preparation of tuberculin. D. A. ZUVERKALOV and A. K. SARKISOV (Ann. Inst. Pasteur, 1936, 57, 111—119).—After suitable hydrolysis a medium can be prepared from potato which will give a heavy growth of tubercle bacilli over a long period. The high buffering power maintains an optimal  $p_H$  for several months. The tuberculin prepared from potato broth produces no reaction in healthy animals, whilst the broth alone gives no reaction even in tuberculous animals and when concn. tenfold.

P. G. M.

Influence of hæmoglobin on the virulence of tubercle bacilli. H. PORGES (Wien. med. Woch., 1935, 85, 1023—1024).—Hæmoglobin was without effect.

A. G. P.

Spontaneous protein flocculation in old, acidified cultures of human *B. tuberculosis* in Sauton's medium and its acceleration by heat. F. VAN DEINSE (Compt. rend. Soc. Biol., 1936, 122, 1019—1020).—The pptn. occurs after 40 days at a  $p_H$   $\geq 6.6$ . The ppt. firmly adsorbs tuberculin and may be redissolved in dil. alkali. It is also irregularly observed in bovine but never in avian cultures.

H. G. R.

Action of poppy-seed oil, with and without added cholesterol, on staphylococcus toxin.

J. SCHWARTZ (Compt. rend. Soc. Biol., 1936, **122**, 1006—1009).—The neutralising action of the oil is not observed when the former contains 3% of added cholesterol.

H. G. R.

**Bactericidal action of ethylapoquinine and ethylhydrocupreine on type strains of pneumococci. I. *In vitro*.** S. MATSUDA (Japan. J. Med. Sci., IV; Proc., 1933, **7**, 45—47).—Ethylapoquinine hydrochloride (I) inhibits types I, II, and III pneumococci in concns. of 1 in 2 million; optoquin (II) requires 1 in 512,000. As a bactericide (I) is 2—8 times as potent as (II). Type III pneumococcus was much more susceptible than type I or II.

CH. ABS. (p)

**Changes produced in spirochaetes of relapsing fever by action of pharmacological reagents. III. Effect of pyridine and its alkyl derivatives.** K. HOSHINA (Luea, Bull. Soc. Jap. Syphiligraph. Kyoto, **7**, 129—136).—The toxicity of 2-methyl-, 2:6- and 2:4-dimethyl-, and 1:4:6-trimethylpyridine increased with increasing length of the side-chain. Low concns. of the first three named caused an increase in mobility, the effect decreasing in the order given.

CH. ABS. (p)

**Inhibitory power of the neutral sulphate of 8-hydroxyquinoline ("sunoxol") on tubercle bacilli in different media, particularly in homogeneous cultures.** P. COURMONT, A. MOREL, L. PERROT, and F. DENARD (Compt. rend. Soc. Biol., 1936, **122**, 1110—1113).—The sulphate is a powerful antiseptic for the bacillus.

H. G. R.

**Inhibitory power of two derivatives of 8-hydroxy-6-methylquinoline on pathogenic bacteria.** A. MOREL, A. ROCHAIX, L. PERROT, and M. Moutou (Compt. rend. Soc. Biol., 1936, **122**, 1113—1114).—The hydrochloride is a powerful antiseptic, comparable with "sunoxol" (cf. preceding abstract), the action being only slightly affected by methylation of the Ph nucleus whereas it is markedly decreased by sulphonation.

H. G. R.

**Inhibitory power of derivatives of 8-hydroxyquinoline on pathogenic bacteria.** A. MOREL, A. ROCHAIX, L. PERROT, and A. PEGON (Compt. rend. Soc. Biol., 1936, **122**, 1115—1116).—The salicylate and sulphosalicylate are only slightly less antiseptic than "sunoxol" (I) (cf. preceding abstract) but are less caustic. The bacterial val. is decreased by sulphonation, but not to the same extent as with (I).

H. G. R.

**Action of ultra-violet light on bacteria.** G. DREYER and M. L. CAMPBELL-RENTON (Proc. Roy. Soc., 1936, B, **120**, 447—472).—The lethal effect of ultra-violet radiation on the 26 species and strains of bacteria tested is greatest for  $\lambda$  2655, and  $2536 > 2804 > 2482 > 2700$ . The bactericidal effect is not  $\propto$  the relative energies of these  $\lambda$ . The shape of the growth-exposure curve varies for different bacteria and between the strains of some bacteria, including some which are serologically alike. Sensitisation by erythrosin markedly increases the sensitivity to long  $\lambda$ ; the effect with shorter  $\lambda$  varies widely. Gram-positive organisms show a much greater sensitivity to long  $\lambda$  than do Gram-negative. The curves

of sensitivity to various dilutions of disinfectants differ from each other and from the corresponding ultra-violet sensitivity curves. In the greater dilutions growth stimulation is observed.

F. A. A.

**Cholesterol and the lytic power of bacteriophage.** B. S. LEVIN and I. LOMINSKI (Compt. rend. Soc. Biol., 1936, **122**, 1063—1065).—The conc. bacteriophage is inhibited by large amounts of cholesterol (I), but when diluted is inhibited by a high and enhanced by a low concn. of (I).

H. G. R.

**Inactivation of crystalline tobacco-mosaic virus protein.** W. M. STANLEY (Science, 1936, **83**, 626—627).—Treatment of the active cryst. protein (A., 1935, 1181) with  $H_2O_2$ ,  $CH_3O$ ,  $HNO_2$ , or ultra-violet light produces inactive native proteins which, although slightly altered, retain certain chemical and serological properties characteristic of the virus protein. The inactive proteins do not produce the mosaic disease, or a protein of high mol. wt. on inoculation into Turkish tobacco plants, or local lesions in *Nicotiana glutinosa*, L.

L. S. T.

**Protective action of rabbit serum for vaccinia virus at high temperatures.** E. W. GOODPASTURE and G. J. BUDDINGH (Science, 1936, **84**, 66—67).—Normal inactivated rabbit serum maintains the viability of vaccinia virus at 37° for longer times than do 50% glycerol, gum acacia, 3% mucin in saline, and sterile egg yolk.

L. S. T.

**New oestrogenic substance from ovaries.** R. H. ANDREW and F. FENGER (Science, 1936, **84**, 18—19).—Crystals, m.p. 95.1° (uncorr.), mol. wt. 320, of a substance (I), probably  $C_{20}H_{41}O_2N$ , which differs chemically and physiologically from urinary oestrogenic substances have been isolated from ovaries. 0.00001 mg. of (I) produces oestrus in rats after 96 hr.

L. S. T.

**Effect of ovarian extracts on oxygen consumption of the uterus.** M. A. KHAYYAL and C. M. SCOTT (Quart. J. Exp. Physiol., 1935, **25**, 77—83).—Fresh follicular fluid from cows contains a substance (not oestrin or luteal hormone) which increases the rate of  $O_2$  consumption of the isolated uterus of mice. The substance also occurs in human serum and is probably released from the ovary by the action of anterior pituitary hormones. Thyroxine also increases the  $O_2$  consumption.

CH. ABS. (p)

**Production *in vitro* of oestrogenic substances from organs.** P. RONDONI, V. CARMINATI, and A. CORBELLINI (Z. physiol. Chem., 1936, **241**, 71—80).—Pulped horse liver containing 5% of added cholesterol yields oestrogenic material after being left for 5—6 weeks at 38—53°.

W. McC.

**Influence of oestrin injections on the balance between the prehypophyseal gonadotropic hormones of the rat.** A. LIPSCHÜTZ (Quart. J. Exp. Physiol., 1935, **25**, 109—120).—The action of oestrin is probably due to a change in the balance between the oestrogenic and luteinising hormones, the proportion of the latter being lowered. Spermatogenesis is usually disturbed.

CH. ABS. (p)

**Testosterone, the crystalline male hormone from ox testes.** K. DAVID (Acta Brev. neerl.

Physiol., 1935, 5, 85—86; Chem. Zentr., 1935, ii, 3254; cf. A., 1933, 1933).—Testosterone forms an *acetate*, m.p. 140—141°, and an *oxime*, m.p. 221—222.5°. It is not acidic, and is saturated. The ultra-violet absorption spectrum is similar to that of cholestenone. Mild oxidation produces a diketone, m.p. 171—173°, with practically the same absorption spectrum, and probably identical with androstenedione.

R. N. C.

Characteristics of the testes hormone. K. MATSUZAKI (Japan. J. Med. Sci., IV, 7, No. 2—3; Proc. Japan. Pharmacol. Soc., 1933, 140—142).—Injection of lipin fractions into normal and castrated male rats during 10 days caused hypertrophy of sex organs.

CH. ABS. (p)

Action of the male sex hormone preparation androstin in female hypertension. H. MAYR-HOFER (Wien. med. Woch., 1935, 85, 1038).

R. N. C.

Assay of *trans*-dehydroandrosterone and its effects on male and female gonadectomised rats. V. KORENCHESKY and M. DENNISON (Biochem. J., 1936, 30, 1514—1522).—*trans*-Dehydroandrosterone (I) is a very weak sex hormone (rat unit approx.  $940 \times 10^{-6}$  g.). (I) shows some of the typical properties of the female hormones, and its restorative effect on the atrophied sexual organs of male and female gonadectomised rats is definite, but (except in the case of the preputial glands) small. The co-operative effect when injected with œstrone is only slight for males and doubtful for females. The ratio of the % increase in wt. of the prostate to that of seminal vesicles after injection of (I) is similar to that of gonadotropic hormone, but different from that observed during normal development.

J. N. A.

Biological determination of the male hormone in carp. A. BEAUNE (Bull. Sci. pharmacol., 1935, 42, 193—199; Chem. Zentr., 1935, ii, 2835).

R. N. C.

Treatment of inefficiency phenomena with male hormone. E. BRAUN (Deut. med. Woch., 1935, 61, 1482).

R. N. C.

Protective action of progesterone on the genital organs of male mice. H. BURROWS (Nature, 1936, 138, 164).—Progesterone protects the genital organs of non-castrated mice from the injurious effects of excessive dosage with œstrone.

L. S. T.

Sexual hormones and related substances.

IX. Substance having powerful action on the vesicular glands of the castrated male mouse. W. DIRSCHERL, J. KRAUS, and H. E. VOSS (Z. physiol. Chem., 1936, 241, 1—10; cf. this vol., 472).—Cryst. follicular hormone from mares' urine (and also probably stallions' but not men's urine) contains a substance (I) which on treatment with  $\text{PtO}_2 + \text{H}_2$  gives a hormone (II) having a powerful stimulating action on the vesicular glands of the castrated male mouse. The purest samples of (II) contained 1 mouse unit in 0.02 mg. and had no effect on the capon's comb. (II) (1 unit in 0.1—0.2 mg.) was also obtained without hydrogenation from wool fat and quassia bark. Other sex hormones also [e.g., equilin, equilenin, testosterone (III)] probably contain (I) and/or (II). The conversion of (I) into (II) possibly involves con-

version of  $\text{:CO}$  into  $\text{:CH}\cdot\text{OH}$  and when this change is made in (III) the effect on the glands is increased tenfold.

W. McC.

Action of follicular hormone on the thyroid of castrated women. M. BENAZZI (Boll. Soc. ital. Biol. sperim., 1932, 7, 472—476).

R. N. C.

Behaviour of calcium and potassium in the blood-serum of castrated bitches following treatment with follicular hormone. L. MANZI (Boll. Soc. ital. Biol. sperim., 1932, 7, 642—646).—Castration increases serum-K slightly without affecting Ca. Follicular hormone causes a rise of Ca, K remaining steady.

R. N. C.

Primary hypercholesterolaemia in rabbits after administration of the luteinising hormone (prolan-B). G. TEILUM (Compt. rend. Soc. Biol., 1936, 122, 981—984).—A few min. after injection, blood-cholesterol is increased by approx. 50%, returning to normal after approx. 1 hr.

H. G. R.

Relation between excretion of chloride and that of water after injection of pituitrin. K. UNNA and L. WALTERSKIRCHEN (Arch. exp. Path. Pharm., 1936, 181, 681—688; cf. Dittmar, A., 1933, 1075).—In fasting dogs with fistulae of the bladder subcutaneous and (at much lower concn.) intravenous injection of small doses of pituitrin (I) increases the urinary excretion of  $\text{Cl}'$  without appreciably increasing the vol. of urine. The min. effective doses of (I) are the same as the min. doses required to inhibit diuresis in dogs receiving much  $\text{H}_2\text{O}$  and the excretion of  $\text{Cl}'$  increases as the dose increases. Doses  $\gg$  the min. effective increase the vol. of urine, the increase depending chiefly on the  $\text{Cl}'$  excretion; small doses also increase the vol. in dogs on a diet rich in  $\text{NaCl}$ .

W. McC.

Effect of extracts of anterior lobe of the pituitary on blood-sugar after elimination of the adrenals. K. J. ANSELMINO and F. HOFFMANN (Arch. exp. Path. Pharm., 1936, 181, 674—680; cf. A., 1935, 1544).—In dogs with adrenals extirpated (or ligated) subcutaneous injection of extracts containing the pancreatropic hormone (I) produces great decrease in the blood-sugar. In the intact dog the increase is very slight because the increased secretion of insulin caused by (I) is followed by increased adrenaline output. After destruction of (I) by heat the action of the substance in the extracts which increases the blood-sugar is unaffected by removal or ligation of the adrenals.

W. McC.

Effect of the fat-metabolism hormone of the anterior pituitary on ketone excretion by rats under experimental conditions. C. SIEVERT (Z. ges. exp. Med., 1935, 96, 429—441; Chem. Zentr., 1935, ii, 3255).—Spontaneous ketonuria under the conditions of Butts, Cuttler and Deuel, Burn, or Ging is caused by fasting or administration of a pure fat diet. The fat-metabolism hormone increases ketonuria on the fat diet, but not in fasting. The hormone in the blood after overcharging with fat corresponds with the pituitary hormone in its properties.

R. N. C.

Pituitary hormones in cerebrospinal fluid. V. COLOMBI and V. PORTA (Boll. Soc. ital. Biol. sperim., 1932, 7, 1103—1105).—The cerebrospinal

fluid of normal men and pregnant women contains no gonadotropic hormones, but exerts a slight oxytocic effect on the isolated uterus of the guinea-pig, even if the animal has been hypophysectomised. The fluid causes a slight increase of blood-pressure in dogs.

R. N. C.

Secretion of an antidiuretic pituitary hormone in response to the need for renal water conservation. A. GILMAN and L. S. GOODMAN (Science, 1936, 84, 24—25).—The posterior pituitary of rats and dogs secretes an antidiuretic hormone which acts on the kidney, escaping ultimately into the urine, in which it is relatively stable. The need for H<sub>2</sub>O conservation by the body is the stimulus for secretion.

L. S. T.

Biological effects of homologous thymus implants in successive generations of rats. N. H. ENHORN and L. G. ROWNTREE (Science, 1936, 84, 23—24).—Frequent implants in albino rats accelerate the rate of growth and development of the young, similarly to daily injections of thymus extract.

L. S. T.

Effect of various hormones on the blood picture, especially on nuclear displacement according to Arneth. I. Thyroid gland. II. Effect of insulin in the correlation between thyroid and insulin. S. MORMOTO (Folia Endocrinol. Japon., 1934, 9, 105—106).—I. After feeding thyroid and in Basedow's disease the blood picture shows a "left shift," and after thyroidectomy a right shift. Thyroid hormone probably stimulates leucopoiesis in bone-marrow.

II. Injection of insulin into rabbits causes a right shift followed by a left shift in the blood picture. Leucocyte changes involved are arrested by feeding thyroid. In thyroidectomised animals leucocyte changes are slow.

CH. ABS. (p)

Effect of the blood-serum of rabbits, in which the thyroid function has been experimentally disturbed, on tissue respiration. K. MUNE (Folia Endocrinol. Japon., 1934, 9, 102—103).—The O<sub>2</sub> consumption of rat muscle is > normal when suspended in serum of hyperthyroidised rabbits, and < normal when in serum of thyroidectomised rabbits.

CH. ABS. (p)

Association and dissociation reactions of thyroglobulin. H. P. LUNDGREN (Nature, 1936, 138, 122).—Previous work (A., 1935, 1522) has been confirmed. Conditions which favour dissociation are low concn. of thyroglobulin (I), low salt concn., high temp.,  $\epsilon$ , and  $p_H$ . Under appropriate conditions, (I) dissociates or associates at slow, measurable rates into components of lower or higher mol. wt. having well-defined sedimentation boundaries. These rates are too slow under the conditions existing in the living cell for these factors alone to account for the mechanism of (I) economy in the body.

L. S. T.

Relations between parathyroid hormone and vitamin-D. M. COPPO and P. FRUGONI (Boll. Soc. ital. Biol. sperim., 1934, 9, 148—151).—Growth of rats is diminished by excess and prevented by absence of vitamin-D; parathormone (I) causes loss of wt. in both cases. The ash content of the body is diminished, but its Ca and P contents are increased and the Ca/P

ratio is diminished in all cases, the increase and diminution being less if (I) is given. -D and (I) do not appear to exhibit antagonism in thyro-parathyroidectomised animals.

R. N. C.

Effect of parathyroid hormone on serum-calcium and calcium excretion of normal and adrenalectomised rats. L. I. PUGSLEY and J. B. COLLIP (Biochem. J., 1936, 30, 1274—1279).—A possible relationship between the adrenal and parathyroid glands is investigated. Adrenalectomised rats show a greater increase in serum- and urinary Ca following injection of parathyroid hormone (I) than do normal rats. With adequate Ca-containing diets, continued injection of (I) produces decreasing responses until the serum- and urinary Ca remain normal.

H. D.

Explanation of adrenaline action. W. J. R. CAMP and J. A. HIGGINS (Science, 1936, 83, 622).—Most of the changes effected by adrenaline are actually produced by K.

L. S. T.

Effect of adrenal capsule on the regulation of blood-sugar. I. Effect of adrenalectomy. II. Effect of removal of the cortex and of the medulla of adrenal capsules. K. YAGI (Folia Endocrinol. Japon., 1934, 9, 113—114, 114—115).—I. In adrenalectomised rabbits a single administration of sugar causes an increase in blood-sugar (I) > that produced in normal animals. The return to normal level is also accelerated. The Staub effect after two administrations of sugar was more marked in treated rabbits.

II. After cauterisation of the cortex of both adrenal capsules the Starke effect was decreased, the increase in (I) was greater, the duration of hyperglycæmia was longer, and the ability to assimilate carbohydrates < that of normal animals. Cauterisation of the medulla produced opposite effects.

CH. ABS. (p)

Effect of age and method of administration on adrenaline action. M. HASEGAWA (Japan. J. Med. Sci., IV, 7, No. 1; Proc. Japan. Pharm. Soc., 1933, 14—15).

CH. ABS. (p)

Adrenaline in the adrenal glands of dogs under low atmospheric pressures. L. BINET and J. LANXADE (Compt. rend. Soc. Biol., 1936, 122, 1011—1012).—The val. is doubled in 1 hr. at pressures equiv. to an altitude of 10,000 m.

H. G. R.

Biological assay of the adrenal cortical hormone by the survival of young [adrenalectomised] rats. P. SCHULTZER (Compt. rend. Soc. Biol., 1936, 122, 978—981; cf. A., 1935, 1421).

H. G. R.

Action of thyroid hormone on cells grown *in vitro*. J. VERNE and D. ODIETTE (Compt. rend. Soc. Biol., 1936, 122, 988—990).—Plasma after injections of thyroxine at first augments and, after repeated injections, retards the growth of *in-vitro* cultures of fibroblasts of chick embryo.

H. G. R.

Isolation of a hypoglycæmic principle in the jejunal mucosa. F. RATHERY, A. CHOAY, and P. DE TRAVERSE (Compt. rend., 1936, 202, 1949—1950).—An aq. EtOH extract of the jejunal mucosa of the ox contains a substance, 10—20 mg. of which lowers the blood-sugar of a rabbit and may produce convulsions.

J. L. D.

**Standardisation of insulin.** J. ŠTEFL (Arch. exp. Path. Pharm., 1936, 181, 617—624).—The method is based on determination of the amount of the material containing insulin required to produce hypoglycaemic convulsions in rabbits. Abs. specificity is attained by taking account only of convulsions which are arrested by injection of glucose. The average experimental error is  $\pm 20\%$ . W. McC.

**Changes in the glutathione content of the blood after insulin treatment.** L. LIACI (Biochim. Terap. sperim., 1933, 20, 329—332; Chem. Zentr., 1935, ii, 2837).—Blood-glutathione is increased.

R. N. C.

**Action of insulin in pregnancy.** E. SAPEGNO (Boll. Soc. ital. Biol. sperim., 1932, 7, 690—691).—The action of insulin in pregnant rabbits is the same as in normal animals, but the effect of the hypoglycaemia on body-temp. is more marked.

R. N. C.

**Insulin and experimental beri-beri in the pigeon.** A. BAGLIONI and V. CONSOLE (Boll. Soc. ital. Biol. sperim., 1934, 9, 153—155).—Insulin (I) lowers the beri-beri quotient in vitamin-B-deficient pigeons to an extent  $\propto$  the quantity of (I) injected, and retards the appearance of the beri-beri symptoms. The effect is not due to anti-beri-beri action of (I), which appears to antagonise -B.

R. N. C.

**Absorption spectra as an aid to vitamin research.** H. RUDY (Naturwiss., 1936, 24, 499—505).—A review.

**Photochemical decomposition of vitamin-A in alcoholic solution. I. Primary reactions.** A. CHEVALIER and P. DUBOULOZ (Bull. Soc. Chim. biol., 1936, 18, 703—722).—Vitamin-A in slightly acid EtOH solution is decomposed by light of  $\lambda$  3650 Å. giving two substances in const. proportion characterised by their absorption spectra and solubility, the quantum yield being  $1/28$ . From the kinetics of the decomp. a method for the determination of -A in blood is proposed. Irradiation of -A in alkaline EtOH solution does not cause the same decomp. A. L.

**Primary, secondary, and non-specific effects of experimental A-avitaminosis in rats.** T. H. DE RUYTER and O. ROSENTHAL (Z. Vitaminforsch., 1936, 5, 169—185).—Primary effects include atrophy and metaplasia of epithelial tissue and atrophy of the lymphatic system, secondary are cessation of growth, loss of appetite, and susceptibility and lowered resistance to infection, whilst indirectly secondary are anaemia and changes in fat metabolism.

F. O. H.

**Action of vitamin-containing ointments on the healing of wounds.** H. J. LAUBER and H. ROCHOLL (Klin. Woch., 1935, 14, 1143—1146).—Vitamin-A added to cholesterol ointments accelerates the healing effect in small and medium doses, but slightly restrains it in large doses.

R. N. C.

**Determination of vitamin-A.** J. F. WARD and T. M. HAINES (Nature, 1936, 138, 128; cf. this vol. 646).

L. S. T.

**Structure of vitamin-B<sub>1</sub>.** R. R. WILLIAMS (J. Amer. Chem. Soc., 1936, 58, 1063—1064).—Cleavage of vitamin-B<sub>1</sub> (I) with liquid NH<sub>3</sub> gives a base,

C<sub>8</sub>H<sub>10</sub>N<sub>3</sub>, the absorption of which resembles that of a 6-amino-5-alkylpyrimidine. The aminosulphonic acid (A., 1935, 1035) and Na in liquid NH<sub>3</sub> afford a little 6-amino-2:5-dimethylpyrimidine. The hydroxy-sulphonic acid (*loc. cit.*) is 6-hydroxy-2-methyl-5-sulphomethylpyrimidine. The compound, C<sub>7</sub>H<sub>11</sub>O<sub>5</sub>N<sub>3</sub>, of Windaus *et al.* (A., 1934, 1415) is probably 6-hydroxy-5-ethoxymethylpyrimidine nitrate. The following structure is now assigned (*cf.* A., 1935, 504) to (I).

H. B.

**Role of adenylic acid in vitamin-B<sub>1</sub> deficiency.** T. W. BIRCH and L. W. MAPSON (Nature, 1936, 138, 27—28).—Adenosine, or adenylic acid (I) from muscle or yeast, increases the bradycardia present in rats deficient in vitamin-B<sub>1</sub>. The -B<sub>1</sub>-deficient animals are unable to render these compounds innocuous at the same rate as does the normal animal. The deaminase activity of -B<sub>1</sub>-deficient cardiac tissue is 20% < that of similar tissues on full diet. This failure of the deaminase mechanism may result in increased accumulation of (I) in the tissue, which is the cause of bradycardia. Other effects, *e.g.*, increased lactic acid and decreased O<sub>2</sub> consumption, obtained with -B<sub>1</sub>-deficient tissue may be due to the inhibition by (I) of oxidative mechanisms which are responsible for the removal of these metabolites.

L. S. T.

**Determination of reduced ascorbic acid in blood-serum and plasma.** F. H. L. TAYLOR, D. CHASE, and J. M. FAULKNER (Biochem. J., 1936, 30, 1119—1125).—Reduced ascorbic acid (I) is determined in 2 c.c. of serum or plasma by pptg. the proteins with tungstic acid and titrating the filtrate with 2:6-dichlorophenol-indophenol. For accuracy it is necessary to dissolve and reppt. the proteins several times. In 33 normal human sera, (I) varied from 0.83 to 2.43 (average 1.61), whilst in 10 scorbutics, the max. val. was 0.55 mg. per 100 c.c. W. O. K.

**Determination of ascorbic acid.** A. EMMERIE and M. VAN EEKELEN (Z. physiol. Chem., 1936, 241, 134).—Wachholder *et al.* (this vol., 766) have overlooked the procedure of the authors (*ibid.*, 255).

W. McC.

**Determination of vitamin-C by Bezssonoff's method.** N. BEZSSONOFF and E. STOERR (Z. Vitaminforsch., 1936, 5, 193—221).—The technique of the use of monomethylphosphotungstic acid in determining vitamin-C in urine, blood, cerebrospinal fluid, milk, adrenal gland, liver, and vegetable tissues is described (*cf.* A., 1935, 670).

F. O. H.

**Vitamin-C content of the ocular fluids and tissues with particular reference to the aqueous humour and the crystalline lens.** G. BIETTI and A. CARTENI (Boll. Soc. ital. Biol. sperim., 1934, 9, 283—286).—Analytical vals. are given for the aq. humour and cryst. lens of the ox, sheep, rabbit, and dog. Ascorbic acid is present in other ocular tissues. The content depends on age and the nutritional state.

R. N. C.

**Variations in the ascorbic acid content of the ovaries, particularly in the corpus luteum.** A.

GIROUD, I. CESA, R. RATSIMAMANGA, and M. RABINOWICZ (Compt. rend. Soc. Biol., 1936, **122**, 899—901).—Ascorbic acid in the corpus luteum increases during the period of formation and decreases during degeneration. H. G. R.

**Alleged formation of vitamin-C from mannose by liver-pulp.** R. AMMON and G. GRAVE (Z. Vitaminforsch., 1936, **5**, 185—192).—The claim of Guha and Ghosh (A., 1935, 131) that vitamin-C is formed from mannose added to rat's liver-pulp at 38° could not be confirmed. Addition of cysteine produces an increase in reducing power of the tissue, but this is probably due to the experimental method.

F. O. H.

**Relations between ascorbic acid and glutathione.** F. G. HOPKINS and E. J. MORGAN (Biochem. J., 1936, **30**, 1446—1462).—The velocity of oxidation of ascorbic acid (I) by hexoxidase (II)  $\propto$  concn. of (II), varies with  $p_H$ , and is const. with time. Glutathione (III) alone is unaffected by (II) but inhibits the oxidation of (I) by (II), being oxidised itself at the same rate as (I) when alone; when (III) is almost completely oxidised the oxidation of (I) begins. 0.002*M*-KCN inhibits the oxidation. The rate of oxidation of (I) is 1/5 that of reduction of the oxidised (I) anaerobically induced by adding (III) when the oxidation is complete. When a dialysed prep. of (II) is used the rate of reduction diminishes rapidly with time. At  $p_H$  7.4 (I) is rapidly autoxidised in the presence of Cu, and (III) much more slowly; when both (I) and (III) are in solution together (I) is wholly protected from oxidation although the oxidation of (III) is unchanged. At  $p_H$  6.0 neither constituent of the mixture is oxidised. Suspensions of liver-tissue from well-fed rabbits show an initial reduction of (III) followed by oxidation whilst the concn. of (I) remains approx. const. With liver from animals starved for 48 hr. oxidation of both (III) and (I) occurs immediately and rapidly; addition of a large excess of (III) inhibits the oxidation of (I).

H. D.

**Ascorbic acid and glutathione contents of immunised animals.** H. I. JUSATZ, T. BERSIN, and H. KOSTER (Klin. Woch., 1935, **14**, 1419—1420).—Blood-glutathione (I) in rabbits is depressed by immunisation with horse serum. Both (I) and ascorbic acid (II) are lowered in the adrenals of immunised animals fed on a diet poor in vitamin-C. (I) and (II) are utilised in antibody formation during immunisation.

R. N. C.

**Destruction of ascorbic acid in water.** H. C. HOV (J. Chinese Chem. Soc., 1936, **4**, 224—234).—Ordinary distilled H<sub>2</sub>O and Shanghai tap-H<sub>2</sub>O have a marked destructive effect on ascorbic acid (I). This effect is considerably reduced when the solutions are sterilised, and hence is at least partly due to certain micro-organisms, the addition of which increases the destructive effect of a sterilised solution. Certain other organisms have a stabilising effect. Aq. (I) is only slightly decomposed when heated rapidly to the b.p.

F. R. S.

**Reduction of iron by tissue extracts and by ascorbic acid, with a note on the stabilisation of ascorbic acid solutions.** W. D. McFARLANE

(Biochem. J., 1936, **30**, 1472—1478).—Reduction of tissue-Fe *in vivo* by ascorbic acid (I) involves some form of Fe-protein complex. Catalytic oxidation of (I) by Cu is inhibited by Na diethyldithiocarbamate (II), cystine, cysteine, and glutathione, and the aerobic oxidation in orange juice by 2:2'-dipyridyl (III) and (II) together; this is not affected by (II) alone and may be increased by (III).

H. G. R.

**Reversible oxidation of ascorbic acid demonstrated by assays with guinea pigs.** N. BEZSSONOFF and M. WOLOSZYN (Compt. rend. Soc. Biol., 1936, **122**, 944—946).—Biological tests confirm the modification of the properties of vitamin-C in biological media as compared with those in pure solution (cf. this vol., 255).

H. G. R.

**Oxidation of vitamin-C.** N. BEZSSONOFF and M. WOLOSZYN (Compt. rend. Soc. Biol., 1936, **122**, 941—944).—It is suggested that a hypothetical "di-ascorbic ether" is an intermediate in the oxidation of ascorbic to dehydroascorbic acid.

H. G. R.

**Effect of light on production and distribution of ascorbic acid in germinated soya-beans.** W. Y. LEE and B. E. READ (J. Chinese Chem. Soc., 1936, **4**, 208—218).—Soya beans germinated at 25° in the dark form ascorbic acid (I) in increasing amount up to the 9th—11th day when approx. 0.4 mg. per seedling is present largely in the reversibly oxidised form. Sunlight increases production of (I), and the possible correlation of these results with the development of the plant and the formation of chlorophyll is discussed.

F. R. S.

**Formation and distribution of vitamin-C in the germinating pea, *Pisum sativum*, L.** W. Y. LEE (J. Chinese Chem. Soc., 1936, **4**, 219—223).—Peas sprouted in the dark for 13 days have a max. content (0.040%) of ascorbic acid on the 8th day. The vitamin is apparently formed in the cotyledons, which have a relatively high content by the 6th day.

F. R. S.

**Role of vitamin-C in animals resistant to scurvy: effects of insulin and adrenaline.** K. M. DAOUD and M. A. S. EL AYYADI (Biochem. J., 1936, **30**, 1280—1292).—The rate of urinary excretion of vitamin-C by rats is decreased by a scorbutic diet or injection of adrenaline (I), and increased by 24 hr. starvation. The -C content of the adrenals is not affected by a scorbutic diet, 24 hr. starvation, or injection of insulin (II) or (I), whilst that of the liver is increased by injection of (II) in rats on a scorbutic diet but not by (I). The quantity of -C in the bodies of rats influences the glycogenolytic response to (I).

H. D.

**Vitamin-C requirements of the guinea-pig.** S. S. ZILVA (Biochem. J., 1936, **30**, 1419—1429).—The relationship of the intake of ascorbic acid (I) to the content in the tissues, the susceptibility to scurvy, and the urinary excretion of (I) is investigated. With scorbutic guinea-pigs (I) appeared in the tissues after injection of 5—8 mg. per day and reached a limiting concn. when 20 mg. per day were injected; increasing the dose caused excretion of (I) in the urine. The time taken for a guinea-pig to die on a scorbutic

diet was independent of the amount of (I) previously ingested. H. D.

**Allergy and vitamin-C.** A. HOCHWALD (Zentr. inn. Med., 1935, 56, 769—771; Chem. Zentr., 1935, ii, 2692).—Vitamin-C and glutathione inhibit anaphylactic but not histamine shock. R. N. C.

**Behaviour of vitamin-C in Addison's disease.** S. SRWE (Klin. Woch., 1935, 14, 1311—1313).—Vitamin storage is not increased by excessive dosage, the excess being excreted immediately in the urine. R. N. C.

**Capillary resistance. IV. Effect of vitamin-C therapy on lowered capillary resistance in patients with gastric achylia.** P. SCHULTZER and O. GRUS (Acta med. scand., 1935, 85, 563—573).—Normal resistance is re-established in certain cases. R. N. C.

**Cataract and ascorbic acid in the guinea-pig eye.** S. W. JOHNSON (Biochem. J., 1936, 30, 1430—1437).—The ascorbic acid (I) content of the aqueous humour and lens, determined both by titration and spectrographically, became zero after 9 days on a scorbutic diet; the rate of disappearance and reappearance after injection ran parallel with that in other tissues. No cataract appeared in animals devoid of (I). H. D.

**Vitamin-D in child health.** F. O. TONNEY (Amer. J. Publ. Health, 1936, 26, 665—671).—A review.

**Formation of a sulphate salt of the anti-rachitic vitamin.** A. E. SOBEL, G. GOLDSTEIN, and B. KRAMER (J. Amer. Chem. Soc., 1936, 58, 1056—1057).—Calciferol (I) and  $C_5H_5N,SO_3$  in  $C_5H_5N-C_6H_6$  give  $C_5H_5N$  calciferyl sulphate which, unlike the ergosteryl and cholesteryl salts (A., 1935, 903), is hydrolysed by aq. KOH to (I). Approx. 60% of the vitamin-D (II) present in cod-liver oil concentrates is separable by successive treatment with  $C_5H_5N,SO_3$  and aq. KOH in presence of light petroleum [which dissolves (II)]. H. B.

**Energy equivalents of vitamin-D units.** R. W. HAMAN and H. STEENBOCK (Ind. Eng. Chem. [Anal.], 1936, 8, 291—293).—Measurements of the energy absorbed when ergosterol is converted into vitamin-D shows that an international unit requires 900 ergs and a Steenbock unit 3000 ergs. Biological tests for potency give a similar ratio. S. C.

**Mode of action of vitamin-D. I. Phosphorus compounds in muscles, liver, and kidneys as influenced by different levels of vitamin-D and phosphorus in the diet.** R. NICOLAYSEN (Biochem. J., 1936, 30, 1329—1337).—In rachitic rats, the vals. for inorg. P+phosphagen of muscle and for inorg. P of liver and kidneys are < for rats on the same diet, but with addition of therapeutic amounts of vitamin-D. A similar reduction was obtained in lipin-P and protein-P in liver and kidneys of rachitic rats but not in muscle. No definite change was observed in readily or difficultly hydrolysable esters in muscles or liver or the difficultly hydrolysable esters of kidney. When P was added to the rachitic diet and the Ca content reduced, the animals remained normal and gave the same results as on the rachitic

diet+D. Addition of -D to this P-rich diet, although giving better calcified bones, did not influence the amounts of P compounds in muscle, liver, and kidney. Massive doses of -D administered for short periods to rachitic rats increased inorg. P to the normal level in muscle, liver, and kidneys and for 2 weeks resulted only in an increase of inorg. P in the kidneys up to double the normal val. P. W. C.

**Isomerides of cholesterol and experimental rickets. II. Pharmacological action of iso-cholesterol.** U. SAMMARTINO (Arch. Farm. sperim., 1936, 61, 88—96).—The failure of normal and irradiated isocholesterol to replace totally vitamin-D in the cure of rats on a rachitogenic diet is similar to that of allo- or  $\beta$ -cholesterol (cf. A., 1933, 1088). F. O. H.

**Cereals and rickets. VII. Role of inorganic phosphorus in calcification on cereal diets.** J. T. LOWE and H. STEENBOCK (Biochem. J., 1936, 30, 1126—1134).—Autolysed, germinated, immature, and HCl-treated maize are less rachitogenic than is mature maize due to the higher content of inorg. P. The inorg. P content of variously treated samples of maize varied directly with their antirachitic action and inversely with their phytin (I) content. (I) fed to rats was a poorly available source of P as compared with inorg. P or Na glycerophosphate (cf. A., 1934, 682). As acid-treated maize produced slightly better calcification than could be accounted for by its inorg. P content, it is possible that other factors still undiscovered play a part in rickets. W. O. K.

**Antirachitic action of the irradiated unsaponifiable fraction of lanoline.** M. DE CARO (Boll. Soc. ital. Biol. sperim., 1932, 7, 1097—1099; Chem. Zentr., 1935, ii, 2839).—Experiments with rats point to a definite antirachitic activity. H. N. R.

**Effect of cod- and tunny-liver oils and of irradiated ergosterol and cholesterol preparations on avian rickets.** M. J. L. DOLS (Z. Vitaminforsch., 1936, 5, 161—169).—Equiv. amounts (as measured in rat-units) of the oils or irradiated cholesterol preps. are effective in healing avian rickets, whilst 10 times this dosage of irradiated ergosterol is insufficient. Calciferol is therefore not identical with the vitamin-D in fish-liver oils, whilst the provitamin-D of impure cholesterol is not ergosterol. F. O. H.

**Antirachitic vitamin from tunny-liver oil.** H. BROCKMANN (Z. physiol. Chem., 1936, 241, 104—115).—The oil on treatment with light petroleum and MeOH followed by chromatographic adsorption on  $Al_2O_3$  using a red indicator, production of a crude 3:5-dinitrobenzoate, and repetition of the adsorption yields vitamin- $D_3$ ,  $[\alpha]_D^{25} +100^\circ$  in  $CHCl_3$ , identical with the irradiation product of 7-dehydrocholesterol.  $-D_3$  combines with maleic anhydride. W. McC.

**Antirachitic substance from tunny-liver oil.** G. A. D. HASLEWOOD and J. C. DRUMMOND (Chem. and Ind., 1936, 598—599).—Tunny-liver oil, containing no vitamin-A and 80,000 international units (I.U.) per g. of -D, gave an inactive fraction, selective absorption at 2760 A., and a strongly adsorbed fraction with antirachitic activity of  $1.5 \times 10^6$  I.U.

A specimen of oil, containing -A, 90,000 I.U. and -D, 30,000 I.U., has been converted into a mixture of allophanates, the most insol. portion having m.p. 185—195°, hydrolysed to a fraction of activity  $10\text{--}20 \times 10^6$  I.U. The substance obtained by Brockmann (preceding abstract) is probably not identical with that now described. F. R. S.

**Antirachitic activity for chicken and rat of vitamin-D from various sources.** A. BLACK and H. L. SASSAMAN (Amer. J. Pharm., 1936, 108, 237—243).—Blue fin, yellow fin, and striped tuna-liver oils contain a vitamin half as active for chicken as for rat. Oils from swordfish, halibut, mackerel, cod, and irradiated cholesterol show no difference, whilst irradiated phytosterol and unsaponifiable matter from lucerne simulate irradiated ergosterol. E. D. Y.

**Determination of vitamin-D.** H. BROCKMANN and Y. H. CHEN (Z. physiol. Chem., 1936, 244, 129—133).—Vitamin-D<sub>2</sub> and -D<sub>3</sub> are colorimetrically determined even in presence of a 5—6-fold excess of -A by means of the orange colour reaction with SbCl<sub>3</sub> in CHCl<sub>3</sub>. Vegetable oils and other sterols (except tachysterol) and sterol derivatives do not interfere unless present in very large excess. EtOH must be absent. W. McC.

**Constituents of rice embryo. II. Vitamin-E.** R. H. KIMM (J. Agric. Chem. Soc. Japan, 1935, 11, 514—523).—The unsaponifiable matter, after removal of sterols, yields on distillation an oil containing vitamin-E and a hydrocarbon, C<sub>15</sub>H<sub>16</sub>, devoid of -E activity. CH. ABS. (p)

**Vitamin-P. Flavanols as vitamins.** S. RUSZNYAK and A. SZENT-GYORGYI (Nature, 1936, 138, 27).—Vitamin-P, closely allied to -C, cures pathological fragility and permeability of the capillary walls to plasma protein. It occurs in Hungarian red pepper and lemon juice, and appears to be flavone or flavonol glucoside. L. S. T.

**Respiration of mango leaves (*Mangifera indica*).** N. K. CHATTERJI (Proc. Nat. Acad. Sci. India, 1936, 6, 149—160).—The CO<sub>2</sub>/O<sub>2</sub> relationship of young (red), mature (green), and old (yellow) leaves is examined. The O<sub>2</sub> intake exceeds the CO<sub>2</sub> output in red and green but not in yellow leaves. The apparently excessive O<sub>2</sub> intake is partly utilised during the conversion of sugars into org. acids in the leaves. In yellow leaves the low O<sub>2</sub> intake is attributed to actual liberation of O<sub>2</sub> resulting from the production of fats from sugars. A. G. P.

**Anaerobiosis in higher plants.** K. PAECH (Planta, 1935, 24, 529—551).—After short anaerobiosis and prior to the onset of irreversible injury, changes occur in the  $\eta$  and permeability of the protoplast similar to those characteristic of narcosis. There is no evidence that the changes result from the formation of an anaerobic product in the system. The EtOH/CO<sub>2</sub> ratio in the products of anaerobic metabolism is much nearer to theoretical val. than is usually supposed. Instances of an apparently large excess of CO, produced are attributed to faulty analysis. Cases of smaller excess may be due to further oxidation of a portion of the EtOH by H-

acceptors present in the cell. Anaerobic metabolism is similar to alcoholic fermentation. A. G. P.

**Effects of soil drought on photosynthesis and respiration in plants.** A. A. ZAITZEVA (Bull. Acad. Sci. U.R.S.S. [Sci. math. nat.], 1935, 19—39).—Respiration of wheat plants was reduced during wilting and remained below normal 40—48 hr. after watering. Increased photosynthesis was observed 20—40 hr. after watering. CH. ABS. (p)

**Tropical fruits. I. Development, ripening, and senescence with special reference to respiration.** C. W. WARDLAW and E. R. LEONARD. **II. Internal gas concentrations in fruit.** C. W. WARDLAW (Ann. Bot., 1936, 50, 621—653, 655—676).—I. Changes in the [O<sub>2</sub>] and [CO<sub>2</sub>] in the interior of large hollow fruits (e.g., papaw) are examined. An increase in [CO<sub>2</sub>] appears prior to the onset of the climacteric and continues steadily thereafter, without any sp. change corresponding with the peak vals. seen in "external" respiration. The post-climacteric decline in external respiration corresponds with a decrease in internal [O<sub>2</sub>] which continues until anaerobic conditions are reached. The onset of ripening is associated with a peak val. for [O<sub>2</sub>]. The later, senescent, stage probably results from failure of O<sub>2</sub> to gain access to fleshy tissue.

II. Changes in internal gas concn. resulting from modification of the external atm. are examined. The rate of respiration as determined by evolution of CO<sub>2</sub> from the external surface is not necessarily a reflexion of cellular respiration and is influenced by the CO, present in the flesh. High initial rates on removal of fruit from air to N<sub>2</sub> are due to adjustment between internal and external [CO<sub>2</sub>]. Subsequent metabolism proceeds at < normal rates. A. G. P.

**Assimilation and respiration of tropical trees of West Java.** O. STOCKER (Planta, 1935, 24, 402—445).—Effects of temp. and light intensity are examined. The quotient, max. assimilation/respiration indicates that dry matter production and H<sub>2</sub>O exchange in plants in all climates fall within certain limits. Variations among species in the same habitat are > the average variation from habitat to habitat. A. G. P.

**Do cut leaves give physiologically correct assimilation values?** P. BAUER (Planta, 1935, 24, 446—453).—Assimilation in cut leaves examined for short periods ( $\approx$  1 hr.) is the same as that in intact leaves. A. G. P.

**Transport in the cotton plant. V. Oxygen supply and the activation of diffusion.** T. G. MASON and E. PHILLIS (Ann. Bot., 1936, 50, 455—499; cf. this vol., 531).—Coating leaf petioles with wax caused an increase and subsequent decline in the carbohydrate (I) content of the lamina and increased the (I) and P in the petiole. Exclusion of O<sub>2</sub> from stems may restrict transport through them but the restriction of growth is much more marked. When the O<sub>2</sub> supply through lenticels is cut off some O<sub>2</sub> may be obtained from the transpiration current. Coating defoliated stems checked the movement of (I) and N to similar extents and that of P, K, and Mg to a smaller degree. Activation of diffusion probably

depends on a special organisation in the cytoplasm, maintained by metabolic energy, which lowers the resistance to solute movement sufficiently to permit diffusion in the sieve tube at rates comparable with those in a gas. A. G. P.

**Effect of potassium on the nitrogen economy of etiolated and green seedlings.** H. JAENICHEN (Angew. Bot., 1935, 17, 374—445).—The growth and succulence of rape, wheat, and maize seedlings increases with the K supply to a max. beyond which larger applications of K have the reverse effects. In amounts  $\gt$  optimum K increases the intake and storage of  $H_2O$ , and the influence of K on the nutrient intake and N distribution of the plants is largely attributable to the improved  $H_2O$  status of the tissues. Differences in the interpretation of analytical data expressed as % of fresh wt. and as total per leaf or plant are emphasised. A. G. P.

**Radio-physiological importance of potassium in chlorophyll-containing and -free cells.** J. STOKLASA (Strahlenther., 1935, 53, 276—295; Chem. Zentr., 1935, ii, 2833—2834).— $\beta$ - and  $\gamma$ -Rays emitted by K accelerate germination, and increase dry matter yield, by their action on the photosynthetic process. Photosynthetic assimilation of  $CO_2$  occurs only in the presence of K and for this purpose Mg cannot replace K. A. G. P.

**Seasonal variations in *Chondrus crispus*.** M. R. BUTLER (Biochem. J., 1936, 30, 1338—1344).—The ash, N, and carbohydrate contents of a series of monthly collections of this marine alga from the same locality are compared with the corresponding contents of the polysaccharide complex (I) extracted therefrom by the method already described (A., 1934, 1047). Similar variations occur in the ash contents of both the whole plant and of (I). The N present in (I) depends directly on the N content of the plants. The carbohydrate content (%) is low until March or April, then increases, and a high level extends from May to October. Carbohydrate and  $SO_4^{--}$  determinations show that an acid type of ester predominates from January to May, the normal type from May to October, whilst from October to January there appears to be a gradual return to the acid type of salt. P. W. C.

**Supply of iron to cultivated plants.** P. EHRENBURG (Z. Pflanz. Düng., 1936, 45, A, 1—95).—The causes of Fe chlorosis, and soil conditions influencing the availability of Fe, are reviewed. An extensive bibliography is given. A. G. P.

**Effect of aluminium ions on plant growth.** K. SCHARRE and W. SCHROPP (Z. Pflanz. Düng., 1936, 45, A, 83—95).—Toxicity tests with various [Al] in sand and  $H_2O$  cultures are recorded. The sensitivity of various crops was in the descending order, barley, wheat, rye, oats, maize, i.e., almost the same order as the susceptibility to  $H^+$ . In some instances small [Al $^{+++}$ ] increased the yield of oats and maize. Al caused root injury in all cases. A. G. P.

**Dependence of the [plant] "condition indicators" on salt nutrition.** Wheat. W. H. FUCHS (Planta, 1935, 24, 725—741; cf. A., 1935, 904).—The influence of  $Na^+$ ,  $K^+$ ,  $Mg^{++}$ ,  $Ca^{++}$ ,  $Cl^-$ ,  $SO_4^{--}$ , and  $NO_3^-$  in nutrient media on the osmotic pressure, conductivity,

and sugar level of the expressed sap of wheat seedlings is examined. A. G. P.

**Nutrient supply and water requirements in cereals and pasture plants.** A. H. K. PETRIE (J. Austral. Inst. Agric. Sci., 1935, 1, 77—78).—Increased N supply has no effect on the transpiration rate per unit wt. of leaf but increases the ratio of leaf to whole plant throughout most of the growing period. Reduction in transpiration ratio following increased N supply is effected by the action of N on growth. Increasing P supply lowers the transpiration per unit wt. of leaf and the leaf: total wt. ratio. The resulting decrease in respiration per unit wt. of plant is  $>$  the increase produced by the growth effect of P. CH. ABS. (p)

**Hydrogen-ion concentration and titratable acidity at different stages of fruit ripening.** N. L. PAL (Proc. Nat. Acad. Sci. India, 1936, 6, 131—135).—Data for *Lycopersicum esculentum*, *Psidium guajava*, *Citrus medica*, and *C. aurantium* at different stages of maturity are given. The [H $^+$ ] increased over the greater part of the period but declined in the final stages. The titratable acidity increased steadily throughout except in the case of *Lycopersicum*. No direct relationship was apparent between the two sets of vals. A. G. P.

**Plant growth-substances. XIX. Effect of unknown factors on the response of *Avena sativa*.** F. KÖGL, A. J. HAAGEN-SMIT, and C. J. VAN HULSEN (Z. physiol. Chem., 1936, 241, 17—33; cf. this vol., 122).—The great variations in the sensitivity of plants to auxins are not due to changes in atm. pressure, intensity of cosmic rays, electrical state of the atm., or p.d. in the plant. The unknown factors which cause the variations appear to be responsible for parallel variations in the respiration and movement of the protoplasm, whilst the nature of the illumination (red or orange light) has a definite effect. W. McC.

**Electrotropism in pollen tubes.** H. D. WULF (Planta, 1935, 24, 602—608).—Growth of pollen tubes through the tissue of the style is probably related to the movement of growth-substance in the tube under the influence of the potential gradient in the style. A. G. P.

**Plant tissue cultures from a hormone viewpoint.** J. BONNER (Proc. Nat. Acad. Sci., 1936, 22, 426—430).—Means of purification of plant hormone-containing materials and of examining their potency in bean tissue cultures are described. A. G. P.

**Endosperm growth-substance and the growth-substance of the coleoptile tip.** R. POHL (Planta, 1935, 24, 523—526).—The growth of the oat coleoptile in light and in darkness is controlled by the growth-substance (I) in the endosperm. The tip does not produce (I) but activates the reserve from the endosperm. The shorter growth of the coleoptile in light may be due to the lower activity of (I), or to smaller ability of the cells to react to (I) in daylight than in darkness. The ability of cells to stretch is not lessened in light, since they respond equally in light and darkness to (I) from urine or to  $\beta$ -indolylacetic acid paste. A. G. P.

**Influence of  $\beta$ -indolylacetic acid on leaf movement and the formation of adventitious roots in *Coleus*.** O. FISHNICH (Planta, 1935, 24, 552—583).—Application of  $\beta$ -indolylacetic acid to stems induces root initiation only from treated areas. With leaf stems and midribs response is slower and roots appear on the underside of the leaf at a distance from the point of application and later on the stem at a distance of 2—3 nodes. A. G. P.

**Light-growth response and auxin curvatures of *Avena*.** J. VAN OVERBEEK (Proc. Nat. Acad. Sci., 1936, 22, 421—425).—The rate of curvature of decapitated coleoptiles treated unilaterally with auxin-A shows a similar response to continuous exposure to light as does the growth rate of the intact seedling on illumination (base growth response). The initial light-growth response of the *Avena* coleoptile (decrease in growth rate) is comparable to the response of the *Raphanus* hypocotl. A. G. P.

**Plant growth effects of heteroauxin applied to soil and plants.** W. F. LOEWING and L. C. BAUGNESS (Science, 1936, 84, 46—47).—Addition of a dil. solution of  $\beta$ -indolylacetic acid (I) to the soil produces a transitory acceleration of growth in stock seedlings. Symptoms due to accelerated growth also appear when localised areas of the plants are treated with (I). L. S. T.

**Vitamins and growth factors in plants. Solubility of growth factors. The factor in urine.** W. H. SCHOPFER (Arch. Mikrobiol., 1935, 6, 290—308).—Small amounts of a growth-substance affecting *Phycomyces* are obtained from wheat germ by extraction with  $\text{CHCl}_3$  and from rice polishings with  $\text{C}_6\text{H}_6$ . The solubility of the active materials and of the growth factor from urine is compared and the possible identity of these factors with vitamin-B<sub>1</sub> is discussed. A. G. P.

**Presence of free sugar in green algae and its relation to photosynthesis.** I. *Codium latum*, Suringar. II. *Cladophora Wrightiana*, Harvey. S. ENDO (Sci. Rep. Tokyo Bunrika Daigaku, 1936, 2, B, 223—231, 291—295).—I. Glucose (I), non-reducing polysaccharide (II) of low mol. wt., and starch (III) are present. The variations in their levels from day to day and with difference in intensity of light indicate that (I) is the first product of photosynthesis of carbohydrate.

II. Fructose (the first product of photosynthesis) and (II), but not (III), are present. F. O. H.

**Plant nutrition. V. Carbohydrate metabolism in relation to nutrient deficiency and to age in barley leaves.** F. G. GREGORY and E. C. D. BAPTISTE (Ann. Bot., 1936, 50, 579—619; cf. this vol., 908).—In sand-cultured barley N deficiency increased the total sugar (I) content but had no consistent effect on the reducing sugars (II) of fully emerged leaves. P deficiency increased (II) but had a much smaller effect on (I). K deficiency decreased both (II) and, to a greater extent, (I). In early leaves little difference in sugar contents appeared before external symptoms of deficiency. Consistent differences in (I) level occurred only after tillering. During senescence the (I) of the earliest

leaves declined with advancing age. In later leaves the reverse change occurred at varying stages of growth. In K-deficient plants the decline in (I) with increasing age was general. The ratio sucrose/(II) was high in N-, low in K-, and intermediate in P-deficient plants. High vals. for (II) in P deficiency are related to the high ratio of amide-/NH<sub>2</sub>-N, both vals. increasing rapidly at the emergence of the fourth leaf. Changes in (I) level are discussed in relation to C assimilation, translocation, protein synthesis, respiration, and meristematic activity. A. G. P.

**Fixation and transfer of nitrogen in the soya bean with special reference to the mechanism of transfer of fixed nitrogen from bacillus to host.** G. BOND (Ann. Bot., 1936, 50, 559—578).—A large proportion (probably 80—90%) of the N fixed by nodule bacteria diffuses into the host cytoplasm and is translocated to other parts of the plant. Storage of N by the organisms is small. Fixation of N is regarded as a form of respiratory activity rather than a stage in the synthesis of bacterial protein. The decline in N-fixing activity with advancing growth of the plant may result from diminished supply of carbohydrate to the bacteria or to the accumulation of inactive organisms. A. G. P.

**Fat oxidation system in *Lupinus albus*.** F. N. CRAIG (J. Biol. Chem., 1936, 114, 727—746).—Pulverised seeds of *L. albus*, when shaken with H<sub>2</sub>O, consume O<sub>2</sub> and form CO<sub>2</sub> with a CO<sub>2</sub>/O<sub>2</sub> ratio  $\approx 0.3$ . There is a small anaerobic production of CO<sub>2</sub>. The optimum  $p_{\text{H}}$  is approx. 7 in PO<sub>4</sub>''' buffer, but no O<sub>2</sub> is used up below 4 in HCl-citrate or above 12 in NaOH-glycine buffers. Acid is produced in very small quantity during the reaction, which is due to a mixture of enzymes on the oil or fatty acid in the seed. O<sub>2</sub> consumption is inhibited by CO, urethane, and under certain conditions by KCN, but is increased by PO<sub>4</sub>''' and sometimes by KCN. Vals. of  $\mu$  in the Arrhenius equation are 11,700 between 5° and 35° when the system is saturated with oil, and 15,200 above 30°, and 3500 below 20° in absence of added oil. J. N. A.

**Mechanism of symbiotic nitrogen fixation. I. Influence of nitrogen pressure.** P. W. WILSON (J. Amer. Chem. Soc., 1936, 58, 1256—1261).—The fixation of N<sub>2</sub> by red clover (*Trifolium pratense*) in absence or presence of A and He is independent of  $p_{\text{N}_2}$ ,  $>0.1$ — $0.2$  but decreases rapidly when  $<0.1$  atm. This function of  $p_{\text{N}_2}$  is characteristic of the N-fixing process; it is not observed in plants supplied with combined N. H. B.

**Phaeophytin formation in leaf organs after temperature effects.** M. ROSEN and M. STERN (Kl. Mitt. Ver. Wasser-, Boden-, Lufthyg., 1935, 11, 47—56; Chem. Zentr., 1935, ii, 2835).—Phaeophytin (I) cannot be detected spectroscopically in heated or frozen leaves, moist and dry heat and chilling showing the same effect, but depending on the reaction of the sap. Withered and dried leaves contain no (I). R. N. C.

**Platinum-gold difference in relation to the potential of indifferent electrodes in tissue pulp of potato tubers.** H. WARTENBERG (Planta, 1935, 24, 711—724).—In certain cases the initial stage of

biological oxidation processes, viz., the transference of the oxidative power from  $O_2$  to a reversible carrier, can be followed potentiometrically by utilising the difference in  $O_2$  sensitivity of Pt and Au electrodes. The method is applied to the examination of tyrosinase activity in potato tuber by means of the  $O_2$  consumption during melanin formation. A. G. P.

**Delayed killing of maize seedlings with X-rays.** G. N. COLLINS and L. R. MAXWELL (Science, 1936, 83, 375—376).—Irradiation of dried seeds with X-ray dosages within a certain range resulted in the death of all plants in the seedling stage without impairment of germination. Higher doses completely inhibited germination. A cytological explanation of these results is discussed. L. S. T.

**Variations of the nitrogen content of the lily-of-the-valley during forcing.** R. QUETEL (Compt. rend., 1936, 202, 2096—2098).—The changes in N content during forcing with  $Et_2O$  are similar to those of the lilac (A., 1933, 758). H. D.

**Effect of acetaldehyde on the structure of the plant cell.** M. MASCRÉ (Compt. rend., 1936, 202, 2094—2096).—The modifications of the tissues of lupins, peas, and of *Allium* by exposure to acetaldehyde vapour are described. H. D.

**Isoelectric point of plant protoplasm.** G. YAMAHARA (Sci. Rep. Tokyo Bunrika Daigaku, 1936, 2, B, 209—221).—The isoelectric points (determined by cataphoresis and/or dye-fixation) of spermatia, zoospores, various parts of pollen mother cells, and of single algae have vals. between *n.* 3.0 and 4.5. F. O. H.

**Chemical composition and structure of the plant plasma.** H. KAHO (Keem. Teated, 1934, 2, 17—26; Chem. Zentr., 1935, ii, 2968).—A review. The role of lipins as dispersive agents in the plasma is emphasised. A. G. P.

**Concentration of solutes in [plant] sap and tissue and the determination of bound water.** T. G. MASON and E. PHILLIS (Ann. Bot., 1936, 50, 437—454).—Comparison of the sugar and  $Cl^-$  contents of expressed sap, of the press-residue and of whole leaves of cotton indicates the presence of bound  $H_2O$  in the tissue. The amount of sap-sol. K (and probably that of other constituents) cannot be determined by aq. extraction of oven-dried material. Approx. 25% of the total K in leaves is not dissolved in the sap. There is no evidence of absorption of sucrose or  $Cl^-$  by tissue. The concn. of these constituents in intact plants is best determined in sap expressed from frozen material. A. G. P.

**Content and alkalinity of the ash of beetroot.** H. COLIN and M. SIMON (Compt. rend., 1936, 202, 2171—2173).—The ash content of the root, stem, and leaves of dried edible and sugar beet is approx. const. (11.0—14.0%) even when grown in soil containing varying amounts of N fertiliser. The acid val. of the ash varies, that of the edible beet being the higher. F. N. W.

**Presence of maltose in the storage organs of *Lathyrus silvestris*.** A. MEUNIER (J. Pharm. Chim., 1936, [viii], 24, 9—17; cf. A., 1933, 990).—Maltose is isolated from the roots of *L. silvestris* by

pptn. with  $Ba(OH)_2$ . The content in the roots falls to a min. in December. H. D.

**Determination of small quantities of fermentable sugars [in plant materials] by carbon dioxide production.** W. O. JAMES and A. L. JAMES (New Phytol., 1936, 35, 1—10).—Determination of sugars by loss of reducing power after fermentation with yeast gave erroneous results in the case of barley embryos when the material was aerated to prevent formation of  $EtOH$ . Reducing substances (probably  $CH_3CO_2H$ ) were formed during the fermentation. Better results are obtained by measurement of  $CO_2$  evolved [ $Ba(OH)_2$  method] during fermentation with a starved yeast culture in the presence of HCN and in an atm. of  $N_2$ . A separate determination is made of  $CO_2$  evolved during autofermentation of yeast. Disaccharides are preferably hydrolysed and determined as hexose. A. G. P.

**Soya-bean proteins. II. Preparation of glycinin.** R. J. HARTMAN and L. T. CHENG (J. Chinese Chem. Soc., 1936, 4, 152—156).—Improvements in Osborne and Campbell's method (A., 1898, ii, 626) are suggested. F. R. S.

**Tryptophan and chlorophyll in the leaves of seedlings of barley mutants.** N. LOFGREN (Z. physiol. Chem., 1936, 241, 142—147).—Tryptophan (I) is determined by heating the dried material with 20% aq. NaOH at  $150^\circ$  for 2.5 hr., adding  $H_2SO_4$ , pptg. with  $HgSO_4$ , dissolving the ppt. in HCl, and reprecip. with the reagent of Folin *et al.* (A., 1927, 892) followed by photometric measurement. In the leaves of chlorophyll-defective barley mutants there is no relation between gramine (A., 1935, 1040) and (I) contents but the (I) levels are low compared with those of normal barley plants. The chlorophyll contents of various mutants appear to bear a simple relation to each other. W. McC.

**Amino-acids of plants. I. Tryptophan content of leguminous plants at different stages of growth.** A. I. VIRTANEN and T. LAINE (Biochem. J., 1936, 30, 1509—1513).—A method for determining the tryptophan (I) content of plants is described. With peas and clover, the content of (I) (as % of total N) is a max. at an early stage of growth before blooming, the level in the plants being double that in the seeds; the val. then falls rapidly until it is only slightly > that in the seeds. With peas there is a definite fall in the abs. amount of (I), but during the early stages of growth there is a remarkable rise, which possibly plays an important part in the metabolism of the young plant. The carotene and (I) contents of clover reach a max. simultaneously. J. N. A.

**Non-protein-nitrogen of pulses. II. Partitioning of the nitrogen and determination of the essential amino-acids.** K. BHAGVAT and M. SREENIVASAYA (Biochem. J., 1936, 30, 1416—1418; cf. A., 1935, 672, 1936, 913).—A discrepancy between the Van Slyke and enzyme methods of arginine (I) determination in the seeds of *Phaseolus mungo* and *Cicer arietinum* indicates the presence of a new base other than (I). H. D.

**Histochemical localisation of hordenine in barley plantules.** R. REILHES (Compt. rend. Soc. Biol., 1936, 122, 852—854).—The alkaloid is localised, together with lipid substances, in the young vacuoles of the meristematic cells.  
H. G. R.

***Strophanthus dichotomus*, D.C.** A. H. MILLARD (Pharm. J., 1936, 137, 147—148).—The seeds yield a powerful cardiac poison on extraction with 70% EtOH. Extracts are distinguished from those of other varieties of *Strophanthus* by the colour reactions with  $H_2SO_4$ , resorcinol-HCl, and PhOH-HCl.  
F. O. H.

**Alkaloid in *Vallesia dichotoma*.** V. CÁRCAMO (Bol. Soc. Quim. Peru, 1936, 2, 25—26).—A preliminary account of an alkaloid or alkaloids present in the "cuncuna," a plant indigenous to Peru.  
L. A. O'N.

**Alkaloids of *Fritillaria roulei*.**—See this vol., 1131.

**Alkaloids of *Lupinus barbiuer*.**—See this vol., 1131.

**Chemical composition of carob seed.** G. IGLESIAS (Anal. Fis. Quim., 1935, 33, 114—118).—The albumin of seeds of *Ceratonia siliqua* (cf. B., 1935, 779) from Majorca contains 77% of mannose and 23% of galactose (cf. Bourquelot *et al.*, A., 1899, i, 968). The embryo contains 6.51% of protein. The phytin, isolated by Boutwell's method (A., 1917, i, 374), contains 42.3%  $P_2O_5$  and is free from inorg. phosphates.  
F. R. G.

***Cuscuta reflexa*, Roxb. III. Constituents of the seed-oil.** R. R. AGARWAL and S. DUTT (J. Indian Chem. Soc., 1936, 13, 264—267; cf. A., 1935, 1550).—The seeds contain 0.05% of cuscutalin, a flavone, and an oil, which yields linolenic (9.92), linoleic (17.26), oleic (25.58), stearic (27.2), and palmitic acid (11.5%), and 1.8% of unsaponifiable matter, including a *phytosterol*, m.p. 134—135°,  $[\alpha]_D^{20}$  —30.9° in  $CHCl_3$  (acetate, m.p. 124—125°).  
R. S. C.

**Latex of *Brosimum galactodendron*.** J. GÓMEZ (Anal. Fis. Quim., 1935, 33, 360—363).—The latex contains 3.48% of rubber, a cryst. wax, m.p. 64—65°, and  $\alpha$ -amyrin.  
F. R. G.

**Preparation and constitution of alginic acid.**—See this vol., 1093.

**Glycosides of madder.**—See this vol., 1095.

**Almonin and its hydrolysis products.**—See this vol., 1095.

**Colouring matter of the flowers of *Lantana camara*, Linn.** J. B. LAL (Proc. Nat. Acad. Sci. India, 1936, 6, 128—130).—The flowers contain an anthocyanin and carotene. The former, isolated from the AcOH extract of flowers, yields reddish-purple *camerin hydrochloride*, m.p. 195° (sintering 180°).  
A. G. P.

**Odorous substance containing sulphur from "shoyu."** S. AKABORI and T. KANEKO (Proc. Imp. Acad. Tokyo, 1936, 12, 131).—The volatile part of "shoyu" contains OPr $\cdot$ SM $\cdot$ , isolated as the compound,  $C_4H_{10}OS, 2.5HgCl_2$ , m.p. 128—128.5°.  
J. N. A.

**Resin of *Dacrydium Colensii*.** Diterpene alcohol from *D. biforme* wood.—See this vol., 1115.

**Hu-man-chiang.** T. OKANISHI (Japan. J. Med. Sci., IV, 7, No. 1; Proc. Japan. Pharmacol. Soc., 1933, 62—63).—The toxic components of *Gelsemium elegans* are substantially the same as those recorded for *G. sempervirens*.  
CH. ABS. (p)

**Components of leaves of *Ficus carica*.**—See this vol., 1121.

**Organic nitrogen bases from pyrolysis of cotton-seed meal.**—See this vol., 1123.

**Determination of alcohol.**—See this vol., 1091.

**Determination of pentoses as furfuraldehyde in citrus fruits.** W. B. SINCLAIR and E. T. BARTHOLOMEW (Amer. J. Bot., 1935, 22, 829—842).—The bromate method gives practically theoretical results for furfuraldehyde (I) but the conversion of *d*-xylose and *l*-arabinose into (I) by the customary acid distillation method is incomplete. In the examination of citrus fruits the (I) distillate contains substances which interfere with the  $BrO_3^-$ , but not with the phloroglucinol. method of analysis. Pre-extraction with 95% EtOH and  $Et_2O$  removes the interfering materials. Data for the peel of Valencia and navel oranges and of lemons are given.  
A. G. P.

**Identification of lactose, alone or associated with glucose, in urine.** F. MORENO MARTIN and A. SEBASTIAN (Anal. Fis. Quim., 1935, 33, 931—936).—Umikoff's reaction (warming with aq.  $NH_3$  and NaOH) is proposed for the detection of lactose (I). 0.5 part per 1000 can be detected in 3 c.c. of urine whether glucose (II) is present or not. (I) is removed by warming with animal charcoal until no positive Umikoff reaction is given, (II) (or other sugars) in the filtrate being determined with Fehling's solution.  
F. R. G.

**Direct micro-titration method for blood-sugar.** B. F. MILLER and D. D. VAN SLYKE (J. Biol. Chem., 1936, 114, 583—595).—Sugar is determined in the Fujita-Iwatake blood filtrate (A., 1932, 75), after removal of Cd with  $BaCO_3$ , by addition of a large excess of  $Fe(CN)_6^{4-}$  (I) and direct titration of the reduced (I) with  $Ce(SO_4)_2$  with setopaline-C as indicator. The vals. obtained agree well with the fermentable sugar vals.  
H. D.

**Determination of saccharides.**—See this vol., 1133.

**Enzymic histochemistry. Micro-determination of alkalis in tissue.** K. LINDERSTRÖM-LANG (Compt. rend. Trav. Lab. Carlsberg, 1936, 21, 111—122).—The tissue is ashed with a mixture of  $Ba(OH)_2$ ,  $BaCO_3$ , and  $BaCl_2$ ; the ash is extracted with  $H_2O$  and the extract, which contains NaCl, KCl,  $BaCl_2$ , and traces of  $CaCl_2$  and  $MgCl_2$ , is treated with  $(NH_4)_2CO_3$  and aq.  $NH_3$  to remove Ba, Ca, and Mg. On evaporating the filtrate to dryness and igniting the residue only KCl and NaCl remain and are determined by electrometric titration of  $Cl^-$  (A., 1931, 1455). The method, applied to material containing  $<4 \times 10^{-4}$  m.-equiv., is accurate to within  $10^{-6}$  m.-equiv.  
W. O. K.

# BRITISH CHEMICAL ABSTRACTS

## A.—PURE CHEMISTRY

OCTOBER, 1936.

### General, Physical, and Inorganic Chemistry.

Energy and velocity as parameters for excitation by collision. W. HANLE and R. JUNKELMANN (Physikal. Z., 1936, 37, 593—594).—Excitation of He by collision with H and D, respectively, provides a simple method of deciding which parameter, energy or velocity, determines the intensity of excitation. The excitation function of He was determined for H and D collisions, and plotted against energy and velocity, respectively. The excitation is not a simple function of either. The excitation function of the H<sub>γ</sub> and D<sub>γ</sub> lines was also determined for He collisions. D was more strongly excited than H.

A. J. M.

Stark effect in the hydrogen isotopes. J. S. FOSTER and A. H. SNELL (Physical Rev., 1935, [ii], 47, 338).

L. S. T.

Interpretation of anomalous Stark intensities. J. S. FOSTER (Physical Rev., 1935, [ii], 47, 329—330).

L. S. T.

Predissociation and autoionisation in term series of the hydrogen (H<sub>2</sub>) spectrum. H. BEUTLER and H. O. JÜNGER (Z. Physik, 1936, 101, 285—303).—A predissociation and an autoionisation limit in the triplet system are 6048 cm.<sup>-1</sup> apart.

A. B. D. C.

Light excitation in helium by collision with potassium ions. W. MAURER (Z. Physik, 1936, 101, 323—334).—An alkali ion source that maintains a current of 0.1 m.amp. for 60 hr. under an acceleration of 1000 volts was used to study light excitation in He from 750 to 12,000 volts.

A. B. D. C.

Fine structure and hyperfine structure of doubly-ionised beryllium. S. S. BALLARD, O. E. ANDERSON, and H. E. WHITE (Physical Rev., 1935, [ii], 47, 256).—Lines arising from the transition 1s2s, <sup>3</sup>S<sub>1</sub>—1s2p, <sup>3</sup>P<sub>0,1,2</sub> are observed at 3720 Å.; the hyperfine structure is narrow.

L. S. T.

Lyman series absorbed by oxygen bands. T. TAKAMINE and T. SUGA (Sci. Papers Inst. Phys. Chem. Res. Tokyo, 1936, 29, 213—221).—A marked weakening of certain lines of the Lyman series of H was due to the presence of a small amount of O<sub>2</sub>, which has strong absorption bands in the neighbourhood of the Lyman lines L<sub>3,5,8,13</sub> (cf. Price, this vol. 1) L<sub>3</sub> may disappear entirely or undergo selective weakening

I B

Relative intensity of the neon lines 744 and 736 Å. against their higher members. T. TAKAMINE and T. SUGA (Sci. Papers Inst. Phys. Chem. Res. Tokyo, 1936, 29, 207—212; cf. this vol., 537).—Contrary to the results for pure Ne, if He containing a trace of Ne is used, λλ 744 and 736 are of only moder-

ate intensity, but the higher members are considerably more enhanced. The change in electron temp. for the mixed gases is suggested as an explanation.

N. M. B.

Stark effect of alkali metal atoms. T. Y. WU (Chinese J. Physics, 1936, 2, 15—21).—Theoretical.

O. D. S.

Electric moment of the <sup>1</sup>Σ<sub>+</sub> to O<sup>+</sup> transition in the continuum of Cl<sub>2</sub>. G. E. GIBSON and O. K. RICE (Physical Rev., 1936, [ii], 50, 380; cf. A., 1933, 991).—A correction.

N. M. B.

Spectrum of trebly ionised argon, A IV. T. L. DE BRUIN (Physica, 1936, 3, 809—814).—Term tables for A IV are given. 50 A IV lines are identified.

O. D. S.

Absorption spectrum of potassium. N. T. ZÉ and W. W. PO (Compt. rend., 1936, 203, 429—431).—Using a long column of K vapour at 500—800° a no. of new lines have been observed and are classified empirically into series.

J. W. S.

Spectrum of ionised calcium excited by shock waves. H. MURAOUR and A. MICHEL-LÉVY (Compt. rend., 1936, 203, 316—319).—The differences between the spectrum of ionised Ca in A and He excited by shock waves from the detonation of pentaerythritol tetranitrate and that obtained by burning a mixture of CaC<sub>2</sub>O<sub>4</sub> and "hexogen" are discussed (cf. this vol., 655).

C. R. H.

Nuclear spin separation of some cobalt terms. E. RASMUSSEN (Z. Physik, 1936, 102, 229—242).—The hyperfine structure of 25 lines of the Co I spectrum has been examined, and the separation factors are calc. for 22 of them. The nuclear spin, *I*, is 7/2.

A. J. M.

Continuous absorption spectrum of bromine. A. P. ACTON, R. G. AICKIN, and N. S. BAYLISS (J. Chem. Physics, 1936, 4, 474—479).—The variations with temp. of the absorption coeffs. of the continuous absorption spectrum of Br vapour between λλ 3274 and 5717 have been determined in the range 20—632°. The continuum probably consists of two overlapping continua; the stronger with its max. at λ4150 is assigned to the transition and the weaker with its max. at λ4950 is assigned to <sup>3</sup>Π<sub>0+u</sub>←<sup>1</sup>Σ<sub>g</sub><sup>+</sup>. Alternative interpretations are discussed.

J. G. A. G.

Displacement of the higher members of the principal series of rubidium by inert gases. N. T. ZÉ and C. S. YI (Compt. rend., 1936, 203, 242—243).—The principal series of Rb has been studied in presence of He (≳ 1.75 atm.), Ne (≳ 13.59 atm.), and

A ( $\approx 7.12$  atm.). He and Ne cause displacement towards shorter  $\lambda$  and A displacement towards longer  $\lambda$ . With He the displacement is a max. for the  $5S-12P$  line, whilst that with A and Ne increases continuously as higher members of the series are reached. The results accord with Fermi's theory (A., 1935, 136). J. W. S.

**Nuclear spins and magnetic moments of  $^{85}\text{Rb}$  and  $^{87}\text{Rb}$ .** S. MILLMAN and M. FOX (Physical Rev., 1936, [ii], 50, 220—225).—The at. beam method of "zero moments" was applied to measure the nuclear spins and hyperfine structure separations,  $\Delta\nu$ , of the  $^2S_{1/2}$  states of  $^{85}\text{Rb}$  and  $^{87}\text{Rb}$ . Respective vals are: spins,  $5/2$  and  $3/2$ ;  $\Delta\nu$   $0.1018$  and  $0.229 \pm 1\%$   $\text{cm}^{-1}$ ; calc. magnetic moments,  $1.44$  and  $2.92$  nuclear magnetons. The ratio of magnetic moments  $\mu_{87}/\mu_{85}$  is  $2.026 \pm 0.2\%$ . The val. of  $\Delta\nu$ , measured for Cs, was  $0.307 \text{ cm}^{-1}$  (cf. Granath, this vol., 2).

N. M. B.

**Red line of cadmium as a standard of wavelength.** C. U. JACKSON (Proc. Roy. Soc., 1936, A, 155, 407—419).—The Michelson Cd lamp under standard conditions gives a  $\lambda$  of Cd  $6438.4696$  reproducible to within  $0.0001 \text{ \AA}$ . The presence of a small pressure of air in the tube is advantageous. The new Osram Cd lamp or the Schuler lamp may also be used as a source of Cd. L. L. B.

**Discharge in tellurium vapour.** R. ROMPE (Z. Physik, 1936, 101, 214—233). A. B. D. C.

**Third spectrum of xenon.** C. J. HUMPHREYS (J. Res. Nat. Bur. Stand., 1936, 16, 639—648).—The third spectrum of Xe, due to  $\text{Xe}^{++}$ , has been studied in the region  $2200-8900 \text{ \AA}$ . The lowest states are  $^3P$ ,  $^1D$ , and  $^1S$ , with an electron configuration  $5s^25p^4$ ; the excited states are  $^4S$ ,  $^2D$ , and  $^2P$ , and are formed by the addition of an  $ns$ ,  $np$ , or  $nd$  electron to the  $5s^25p^3$  configuration. The ionisation potential is  $32.0$  volts. R. S. B.

**Spectrum of trebly ionised cerium.** R. J. LANG (Canad. J. Res., 1936, 14, A, 127—130; cf. A., 1935, 1183).—The following terms have been located:  $6S$ ,  $7S$ ,  $8S$ ,  $6P$ ,  $5D$ ,  $6D$ ,  $7D$ ,  $4F$ ,  $5F$ ,  $5G$ , and  $6G$ . 30 lines are classified. The three  $S$  terms follow a Ritz formula, and give  $296,197 \text{ cm}^{-1}$  for the abs. val. of the deepest term,  $4F_{5/2}$ . The ionisation potential of Ce IV from this term is  $36.5$  volts. A. J. M.

**Intensity distribution and total radiation of the super-high-pressure mercury discharge.** W. ELENBAAS (Physica, 1936, 3, 859—871).—The intensity distribution and total radiation of Hg discharges at pressures from  $20$  to  $200$  atm. have been measured between  $0.4$  and  $3\mu$ . O. D. S.

**Emission and absorption spectrum of mercury vapour at very high pressures (up to  $300$  atm.).** W. DE GROOT (Ingenieur [s'Gravenhage], 1935, 50, No. 24, E, 92—94; Chem. Zentr., 1935, ii, 3484).—The discharge through Hg vapour in a narrow tube shows diffuse lines, mostly displaced towards the red, an intense continuum between  $2300$  and  $12,000 \text{ \AA}$ , and a region of absorption at  $2637 \text{ \AA}$ , the breadth of which is a function of the pressure. J. S. A.

**Intensity variations of mercury molecular spectra and the origin of the bands at  $2482 \text{ \AA}$ .** T. C. CHOW and K. J. CHAO (Chinese J. Physics, 1936, 2, 22—37).—The variations with current, pressure, and addition of  $\text{N}_2$  of the  $2482$  band of Hg and of the  $3300$  and  $2345 \text{ \AA}$  bands in a high-pressure discharge tube are compared, and found to be dissimilar. It is concluded that the  $2482$  band is due to a mercury mol. ion dissociating to  $\text{Hg}'(^3P_1)$  and  $\text{Hg}^+$ . O. D. S.

**Isotope effect of ionised mercury hydride ( $\text{Hg}^+\text{H}/\text{Hg}^+\text{D}$ ).** T. HORI and J. HURUTTI (Z. Physik, 1936, 101, 279—284).—Analysis of  $\text{Hg}^+\text{H}$  and  $\text{Hg}^+\text{D}$  band spectra gives isotope effects that are accurately accounted for by mass differences alone. A. B. D. C.

**Hyperfine structure separations of some terms in the thallium II spectrum.** S. SMITH and J. CONVEY (Canad. J. Res., 1936, 14, A, 139—151).—The hyperfine structure separations of 25 terms of the Tl II spectrum have been determined. Considerable isotope displacements were found in 5 terms arising from the  $5d^26s^26p$  configuration and in the  $6p^2\ ^3P$ , and  $6p^2\ ^1D_2$  terms, all of which are configurations containing completed  $6s$  systems. The summation rules were applied to the separation factors of the  $6snd$  and  $6snf$  configurations. The greatest discrepancy occurs for the  $6s7d$  configuration, and is due to perturbation. The ratio of magnetic to mechanical moment of the nucleus,  $g(I)$ , is calc. from the separation factors. A. J. M.

**Zeeman effect of thallium I  $\lambda 5351 \text{ \AA}$ .** J. OKUBO and S. SATO (Sci. Rep. Tohoku, 1935, 25, 141—155).—The vals. obtained for the separation and intensity of the various  $s$  and  $p$  components of the green Tl line at  $5351 \text{ \AA}$ . are in close agreement with those calc. from Goudsmit and Bacher's expression. A. R. P.

**Hyperfine structure of lead III.** A. M. CROOKER (Canad. J. Res., 1936, 14, A, 115—126).—Hyperfine structures at  $\lambda 2117-5858$  in the spectrum of Pb III excited by an electrodeless discharge lead to an  $I$ -val. of  $1/2$  and a  $g(I)$  factor of  $1.2$  for  $^{207}\text{Pb}$ , confirming published results. The isotope displacements between  $^{208}\text{Pb}$  and  $^{207}\text{Pb}$  are  $0.5 \text{ cm}^{-1}$  for each  $6s$  electron (cf. A., 1933, 2). There was no definite evidence of  $^{204}\text{Pb}$ . J. G. A. G.

**Phenomenon of photo-luminescence in the upper atmosphere; excitation by sunlight of the  $6300 \text{ \AA}$ . line of oxygen.** J. CABANNES and H. GARRIGUE (Compt. rend., 1936, 203, 484—487).—The variations of intensity of the  $6300 \text{ \AA}$ . line in the night spectrum with altitude have been deduced. On one date, a max. intensity was reached at  $110 \text{ km}$ . approx. It was possible to obtain vals. up to  $1000 \text{ km}$ . on a favourable occasion. D. C. J.

**Relative luminosity in the extreme red.** C. F. GOODEVE (Proc. Roy. Soc., 1936, A, 155, 664—683).—The relative luminosity in the extreme red has been measured by the threshold method up to  $900 \text{ m}\mu$ . At this  $\lambda$  the relative luminosity is  $1.66 \times 10^{-8}$  of that at  $556 \text{ m}\mu$ . When working above  $820 \text{ m}\mu$ , it is necessary to use a double monochromator and an infra-red filter to ensure that the light seen is not

scattered light. Some of the photo-chemical conclusions to be reached from the experiments are discussed.  
L. L. B.

**Spark potential of pre-ionised glow discharges.** C. DEIMEL (Physikal. Z., 1936, 37, 610—623).—The effect of pre-ionisation (produced by a discharge behind the cathode) on the spark potential, cathode drop, and characteristics of the glow discharge in Ne, He, A, and H<sub>2</sub> was examined in the pressure range 0.5—15 mm. The normal cathode drop was considerably diminished by the pre-ionisation.  
A. J. M.

**Inert gas-mercury vapour lamps. II.** K. SIEBERTZ (Z. Physik, 1936, 101, 255—259).—The origin of spectroscopic effects previously observed (cf. A., 1934, 1280) has been investigated by Langmuir's probe method.  
A. B. D. C.

**Tungsten spark as light source for Schumann region.** R. SERVANT (Rev. Opt. théor. inst., 1935, 14, 293—294; Chem. Zentr., 1935, ii, 3548).—A condensed W spark, running in N<sub>2</sub>, may be used down to 1250 Å. where a continuum is not required.  
J. S. A.

**Relative intensities of the X-ray non-diagram lines in the K-series.** M. SAWADA (Japan. J. Physics, 1936, 11, 1—8).—The ratio of intensities of the non-diagram Al K $\alpha$  lines was measured, for the excitation range 4—16 kv., by the photographic photometric method. Results indicate that the origin of K $\alpha_3$  and K $\alpha_4$  differs from that of K $\alpha_5$  and K $\alpha_6$  lines. With Kennard's view as to origin (cf. A., 1935, 138) relative probabilities of single and double, and of single and triple, ionisation are estimated.  
N. M. B.

**Fine structure of the X-ray K absorption spectrum of nickel.** T. HAYESI (Sci. Rep. Tohoku, 1935, 25, 1—10).—The principal absorption region is divided into two parts, the absorption intensity on the long-wave side being about half that on the short-wave side. The fine structures of the K absorption spectrum of the 50:50 Ni-Cu alloy is similar to that of pure Ni.  
A. R. P.

(A) **Fine structure in the K X-ray absorption edge of gallium.** W. W. MURCH. (B) **Theoretical investigation.** R. SMOLUCHOWSKI (Physical Rev., 1936, [ii], 50, 197—201, 201—203).—(A) Investigation from the main K absorption edge towards shorter  $\lambda\lambda$  for about 250 volts for Ga foil at room temp. shows no fine structure; at  $-67^\circ$  and  $-140^\circ$  progressive extended fine structure appears with fall of temp. The  $\lambda$  of the main K absorption edge is 1192.5 Å.

(B) The fine structure of the Ga X-ray absorption edge is calc. by Kronig's theory. A method previously reported (cf. A., 1935, 812) for calculating the fine structure in complicated crystals is applied to a non-cubic crystal and good agreement with experiment is found.  
N. M. B.

**Effects of chemical composition on X-ray lines.** H. H. ROSEBERRY and J. A. BEARDEN (Physical Rev., 1936, [ii], 50, 204—208).—The effect of combination with O<sub>2</sub> on the width, index of asymmetry and separation, and ratio of peak intensities of the  $\alpha$ -

doublet for Ti, Cr, Mn, Fe, and Zn, of the K-series emission lines was studied with a double-crystal spectrometer. The width of the  $\alpha$ -lines increased 3—35% and of the  $\beta$ -lines 4—30% except for the K $\alpha_1$  line of TiO<sub>2</sub> (3% decrease) and the  $\beta$ -lines of Mn (no change). No alteration of  $\gamma$ -line widths or of  $\alpha_1 \rightarrow \alpha_2$  separations was found. Asymmetries were unaffected except for TiO<sub>2</sub>  $\alpha$ -lines and K $\alpha_1$  and  $\beta$ -lines of MnO and Mn<sub>2</sub>O<sub>4</sub>. The ratios of peak intensities of the  $\alpha$ -lines were affected by changes of width caused by composition such that the ratio of areas remained 2:1.  
N. M. B.

**Intensity of X-ray spectrum lines of heavy elements.** H. S. W. MASSEY and E. H. S. BURHOP (Proc. Camb. Phil. Soc., 1936, 32, 461—470).—Mathematical. Intensities of lines resulting from transitions between K, L, and M shells are calc. for U, Au, and Sb.  
O. D. S.

**Intensities of X-ray reflexion from Bi crystals between 25° and 530° absolute.** R. B. JACOBS and A. GOETZ (Physical Rev., 1935, [ii], 47, 257; cf. A., 1935, 16).—Integrated intensities of Mo K $\alpha$  radiation from (111) of highly-purified Bi crystals have been measured.  
L. S. T.

**L Emission and absorption spectra of rhenium (75).** (MLLE.) Y. CAUCHOIS (Compt. rend., 1936, 203, 169—171; cf. A., 1928, 1294).— $\lambda\lambda$  are recorded and classified.  
J. G. A. G.

**L Spectra of iron, cobalt, nickel, and copper.** F. C. CHALKLIN (Proc. Roy. Soc., 1936, A, 155, 366—385).—The L spectra of Fe, Co, Ni, and Cu have been studied with a plane-grating vacuum spectrograph. The vals. of the energy levels are independent of the ferromagnetic condition of the metals. Anticathodes, when heated and free from oxidation, give the same results as previous workers have obtained using cold anticathodes. The L $\alpha$  lines possess an abnormal spread on the long-wave side, which is attributed to an energy spread in the level.  
L. L. B.

**Enhancement of certain L- and M-series X-ray satellite lines by the Auger effect.** F. R. HIRSH, jun. (Physical Rev., 1936, [ii], 50, 191—197; cf. this vol., 3).—Integrated relative energies of L $\beta_1$  satellites were measured photographically, and a marked relative intensity change at at. no. 40 was found. A theoretical study of satellite enhancement for the M-series shows qual. agreement with available data.  
N. M. B.

**L $\alpha$  Satellites of the elements 68, 70, and 71.** (MLLE.) Y. CAUCHOIS (Compt. rend., 1936, 203, 398—399).—The L $\alpha$  satellites of elements of at. no. 68, 70, and 71 have been observed. The L $\alpha_1$  band is degraded towards the violet, and is complex.  
A. J. M.

**L Spectrum of radium (88).** I. H. HULUBEI (Compt. rend., 1936, 203, 399—400).—The  $\lambda\lambda$  of the strongest lines in the X-ray L spectrum of Ra are given.  
A. J. M.

**Optical L spectra of elements potassium to chromium: K X, K XI, Ca XI, Ca XII, Sc XII, Ti XIII, V XIV, and Cr XV.** B. EDLÉN and F. TYRÉN (Z. Physik, 1936, 101, 206—213).  
A. B. D. C.

**Röntgen absorption spectra.** A. SANDSTRÖM (Nov. Acta Reg. Soc. Sci. Upsal., 1935, [iv], 9, No. 11, 88 pp.; Chem. Zentr., 1935, ii, 2494).—Data for  $\lambda$  in the *L* absorption spectra of elements from Cu to Te, and the *K* absorption spectra of Mg and Al, are given. The electronic transitions involved and the significance of complex absorption edges are discussed.

J. S. A.

**Forms of the X-ray absorption edges in metals and insulators.** T. MURO (Bull. Inst. Phys. Chem. Res. Japan, 1936, 15, 444—450).—For the absorption edge or its neighbourhood the absorption coeff. must be calc. by the Wigner-Seitz-Slater approximation method.

N. M. B.

**Mass absorption coefficients of monochromatic X-rays for Cellophane, aluminium, selenium, silver, cadmium, tin, antimony, and tellurium up to 10 Å.** H. H. BIERMANN (Ann. Physik, 1936, [v], 26, 740—760; cf. A., 1930, 982).—Apparatus for the production of intense monochromatic X-rays with  $\lambda$  up to 9.87 Å. is described. The mass absorption coeffs. ( $\mu/\rho$ ) of the above substances were determined for rays of  $\lambda$  1.66—9.87 Å. The  $C\lambda^n$  law is obeyed. The *K*-jump for Al, and the *L*-jumps for the other elements examined, are given. A. J. M.

**Mass absorption coefficients of monochromatic X-rays for selenium, silver, cadmium, tellurium, gold, lead, and bismuth up to about 2 Å.** K. SCHULZ (Ann. Physik, 1936, [v], 27, 1—14).—Mass absorption coeffs.,  $\mu/\rho$ , have been measured between 0.16 and 2.3 Å. The consts. *C* and *n* in  $\mu = C\lambda^n$  are tabulated on either side of the *K* edge for Se, Ag, Cd, and Te and of the *L<sub>I</sub>*, *L<sub>II</sub>*, and *L<sub>III</sub>* edges for Au, Pb, and Bi. Results are in agreement with those of Grosskurth (A., 1934, 824).

O. D. S.

**Measurement of shape and width of the Compton lines of gaseous neon, oxygen, and nitrogen, and of solid lithium, carbon, and sodium fluoride.** H. KAPPELER (Ann. Physik, 1936, [v], 27, 129—168).

O. D. S.

**Cloud chamber study of the Compton effect.** H. R. CRANE, E. R. GAERTTNER, and J. J. TURIN (Physical Rev., 1936, [ii], 50, 302—308).—To test the photon theory of scattering in the energy range 0.5—2.6 m.e.v., an experiment using radiation from a Th source scattered by celluloid in a cloud chamber is described. Out of 10,000 photographs, 300 electron-photon combinations were found, the angular and energy relations of which indicate the validity of the theory.

N. M. B.

**Experimental proof of the photon theory.** W. BOTHE and H. MAIERLEBNITZ (Z. Physik, 1936, 102, 143—155).—The coincidences between the Compton radiation and recoil electrons produced when filtered  $\gamma$ -rays from Th-C'' pass through a Cellophane film were studied with a counter tube. The results agree well with the photon theory of the Compton effect.

A. J. M.

**Effect of an electrostatic field on rate of vaporisation.** E. HUTCHINSON (Physical Rev., 1935, [ii], 47, 328).—The rate of vaporisation is calc. on the basis of a change in the binding forces of surface atoms of Mo in presence of an electric field.

L. S. T.

**Effect of temperature, degree of thoriation, and breakdown on field currents from tungsten and thoriated tungsten.** A. J. AHEARN (Physical Rev., 1936, [ii], 50, 238—253).—Electron field currents from thoriated W, with different degrees of thoriation, were independent of temp. The characteristic field current curve was independent of the degree of thoriation of the W filament. Breakdown phenomena and effects of heat-treatment are described in detail.

N. M. B.

**Relation between electron field emission and contact electromotive force for liquid mercury.** D. H. MOORE (Physical Rev., 1936, [ii], 50, 344—347).—The relation between contact e.m.f. and the impulsive potential necessary to initiate a vac. spark was studied for a liquid Hg cathode. The magnitude and time of application of the impulsive potential were determined by a cathode-ray oscillograph. For impure Hg no definite relation was found; for carefully distilled Hg the relation between the work function and breakdown field was in qual. but not in quant. agreement with theory.

N. M. B.

**Velocity distribution of atomic electrons by the method of electron impact.** G. E. M. JAUNCEY (Physical Rev., 1936, [ii], 50, 326—327; cf. A., 1934, 1282).—Mathematical.

N. M. B.

**After-effects produced on metallic surfaces by cathode-ray bombardment or by low-pressure gas discharges.** M. HATOYAMA and M. KIMURA (Bull. Inst. Phys. Chem. Res. Japan, 1936, 15, 681—691).—No after-effects were observed when Zn, Cu, Cd, Al, Ag, and Mg were bombarded in a vac. with high-speed electrons, but in air or H<sub>2</sub> low-energy electrons (< 50 volts) were emitted spontaneously. Similar effects were observed when using the metals as anodes in a discharge.

R. S. B.

**Energy distribution of secondary electrons from niobium.** L. J. HAWORTH (Physical Rev., 1936, [ii], 50, 216—219).—Energy distribution curves were obtained, and the no. of elastically reflected electrons was studied as a function of primary energy. Results show marked similarity to those for Mo (cf. A., 1935, 1047). The lower energy vals. involved in the various phenomena in the case of Nb are in agreement with its lower at. no. and larger lattice const.

N. M. B.

**Scattering of fast electrons by helium.** A. L. HUGHES and S. S. WEST (Physical Rev., 1936, [ii], 50, 320—325).—In view of the smaller scattering predicted by wave mechanics than by classical mechanics, scattering of 2000- and 4000-volt electrons by He atoms was investigated. The scattering is due to the nuclei (elastic scattering) and to the at. electrons (inelastic scattering) independently. The scattering ratio, compared with the vals. given by the two theories, agrees with the wave-mechanical theory.

N. M. B.

**Elastic scattering of fast electrons in mercury and agreement with Mott's theory.** W. E. STEPHENS (Physical Rev., 1935, [ii], 47, 255).—Agreement over the whole angular range for 2000 volts in Hg is not good.

L. S. T.

**Elastic scattering of slow electrons from organic molecules.** S. HILL and A. H. WOODCOCK

(Proc. Roy. Soc., 1936, A, 155, 331—344).—Measurements have been made on a group of gases ( $\text{CF}_4$ ,  $\text{CCl}_4$ , and  $\text{CBr}_4$ ) the mols. of which differ in size but have approx. spherically symmetrical outer potential contours. The results are reviewed in terms of a theoretical treatment which combines the theory of Faxen and Holtsmark with the interference theory developed by Debye for the scattering of X-rays.

L. L. B.

Variation of the mobility of gaseous ions with temperature. II. Cæsium and sodium ions in helium. A. F. PEAROE (Proc. Roy. Soc., 1936, A, 155, 490—498).—A temp. range of  $410^\circ$  abs. from the b.p. of  $\text{N}_2$  upwards was used. The mobility of the Cs ion at const.  $d$  passes through a max., and a similar max. probably occurs for the Na ion at a higher temp. The results are discussed in terms of the theories of Langevin and of Hassé and Cook (A., 1931, 1107).

L. L. B.

Ionisation of mercury vapour by positive sodium ions. R. N. VARNEY and W. C. COLE (Physical Rev., 1936, [ii], 50, 261).—Using a balanced space-charge method of detection (cf. A., 1935, 556), ionisation was observed for  $\text{Na}^+$  energies  $< 88 \pm 4$  volts. A corresponding val. for  $\text{Cs}^+$  is indicated at 59 volts.

N. M. B.

Production of slow positive potassium ion rays. H. POEVERLEIN (Ann. Physik, 1936, [v], 27, 92—96).—Apparatus to produce slow  $\text{K}^+$  ion rays of high intensity and uniform velocity is described.

O. D. S.

Light excitation in helium by collisions of positive potassium ions of 2500—8000 volts. H. BUMANN (Z. Physik, 1936, 101, 1—12).—A K-ion source giving up to  $2 \times 10^{-5}$  amp. was used to obtain He and K excitation functions.

A. B. D. C.

Velocity of atoms and ions projected from a wire exploded electrically. T. FUTAGAMI (Bull. Inst. Phys. Chem. Res. Japan, 1936, 15, 711—717).—The velocity ( $v$ ) was measured by the inclination of spectral lines, and amounts, at first, to 1—2 km. per sec.  $v_{\text{ion}} > v_{\text{atom}}$  and the initial  $v \propto (\text{at. wt.})^{-1/2}$ .

R. S. B.

Negative atomic ions. H. S. W. MASSEY and R. A. SMITH (Proc. Roy. Soc., 1936, A, 155, 472—489).—Processes leading to the formation of negative at. ions (direct radiative capture, dissociation of mols. on electron impact, collision processes with heavy atoms, extraction of electrons from metals), and those leading to the neutralisation of the ions (light absorption, ionisation by electrons and by heavy particles, neutralisation by collision with metal surfaces), are discussed. The absorption and emission of light by negative ions are not completely analogous to those by neutral atoms.

L. L. B.

Existence of negative ions according to the statistical model. H. JENSEN (Z. Physik, 1936, 101, 141—163).—Ionisation potential, and diamagnetic susceptibility and its decrease on crystal formation, are calc. from a modified Fermi equation.

A. B. D. C.

Positive-ray analysis of ions from a high-frequency spark. S. L. CH'U (Physical Rev., 1936,

[ii], 50, 212—215).—Results are given for a no. of metals and minerals as spark materials. The Dempster high-frequency spark method gives strong sources of multiply charged ions in almost all cases.

N. M. B.

History of the discovery of element 87, eka-cæsium. J. C. DE WIJS (Chem. Weekblad, 1936, 33, 515—519).—A review.

S. C.

Mass of the standard litre of ammonia gas. At. wt. of nitrogen. E. MOLES and J. SANCHE (Anal. Fís. Quím., 1934, 32, 931—953).—The mass of 1 litre of  $\text{NH}_3$  at  $0^\circ$  and 760 mm. ( $L_{760}$ ) is  $0.77142 \pm 0.00003$  g., that at 380 mm., corr. to 760 mm. ( $L_{760/380}$ ), is  $0.76562 \pm 0.00005$  g., and, by extrapolation, the limiting val. when  $p \rightarrow 0$  ( $L_{\text{lim}}$ ), corr. to 760 mm., is  $0.75982$  g. Hence the at. wt. of N is  $14.008 \pm 0.001$ .

D. R. D.

Relationship between the standard densities of nitrogen, carbon monoxide, and oxygen. At. wts. of carbon and nitrogen. E. MOLES and M. T. SALAZAR (Anal. Fís. Quím., 1934, 32, 954—978; cf. preceding abstract).—For CO,  $L_{760}$  is  $1.25001 \pm 0.00001$  g.,  $L_{760/380}$  is  $1.24975 \pm 0.00001$  g., and  $L_{\text{lim}}$  is  $1.24950$  g. For  $\text{O}_2$ ,  $L_{760}$  is  $1.42895 \pm 0.00001$  g.,  $L_{760/380}$  is  $1.42831 \pm 0.00001$  g., and  $L_{\text{lim}}$  is  $1.42767$  g. For  $\text{N}_2$ ,  $L_{760}$  is  $1.24049 \pm 0.00001$  g.,  $L_{760/380}$  is  $1.25022 \pm 0.00002$  g., and  $L_{\text{lim}}$  is  $1.24995$  g. Hence, the at. wt. of C is  $12.008 \pm 0.0005$  and that of N is  $14.0083 \pm 0.0002$ .

D. R. D.

Hyperfine structure of platinum isotopes. III. Relative frequency of platinum isotopes from hyperfine structure of some Pt  $\gamma$  lines. H. KOPFERMANN and K. KREBS (Z. Physik, 1936, 101, 193—205; cf. this vol., 916).—The relative frequency of  $^{194}\text{Pt}$  :  $^{195}\text{Pt}$  :  $^{196}\text{Pt}$  :  $^{198}\text{Pt}$  is as 19 : 20 : 13 : 5.

A. B. D. C.

Hyperfine structure and isotopy. H. KOPFERMANN (Naturwiss., 1936, 24, 561—567).—A lecture.

Ionic emission of alkali metals from glass melts and data from mass-spectrometric measurements of the relative frequencies of isotopes of lithium, potassium, and rubidium. H. BONDY and V. VANICEK (Z. Physik, 1936, 101, 186—192).—Relative isotope frequencies are:  $^7\text{Li}$  :  $^6\text{Li}$  12 : 1,  $^{39}\text{K}$  :  $^{41}\text{K}$  14 : 1. The frequency of Rb isotopes depends on the origin of the Rb.

A. B. D. C.

Masses of light atoms from transmutation data. H. BETHE (Physical Rev., 1935, [ii], 47, 633—634, 795).—Stability considerations require for  $^9\text{Be}$  an at. wt.  $< 9.0124$  as compared with the mass-spectroscopic val. 9.0154. This discrepancy and other difficulties connected with  $^{11}\text{B}$  and  $^{12}\text{C}$  can be resolved only on the assumption that the ratio He : O is incorrect. This also follows from the energy balance of nuclear transformations. All stability difficulties can be solved and all energy balances made to agree if  $^4\text{He}$  is assumed to be  $3.0 \pm 0.7$  parts in  $10^4$  heavier than hitherto supposed. At. wts. derived solely from transmutation data are ( $^{16}\text{O} = 16.0000$ ):  $^{12}\text{C}$  12.0085,  $^1\text{H}$  1.00807,  $^4\text{He}$  4.0033,  $^9\text{Be}$  9.0135,  $^{10}\text{B}$  10.0146,  $^{11}\text{B}$  11.0111,  $^{12}\text{C}$  12.0037,  $^{14}\text{N}$  14.0076, etc. L. S. T.

Abundance ratio of the isotopes of lithium. A. K. BREWER (Physical Rev., 1935, [ii], 47, 571—

572).—A re-determination with a new mass spectrograph gives  ${}^7\text{Li}/{}^6\text{Li}=11.60\pm0.06$  (cf. A., 1935, 140). The abundance ratio remains const. for cryst. emitters up to near the m.p., where the lighter isotope is emitted more readily than the heavier. L. S. T.

**Mass-spectrum analysis.** (1) Mass spectrograph. (2) Existence of isobars of adjacent elements. K. T. BAINBRIDGE and E. B. JORDAN (Physical Rev., 1936, [ii], 50, 282—296).—An improved instrument giving high resolving power, sensitivity, and dispersion is described. Singly or doubly ionised Ge, Cd, In, Sn, Te, Hg, Pb, and Bi were examined, using H-free ion sources. Proof was obtained for the existence of three apparently stable isobaric pairs  ${}^{113}\text{Cd}/{}^{113}\text{In}$ ,  ${}^{115}\text{In}/{}^{115}\text{Sn}$ , and  ${}^{123}\text{Sb}/{}^{123}\text{Te}$ . Isotopes  ${}^{115}\text{Cd}$ ,  ${}^{121}\text{Sn}$ ,  ${}^{197}\text{Hg}$ , and  ${}^{209}\text{Pb}$ , which have been reported as members of isobaric pairs, cannot be present to  $>1/8$ ,  $1/60$ ,  $1/2$ , and  $1/10$ , respectively, of the amounts given by Aston. The existence of  ${}^{205}\text{Pb}$  is doubtful. Stability conditions are discussed. N. M. B.

**Isotopes of cobalt and their radioactivity.** M. B. SAMPSON, L. N. RIDENOUR, and W. BLEAKNEY (Physical Rev., 1936, [ii], 50, 382).—In order to interpret the slow-neutron absorption of Co, a mass-spectrograph examination, using a mol. beam of  $\text{CoCl}_2$  ionised by slow electrons, was made.  ${}^{57}\text{Co}$  was found as the  $\text{CoCl}^+$  ion; peaks were observed at 92 ( ${}^{57}\text{Co}/{}^{35}\text{Cl}$ ), 94 ( ${}^{57}\text{Co}/{}^{37}\text{Cl}$  and  ${}^{59}\text{Co}/{}^{35}\text{Cl}$ ), and 96 ( ${}^{59}\text{Co}/{}^{37}\text{Cl}$ ). The abundance ratio  ${}^{57}\text{Co}/{}^{59}\text{Co}$  is approx.  $1/600\pm20\%$ ; assuming packing fraction  $-9$ , the at. wt. is 58.93. A Co cylinder, bombarded for nearly a month with neutrons from a Ra-Be source, exhibited a strong activity of half-life of the order 1 year; this activity explains the large slow-neutron cross-section of Co. Short-period activity is attributed to  ${}^{58}\text{Co}$ , formed by the capture of a neutron in  ${}^{57}\text{Co}$ , and the long-period activity to  ${}^{60}\text{Co}$ . N. M. B.

**Radioactivity determined by counter tubes and ion compensation amplifier.** C. B. MADSEN (Z. physik, 1936, 101, 72—76). A. B. D. C.

**Radioactive manganese as an indicator in testing for possible equilibria between several valencies of manganese.** M. J. POLISSAR (J. Amer. Chem. Soc., 1936, 58, 1372—1376).—Observations with radioactive Mn show that no exchange occurs in the pair-systems  $\text{MnO}_4'-\text{Mn}^{++}$ ,  $\text{MnO}_4'-\text{Mn}(\text{C}_2\text{O}_4)_2'$ ,  $\text{MnO}_4'-\text{MnO}_2$ , and  $\text{MnO}_2-\text{Mn}^{++}$ , but rapid, complete exchange occurs in  $\text{Mn}(\text{C}_2\text{O}_4)_2'-\text{Mn}^{++}$ . The significance of the observations is discussed. E. S. H.

**Stopping-power of mica for  $\alpha$ -particles.** W. E. BENNETT (Proc. Roy. Soc., 1936, A, 155, 419—434).—The stopping-power of mica has been determined by (1) measuring the velocities of the  $\alpha$ -particles of Th active deposit before and after they had passed through a sheet of mica, and (2) measuring the ranges of the incident and emergent  $\alpha$ -particles in an air chamber. The results show that no permanent data can be relied on to within 2—3%. L. L. B.

**Continuous  $\beta$ -[ray] spectrum of radium-E.** M. LECOIN (Compt. rend., 1936, 203, 171—173).—The range 0— $16^6$  e.v. has been studied. The mean energy

is  $2.5\times10^5$  e.v. and the probability of emission for low energies is small. J. G. A. G.

**$\beta$ -Ray spectrum of radium-E.** P. C. HO and M. H. WANG (Chinese J. Physics, 1936, 2, 1—9).—The  $\beta$ -ray spectrum of Ra-E has been investigated by means of an automatic cloud chamber. The spectrum is found to have an end-point at 7500  $H_p$ . The average energy per disintegration is estimated as  $4.01\times10^5$  e.v. O. D. S.

**Internal conversion coefficient for  $\gamma$ -rays.** H. R. HULME, N. F. MOTT, F. OPPENHEIMER, and H. M. TAYLOR (Proc. Roy. Soc., 1936, A, 155, 315—330).—The results obtained by previous authors in the theory of the internal conversion of  $\gamma$ -rays are discussed, and compared with experiment. The results support the hypothesis that soft  $\gamma$ -rays correspond with transitions between the states of a nuclear multiplet. L. L. B.

**Probability of  $\gamma$ -ray emission.** F. BLOCH and G. GAMOW (Physical Rev., 1936, [ii], 50, 260).—For at. nuclei, the reduction, by a factor of several thousands, of the probability of dipole transitions is explained by taking into account the exchange of charge between neutrons and protons. N. M. B.

**Continuous  $\gamma$ -radiation accompanying the  $\beta$ -decay.** F. BLOCH (Physical Rev., 1936, [ii], 50, 272—278).—Mathematical. Formulæ for spectral distribution and total intensity are developed for light elements. The relative energy liberated as radiation increases with increasing total energy, and for radioactive B is about 0.6%. N. M. B.

**Geiger-Nuttall relation.** K. C. KAR (Current Sci., 1936, 5, 17).—A wave-statistical basis is reported for the above relation. D. C. J.

**Resonance capture of slow neutrons.** H. H. GOLDSMITH and F. RASETTI (Physical Rev., 1936, [ii], 50, 328—331).—The energies of neutron groups selectively activating various elements have been measured by the B absorption method. Rh (3.9 min.), Rh (44 sec.), Ag (22 sec.), In (13 sec.), In (54 min.), Ir (19 hr.), and Au (2.7 days) show resonance capture for neutrons of energies 1—5 volts. Mn (2.5 hr.), Cu (5 min.), As (26 hr.), Br (18 min.), Ag (2.3 min.), I (25 min.), and Re (20 hr.) seem to be activated only by 30—85 volt neutrons. Gd and Sm may have resonance groups within the Cd absorption region (thermal energies). N. M. B.

**Neutron absorption in aqueous solutions.** W. H. FURRY (Physical Rev., 1936, [ii], 50, 381).—Mathematical. The theory of a simplified method, using only the velocity distribution of the neutrons, is developed. N. M. B.

**Diffusion of slow neutrons in flowing water.** P. HARTECK and F. KNAUER (Naturwiss., 1936, 24, 558).—The edge effect which limits the val. of previous determinations of the diffusion of slow neutrons in flowing  $\text{H}_2\text{O}$  has been avoided by making experiments in a canal. Neutrons are carried along by  $\text{H}_2\text{O}$  flowing with a velocity of a few m. per sec. Assuming that neutrons arrive at the Rh sheet, at which their activity is measured, only by thermal diffusion, the

diffusion const. was found to be  $3.5 \times 10^4$  and the mean life  $2 \times 10^{-3}$  sec. The mean free path was 0.4 cm.

A. J. M.

**Non-elastic collision cross-sections for slow neutrons.** G. BECK and L. H. HORSLEY (Physical Rev., 1935, [ii], 47, 510).—A discussion. L. S. T.

**Magnetic scattering of neutrons.** F. BLOCH (Physical Rev., 1936, [ii], 50, 259—260).—Mathematical. A basis for several suggested experimental methods of obtaining information on the magnetic moment of the neutron is deduced. N. M. B.

**Scattering of protons in collisions with neutrons.** W. D. HARKINS, D. M. GANS, M. KAMEN, and H. W. NEWSON (Physical Rev., 1935, [ii], 47, 511—512).—Data for neutron-proton collisions in  $C_2H_4$  and in  $H_2$  are recorded. L. S. T.

**Energy of the neutrons emitted from beryllium when bombarded by deuterons.** J. R. RICHARDSON and F. N. D. KURIE (Physical Rev., 1935, [ii], 47, 253—254).—This energy has been investigated by measuring the ranges and angles of projection of He recoil atoms in a neighbouring cloud chamber. The spectrum extends from  $< 1$  mv. to 10 mv. and possibly beyond. L. S. T.

**Resonance absorption of neutrons.** C. Y. CHAO and C. Y. FU (Sci. Rep. Nat. Tsing Hua Univ., 1936, 3, 451—455).—The activity induced in Ag and I by photo-neutrons from a source surrounded by increasing thicknesses of paraffin increases to a max. at 2.5 cm. thickness and then decreases; for I, there is appreciable activity at zero thickness of paraffin. The total width of the Ag absorption band is approx.  $2 \times 10^4$  e.v. N. M. B.

**Passage of neutrons through matter.** C. H. COLLIE and J. H. E. GRIFFITHS (Proc. Roy. Soc., 1936, A, 155, 434—446).—The passage of neutrons through matter has been studied under conditions such that absorption coeffs. could be measured independently of scattering. Using Al and Si detectors, absorption cross-sections ( $1-1.4 \times 10^{-24}$  sq. cm.) were obtained which did not show a systematic increase with increasing at. no. I and Ag have a greatly enhanced probability of reacting with slow neutrons, and using these as detectors an increase in activity was found with all the elements examined except S and I. L. L. B.

**Secondary radiation emitted under the action of neutrons.** C. HAENNY (Compt. rend., 1936, 203, 173—175).—In presence of slow neutrons,  $\gamma$ -radiation ( $\times 10^6$  e.v.) is emitted by Gd (7—8), Cl (6), Cd (10), Hg (soft and  $> 15$ ), and Au. The transformations are discussed. J. G. A. G.

**Transmutation of sulphur by thorium-C'  $\alpha$ -particles.** C. J. BRASEFIELD and E. POLLARD (Physical Rev., 1936, [ii], 50, 296—301).—The protons emitted from S under bombardment by Th-C'  $\alpha$ -particles were resolved into three groups corresponding with nuclear energy changes  $-2.4 \pm 0.3$ ,  $-2.85 \pm 0.3$ , and  $-3.6 \pm 0.3$  m.e.v. The calc. mass of  $^{32}S$  is  $31.9812 \pm 0.0016$ . An excitation curve for proton emission obeys the Gamow penetration formula; from this the calc. nuclear radius of  $^{32}S$  is  $3.4 \pm 0.3 \times 10^{-13}$  cm. N. M. B.

**Metastable nuclei produced by the hard  $\gamma$ -rays from radium-B + C.** L. DEVOL (Physical Rev., 1935, [ii], 47, 325—326).—Al and Ni-walled counters enclosed in Pb glass were exposed to radiation from Ra-B + C filtered by 6.25 cm. of Pb. 10% of the discharges were apparently due to a secondary radiation associated with a decay period of the order  $1/2$  sec. L. S. T.

**Disintegration of beryllium by  $\gamma$ -rays and of boron by neutrons.** S. NISHIDA (Japan. J. Physics, 1936, 11, 9—11).—A preliminary report is given of an investigation of the reactions  $^9Be + h\nu \rightarrow ^8Be + ^1_0n$ ;  $^9Be + h\nu \rightarrow ^2_2He + ^7_3Li$ , and  $^{10}B + ^1_0n \rightarrow ^7_3Li + ^4_2He$ ;  $^{10}B + ^1_0n \rightarrow ^2_2He + ^8_4Be$  (cf. Taylor, A., 1935, 1297). N. M. B.

**$\gamma$ -Rays from the disintegration of beryllium by deuterons and protons.** H. R. CRANE, L. A. DELSASSO, W. A. FOWLER, and C. C. LAURITSEN (Physical Rev., 1935, [ii], 47, 782—783; cf. A., 1935, 1297).—The existence of the strong component at approx. 0.7 m.e.v. in the  $\gamma$ -radiation accompanying the neutrons obtained from Be bombarded by deuterons has been confirmed, and additional, but weaker,  $\gamma$ -ray lines up to 4 m.e.v. have been observed. Both neutrons and  $\gamma$ -rays probably arise from the reaction  $^9Be + D \rightarrow ^{10}B + ^1_0n + \gamma$ .  $\gamma$ -Ray lines at 2.2, 3.7, 4.8, and 6.0 m.e.v. are indicated in the energy spectra of negative electrons ejected from the cloud chamber by the  $\gamma$ -radiation from Be bombarded by protons. Assuming a stable mass for  $^9Be$ , the reaction involved appears to be  $^9Be + ^1H \rightarrow ^{10}B + \gamma$ . Referred to  $^{10}B = 10.0135$  and  $H^1 = 1.0078$ ,  $^9Be$  is  $> 9.0117$ . L. S. T.

**Energy levels of some light nuclei.** A. N. MAY and R. VAIDYANATHAN (Proc. Roy. Soc., 1936, A, 155, 519—532).—The disintegration of F, Na, and P by  $\alpha$ -particles from Ra-C has been studied by the method developed by Duncanson and Miller (A., 1934, 1184). The nuclei formed in these reactions,  $^{22}Ne$ ,  $^{26}Mg$ ,  $^{30}Si$ , and  $^{34}S$ , form a series in which each member would be obtained from the one before by the addition of an  $\alpha$ -particle, and experiment shows that this similarity in structure gives rise to a similarity in the level systems. L. L. B.

**Attempt to produce artificial radioactivity by an electron beam.** The behaviour of newly made Geiger-Müller counters. W. B. LEWIS and W. E. BURCHAM (Proc. Camb. Phil. Soc., 1936, 32, 503—505).—No radioactivity was detected in Al after bombardment with electrons at 300 kv. The activity of Geiger-Müller counters with newly cleaned surfaces is ascribed to ionisation accompanying oxidation. O. D. S.

**Short periods in artificial radioactivity.** M. E. NAHMIAS and R. F. WALLEN (Compt. rend., 1936, 203, 176—177).—Activity of Li bombarded by neutrons was not detected. A small effect was observed with B (cf. this vol., 772). J. G. A. G.

**Artificial production of radioactive elements.** A. I. ALICHANOV and A. I. ALICHANIAN (Uspechi Fiz. Nauk., 1935, 15, 281—314).—A review and discussion. CH. ABS. (e)

**Analysis of data on radioactivity induced by neutron bombardment.** C. N. WARFIELD and

A. E. RUARK (Physical Rev., 1935, [ii], 47, 700—701).—The 27 elements for which the isotope given by neutron bombardment is known are classified into three groups, viz., those activated by simple capture of a neutron, by capture of a neutron with emission of a proton, and by capture of a neutron with  $\alpha$ -emission. The rules concerning at no., the mass no., and at. no. — mass no. which then become apparent are defined. L. S. T.

Radioactivity caused by bombardment with neutrons. X. E. AMALDI, O. D'AGOSTINO, E. FERMI, B. PONTECORVO, and E. SEGRÈ (Ric. sci. Prog. tec., 1935, I, 6, 581—584; Chem. Zentr., 1935, ii, 3358).—The activity of Ag, V, and Al, induced by slow neutrons, increased as the temp. of the surrounding paraffin was lowered. Data are given for the relative ease of excitation of P, Si, Al, V, and Rh with neutrons from  $\text{CaF}_2 + \text{Rn}$ ,  $\text{Mg} + \text{Rn}$ , and  $\text{Al} + \text{Rn}$ . The production of neutrons by  $\gamma$ -rays is discussed. J. S. A.

Disintegration of beryllium, boron, and carbon by deuterons. T. W. BONNER and W. M. BRUBAKER (Physical Rev., 1936, [ii], 50, 308—314; cf. this vol., 264).—Bombardment was effected by 0.9 m.e.v. deuterons. For Be (cf. A., 1935, 1049), the energy of disintegration was  $4.25 \pm 0.2$  m.e.v.; lower energy groups due to excited  $^{10}\text{B}$  nuclei were observed, the corresponding energies being 3.7, 2.1, and 0.8 m.e.v. The reactions for B are:  $^{11}\text{B} + ^2\text{H} \rightarrow ^{12}\text{C} + n + Q_2$ ;  $^{11}\text{B} + ^2\text{H} \rightarrow ^3\text{He} + ^9\text{Be} + Q_3$ ;  $^{10}\text{B} + ^2\text{H} \rightarrow ^{12}\text{C} + n + Q_4$ , the second being the most probable, and giving rise to a group of neutrons with a continuous distribution of energies  $< 3$  m.e.v. The other disintegration energies are:  $13.5 \pm 0.3$ ,  $Q_2$   $9.1 \pm 0.2$ ,  $6.2 \pm 0.2$ ,  $Q_3$   $4.0 \pm 0.1$  m.e.v. The reactions for C are:  $^{12}\text{C} + ^2\text{H} \rightarrow n + Q_5$  and ; the former accounts for approx. 99% of the neutrons from C, and the latter for the remainder. Energies are:  $Q_5$   $-0.37 \pm 0.05$  and  $Q_6$   $5.2 \pm 0.4$  m.e.v. The calc. max. energy of the positrons from  $^{13}\text{N}$  is 1.16 m.e.v. A complete set of calc. masses of the light elements is tabulated. N. M. B.

Emission of negative electrons from boron bombarded by deuterons. H. R. CRANE, L. A. DELSASSO, W. A. FOWLER, and C. C. LAURITSEN (Physical Rev., 1935, [ii], 47, 887—888).—The  $\beta$ -ray spectrum obtained from B bombarded by deuterons is continuous with an upper energy limit of approx. 11 m.e.v. The probable reaction is  $^{11}\text{B} + \text{D} \rightarrow ^{12}\text{B} + ^1\text{H}$   $^{12}\text{C} + e^- + ^1\text{H}$ . In disintegrating,  $^{12}\text{B}$  loses an amount of mass  $\leq$  that corresponding with the upper limit of energy of the electron spectrum. L. S. T.

Emission of negative electrons from lithium and fluorine bombarded with deuterons. H. R. CRANE, L. A. DELSASSO, W. A. FOWLER, and C. C. LAURITSEN (Physical Rev., 1935, [ii], 47, 971—972).—Energy distribution curves of negative electrons emitted from targets of  $\text{LiCl}$  and  $\text{CaF}_2$  bombarded by deuterons are reproduced. The probable reactions are  $^7\text{Li} + \text{D} \rightarrow ^8\text{Li} + ^1\text{H} \rightarrow ^8\text{Be} + e^- + ^1\text{H} \rightarrow ^4\text{He} + ^4\text{He} + e^- + ^1\text{H}$  and  $^{19}\text{F} + \text{D} \rightarrow ^{20}\text{F} + ^1\text{H} \rightarrow ^{20}\text{Ne} + e^- + ^1\text{H}$ , respectively. The half-life indicated for the active

constituent in the first reaction is  $0.5 \pm 0.1$  sec., and that for radio-F is  $12 \pm 2$  sec. L. S. T.

Chemical identification of the radioactive element produced from carbon by deuteron bombardment. L. N. RIDENOUR, D. M. YOST, and K. SHINOHARA (Physical Rev., 1935, [ii], 47, 253; cf. A., 1935, 559). L. S. T.

Barometer effect of ultra-radiation collisions. W. MESSERSCHMIDT (Physikal. Z., 1936, 37, 557).—The barometer effect is to be explained by the variation of  $\text{H}_2\text{O}$  content of the atm. An experiment is described to show the effect of  $\text{H}_2\text{O}$  on the no. of ultra-radiation collisions. A. J. M.

Heavy particle component of the cosmic radiation. R. B. BRODE, H. G. MACPHERSON, and M. A. STARR (Physical Rev., 1936, [ii], 50, 383).—A study of 8500 photographs of a Wilson cloud-chamber indicates that about 1% of the ionisation produced by cosmic rays at sea level is due directly to heavy particles; these may be  $\alpha$ -particles or protons, probably the latter. N. M. B.

Measurements of the angular distribution of cosmic-ray intensities in the stratosphere with Geiger-Müller counters. W. F. G. SWANN and G. L. LOCHER (Physical Rev., 1935, [ii], 47, 326). L. S. T.

Cosmic ray measurements under 30 m. of clay. D. H. FOLLETT and J. D. CRAWSHAW (Proc. Roy. Soc., 1936, A, 155, 546—558).—Proof is obtained that showers are produced under 30 m. of clay, and that the ratio (shower rate) : (vertical intensity) at that depth is of the same order as that at ground level; much of the radiation which penetrates 30 m. of clay must therefore consist of positive or negative electrons. L. L. B.

Soft primary corpuscular radiation as a shower producer. J. CLAY and A. VAN GEMERT (Physica, 1936, 3, 763—768; cf. A., 1936, 773).—The production of a shower in Pb layers from 0 to 14 cm. thick is found to coincide always with the passage of a particle through counters covering the top of the Pb sheet. Experiments in which Fe or Pb sheets are arranged in different positions above the shower counters indicate that the showers are chiefly produced in the lowest layers of the material. O. D. S.

Analysis of showers from cosmic rays by using their divergence. P. AUGER and (MME.) GRIVET-MEYER (Compt. rend., 1936, 203, 246—248).—By comparison of the nos. of collisions recorded by a Geiger counter at various distances from a single Pb screen, with and without a further Pb screen beyond the first, the effects of shower production and of absorption of shower-producing rays and of showers can be separated. J. W. S.

Shower groups in the cosmic radiation. J. C. STREET and R. T. YOUNG (Physical Rev., 1935, [ii], 47, 572—573).—The no. and rates of occurrence of the showers for different thicknesses of Pb above an ionisation chamber are recorded and discussed for three different localities. L. S. T.

Enhancement of cosmic-ray nuclear bursts by the presence of subsidiary material. C. G.

MONTGOMERY, D. D. MONTGOMERY, and W. F. G. SWANN (Physical Rev., 1935, [ii], 47, 512).

L. S. T.

Shower producing cosmic-ray primaries. J. H. SAWYER, jun. (Physical Rev., 1935, [ii], 47, 635).

L. S. T.

Connexion between cosmic-ray showers and bursts. W. EHRENBERG (Proc. Roy. Soc., 1936, A, 155, 532—545).—Experiments in which the recording of the ionisation current in a cosmic-ray ionisation chamber is controlled by triple coincidences of Geiger-Müller counters lead to the conclusion that bursts are showers measured by the ionisation they produce. Most of the showers produced in a Pb shield consist of far more particles than are necessary to operate a triple coincidence set.

L. L. B.

Problem of "swarms." G. BERNARDINI and D. BOCCIARELLI (Ric. sci. Prog. tec., 1935, 6, II, 83—90; Chem. Zentr., 1935, ii, 3633).— $>10\%$  of observed swarms are produced by the primary corpuscular radiation.

J. S. A.

Results of the Dutch cosmic-ray expedition 1933. VIII. Ionisation balance in the atmosphere. M. R. VAN DER LOEFF. IX. Ionisation balance for cosmic rays on the ocean. J. CLAY and M. R. VAN DER LOEFF (Physica, 1936, 3, 775—780, 781—796).—VIII. Theoretical. An expression for the ionisation balance is derived which takes account of the influence of large ions on measurements of ion no. and life.

IX. The ionisation balance on the open sea with clear sky is in accordance with the val. due to cosmic radiation alone, but experimental errors tend to make the measured val. too low.

O. D. S.

Flügge atomic nucleus model. K. UMEDA and Y. ONO (Bull. Inst. Phys. Chem. Res. Japan, 1936, 15, 674—680).—The formation of at. nuclei from neutrons and protons is discussed.

R. S. B.

Radiationless transitions involving three-body collisions. R. A. SMITH (Proc. Camb. Phil. Soc., 1936, 32, 482—495).—Mathematical. The probability of the formation of negative ions by three-body collision between an atom and two electrons is calc. The process appears to be of little importance in discharges.

O. D. S.

Absorption coefficient of  $H^-$ . C. K. JEN (Chinese J. Physics 1936, 2, 38—42; cf. A., 1933, 547).—Mathematical. The absorption coeff. of negative H ions is calc. by wave mechanics to be of the order of magnitude of  $10^{-17} \text{ cm}^2$  from 17,000 to 1400 Å.

O. D. S.

Variational wave functions of doubly excited states of helium. T. Y. WU and S. T. MA (J. Chinese Chem. Soc., 1936, 4, 344—353).—The wave functions and energies of eight states of He are given.

J. G. A. G.

(A) Nuclear spin in isotopic mixtures. (B) Determination of the sign of nuclear magnetic moments by the method of atomic beams. I. I. RABI (Physical Rev., 1935, [ii], 47, 334, 338).—Nuclear spins and magnetic moments of the different

isotopes of a mixture can often be measured by means of at. beams.

L. S. T.

Nuclear magnetic moment of cobalt. K. R. MORE (Physical Rev., 1935, [ii], 47, 256; cf. A., 1934, 1279).—The nuclear  $g$ -factor is 0.77, giving 2.7 nuclear magnetons for the magnetic moment of Co.

L. S. T.

Nuclear spin and magnetic moment of  $^6\text{Li}$ . J. H. MANLEY and S. MILLMAN (Physical Rev., 1936, [ii], 50, 380; cf. this vol., 1039).—The spin of the  $^6\text{Li}$  nucleus and the hyperfine structure separation,  $\Delta\nu$ , of the  $^2S_{1/2}$  state were measured by the at. beam method of zero moments. The spin is  $2/2$ , and  $\Delta\nu$   $0.0077 \pm 0.0001 \text{ cm}^{-1}$ ; the calc. magnetic moment of  $^6\text{Li}$  is 0.85 nuclear magneton, the same val. as that reported for the deuteron.

N. M. B.

Magnetic moment of the  $^7\text{Li}$  nucleus. II. J. H. BARTLETT, jun., J. J. GIBBONS, jun., and R. E. WATSON (Physical Rev., 1936, [ii], 50, 315—319; cf. this vol., 653).—The calc. val., using a wave function due to James (cf. this vol., 774), is 3.33 nuclear magnetons.

N. M. B.

Tests of the validity of X-ray crystal methods of determining  $e$ . J. W. M. DU MOND and V. L. BOLLMAN (Physical Rev., 1936, [ii], 50, 383).—Investigations with calcite powder of grain size  $>2 \times 10^4 \text{ cm}$ . tend further to establish the validity of the X-ray crystal method.

N. M. B.

Attempt to calculate the number of energy levels of a heavy nucleus. H. A. BETHE (Physical Rev., 1936, [ii], 50, 332—341).—Mathematical.

N. M. B.

Relativity and nuclear forces. H. MARGENAU (Physical Rev., 1936, [ii], 50, 342—344).—Mathematical. An estimate of the relativity correction in nuclear problems is obtained.

N. M. B.

Forces between nuclear particles. W. V. HOUSTON (Physical Rev., 1935, [ii], 47, 260; cf. A., 1935, 1051).—Theoretical.

L. S. T.

Nuclear structure and the negative proton. E. C. WESTERFIELD and W. B. PIETENPOL (Physical Rev., 1935, [ii], 47, 325).—The negative proton (the anton) may be more fundamental to nuclear structure than hitherto supposed. The theory that nuclei are constructed of protons, antons, and a min. no. of neutrons is discussed in relation to structure of at. nuclei and known reactions of artificial and induced radioactivity.

L. S. T.

Nuclear reactions and their classification by atomic and isotopic numbers. W. D. HARKINS (Physical Rev., 1935, [ii], 47, 702—704).—Nuclear reactions are represented in a simple manner by means of diagrams connecting at. no. and isotopic no. Reactions given by a single type of projectile, neutron, proton, etc., are of relatively few simple types.

L. S. T.

Nuclear three- and four-particle eigenvalue problems. E. FEENBERG and S. S. SHARE (Physical Rev., 1936, [ii], 50, 253—257).—Mathematical. The determination of intranuclear forces from the mass defects of the H and He isotopes is investigated and approx. solutions are obtained.

N. M. B.

Connecting link between classical electromagnetic theory and wave mechanics *via* a derivation of the Schrödinger equations as a boundary value problem on the atom. L. T. DE VORE (Physical Rev., 1935, [ii], 47, 333). L. S. T.

Relativistic wave equations. P. A. M. DIRAC (Proc. Roy. Soc., 1936, A, 155, 447—459).—Wave equations for particles of spin  $>0.5$  quantum are formulated. L. L. B.

Townsend coefficients in nitrogen. D. Q. POSIN (Physical Rev., 1935, [ii], 47, 258).—Vals. are tabulated. L. S. T.

Forces acting on high-energy protons at collision. A. BRAMLEY (J. Franklin Inst., 1936, 222, 141—148).—Theoretical. The effect of a magnetic field on the interaction between relatively slow particles, such as protons, has been examined by the use of the Born-Infeld system of electrodynamics (A., 1935, 912). The interaction between protons at collision should have an upper limit dependent on the val. of  $b$ , the natural unit of electric intensity. Terms due to the effect of the magnetic field set up by the moving charges become of special importance when the relative velocity of the protons is  $>3\%$  of the velocity of light. Calculation of  $b$  for such protons gives a val. approx. the same as that for electrons, indicating that the mass of the proton is due to its spin rather than to its electrostatic field. A. J. M.

Theory of the photon and the relativistic wave-mechanics of the system. L. DE BROGLIE (Compt. rend., 1936, 203, 473—477).—Theoretical. D. C. J.

Neutrino theory of light. I. P. JORDAN (Z. Physik, 1936, 102, 243—252).—Mathematical. A. J. M.

Universal constants and atomic quantities. I. M. FREEMAN (Naturwiss., 1936, 24, 557).—Theoretical. A. J. M.

Theory of absorption spectra of insulating crystals. A. SMEKAL (Physikal. Z., 1936, 37, 554—556).—The ionisation of centres by the absorption of light is discussed. The theory of normal and abnormal centres and the displacement of the absorption spectrum on excitation is given, and compared with experiment. A. J. M.

Nature of "excited" colour centres. H. WOLFF (Physikal. Z., 1936, 37, 552—554).—The excitation of colour centres in synthetic rock-salt crystals to which a little  $\text{SrCl}_2$  has been added has been examined. The absorption spectrum of the unexcited colour centres was the same as that obtained for pure  $\text{NaCl}$ , exhibiting a max. at  $465 \text{ m}\mu$ . Irradiation within this band produced the excited centres, and there was not only the usual long-wave widening of the absorption spectrum, but also a reversible displacement of the max. towards the red. This displacement is dependent on the amount of  $\text{SrCl}_2$  added, but never exceeds  $10 \text{ m}\mu$ . The occurrence of excited centres is to be ascribed to the presence of small numbers of foreign atoms which produce a tension in the lattice. The effect was also noted when  $\text{NaNO}_3$  was added to  $\text{NaCl}$  in place of  $\text{SrCl}_2$ . Plastic deformation produces the same result. A. J. M.

Huggins' bands in the spectrum of the blue sky and the temperature of the atmospheric ozone. J. DUFAY (Compt. rend., 1936, 203, 383—386).—The absorption coeffs. of the Huggins bands of blue sky, photographed in the zenith when the sun is low, are intermediate between the absorption coeffs. of  $\text{O}_3$  at  $15^\circ$  and  $-80^\circ$ . R. S.

Transfer of rotational energy in molecular collisions. I. Elementary processes which lead to abnormal rotation of the  $\text{HgH}$  molecule. F. F. RIEKE (J. Chem. Physics, 1936, 4, 513—525; cf. A., 1930, 1083).—The effect of  $0.9\text{--}160 \text{ mm.}$  of  $\text{N}_2$  and  $0.7\text{--}17 \text{ mm.}$  of  $\text{H}_2\text{O}$  on the intensity distribution within the  $\text{HgH}$   $4017 \text{ \AA.}$  band has been determined by a photographic photometric method. The distribution of intensity is a function of  $[\text{N}_2]$  and  $[\text{H}_2\text{O}]$ , and the proportion of excited  $\text{HgH}$  with rotational energy  $>0.2$  volt is much  $>$  the thermal val. in all circumstances, in disaccord with published work. The nature of the collision process is discussed. The excess of rotation observed does not result from the reactions  $\text{Hg}^* + \text{H}_2 \rightarrow \text{HgH} + \text{H}$  and  $\text{Hg}^* + \text{H}_2\text{O} \rightarrow \text{HgH} + \text{OH}$ , but originates from two processes: (i) collisions of the second kind between unexcited  $\text{HgH}$  and metastable  $\text{Hg}$  atoms of which the excitation energy is taken up by the  $\text{HgH}$  partly as rotational and partly as electronic energy, and (ii) collisions of the second kind between normal  $\text{N}_2$  and highly excited  $\text{HgH}$  whereby part of the electronic and vibrational energy is converted into rotational energy of the  $\text{HgH}$ . There is only a small probability of rotational energy transfer in collisions between normal  $\text{N}_2$  or  $\text{H}_2\text{O}$  and  $\text{HgH}$  in the  $2\Pi_1$  ( $v=0$ ) state, but  $\text{H}_2\text{O}$  diminishes the average rotational energy by absorbing energy from  $\text{HgH}$  in highly excited states, thus transferring them to low rotational levels of the  $2\Pi_1$  ( $v=0$ ) state. J. G. A. G.

Band spectra of carbon deuteride. T. SHIDEI (Japan. J. Physics, 1936, 11, 23—34).—Using a low-pressure condensed discharge in presence of  $\text{D}_2\text{O}$  vapour and  $\text{CO}$ , the band spectra of  $\text{CD}$  have been photographed at high dispersion. Analyses are tabulated and data are discussed in relation to those for  $\text{CH}$ . N. M. B.

Symmetric C-D linking vibration in heavy acetylene. G. GLOCKLER and C. E. MORRELL (Physical Rev., 1935, [ii], 47, 569).—More prolonged exposure has given the other symmetrical valency frequency, at  $2700 \text{ \AA.}$  (cf. this vol., 407). L. S. T.

Absorption spectrum of  $\text{NH}$ . G. W. FUNKE (Z. Physik, 1936, 101, 104—112).—Analysis of the  $3360 \text{ \AA.}$  band gives the  $\text{NH}$  separation as  $1.035 \text{ \AA.}$  in the ground and activated levels. A. B. D. C.

Ultra-violet absorption spectrum of  $\text{ND}_3$ . A. B. F. DUNCAN (Physical Rev., 1935, [ii], 47, 886—887).—Spectra in the region  $2300$  to  $770 \text{ \AA.}$  have been obtained at various pressures of  $\text{ND}_3$ . The three  $0, 0$  bands of  $\text{ND}_3$  almost coincide with the corresponding bands of  $\text{NH}_3$ . The predissociation in progression 1 appears to start at approx. the same point in  $\text{ND}_3$  as in  $\text{NH}_3$ , but the rotational fine structure visible in  $\text{NH}_3$  is not apparent in  $\text{ND}_3$ . L. S. T.

**Band spectrum of MnH.** T. HEIMER (Naturwiss., 1936, 24, 521—522).—The strongest emission band, which is also the strongest absorption band, in the spectrum of MnH has its edge at 5680 Å., degraded towards the violet. Weaker bands at 6200 and 5205 Å. are 0—1 and 1—0 bands, respectively. There are further bands in the blue and violet. The MnH bands also occur in stellar spectra. A. J. M.

**Term scheme for gold deuteride.** T. HEIMER (Z. Physik, 1936, 101, 121—128).—The energy of dissociation for the  $^1\Sigma$  state is 3.7 volts.

A. B. D. C.

**Absorption spectra of solutions of iodine in carbon tetrachloride, titanium tetrachloride, and stannic chloride.** L. HOCK and W. KNAUFF (Z. anorg. Chem., 1936, 228, 209—212).—The spectra show max. absorption about  $\lambda$  520 m $\mu$ . No such max is observed in AsCl<sub>3</sub>.

E. S. H.

**Optical absorption of tellurium dichloride and oxychloride vapours.** M. KANTZER (Compt. rend., 1936, 203, 163—164).—TeCl<sub>2</sub> has 15 regularly spaced absorption bands between 3960 and 4358 Å. TeOCl<sub>2</sub> has 9 bands between 5015 and 5750 Å. The vapours are transparent outside these limits. J. G. A. G.

**Molecular spectra of metal halides.** K. BUTKOV (Acta Physicochim. U.R.S.S., 1935, 3, 205—217).—The ultra-violet absorption spectra and photodissociation of the following metal halide vapours are discussed: TlX, MX<sub>2</sub> (M=Hg, Cd, Zn, Pb, Sn), MX<sub>3</sub> (M=Bi, Pb), and M<sub>2</sub>X<sub>2</sub> (M=Au, Cu, Tl), where X=F, Cl, Br, I. For some of these substances new absorption data are recorded.

O. J. W.

**Energy levels of electrons in crystals.** P. TARTAKOVSKI (Acta Physicochim. U.R.S.S., 1935, 3, 340—344).—Electronic energy level diagrams for NaCl and KCl crystals, obtained from absorption spectra, are interpreted.

O. J. W.

**Behaviour of chlorine dioxide in carbon tetrachloride solution in dark and light. II. Behaviour in light.** R. LUTHER and R. HOFFMANN (Z. physikal. Chem., 1936, 177, 17—28; cf. A., 1931, 1377).—The absorption spectra in the violet and ultra-violet of ClO<sub>2</sub> and Cl<sub>2</sub>O in CCl<sub>4</sub> solution have been determined. ClO<sub>2</sub> has a regular band spectrum. After irradiation a CCl<sub>4</sub> solution of ClO<sub>2</sub> previously stabilised to darkness by washing with alkali decomposes in the dark according to  $-d[\text{ClO}_2]/dt = k[\text{ClO}_2]^{1/3}$ ; catalysis by Cl<sub>2</sub>O formed in the light is probably responsible, for Ba(OH)<sub>2</sub>·8H<sub>2</sub>O inhibits decomp. Photolysis of a ClO<sub>2</sub> solution in the light of a 'Uviol' lamp is a reaction of zero order; the Cl<sub>2</sub> formed has no effect.

R. C.

**Ultra-violet bands of beryllium oxide. II.** A. CICCONI (Ric. sci. Prog. tec., 1935, 6, II, 108—111; Chem. Zentr., 1935, ii, 3638).—Two singlet systems and a triplet system are identified.

J. S. A.

**Rotation analysis of the (1, 0)b<sup>3</sup> $\Sigma$ →a<sup>3</sup> $\Pi$  carbon monoxide band.** L. GERÖ (Z. Physik, 1936, 101, 311—322).

A. B. D. C.

**Rotation constants of the IV positive carbon monoxide bands.** R. SCHMID and L. GERÖ (Z. Physik, 1936, 101, 343—351).

A. B. D. C.

**Rotational analysis of the Ångström bands [of carbon monoxide] at  $\lambda$  6080 and 6620 Å.** R. K. ASUNDI (Proc. Indian Acad. Sci., 1936, 3, A, 554—561).—Full data are tabulated and discussed. There is probably predissociation (see following abstract).

N. M. B.

**Dissociation energy of carbon monoxide.** R. K. ASUNDI and R. SAMUEL (Proc. Indian Acad. Sci., 1936, 3, A, 562—565).—Experimental and theoretical objections to the low vals. (8.41 and 6.9 volts) generally reported for the dissociation energy of CO are discussed. The probable val. is 10.45 volts, or, if predissociation is proved, 9.57 volts. A val. of this order is supported by thermochemical data.

N. M. B.

**New band systems of selenous anhydride SeO<sub>2</sub>, selenium S<sub>2</sub>, and of tellurium Te<sub>2</sub> in the far ultra-violet.** C. S. PIATOW (Compt. rend., 1936, 203, 239—241; cf. A., 1935, 1443).—A third band system of SeO<sub>2</sub> has been found, which appears at 200° and comprises 10 bands between 2069 and 2195 Å., all degraded towards the red. The band system found previously has been extended from 2400 to 2200 Å. 20 bands of Se<sub>2</sub>, appearing at 230°, have been found between 1777 and 1939 Å., comprising two series with sharp and diffuse bands, respectively. At 430° the Te<sub>2</sub> spectrum shows a system of 30 bands at 1975—2107 Å.; at higher temp. a further system of 20 bands appears between this system and 2260 Å., whilst at about 640° a third system is found of 30 bands extending to 2495 Å. All the bands have sharp heads and are mainly degraded towards the violet.

J. W. S.

**Absorption spectrum of tervalent cerium salts.** T. Y. WU and A. T. KIANG (Chinese J. Physics, 1936, 2, 10—14).—The absorption spectra of aq. solutions of CeCl<sub>3</sub> and Ce<sub>2</sub>(SO<sub>4</sub>)<sub>3</sub> have been photographed between 2000 and 10,000 Å. A new broad absorption region was observed with centre about 2105 Å. No absorption was observed in the infra-red.

O. D. S.

**Spectrophotometric investigation of the hydrolysis of ferric salts.** J. CATHALA and J. CLUZEL (Compt. rend., 1936, 203, 401—403).—The absorption spectrum of solutions of Fe(NO<sub>3</sub>)<sub>3</sub> in buffers of known  $p_H$  was examined. The absorbing mols. appear to be complexes of Fe<sup>+++</sup> and Fe(OH)<sub>3</sub>.

A. J. M.

**Far ultra-violet absorption spectra and ionisation potentials of methyl bromide and chloride.** W. C. PRICE (Physical Rev., 1935, [ii], 47, 510).—The spectra in the region 1800—1000 Å. give ionisation potentials of 10.488 and 10.805 volts ( $\pm 0.002$  volt) for MeBr, and 11.17 and 11.25 volts ( $\pm 0.01$  volt) for MeCl.

L. S. T.

**Effect of temperature on absorption spectrum of ethyl iodide in the quartz ultra-violet.** A. HENRICI and G. MILAZZO (Z. physikal. Chem., 1936, B, 33, 201—228).—The effect of temp. and pressure on the spectrum down to 1950 Å. has been examined. It consists of two groups of bands. The first is characterised by a sequence of narrow singlet bands with an approx. separation of 17 cm.<sup>-1</sup> and by the marked effect of temp. on the probabilities of trans-

ition underlying the strongest bands; these are assigned to an upper state *B*, the probability of transition into which is the same as into the *B* state. The second group of bands leads from the ground state to the *B* term and forms groups of four, with the approx. intensity ratio 4:7:2:1. Compared with MeI (this vol., 8) the *B* term is shifted by 260 cm.<sup>-1</sup> towards shorter  $\lambda$ . R. C.

**Substitution and absorption band displacement. VIII. Dihalogenobenzenes.** H. CONRAD-BILLROTH and G. FORSTER (Z. physikal. Chem., 1936, B, 33, 311—318; cf. this vol., 1048).—The ultra-violet absorption spectra of dihalogenobenzenes in C<sub>6</sub>H<sub>11</sub> solution have been determined. Those containing only Cl and Br obey the rule previously formulated (A., 1933, 445), whilst with the I compounds there are discrepancies. The spectra of the I compounds have been resolved into the spectrum of the nucleus and that of the I, the former varying with the second substituent, and the latter not. R. C.

**Absorption spectrum of methyl ethyl ketone.** A. B. F. DUNCAN, V. R. ELLS, and W. A. NOYES, jun. (J. Amer. Chem. Soc., 1936, 58, 1454—1456).—The absorption spectrum has been investigated at room temp. from the visible region down to 780 Å. The results are discussed and compared with data for COMe<sub>2</sub>. Four or five excited states explain the absorption regions. E. S. H.

**Photochemistry of nitrates, nitrites, and nitro-compounds. II.** C. H. PURKIS and H. W. THOMPSON (Trans. Faraday Soc., 1936, 32, 1466—1474; cf. this vol., 544).—Ultra-violet spectral data for Me, Et, isoamyl, and Bu<sup>n</sup> nitrites, dimethyl- and diethyl-nitrosoamine, *ON*-dimethylhydroxylamine, and chloronitrosopropane are recorded. MeNO<sub>2</sub> and EtNO<sub>2</sub> are decomposed by the radiation from a Hg lamp, yielding mainly N<sub>2</sub> and N<sub>2</sub>O as gaseous products; condensable products are also formed. E. S. H.

**Ultra-violet absorption spectrum of tyrosine.** K. FERAUD, M. S. DUNN, and J. KAPLAN (J. Biol. Chem., 1936, 114, 665).—The authors have been unable to repeat their observation (this vol., 135) of the bands in the ultra-violet absorption spectrum of tyrosine at 260, 254, 247, and 241 m $\mu$ . H. D.

**Absorption spectra of kephalin, lecithin, and selected antigens.** A. WADSWORTH and M. O'L. CROWE (J. Physical Chem., 1936, 40, 739—745).—Selective absorption in the regions 2850—2500 Å. and 2550—2200 Å. is common to kephalin, lecithin, and beef-heart antigens. The former range is near the absorption range of proteins. Complement-fixation and pptn. antigens differ in absorption, as do each when prepared in different ways. J. W. S.

**Absorption [spectra] of fluorescent substances in different solvents.** (MLLE.) G. BRAUN (J. Chim. phys., 1936, 33, 559—568).—The absorption by eosin, uranine, and rhodamine B in H<sub>2</sub>O, COMe<sub>2</sub>, EtOH, glycerol, C<sub>6</sub>H<sub>6</sub>, and binary mixtures has been investigated. The position and magnitude of the absorption max. vary with the solvent, and Beer's law is not always obeyed. Some of the dye solutions

contain an equilibrium mixture of coloured and colourless mols. J. G. A. G.

**Application of the diffraction grating to the photographic study of fluorescence spectra.** C. DHÉRE and O. BIERMACHER (Compt. rend. Soc. Biol., 1936, 112, 1144—1147).—The application to the spectrum of pyrroporphyrin and reference spectra for the infra-red and ultra-violet are described.

H. G. R.  
**Optical absorption of porphyrins. VI.** A. STERN, H. WENDERLEIN, and H. MOLVIG (Z. physikal. Chem., 1936, 177, 40—81; cf. this vol., 662).—The absorption spectrum of dissolved porphin has six bands in the visible and both it and the fluorescence spectrum vary little with the solvent. The absorption spectra of porphin, doubly-substituted porphyrins, and porphyrin fully substituted in nuclei I and II of the porphin system and not substituted in nuclei III and IV are of the phyllo-type, whilst porphyrins substituted only in nuclei I and III have spectra of the atio-type. Apparently in partly substituted porphyrins nuclei I and III have the same structure. The absorption curves of Cu salts of di-, tetra-, and octa-substituted porphyrins all have two bands, which are displaced towards the red by substitution. The curves are of two types, depending on the no. of substituents. In all these salts the state of combination of the Cu is the same. The absorption curves of  $\beta$  $\delta$ -di-iminoatiorporphyrin II and of a monoinimoatiorporphyrin resemble those of the corresponding porphyrins; apparently these have the porphyrin structure with *tert.* N in place of one and two methine bridges, respectively, in the porphin system. Introduction of Cu into the mol. of the Me<sub>4</sub> ester of  $\beta$  $\delta$ -di-iminocoproporphyrin II does not change the no. of absorption bands, and the effects on the absorption spectrum as a whole are similar to those of the introduction of Mg into the dihydroporphin system. 4:4'-Dimethyl-3:3'-diethylpyromethene-5:5'-diethylurethane has, in addition to a band in the blue, a band in the red, due to a labile H permitting the formation of a tautomeric form having a C:N group in special conjugation to the pyromethene system. R. C.

**Fluorescence of the chlorophyll series. Fluorescence and photodecomposition in solutions of phaeophorbide-*b* and methylphaeophorbide-*b*.** H. V. KNORR and V. M. ALBERS (Physical Rev., 1935, [ii], 47, 329; cf. this vol., 1129).—The fluorescence spectrum of phaeophorbide-*b* in anhyd. COMe<sub>2</sub> consists of an intense band, max. at 650 m $\mu$ , and a weaker band, max. at 678 m $\mu$ . As photodecomp. proceeds, the relative intensities of the individual bands vary considerably and an additional band, max. 654 m $\mu$ , appears. In the fluorescence of methylphaeophorbide-*b* in anhyd. COMe<sub>2</sub> three bands of approx. equal intensity have max. at 686, 651, and 640 m $\mu$ , respectively. After irradiation the intensity of the 686 and 640 m $\mu$  bands decreases almost to zero, and an additional band, max. 654 m $\mu$ , appears. This band is also present in the fluorescence spectrum of chlorophyll-*b*. L. S. T.

**Fluorescence of the chlorophyll series.**—See this vol., 1129.

**Low-frequency double vibrations of the deuterioammonias.** E. F. BARKER and M. MIGEOTTE (Physical Rev., 1935, [ii], 47, 702).—Pairs of absorption max. representing the zero branches of  $\nu_3$  for  $\text{NH}_3$ ,  $\text{NH}_2\text{D}$ ,  $\text{NHD}_2$ , and  $\text{ND}_3$  are recorded.

L. S. T.

**Absorption spectrum of aqueous solutions between 0.70 and 0.90  $\mu$ .** E. GANZ (Z. physikal. Chem., 1936, B, 33, 163—178).—Investigation of the effect of temp. and concn.,  $c$ , of solutes on the absorption bands of  $\text{H}_2\text{O}$  at 0.77 and 0.845  $\mu$  has confirmed the results previously published (this vol., 775). The  $\text{H}_2\text{O}$  absorbs like pure  $\text{H}_2\text{O}$  at a higher temp.,  $T$ ;  $T$  is the higher the larger is the anion of the dissolved salt. At the first max. the absorption approx.  $\propto$  the salt concn., and the position of the max. shifts towards the blue with increasing  $c$ , except at higher  $c$ , where its position does not alter. With increasing concn. of  $\text{HCl}$  the 0.77  $\mu$  band gradually disappears, whilst  $\text{H}_2\text{SO}_4$  and  $\text{HNO}_3$  sharpen it. In conc. aq.  $\text{NaOH}$  a sharp OH band is superimposed on the  $\text{H}_2\text{O}$  band at 0.74  $\mu$ . Aq.  $\text{NH}_3$  has a sharp max. at 0.80  $\mu$ .

R. C.

**Absorption spectrum of methyl alcohol vapour in the photographic infra-red.** R. M. BADGER and S. H. BAUER (J. Chem. Physics, 1936, 4, 469—473).—Regions of absorption were found at  $\lambda$  9500 and 7300 Å., corresponding with two harmonics of the O-H vibration, and at  $\lambda$  12,000 which is a harmonic of the C-H vibration. Under high dispersion, the bands at  $\lambda$  9500 and 7300 have a complex rotation structure. The interpretation of the spectrum is discussed, and further development of the theory of the torsion oscillator rotator is deemed necessary. J. G. A. G.

**Pressure effect in the HCN bands in the near infra-red.** S. D. CORNELL and W. W. WATSON (Physical Rev., 1936, [ii], 50, 279—281).—All the lines of the HCN absorption band at 1.04  $\mu$  are broadened equally by increase in gas pressure, contrary to the observations of Herzberg (cf. A., 1935, 281). The half-widths increase linearly with pressure at the rate of 0.56  $\text{cm}^{-1}$  per atm. Results indicate that broadening is due mainly to dispersion forces.

**Absorption spectra in the near infra-red of aniline derivatives.** (MME.) M. FREYMAN, R. FREYMAN, and P. RUMPF (Compt. rend., 1936, 203, 309—311).—The absorption spectra of  $\text{NH}_2\text{Ph}$  derivatives alone and/or in  $\text{CCl}_4$  have been measured. In each case the interval between the two characteristic bands due to the NH group is approx. 300  $\text{cm}^{-1}$ . In  $\text{CCl}_4$  all the bands are displaced towards higher frequencies. The influence of substituents is generally more marked in the *o*- than in the *m*- and *p*-positions.

C. R. H.

**Recording grating spectrometer. Application to absorption spectra of benzene derivatives in the region of 3000  $\text{cm}^{-1}$ .** P. LAMBERT and J. LECOMTE (Compt. rend., 1936, 203, 164—167).—Photographic records of the absorption spectra between 2500 and 3700  $\text{cm}^{-1}$  were obtained directly by means of an echelette spectrometer of high resolving power. The 3093, 3074, and 3037  $\text{cm}^{-1}$  bands in  $\text{C}_6\text{H}_6$  are slightly modified in  $\text{PhMe}$ ,  $\text{PhEt}$ ,

and  $\text{PhPr}$ , and displaced towards lower  $\nu$  in  $\text{PhBu}^{\text{B}}$  and isoamylbenzene. The intensity of the middle band at 3050  $\text{cm}^{-1}$  is its neighbours in  $\text{PhCl}$ ,  $\text{PhBr}$ , and  $\text{PhI}$ . The three  $\text{C}_6\text{H}_6$  bands do not coexist in the xylenes, and almost vanish in mesitylene and  $\psi$ -cumene.

J. G. A. G.

**Infra-red absorption of carbon disulphide at 4.57  $\mu$ .** J. A. SANDERSON (Physical Rev., 1936, [ii], 50, 209—211).—The transmission curve for the band was found by investigation with a Pfund stigmatic spectrometer. Rotational structure has been partly resolved, and consts. and data for *P* and *R* branches are given. An expression for the positions of the rotational lines is found. The location of the band centre at 2184.5  $\text{cm}^{-1}$  does not agree with that found by Bailey and Cassie (cf. A., 1931, 996).

N. M. B.

**Atomic polarisation and absorption of liquids in the extreme infra-red.** C. H. CARTWRIGHT and J. ERRERA (Acta Physicochim. U.R.S.S., 1935, 3, 649—684).—The abs. intensity of absorption in the infra-red (52—152  $\mu$ ) for polar liquids is generally for non-polar liquids,  $\text{H}_2\text{O}$  and  $\text{COMe}_2$  absorbing to the greatest degree. The data are discussed in relation to intermol. oscillation-vibrations and oscillation-rotations. From  $n$  data in the visible and extreme infra-red, at. polarisations were calc. and compared with existing data. The val. for  $\alpha$ -picoline affords no support for the existence of two tautomeric forms, as suggested by Rau *et al.* (cf. A., 1934, 943).

C. R. H.

**Raman spectrum and constitution of water.** M. MAGAT (Ann. Physique, 1936, [xi], 6, 108—193).—Data for the effect of temp. and the presence of electrolytes on the Raman spectra of  $\text{H}_2\text{O}$  are given, and, in conjunction with an analysis of the infra-red spectrum, frequencies are identified with the fundamental frequencies of the mol. A model for liquid  $\text{H}_2\text{O}$ , in conformity with mol. structure, is evolved, and from this are calc. heat of evaporation and energy of free rotation.

N. M. B.

**Raman spectra of some boron compounds.** R. ANANTHAKRISHNAN (Proc. Indian Acad. Sci., 1936, 4, A, 74—81).—Full data are tabulated for  $\text{Me}$  and  $\text{Et}$  borate and for  $\text{BBr}_3$ . Results for the first-named differ widely from those of Joglekar (cf. this vol., 547). A pyramidal structure is postulated for the  $\text{B(OMe)}_3$  mol. Observed and calc. frequencies are in fair agreement.  $\text{BBr}_3$  shows two very intense lines and three very weak ones.  $\text{H}_3\text{BO}_3$  shows only one line, 875  $\text{cm}^{-1}$ , attributed to the totally symmetrical vibration of the mol.

N. M. B.

**Raman spectra of selenious acid and its sodium salts.** C. S. VENKATESWARAN (Proc. Indian Acad. Sci., 1936, 3, A, 533—543; cf. this vol., 136).—Data are tabulated for  $\text{H}_2\text{SeO}_3$  cryst., aq., and in  $\text{MeOH}$  at various concns., and for aq.  $\text{NaHSeO}_3$  and  $\text{Na}_2\text{SeO}_3$ . The solid gives 13 sharp and intense lines; on melting and in solution these lines broaden and undergo variations in frequency shift and intensity. The marked changes in the lines 706 and 597  $\text{cm}^{-1}$  are explained by postulating two types of mol.:  $\text{O:Se(OH)}_2$  and  $\text{O}_2\text{SeH}\cdot\text{OH}$  in dynamic equilibrium in the acid; the latter is predominant in the solid and in  $\text{MeOH}$

solution, and in aq. solution almost the whole of the acid is converted into the former type. The spectra at different concns. indicate that dissociation is weak, and that the proportion of mols. dissociated to  $\text{HSeO}_3'$  is almost const. throughout. The line  $895\text{ cm}^{-1}$  is assigned to  $\text{HSeO}_3'$  ions. Results are compared with those for  $\text{H}_2\text{SO}_3$ . Other lines are attributed to vibrations of definite mol. species by comparing them with those of the Na salts. N. M. B.

**Raman spectra of propylene and isobutane.** R. ANANTHAKRISHNAN (Proc. Indian Acad. Sci., 1936, 3, A, 527—532).—Data and analyses are tabulated and discussed in relation to polarisation. For  $\text{C}_3\text{H}_6$  the fundamental frequencies of the C chain are  $1648$  and  $920$  (valency type), and  $432\text{ cm}^{-1}$  (deformation frequency). The 14 additional lines are attributed to oscillations of the H atoms and are sharp. The isobutane lines are, in general, very broad and highly depolarised; the difference is probably due to the symmetry of the mol. which causes many of the vibrations to be degenerate. An interpretation with the help of polarisation data is given. There is a close similarity to the Raman spectrum of  $\text{CHCl}_3$ . N. M. B.

**Raman spectra of cyclopropane and ethylene oxide.** R. ANANTHAKRISHNAN (Proc. Indian Acad. Sci., 1936, 4, A, 82—90; cf. Harris, this vol., 777).—Full data are tabulated, and the state of polarisation of the vibrational Raman lines is discussed. *cyclopropane* (I) shows 10 frequencies, and the four intense lines of the liquid have also been recorded in the vapour spectrum, with modified intensity. The Raman spectrum of  $(\text{CH}_2)_2\text{O}$  shows 10 frequencies, and closely resembles that of (I). N. M. B.

**Raman effect and dipole moment in relation to free rotation. V. Intramolecular potential of ethane derivatives.** S. MIZUSHIMA and Y. MORINO (Sci. Papers Inst. Phys. Chem. Res. Tokyo, 1936, 29, 188—206; cf. this vol., 924).—Additional data for  $\text{C}_2\text{H}_5\text{ClBr}$  and  $\text{C}_2\text{Cl}_6$  are given and intramol. potential is discussed in detail. Results show no evidence of "free rotation" around C—C, but, in some cases, a "frozen rotation" without oscillatory mol. rotation of finite amplitude. The mutual energy effect between rotating groups is of the order  $kT$ ; hence a change in intramol. rotational state can be effected by a change in the state of aggregation. Normal vibrations of  $\text{C}_2\text{H}_5\text{ClBr}$  are calc. N. M. B.

**Raman effect. LVII. Five-membered rings. I. Raman spectra.** A. W. REITZ (Z. physikal. Chem., 1936, B, 33, 179—195).—The Raman spectra of *cyclopentane*, *cyclopentene*, *cyclopentadiene*, *thiophen*, *furan*, and *pyrrole* have been determined. The selection rules and types of vibration corresponding with the symmetry properties of a plane five-membered ring and the frequencies corresponding with the potential law for a valency-force system in such a ring have been worked out. R. C.

**Polarisation of Raman lines of formic acid, and formate and trichloroacetate ions.** J. GUPTA (Indian J. Physics, 1936, 10, 313—318).—The degree of depolarisation,  $\rho$ , of the stronger Raman lines of aq. solutions of  $\text{HCO}_2\text{H}$  (I),  $\text{HCO}_2\text{Na}$  (II), and

$\text{CCl}_3\cdot\text{CO}_2\text{Na}$  (III) has been determined. The  $1352$  line of (II) is much more polarised than the  $1398$  line of (I). These lines cannot therefore have their origin in the deformation oscillation of C—H in the  $\text{HCO}$  group.  $\rho$  for the  $1352$  line of (II) is approx. the same as that for the  $1330$  line of (III), indicating that they arise from the same mol. vibration. The  $1352$  line of (II), which is sharp and intense, is caused by the symmetrical oscillation of the ion  $(\text{C}\cdot\text{O})'$ , and this is confirmed by the fact that the  $1330$  line of (III) is strongly polarised, and the  $1650$  line of (III) is depolarised. A reversal of this behaviour is found in (I). The val. of  $\rho$  for the  $2735$  line of (II) is considerably  $>$  that of the  $2834$  line of (II), and hence these lines are due to two different modes of vibration of C—H. A. J. M.

**Raman spectra of deuterioacetones and methyl alcohol-d.** J. R. BATES, L. C. ANDERSON, and J. O. HALFORD (J. Chem. Physics, 1936, 4, 535).—Raman frequencies are tabulated for equilibrium solutions of the several deuterioacetones containing 0—91% of D. With increasing % of D, certain lines fade, whilst new lines appear. The  $1706\text{ cm}^{-1}$  line, ascribed to C=O, is unchanged, and there are six frequencies at  $2000$ — $2250\text{ cm}^{-1}$  with 91% of D, whereas  $\text{COMe}_2$  has only three at  $2900$ — $3000\text{ cm}^{-1}$ . The OD band in MeOD is at  $2500\text{ cm}^{-1}$  (cf. the OH band at  $3400\text{ cm}^{-1}$  in MeOH). J. G. A. G.

**Raman spectrum of deuterioacetaldehyde.** R. W. WOOD (J. Chem. Physics, 1936, 4, 536).—The wave no. differences of nine lines excited by the Hg line  $\lambda 4358$  are tabulated. J. G. A. G.

**Continuous spectrum observed in Raman scattering.** S. V. C. AIYA (Physical Rev., 1936, [ii], 50, 260—261).—An explanation is proposed. N. M. B.

**Doppler effect in light scattering in liquids. III. Polarisation of light transversely scattered by formic and acetic acids.** B. V. R. RAO (Proc. Indian Acad. Sci., 1936, 3, A, 607—609; cf. A., 1935, 1445).—The central undisplaced component of the triplet in the transversely scattered light shows appreciable depolarisation, differing from the case of non-associated liquids such as  $\text{CCl}_4$ , PhMe, and  $\text{CS}_2$  in which the central component is unobservable in the horizontal vibration of the transversely scattered light. Results indicate the presence of large non-rotating or immobile mol. clusters which depolarise the scattered light. N. M. B.

**Structure of the Rayleigh radiation of liquids.** K. BIRUS (Physikal. Z., 1936, 37, 548—549).—Polarisation determinations with Hg  $\lambda 4078\text{ Å}$  show that the scattered light consists of two parts, (1) a symmetrical triplet polarised in the direction of incidence, and (2) depolarised anisotropic radiation, degree of depolarisation  $6/7$ . A. J. M.

**Dispersion of depolarisation of Rayleigh scattering. I. Fatty acids.** R. S. KRISHNAN (Proc. Indian Acad. Sci., 1936, 3, A, 566—571).—Results of measurements are tabulated for  $\text{C}_6\text{H}_5$ ,  $\text{HCO}_2\text{H}$ ,  $\text{AcOH}$ ,  $\text{EtCO}_2\text{H}$ , and  $\text{Pr}^n\text{CO}_2\text{H}$ . The depolarisation factor for  $\text{C}_6\text{H}_5$  is const. over a wide range of  $\lambda$ ; for  $\text{HCO}_2\text{H}$  and  $\text{EtCO}_2\text{H}$  it increases, and for  $\text{AcOH}$

it decreases, towards the ultra-violet. The observed dispersion of depolarisation is probably due to the formation of large mol. groups in the fatty acids.

N. M. B.

**Distribution of luminescence carriers in gypsum crystals.** E. IWASE (Bull. Chem. Soc. Japan, 1936, 11, 475—479).—The fluorescence of gypsum crystals in ultra-violet light was of an "hour-glass" pattern. The impurities which cause the luminescence are supposed to be deposited during the growth of the crystal only at certain crystal faces.

C. R. H.

**Polarised fluorescence of organic dye solutions.** L. GRISEBACH (Z. Physik, 1936, 101, 13—22).—Degree of polarisation of fluorescent radiation excited by linearly polarised  $\lambda\lambda$  between 2330 and 5780 Å. was determined for fluorescein, eosin, rhodamine B, and aesculin in glycerol. Elliptically polarised  $\lambda\lambda$  did not give elliptically polarised fluorescence.

**Luminescence of frozen solutions of certain dyes.** F. G. WICK and C. G. THROOP (Physical Rev., 1935, [ii], 47, 329).—The effect on luminescent solutions of certain dyes of freezing and cooling to liquid air temp. has been determined. Marked changes in intensity and colour of the fluorescence occur and in some cases the frozen solutions are strongly phosphorescent.

L. S. T.

**Sharpness of coincidence with counter tubes.** W. CHRISTOPH (Physikal. Z., 1936, 37, 558—559).—An experiment for determining the "resolving power" of counter tubes is described.

A. J. M.

**Measurement of the number of colour centres in KCl crystals.** F. C. KLEINSCHROD (Ann. Physik, 1936, [v], 27, 97—107; cf. Pohl, A., 1935, 915).—The no. of colour centres is measured by chemical determination of the free metal atoms. This no. is greater by 24% than that calc. from the max. absorption coeff. and the half width of the  $F$  absorption band. Similar measurement for the  $U$  centres is in agreement with optical vals.

O. D. S.

**Photochemistry of crystals.** M. SAVOSTJANOVA (Acta Physicochim. U.R.S.S., 1935, 3, 345—354).—The photochemical behaviour of alkali and Ag halide crystals is discussed.

O. J. W.

**External photo-effect in alkali halides coloured by cathode rays.** E. ASMUS (Ann. Physik, 1936, [v], 26, 723—739).—Powdered NaCl, KCl, LiCl, and LiBr were coloured by irradiation with cathode rays and the external photo-effect was investigated with visible light. The photo-current ( $i$ ) at first increased with time ( $t$ ), but reached a max. and then slowly decreased. The time taken to reach the max. and the max.  $i$  itself varied with the intensity of the light. The  $i$ - $t$  curve was also studied for lights of different colours. The results can be explained by supposing that it is not the colour centres themselves which are responsible for the external photo-effect, but excited colour centres, which are produced by light absorbed in the  $F$  band.  $i \propto$  no. of excited colour centres.

A. J. M.

**New investigations with semi-conductors.** A. SCHULZE (Chem.-Ztg., 1936, 60, 545—547).—Recent

work on the semi-conducting properties of Si, C, Ti, Zr, Hf, Th, B, As, and Te is described.

A. J. M.

**Chemical condition of the photo-electrically active hydrogen absorbed in platinum and tantalum.** K. REGER (Z. Physik, 1936, 102, 156—162; cf. A., 1933, 441).—The photo-electric effect with Pt and Ta foils which had been treated with  $H_2$  was examined for samples of  $H_2$  of different purity and dryness. Electrolytic  $H_2$ , not specially purified, is photo-electrically active when absorbed by the foils, but this is not the case if the gas is freed from  $H_2O$ , at. H, and other impurities. Pure mol.  $H_2$  is not photo-electrically active. Traces of  $O_2$  appear to act catalytically in promoting the activity of  $H_2$ .

A. J. M.

**Migration of caesium on tungstic oxide.** L. FRANK (Trans. Faraday Soc., 1936, 32, 1403—1414).—The photo-electric effect of thin films of Cs on  $WO_3$  decreases with time. A study of the adsorption of such films at 125—400° abs. by a photo-electric method indicates that the decay of activity is due to migration of Cs atoms into the mass of  $WO_3$ . The activation energy connected with the migration has been calc.

E. S. H.

**Direction of rectifier action for excess- and defect-semi-conductors.** W. HARTMANN and W. SCHOTTKY (Naturwiss., 1936, 24, 558).—Sintered ZnO, an excess-semi-conductor, was deposited on Ag covered with a bakelite film. The arrangement acts as a rectifier, the direction of rectification being opposite to that when  $Cu_2O$ , a defect-semi-conductor, is used. This is in agreement with Schottky's theory (Z. tech. Physik, 1935, 16, 512).

A. J. M.

**Electrical breakdown in the cloud chamber.** H. RAETNER (Physikal. Z., 1936, 37, 560—562).—The first ionisation process preceding the passage of the spark takes place in "canals." The maintenance of the discharge at high pressures is due to photo-electrons.

A. J. M.

**Voltaic photo-effect in silver halides.** E. KIRILLOV, M. KITAIGORODSKI, and A. MOLCHANOV (Acta Physicochim. U.R.S.S., 1935, 3, 361—367).—Photovoltaic effects at a monocryst. AgCl surface and at a junction between polycryst. AgI and Ag or Au are described.

O. J. W.

**Electrification by friction.** F. MICHAUD (J. Chim. phys., 1936, 33, 546—558).—Theoretical. Electrification caused by friction and by blows arises from the thermo-electric effects of the temp. gradients produced. The theory explains some anomalies, and its consequences are discussed.

J. G. A. G.

**Ionic conductivity in solid salts.** W. SEITH (Z. Elektrochem., 1936, 42, 635—654).—A review.

**Mean values for the dipole moments of the harmonic and anharmonic oscillator in quantum mechanics.** R. P. BELL and E. A. GUGGENHEIM (Trans. Faraday Soc., 1936, 32, 1013—1017).—Theoretical.

O. J. W.

**Modern concept of the structure of anisotropic liquids and its foundation.** V. FREEDERICKSZ (Acta Physicochim. U.R.S.S., 1935, 3, 741—748).—Light scattering, variations in dielectric const. under the action of a magnetic field, orientation of electrical

dipole moments, and properties of thin films of anisotropic liquids are discussed. C. R. H.

**Dipole effect of viscous liquids at high frequencies.** C. SCHRECK (Physikal. Z., 1936, 37, 549—552; cf. Wien, this vol., 549).—The deviations from the Debye theory exhibited by conc. solutions of fructose at long  $\lambda$  may be supposed to be due to the existence in the solution of dipoles of different relaxation times. Calculations of dipole loss based on the assumption of 2 or 3 relaxation times give results in agreement with experiment over a considerable  $\lambda$  range. The effect of viscosity on dipole loss was investigated for glycerol solutions. The loss for given  $\lambda$  is a max. at a temp. in the neighbourhood of the f.p. The rate of increase of the loss with  $\lambda$  is different at different temp. A. J. M.

**Polarisation and dielectric constant of liquids.** J. WYMAN, jun. (J. Amer. Chem. Soc., 1936, 58, 1482—1486).—The empirical relation between polarisation and dielectric const.,  $p=(\epsilon+1)/8.5$ , is deduced from published data. E. S. H.

**Electric moments of molecules in liquids.** L. ONSAGER (J. Amer. Chem. Soc., 1936, 58, 1486—1493).—Theoretical. By analysis of the internal field, and dielectric const. of pure polar liquids, and of solutions, formulæ similar to Wyman's are obtained (cf. preceding abstract). E. S. H.

**Measurement of the dielectric constant of air at radio-frequencies.** L. G. HECTOR and H. L. SCHULTZ (Physical Rev., 1935, [ii], 47, 327).—The  $\epsilon$  of air at 900,000 cycles per sec. by the heterodyne-beat frequency method agrees closely with vals. obtained at low frequencies and with d.c. measurements. L. S. T.

**Refractivity and dielectric constant of carbon dioxide at high pressures.** P. O. JOHN (Phil. Mag., 1936, [vii], 22, 274—281).—Discussion of deviations from the Lorentz formula over a wide range of densities shows that, in conformity with the Raman-Krishnan theory of the anisotropic polarisation field in dense media, the anisotropy of the polarisation field increases progressively with increase in density, and, for any given density, the degree of anisotropy required to explain the deviations is the same for different  $\lambda\lambda$  of the incident light. N. M. B.

**Dielectric constants of gases and vapours.** V. M. KUBO (Sci. Papers Inst. Phys. Chem. Res. Tokyo, 1936, 29, 179—187; cf. this vol., 924).—The dielectric const. of the vapour of  $\text{CH}_2(\text{OMe})_2$ , the mol. of which has two axes of free rotation, was measured for various temp., and used to calculate the dipole moment, which increases with rising temp. Theoretical investigation indicates that even at 200° the rotations are not perfectly free; the mol. executes rotational oscillations around the two axes of free rotation. The most stable configuration is that in which two Me are at opposite sides of the plane containing the central C and the two O. N. M. B.

**Dielectric coefficients of gases and vapours.** K. L. RAMASWAMY (Proc. Indian Acad. Sci., 1936, 4, A, 108—133).—Full data for the dielectric coeffs. measured at two or three temp. and the calc. electrical

moments are tabulated for MeF, MeCl, MeBr, MeI, EtCl,  $\text{CH}_2\text{Cl}_2$ ,  $\text{CHCl}_3$ ,  $\text{CCl}_4$ , MeOH,  $\text{COMe}_2$ , MeCN,  $\text{Me}_2\text{O}$ ,  $\text{NH}_2\text{Me}$ , cyclopropane (I),  $(\text{CH}_2)_2\text{O}$ , and  $\text{C}_6\text{H}_6$ . (I),  $\text{C}_6\text{H}_6$ , and  $\text{CCl}_4$  are non-polar; the others have appreciable electric moments. Compressibilities at room temp. are determined from the variation of  $n$  with pressure. Results are compared with available data. N. M. B.

**Dipole moments of the alkali halides.** W. H. RODEBUSH (J. Chem. Physics, 1936, 4, 536).—The vals. published (this vol., 924) may be 10% too high. J. G. A. G.

**Dispersion determinations with decimetre waves.** M. VON ARDENNE, O. GROOS, and G. OTTERBEIN (Physikal. Z., 1936, 37, 533—544).—The first method of Drude, involving the determination of  $n$  for undamped waves of  $\lambda$  about 1 dm., was used to investigate the dispersion of  $\text{H}_2\text{O}$ , sucrose solutions, MeOH, EtOH, and glycerol. The dispersion bands often observed for  $\text{H}_2\text{O}$  were not found. The dispersion of sucrose solutions showed that  $n^2$  was the smaller the smaller was the concn. of  $\text{H}_2\text{O}$  in the solution. There was a variation of  $n^2$  with viscosity of the solution, which indicated that any anomalous dispersion in the case of  $\text{H}_2\text{O}$  must occur at  $\lambda$  about 1 cm. For MeOH anomalous dispersion just begins in the  $\lambda$  range 10—60 cm. The results for EtOH agree with the Debye theory, and give a mol. radius of 2.2 Å. The absorption max. of  $\text{PhNO}_2$  at  $\lambda$  6 m. found by Beck (A., 1933, 1103) and those of  $\text{Bu}^n\text{OH}$ ,  $\text{Bu}^s\text{OH}$ , and  $n\text{-C}_5\text{H}_{11}\text{OH}$  found by Krause (A., 1934, 1057) are not due to anomalous dispersion. The high frequency loss of  $\text{Bu}^n\text{OH}$ ,  $\text{Bu}^s\text{OH}$ , and  $n\text{-C}_5\text{H}_{11}\text{OH}$  increases with decreasing  $\lambda$ . A. J. M.

**Absorption in dipolar liquids in the region of 3—7 m. wave-length.** E. KEUTNER (Ann. Physik, 1936, [v], 27, 29—48).—The absorptions of Et, Pr, Bu, amyl, and hexyl alcohols, glycerol containing varying % of  $\text{H}_2\text{O}$ ,  $\text{PhNO}_2$ ,  $\text{PhCl}$ ,  $\text{COMe}_2$ , and  $\text{C}_6\text{H}_6$  are given between 15° and 35°. The results for the alcohols are in agreement with the Debye theory and vals. of the mol. radius, time of relaxation, and the const. determining the dispersion are calc. The vals. for glycerol and  $\text{PhNO}_2$  are not in agreement with the simple Debye theory. O. D. S.

**Anomalous behaviour of the dielectric constants of the higher organic acids near the f.p.** B. PIEKARA (Physikal. Z., 1936, 37, 624—627).—The freezing of stearic, palmitic, and oleic acids is accompanied by a sudden increase in the dielectric const. ( $\epsilon$ ), after which there is the normal decrease. The increase at the f.p. is not markedly altered by variation of the  $\lambda$  at which  $\epsilon$  is determined within the limits 200—3000 m. No anomaly in  $\epsilon$  was found in the case of  $\text{AcOH}$ ,  $\text{CH}_3\text{Cl}\cdot\text{CO}_2\text{H}$ , or octoic acid. A solution of palmitic acid in  $\text{C}_6\text{H}_{14}$  showed the anomaly, but it was spread over a wider temp. range, thus giving the temp.- $\epsilon$  curve a "hysteresis" loop. A. J. M.

**Polarity of chemical compounds. IX.** K. HIGASI (Bull. Inst. Phys. Chem. Res. Japan, 1936, 15, 766—786; cf. A., 1935, 568).—The dipole moments of  $\text{Pr}^s\text{OH}$  and  $\text{Bu}^s\text{OH}$  have been determined at 20° in  $\text{C}_6\text{H}_6$  ( $1.70_\epsilon$  and  $1.70_2 \times 10^{-18}$ , respectively) and in

$\text{CS}_2$  ( $1.48$  and  $1.41 \times 10^{-18}$ , respectively). The moments in  $\text{C}_6\text{H}_6$  are greater by  $0.13$  and  $0.07 \times 10^{-18}$ , respectively, than the vals. in the vapour, in agreement with the author's theory. The moments in  $\text{CS}_2$  and the results of Earp and Glasstone (this vol., 150) are explained.

R. S. B.

**Dielectric polarisation. XVII.** Dipole moments of some aromatic acid halides. **XVIII.** Dipole moments of the chlorides of some dicarboxylic acids. **XIX.** Dipole moments of some aromatic sulphonyl chlorides. G. T. O. MARTIN and J. R. PARTINGTON. **XX.** Dependence of polarisation and apparent moment of nitriles on solvent and temperature. E. G. COWLEY and J. R. PARTINGTON (J.C.S., 1936, 1175—1178, 1178—1182, 1182—1184, 1184—1194; cf. this vol., 408).—**XVII.** The following dipole moments ( $\mu$ ) in  $D$  at  $20^\circ$  and in  $\text{C}_6\text{H}_6$  solution are recorded:  $\text{BzCl}$ ,  $3.33$ ,  $\text{CH}_2\text{Ph}\cdot\text{COCl}$  (I),  $2.54$ ,  $p\text{-C}_6\text{H}_4\text{Cl}\cdot\text{COCl}$ ,  $2.00$ ,  $p\text{-C}_6\text{H}_4\text{Br}\cdot\text{COCl}$ ,  $2.03$ ,  $p\text{-NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{COCl}$ ,  $1.11$ ,  $3:5\text{-(NO}_2)_2\text{C}_6\text{H}_3\cdot\text{COCl}$ ,  $1.20$ ,  $p\text{-C}_6\text{H}_4\text{Me}\cdot\text{COCl}$ ,  $3.81$ ,  $\text{BzBr}$ ,  $3.37$ . The fact that for  $\text{BzCl}$  is  $>$ , and for (I) is  $<$ , for  $\text{AcCl}$  or  $\text{EtCOCl}$  is in accord with the vals. for other  $\text{Bz}$  compounds. The results support the conclusions reached previously regarding the direction of the  $\text{COCl}$  group moment (this vol., 408).

**XVIII.**  $\text{C}_2\text{O}_2\text{Cl}_2$ ,  $\text{CH}_2(\text{COCl})_2$  (II),  $(\text{CH}_2\cdot\text{COCl})_2$  (III), and  $s$ -phthalyl chloride (IV) in  $\text{C}_6\text{H}_6$  at  $20^\circ$  give  $\mu$   $0.92$ ,  $2.80$ ,  $3.00$ , and  $5.12$ , respectively. These results are discussed in relation to the spatial configuration of the  $\text{COCl}$  groups, and the possibility of isomeric ring forms of (II) and (III) is discussed.  $\mu$  for the liquid form of (IV) confirms its symmetrical structure.

**XIX.**  $\text{PhSO}_2\text{Cl}$ ,  $p\text{-C}_6\text{H}_4\text{Me}\cdot\text{SO}_2\text{Cl}$ , and  $p\text{-C}_6\text{H}_4\text{Br}\cdot\text{SO}_2\text{Cl}$  in  $\text{C}_6\text{H}_6$  at  $20^\circ$  give  $\mu$   $4.47$ ,  $5.01$ , and  $3.23$ , respectively. The measured vals. are higher than the calc., but are in the same order.

**XX.** The polarisations and apparent moments of  $\text{PhCN}$  and  $\text{EtCN}$  have been measured in  $\text{C}_6\text{H}_{14}$ , cyclohexane,  $\text{CCl}_4$ ,  $\text{C}_6\text{H}_6$ ,  $\text{PhMe}$ , and  $\text{CS}_2$  and at various temp.  $\mu$  falls regularly with increasing dielectric const. of the solvent at const. temp., and for the same solvent decreases with fall in temp. The data are compared with the moments for the vapours by various formulæ, but the agreement between observed and calc. vals. is only approx.

J. W. S.

**Intermolecular force effects with the isomeric  $\beta\gamma$ -dibromobutanes.** H. G. TRIESCHMANN (Z. physikal. Chem., 1936, B, 33, 283—289).—The isomeride of lower b.p. (I) has a higher dielectric const. and smaller heat of vaporisation than the other (II). It is inferred that in (I) the intermol. force effects are  $<$  than in (II), and that (I) is therefore the *meso*-form and (II) the active form. The  $\beta$ -butylene of higher b.p. must then be the *cis*-form and that of lower b.p. the *trans*-form (cf. A., 1935, 825). (I) and (II) have the same dipole moment.

R. C.

**Dipole moments of benzoquinone, beryllium acetylacetonate, basic beryllium acetate, and *o*-nitrophenol.** H. O. JENKINS (J.C.S., 1936, 910—911).—The apparent dipole moments of  $\text{Be}$  acetylacetonate (I) and basic  $\text{Be}$  acetate (II) can be calc. from that of benzoquinone (III). From the given

equations the orientation polarisations of (III), (I), and (II) are predicted to be in the ratios of  $1:2:3$ ; experimental vals. are approx. in this ratio.

W. R. A.

**Dipole moments of nitrophenols.** H. O. JENKINS (J.C.S., 1936, 1049—1050).—The dipole moment of  $o\text{-NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{OH}$  in  $\text{C}_6\text{H}_6$  at  $25^\circ$  is  $3.11 D$ , in good agreement with previous data. Resonance effects or influence of the solvent may account for the fact that the electric moments of the substituted phenols increase in a direction contrary to the expected direction.

W. R. A.

**Inductive effects in the diphenyl series.** (MRS.) C. G. LE FEVRE and R. J. W. LE FEVRE (J.C.S., 1936, 1130—1137).—The following dipole moments (in  $D$ ) are recorded in  $\text{C}_6\text{H}_6$  solution at  $25^\circ$ : 4-fluoro-,  $1.50$ , 4-chloro-  $1.56$ , 4-bromo-  $1.64$ , 2-nitro-  $3.80$ , 4-nitro-  $4.17$ , 4-amino-  $1.76$ , 4-acetamido-  $3.83$ , 4-nitro-4'-amino-  $6.46$ , 4-bromo-4'-amino-  $3.30$ , and 4-bromo-3'-nitro-4'-piperidino-diphenyl  $4.30$ ,  $\text{PhF}$   $1.47$ ,  $\text{PhCl}$   $1.54$ ,  $\text{PhBr}$   $1.55$ ,  $\text{PhNO}_2$   $4.03$ ,  $\text{NH}_2\text{Ph}$   $1.51$ ,  $\text{NHPhAc}$   $4.01$ ,  $p\text{-NO}_2\cdot\text{C}_6\text{H}_4\cdot\text{NH}_2$   $6.32$ ,  $p\text{-C}_6\text{H}_4\text{Br}\cdot\text{NH}_2$   $2.85$ , 4'-bromo-2'-nitro-1-phenylpiperidine  $4.29$ . The results indicate mesomerism in the disubstituted diphenyls and benzenes, whence it is concluded that the independent conjugation of the nuclei in  $\text{Ph}_2$  derivatives is not so complete as has generally been considered.

J. W. S.

**Dipole moment and molecular structure. XVII.** Dipole moments of azo-dyes and similar substances. **XVIII.** Dipole moments of substituted  $\alpha$ -methylstyrenes. E. BERGMANN and (Miss) A. WEIZMANN (Trans. Faraday Soc., 1936, 32, 1318—1326, 1327—1331; cf. this vol., 715).—**XVII.** Data for 24 compounds are recorded. The structures of *p*- and *o*-hydroxyazo-dyes are discussed in the light of the results. The "zwitterion" structure for the *p*-compounds is excluded by their relatively low dipole moments.

**XVIII.** Data for 10 compounds are recorded and discussed.

E. S. H.

**Discontinuous variations of the atomic volume in the solid state and at fusion.** G. DESTRIAU (J. Chim. phys., 1936, 33, 526—531).—The elements conform to the relation  $nC = K \times T \times (\text{at. vol.})$ , where  $C$  is approx.  $0.155$ ,  $K$  is the coeff. of cubical expansion of the solid,  $T^\circ$  abs. is the m.p., and  $n$  is an integer between 2 and 8 probably related to  $F'$  in Forrer's m.p. law (A., 1935, 1305). The change in g. at. vol. at fusion is  $\Delta V = n'C'$ , where  $n'$  is an integer and  $C'$  is approx.  $0.12$ .

J. G. A. G.

**Refractive index of gaseous heavy water.** C. CUTHBERTSON and M. CUTHBERTSON (Proc. Roy. Soc., 1936, A, 155, 213—217).—The vals. found for  $\mu$  of  $\text{D}_2\text{O}$ , 99.2% pure, for  $\lambda$   $5462.23$  and the dispersion  $\lambda\lambda$   $5462$ — $2968$  are expressed by  $\mu - 1 = (2.6756 \times 10^{27}) / (11,000 \times 10^{27} - n^2)$ ,  $n$  being the no. of vibrations per sec. for the  $\lambda$  in question. This gives a val. for  $\lambda$   $5462.23$  of  $0.0002501$ , against  $0.0002527$  for  $\text{H}_2\text{O}$ , and a flatter dispersion curve. The American observations on liquid  $\text{D}_2\text{O}$  are thus approx. confirmed for the gaseous form.

L. L. B.

**Anisotropy of the optical polarisation field in liquids.** IV, V. B. S. R. RAO (Proc. Indian Acad. Sci., 1936, 4, A, 64—71, 72—73; cf. this vol., 780).—IV. The molar refractivity, measured at different temp., for  $\text{Bu}^\alpha\text{OH}$ ,  $\text{Et}_2\text{O}$ ,  $\text{C}_5\text{H}_{12}$ ,  $\text{C}_6\text{H}_{14}$ , and  $\text{C}_7\text{H}_{16}$  increases (except for  $\text{Bu}^\alpha\text{OH}$ ) with temp., showing that the optical polarisation field is not of the Lorentz type but should be regarded as anisotropic. For  $\text{Bu}^\alpha\text{OH}$ , the molar refractivity first slightly increases and then diminishes, as for an associated liquid. For  $\text{C}_5\text{H}_{12}$ ,  $\text{C}_6\text{H}_{14}$ , and  $\text{C}_7\text{H}_{16}$ , the ratio of the coeffs.  $p_2/p_1$ , constituting a measure of the anisotropy of the optical polarisation field, increases on ascending the series, and the deviations from the Lorentz law are similarly more marked. With rise of temp.  $p_2/p_1$  rapidly approaches unity in all cases except that of  $\text{Bu}^\alpha\text{OH}$ .

V. Vals. of  $p_2/p_1$  for 8 liquids are tabulated and plotted against temp. The curves fall into three classes: slow and regular fall in anisotropy of the optical polarisation field ( $\text{CS}_2$ ,  $\text{C}_6\text{H}_6$ ,  $\text{PhNO}_2$ ); rapid and relatively large fall ( $\text{C}_5\text{H}_{12}$ ,  $\text{C}_6\text{H}_{14}$ ,  $\text{C}_7\text{H}_{16}$ ); abnormal and erratic variation ( $\text{AcOH}$ ,  $\text{BuOH}$ ) probably connected with the associating nature of the liquids.

N. M. B.

**Rotatory power of sugar hydrazones in relation to the stereochemical structure of the  $\alpha$ -carbon atom.**—See this vol., 1234.

**Rotatory dispersion.** XXIX. Absorption and circular dichroism of camphorquinone. T. M. LOWRY and (Miss) D. M. SIMPSON (J.C.S., 1936, 1156—1159).—The curve of the circular dichroism of camphorquinone in cyclohexane solution as a function of  $\lambda$  is roughly parabolic, with a rounded max. at 4700 Å. ( $\epsilon_r - \epsilon_i = 1.95$ ), but is steeper on the side of longer  $\lambda$ . The visible absorption band has a max. at 4780 Å., and there is another max. at 2650 Å. The principal component of the visible absorption is the optically active band, but the absorption band is less regular than that of the circular dichroism, and can be interpreted only by assuming the presence of optically inactive components on either side of the main component with max. about 4900 and 4230 Å., respectively.

J. W. S.

**Influence of solvents and of other factors on the rotation of optically active compounds.** XXXIII. Behaviour of  $\beta$ -octyl alcohol and of  $\beta$ -octyl acetate. T. S. PATTERSON and (Miss) G. M. HOLMES (J.C.S., 1936, 1007—1014).—The rotation of  $\beta$ -octyl acetate in  $\text{C}_6\text{H}_6$ ,  $\text{CS}_2$ , and Et cinnamate (I) has been studied. It is concluded that two regions of visibly anomalous dispersion would be exhibited by the  $T$ - $R$  curves if a sufficient range of temp. could be studied.  $\text{C}_6\text{H}_6$  displaces the  $T$ - $R$  curves to the left; the other solvents displace the curves to the right. Although  $\text{CS}_2$  and (I) have similar effects as regards rotation, they have opposite effects on the apparent mol. solution vol.

W. R. A.

**Constitution of formic acid and the formates.** T. S. WHEELER (Current Sci., 1936, 5, 17—18).—A reply to Halasyam (this vol., 412).

D. C. J.

**Constitution of complex metallic salts.** IV. Constitution of certain bridged dipalladium derivatives. Novel type of tautomerism. F. G.

MANN and D. PURDIE (J.C.S., 1936, 873—890).— $\text{NH}_4$  palladochloride reacts with the bisalkylphosphine- (and arsine-) palladium dichlorides  $[(\text{R}_3\text{P})_2\text{PdCl}_2]$  and  $[(\text{R}_3\text{As})_2\text{PdCl}_2]$  (this vol., 140), forming a new type of bridged di-Pd compound,  $[\text{R}_3\text{PPdCl}_2]_2$  and  $[\text{R}_3\text{AsPdCl}_2]_2$ . These compounds are markedly darker in colour and have generally higher m.p. than the parent substances; their mol. wt. in all solvents is twice that of the empirical formula. Corresponding members are isomorphous; the compounds have been prepared also with I,  $\text{NO}_2$ , and CNS instead of Cl. These compounds should exist as the unsymmetric form (I) and as *cis* and *trans* modifications of the symmetric form (II). In the solid state they exist in one form only, but in org. solvents an equilibrium mixture of (I) and (II) exists, since decisive reactions for both forms are given. These compounds are termed *dichlorobis(trialkyl-phosphine or -arsine)- $\mu$ -dichlorodipalladium*. Their reactions are described; dipole moment, crystallographic and parachor data have been obtained, and are discussed in relation to the structure of the mols.

W. R. A.

**Polarity and tautomerism.** V. RASUMOVSKI (Compt. rend. Acad. Sci. U.R.S.S., 1936, 2, 381—387; cf. A., 1935, 1348; this vol., 925).—Theoretical. Tautomeric changes in many org. and inorg. mols. are indicated, the occurrence of which is due to the bond electrons dividing their time between the attraction spheres of the atoms they join, the degree of inequality of division determining which shall be the more stable modification of the mol. concerned. In extreme cases ionisation results; in others, a given atom in a mol. is alternately positive and negative, so that acids and bases may become amphoteric.

R. C. M.

**Nature of the *trans*-effect.** A. GRUNBERG (Acta Physicochim. U.R.S.S., 1935, 3, 573—582).—Theoretical. In symmetrical complex ions of the type  $\text{PtCl}_4^{2-}$ , the anions are placed symmetrically around the cation, so that the effect of dipoles induced by reciprocal polarisation is neutralised. Substitution of a new anion disturbs the reciprocal polarisation, resulting in a dipole in the cation. *trans*-Effect appears when the central ion has strong polarisation properties, and is further influenced by all properties related to polarisation.

C. R. H.

**Action of the electric field on anisotropic liquids.** I. Motion of the liquid in the electric field. II. Orientation of the liquid in the electric field. V. FREDERICKS and V. ZVETKOV (Acta Physicochim. U.R.S.S., 1935, 3, 879—894, 895—912; cf. A., 1935, 1305).—I. The electric field induces an intensive motion in the liquid, which increases with the field strength. Experiments with films of varying thickness show that for a given field strength  $E$  the effect appears only when the thickness is  $>$  a certain val.  $z_0$  and  $z_0 E$  is a const. which increases with time. A magnetic field  $H$  parallel to the surface of the liquid and perpendicular to the electric field increases  $z_0$  but when parallel to the electric field and perpendicular to the surface,  $z_0$  is diminished.

II. The orienting action of the electric field has been determined by investigating the simultaneous action of electric and magnetic fields on a liquid layer of

thickness  $< z_0$ . Azoxyanisole (I) and *p*-acetoxybenzylideneazine are oriented perpendicular to the electric field according to Zocher's rule, whilst dibenzylideneazine and anisylidenebenzidine take up positions with the mol. axis parallel to the lines of force. The orienting effect depends on the dielectric anisotropy of the liquid, and the theoretical relation  $\alpha H^2 + \beta E^2 = 1/z_0^2$  is in good agreement with the experiments. The effect of a magnetic field  $H_e$  can be counteracted by an electric field  $E_e$ , the ratio  $H_e/E_e$  decreasing with temp. The diamagnetic anisotropy and the elasticity const.  $A$  of (I) have been calc. R. S.

**Bond strength in the hydrogen molecule.** Comparison of spectroscopic and wave mechanics data. H. BEUTLER and H. O. JÜNGER (Z. Physik, 1936, 101, 304—310).—Energy of dissociation of  $H_2$ , 36,100 cm.<sup>-1</sup>, energy of ionisation 124,425 cm.<sup>-1</sup>, and energy of dissociation of  $H_2^+$ , 21,366 cm.<sup>-1</sup>, are the same according to spectroscopic and wave-mechanics data. A. B. D. C.

**Second virial coefficient of heavy hydrogen.** K. SCHÄFER (Naturwiss., 1936, 24, 539).—The second virial coeff. of  $D_2$  was determined between 23° and 46° abs. It is approx. 20%  $>$  that of  $H_2$ . It is concluded that the intermol. force between two  $D_2$  mols. is the same as that between two  $H_2$  mols. Double mols.,  $D_4$  and  $H_4$ , of transitory existence, are formed by collision at low temp., the distance between the two mols. being  $>$  the distance between the atoms in the single mols. In the determination of permitted energy levels, the difference between *o*- and *p*- $H_2$  must be considered. There is a measurable difference between the virial coeffs. of these two forms of  $H_2$ . A. J. M.

**Modern representations of chemical combination.** H. FROMHERZ (Angew. Chem., 1936, 49, 429—437).—A brief elementary review of quantum mechanics and of the electronic structure of simple compounds. E. W. W.

**Form of [the] nitrous oxide molecule.** C. E. SUN and T. Y. WU (J. Chinese Chem. Soc., 1936, 4, 340—343).—The calc. binding energies for the mols. are: NON 144.6, NNO 197.6, OCO 248.5, and COO 202.2 kg.-cal., in agreement with a symmetrical mol. for  $CO_2$  and an asymmetric form for  $N_2O$ . J. G. A. G.

**Normal vibrations and the isotope effect of molecules of the type  $X_2Y_N$  with an *N*-fold axis of symmetry.** H. SCHIMMEL (J. Chem. Physics, 1936, 4, 508—512).—Mathematical. Frequencies, and shifts of frequency due to isotopes, are calc. in terms of the masses, geometrical consts. of the mol., and parameters of a general quadratic potential energy form, with sp. reference to the  $X_2Y_3$  mol. J. G. A. G.

**Electron affinity of bromine atoms from space-charge effects.** G. GLOCKLER and M. CALVIN (J. Chem. Physics, 1936, 4, 492—493; cf. A., 1935, 129).—The electron affinity of Br atoms determined by using a hot W filament in Br vapour is  $88 \pm 3.4$  kg.-cal. J. G. A. G.

**Transfer of translational and vibrational energy in oxygen as influenced by small im-**

purities of water or ammonia vapour. V. O. KNUDSEN and L. ORERT (Physical Rev., 1935, [ii], 47, 256).—For mol. collisions in  $O_2$ , the no. of transitions from the excited to the normal state per mol. per sec. is practically a linear function of  $[NH_3]$ , and a quadratic function of  $[H_2O]$  when these concns. are small. L. S. T.

**Collision frequency in solutions.** K. S. G. DOSS (Proc. Indian Acad. Sci., 1936, 4, A, 23—26).—An interpretation of a collision in solution is given on the basis of Wheeler's theory of liquids (cf. A., 1934, 1159). The expressions for the collision frequencies are similar to those obtained by other methods and used in interpreting the kinetics of reactions in solution. N. M. B.

**Collision mechanism and the primary photochemical process in solutions.** E. RABINOWITCH and W. C. WOOD (Trans. Faraday Soc., 1936, 32, 1381—1387).—Theoretical. E. S. H.

**X-Ray interference at the diamond as a wave-mechanics problem. II. Linear chains of atoms.** P. P. EWALD and H. HONL (Ann. Physik, 1936, [v], 26, 673—696; cf. this vol., 412).—Theoretical. The charge distribution in a linear chain of atoms is calc. A. J. M.

**Atomic forces of solid states. III.** W. WEN-PO (Phil. Mag., 1936, [vii], 22, 281—286; cf. this vol., 1052).—Mathematical. N. M. B.

**Quantum-mechanical calculation of the variation of lattice energy with lattice separation in the sodium chloride lattice.** R. LANDSHOFF (Z. Physik, 1936, 102, 201—228).—Mathematical. A general formula for the lattice energy of an alkali halide crystal is derived in terms of electrostatic interaction and exchange energies. Using the wave functions for  $Na^+$  and  $Cl^-$  calc. by Hartree and Fock, the lattice energy of the NaCl crystal is calc. A. J. M.

**Lattice theory of alkaline-earth carbonates. I. Lattice energy of crystals of aragonite type and their thermochemical applications.** B. Y. OKE (Proc. Indian Acad. Sci., 1936, 4, A, 1—10).—The lattice energies of the orthorhombic crystals aragonite,  $SrCO_3$ , and  $BaCO_3$  are calc. The stabilising forces other than the electrostatic attractions and repulsions of the charges are investigated with the help of compressibility measurements. The lattice energy vals. are verified by a thermochemical cyclic process. N. M. B.

**Energy levels of the asymmetrical rotator in the new quantum theory.** E. E. WITMER (Physical Rev., 1935, [ii], 47, 340).—Mathematical. L. S. T.

**Modification of the Heitler and London method.** C. ZENER (Physical Rev., 1935, [ii], 47, 334). L. S. T.

**Free and total surface energies and related quantities.** A. FERGUSON and S. J. KENNEDY (Trans. Faraday Soc., 1936, 32, 1474—1481).—Surface energy data for supercooled liquids at 0° abs. have been calc. from published work. E. S. H.

**Intensity of reflexion of X-rays from calcite.** P. E. TAHVONEN (Soc. Sci. fenn., Comm. phys.-

math., 1935, 8, No. 6, 1—84; Chem. Zentr., 1935, ii, 3637).—Intensities measured indicate a more ideal lattice than was found by Bragg. The effective absorption coeff. as measured by Bragg *et al.* gives too high vals. J. S. A.

**Study of the orientation of inclined aluminium wires and foil by means of Weissenberg's Röntgen goniometer.** J. PALACIOS and J. GARCÍA DE LA CUEVA (Anal. Fis. Quim., 1934, 39, 774—778; cf. A., 1935, 433).—The interference diagrams obtained with Al wire inclined at various angles to the axis of rotation of the apparatus are used to determine the orientation of the crystals. F. R. G.

**Supercooling.** A. GOETZ (Physical Rev., 1935, [ii], 47, 257; cf. A., 1935, 151).—In metals, supercooling is the more likely the more the lattice of the crystal differs from a close-packed configuration and the more groups of paracryst. qualities have been destroyed in the fused mass. L. S. T.

**Effect of sudden heating on the recrystallisation of metals.** U. YOSHIDA, S. NAGATA, and C. MITSUKI (Mem. Coll. Sci. Kyoto, 1936, 19, 169—180).—The grain no. is much greater when a thin Al plate is heated suddenly to a given temp. than when gradual heating is employed. C. W. G.

**Lattice constant of pure aluminium.** A. LEVINS and M. STRAUMANIS (Z. physikal. Chem., 1936, B, 33, 265—274).—The val. is  $4.04146 \pm 0.00003$  A. at  $25^\circ$  and  $4.04078 \pm 0.00002$  A. at  $18^\circ$ . The coeff. of expansion is  $23.13 \times 10^{-6}$ . R. C.

**Crystal structure of  $\beta$ -manganese.** T. A. WILSON (Physical Rev., 1935, [ii], 47, 332).— $\beta$ -Mn is cubic,  $a$  12.58 A.,  $d_{\text{calc.}}$  7.29; space-group  $O_h^2$ , with 160 atoms per cube. L. S. T.

**X-Ray studies on electro-deposited silver.** S. BASU and M. HUSSAIN (Indian J. Physics, 1936, 10, 267—274).—The effect of c.d. on the brightness and hardness of electro-deposited Ag films has been investigated by X-ray methods. The brightness, determined photographically, decreases with increase of c.d. The diffracted lines from 111, 200, and 311 planes are the most intense, and decrease in intensity with increasing c.d. The Brinell hardness of the deposit showed no relationship between degree of orientation of crystallites and hardness, but the breadth of X-ray lines increases with hardness. A. J. M.

**Polymorphic transformations of simple ionic lattices. II. Transformation of sodium chloride lattice into caesium chloride lattice.** G. WAGNER and L. LIPPERT (Z. physikal. Chem., 1936, B, 33, 297—303; cf. this vol., 416).—RbCl condensed from the vapour on TiCl at  $-190^\circ$  has the CsCl lattice with  $a_w$  3.74, A.,  $d$  3.80. At room temp. it changes to the NaCl lattice. R. C.

**Crystal structure of  $\text{Co}_9\text{S}_8$  and of pentlandite  $(\text{Ni,Fe})_9\text{S}_8$ .** M. LINDQVIST, D. LUNDQVIST, and A. WESTGREN (Svensk Kem. Tidskr., 1936, 48, 156—160).—Synthetic and recryst. specimens were prepared. The 111 line of cubic Co is faintly but clearly present in a prep. containing 46 at.-% S, but is absent from one with 48 at.-% S, while a few faint lines belonging to CoS are seen in the latter. In the  $\text{Co}_9\text{S}_8$  structure,

the S are in cubic close-packing, and the Co are located in the interstices. Photographs of  $\text{Co}_9\text{S}_8$  and pentlandite are almost identical; formula  $(\text{Ni,Fe})_9\text{S}_8$  is suggested for the latter. D. C. J.

**Crystalline structure of calcium sulphate dihydrate (gypsum).** J. PALACIOS and E. E. GAL-LONI (Anal. Fis. Quim., 1934, 32, 779—786).—A more detailed account of matter previously abstracted (this vol., 783). F. R. G.

**Lattice constant of topaz.** S. ELG (Z. Physik, 1936, 101, 113—116).—This is 4186.97 X.

A. B. D. C.

**Fine structure and transformations of alkali salts of long-chain fatty acids.** P. A. THIESSEN and J. STAUFF (Z. physikal. Chem., 1936, 176, 397—429; cf. A., 1933, 1004).—The unit cell of rhombic Na stearate (I) contains 8 mols. and has  $a$  8.04,  $b$  9.24,  $d$  12.25,  $c$  51.77 A.; space-group  $D_{2h}^2$ . Rhombic Na palmitate (II) has  $a$  8.06,  $b$  9.24,  $c$  47.70. In both the mols. are arranged along the  $c$  axis in pairs, one behind the other. On heating from room temp. (I) and (II) undergo irreversible transformation into a monoclinic  $\beta$ -form at  $52^\circ$  and  $42^\circ$ , respectively. The ordinary ( $\alpha$ ) forms are partly unstable, the sp. vols. and sp. heats being  $<$  those of the  $\beta$ -forms. The  $\beta$ -form of (I) has  $a$  7.80,  $b$  5.33,  $c$   $\sin \beta = 46.10$  A. and 4 mols. in the unit cell; probable space-group  $C_{2h}^2$ . The  $\beta$ -form of (II) has  $a$  7.83,  $b$  5.40,  $c$   $\sin \beta = 42.10$  A. The existence of  $\alpha$ - and  $\beta$ -forms is due to the ionic linking between the Na and the fatty acid residue, the  $\text{CO}_2\text{Na}$  constituting a dipole and the two forms corresponding with two orientations of the mol. dipoles in the double mol. In the  $\alpha$ -forms the lattice structure is determined by mol. cohesion forces, in the  $\beta$ -forms by these forces together with polar orienting forces. Above the genotypic transformation point the orientation effect is dominant. R. C.

**X-Ray scattering and the polarisation field of di-, tetra-, and deca-hydronaphthalene.** M. S. JEGLEKAR (Z. Physik, 1936, 101, 398—404).—The polarisation field for  $\text{C}_{10}\text{H}_{18}$  is less anisotropic than that for  $\text{C}_{10}\text{H}_8$  (cf. Krishnan and Rao, A., 1929, 1129). A. B. D. C.

**Comparison by X-ray diffraction of  $p$ -azoxy-anisole in liquid and liquid-crystalline phases.** H. R. LETNER and G. W. STEWART (Physical Rev., 1935, [ii], 47, 332; cf. this vol., 670). L. S. T.

**Geometrical and optical study of  $p$ -azoxyphenetole crystals.** P. CHATELAIN (Compt. rend., 1936, 203, 266—268).— $p$ -Azoxyphenetole crystals have  $a$  15.9,  $b$  5.42,  $c$  17.5 A.,  $\beta$   $94^\circ 20'$ ,  $d$  1.253. The unit cell contains 4 mols. Refractivity data are also recorded. J. W. S.

**X-Ray study of the phthalocyanines. II. Quantitative structure determination of the metal-free compound.** J. M. ROBERTSON (J.C.S., 1936, 1195—1209; cf. A., 1935, 813).—Bv comparison of the abs. measurements of corresponding reflexions of phthalocyanine and of its Ni derivative, the 300 significant phase consts. of the ( $h0l$ ) zones of the two compounds have been determined. Fourier analysis of the results determined two co-ordinates for each C and N in the structure and the regularity

of the projection indicate that the mol. is planar. The orientation of the mol. in the crystal is deduced and the third co-ordinate of the atoms calc. The results confirm Linstead's structure (A., 1934, 1114). The inner porphyrin nucleus comprises a closed system of 8 C and 8 N in a state of double linking—single linking resonance, with an interat. distance of  $1.34 \pm 0.03$  Å. This system is linked to the four  $C_6$  rings by C—C linking  $1.49 \pm 0.03$  Å. long, including a smaller % of double-linking character, these linkings being strained  $15^\circ$  from their normal positions. The whole mol. shows slight distortion from true tetragonal symmetry, probably owing to internal H—H linking between the two isoindole N atoms. In the crystal the planes of adjoining mols. are almost at right angles and the (min.) intermol. approach distance is 3.35 Å. The perpendicular distance between the mol. planes of parallel mols. is 3.38 Å. J. W. S.

**Diffraction of electrons by graphite.** G. I. FINCH and H. WILMAN (Proc. Roy. Soc., 1936, A, 155, 345—365).—Both artificial and natural graphite powders give many diffractions which do not seem to fit in with the structure deduced for graphite from X-ray data. These "extra" diffractions are not due to impurities or to lattice dimension deviations. Thin single crystals of graphite also give the "extra" diffractions, whereas thick crystals give Kikuchi line systems which confirm the assigned X-ray structure. It is concluded that the "extra" diffractions obtained with thin crystals are due to the fact that the graphite lattice, though unbounded in the cleavage plane direction, is limited in the other dimensions by the thinness of the crystal, so that diffractions of fractional  $l$  index and those normally forbidden by structure factor considerations can occur. Experimental evidence in support of this theory is adduced. L. L. B.

**Examination of cellulose by electron diffraction.** G. NATTA and M. BACCAREDDA (Atti R. Accad. Lincei, 1936, [vi], 23, 444—448).—Thin laminae of cellulose (I) from solutions prepared by dissolving (I) in 1% NaOH at 8 atm. pressure give an X-ray lattice of  $a$  8.60,  $b$  10.30,  $c$  8.07 Å.,  $\beta$   $82^\circ$ . Preps. from (I) in Schweitzer's reagent give similar data ( $a$  8.25 Å.), the vol. of the unit cell being  $672 \times 10^{-24}$  c.c. F. O. H.

**Intensity distribution in electron patterns.** K. LARK-HOROVITZ, H. J. YEARMAN, and J. D. HOWE (Physical Rev., 1935, [ii], 47, 331).—The intensity distribution in the electron diffraction patterns of thin films of Bi, Cd,  $Ca(OH)_2$ , Cu,  $Cu_2O$ , Au,  $Na_3N$ , Ni, W oxide, Zn, ZnO, and ZnS obtained with cathode rays from a 50—80-kv. gas discharge is discussed. L. S. T.

**Kikuchi envelopes.** M. VON LAUE (Physikal. Z., 1936, 37, 544—547).—Mathematical. A. J. M.

**Optical and electrical properties of thin metallic films at low temperatures.** T. FUKUROI (Bull. Inst. Phys. Chem. Res. Japan, 1936, 15, 663—673).—The decrease in electrical resistance on exposure to ultra-violet light has been studied at low temp. with films of Hg, Cd, and Zn condensed on glass and quartz, and is explained by the photo-electric effect of colloidal particles. R. S. B.

**Production of piezoelectricity by torsion.** R. E. GIBBS and L. C. TSIEN (Phil. Mag., 1936, [vii], 22, 311—322).—The production of piezoelectricity by torsion is considered for right circular cylinders of quartz cut with their axes parallel to the optic axis. Available data agree with the formula deduced. The Lindemann electrometer was suitable for the study of piezoelectricity and demonstrated the static development of vol. charges. Torsional oscillations have been produced in both hollow and solid cylinders, and were studied by the glow discharge, dust, and polarised light methods. N. M. B.

**Influence of tension, pressure, and torsion on longitudinal magnetostriction.** H. KIRCHNER (Ann. Physik, 1936, [v], 27, 49—69).—The influence of tension, pressure, and torsion on the saturated longitudinal magnetostriction  $\lambda$  of Ni containing 0.05% Be and alloys of Fe and Ni containing 15% and 50% Ni (0.5% Mn present as impurity) have been investigated. For Ni,  $\lambda$  increases to a limiting val.,  $1.5\lambda_0$ , with tension, decreases rapidly to zero with pressure, and decreases to a limiting val.,  $0.72\lambda_0$ , with torsion. O. D. S.

**Influence of elastic strains on the alternating current magnetisation curve.** H. LITTMANN (Ann. Physik, 1936, [v], 27, 186—200).—The influence of tension, torsion, and annealing on the  $\mu$ - $H$  curve at 50 Hz. of Ni, Ni-Fe alloys, and permalloy C has been investigated for longitudinal and circular magnetisation. Tension causes a decrease of  $\mu$  and a flattening of the  $\mu$ - $H$  curve for longitudinally magnetised Ni and circularly magnetised alloys, and an increase of  $\mu$ , at high field strength, in circularly magnetised Ni and longitudinally magnetised alloys. This is in agreement with the theory of Becker. O. D. S.

**Magnetic properties of nickel up to the Curie point.** W. SCHNABL (Ann. Physik, 1936, [v], 27, 169—185).—Permeability of Ni is measured at 0, 50, and 500 Hz. from room temp. to  $326^\circ$ . A dependence of magnetic losses on frequency is observed, not accounted for by eddy current losses. O. D. S.

**Magnetic anisotropy of nickel-cobalt single crystals.** J. W. SHIR (Physical Rev., 1936, [ii], 50, 376—379; cf. A., 1934, 1061).—The direction for easiest magnetisation changes from  $\langle 111 \rangle$  to  $\langle 100 \rangle$  as the Co content increases 3—10%, and changes back to  $\langle 111 \rangle$  when Co exceeds 20%. Anisotropy const. calc. for monocryst. and polycryst. specimens diverged beyond the limits of experimental error. N. M. B.

**Measurement of permeability by means of skin effect.** R. BECKER (Ann. Physik, 1936, [v], 27, 123—128; cf. Kreielsheimer, A., 1933, 76).—Theoretical. O. D. S.

**Ising's model of ferromagnetism.** R. PEIERLS (Proc. Camb. Phil. Soc., 1936, 32, 477—481).—O. D. S.

**Crystal structure and ferromagnetism of the transition metals.** U. DEHLINGER (Z. Metallk., 1936, 28, 117—121).—A crit. review of recent work and theories. A. R. P.

**Magnetic and electrostatic energy. Thermodynamics of magnetisation.** E. A. GUGGENHEIM

(Proc. Roy. Soc., 1936, A, 155, 49—70, 70—101).—Mathematical.

**Magnetisation curves of a superconducting sphere and ring.** D. SHOENBERG (Proc. Roy. Soc., 1936, A, 155, 712—726).—The magnetisation curve of a superconducting pure Pb sphere has been measured by the Faraday method. It consists of two straight lines, one of which corresponds with transition between the superconducting and normal states.

L. L. B.

**Galvomagentic effects in bismuth.** H. JONES (Proc. Roy. Soc., 1936, A, 155, 653—663).—Mathematical. The change of resistance in a magnetic field and the Hall coeffs. of Bi crystals are calc. The large galvomagentic effects observed are accounted for by the theory previously proposed to explain the diamagnetic properties of Bi (A., 1935, 153). Minute traces of impurity have a great effect on the galvomagentic properties.

L. L. B.

**Theory of constant paramagnetism. Application to manganese.** L. NÉEL (Compt. rend., 1936, 203, 304—306).—Mathematical. The occurrence of a break in the sp. heat curve of Mn at the same temp. (628° abs.) at which the susceptibility commences to vary with temp. is in agreement with the author's theory.

C. R. H.

**Permanent magnetisation of steel in the neighbourhood of a circuit carrying a rapid aperiodic discharge.** R. CHEVALLIER and M. LAPORTE (Compt. rend., 1936, 203, 302—304).—Near to the circuit steel needles are magnetised in the opposite sense to the field. On moving away from the circuit the magnetisation decreases and, after passing through a neutral point, increases in the same sense as the field. A few cm. from the circuit a max. val. is reached, followed by a decrease.

C. R. H.

**Influence of traces of slip planes on glow emission.** II. H. MAHL and D. SCHENK (Z. Physik, 1936, 101, 117—120; cf. this vol., 537).—Lines of different emissivity are visible on metal crystal surfaces with a layer of electropositive atoms, and these lines represent traces of slip planes.

A. B. D. C.

**Effect of recrystallisation on the emission of platinum.** F. SCHUBERT (Physikal. Z., 1936, 37, 595—598).—The degree of polarisation of radiation emitted from Pt after it had been heated to temp. above the recryst. temp. was investigated. The theoretical degree of polarisation is not reached as the emitted radiation contains a proportion of unpolarised radiation arising from the boundaries of the crystallites. If this is corr. by investigation of photomicrographs of the Pt surface, together with other phenomena, the experimental val. for the degree of polarisation agrees with that calc. from the known optical consts. of Pt. There is no effect of temp. on the optical consts. of Pt up to 1275°.

A. J. M.

**Optical properties of magnesium oxide.** R. T. BRICE and J. STRONG (Physical Rev., 1935, [ii], 47, 255—256).— $n$  has been measured for  $\lambda\lambda$  in the visible and ultra-violet; transmission limit, approx. 2200 Å. Windows of MgO in high-temp. furnaces withstand

etching by Li, Na, K, and Ca better than other materials.

L. S. T.

**Optical properties of sputtered metal films.** J. B. NATHANSON and H. S. SEIFERT (Physical Rev., 1935, [ii], 47, 328).—Comparison of computed and observed masses of Cu films, produced by sputtering in H<sub>2</sub>, indicates a higher  $u$  and/or lower  $d$  for the films compared with the metal in bulk.

L. S. T.

**Optical and electrical properties of thin metallic films at low temperature.** T. FUKUROI (Bull. Inst. Phys. Chem. Res. Japan, 1936, 15, 411—429).—The spectral reflectivity for light and the electrical conductivity at liquid air temp. of Hg, Cd, and Zn films condensed from vapours have been investigated, and the reflectivity result for Hg is compared with that based on a theory of spherical colloidal film particles.

N. M. B.

**Birefringence of potassium chloropalladite and potassium chloroplatinite.** D. P. MELLOR and F. M. QUODLING (J. Proc. Roy. Soc. New South Wales, 1936, 69, 167—170).—Both K<sub>2</sub>PdCl<sub>4</sub> and K<sub>2</sub>PtCl<sub>4</sub> are optically negative and strongly birefringent,  $n$  being greater for a polarised ray with its electric vector in the plane of MX<sub>4</sub> than for the perpendicular polarised ray. This indicates a planar structure for MX<sub>4</sub> in these compounds, agreeing with results of X-ray analysis.

A. J. M.

**Elastic constants of alkali halides.** J. A. VASASTJERNA (Soc. Sci. fenn., Comm. phys.-math., 1935, 8, No. 9, 1—9; Chem. Zentr., 1935, ii, 3629—3630).—Theoretical. The compressibility of NaCl-type crystals is expressed as a function of the elastic consts.

J. S. A.

**Quantum theory calculations for alkali halide lattices.** H. JENSEN (Z. Physik, 1936, 101, 164—185).—Exchange energies are calc. by the statistical method for ion cores in alkali halide crystals. Born's repulsive forces arise from the Pauli principle rather than from electrostatic interaction. Lattice consts., compressibilities, and infra-red frequencies are deduced.

A. B. D. C.

**Modulus of elasticity of certain definite intermetallic compounds.** A. PORTEVIN and L. GUILLET, jun. (Compt. rend., 1936, 203, 237—239).—Intermetallic compounds are of two classes, those of metallic type (e.g., CuZn, Ag<sub>3</sub>Sb, and MgZn<sub>2</sub>) having elastic moduli approximating to the val. anticipated from the law of mixtures, and those of homopolar type (e.g., CuZn<sub>6</sub>, Cu<sub>31</sub>Sn<sub>8</sub>, and Cu<sub>9</sub>Al<sub>4</sub>) for which the moduli exceed considerably the val. anticipated theoretically.

J. W. S.

**Plasticity of metal crystals and its significance for the properties of metals.** G. WASSERMANN (Z. Ver. deut. Ing., 1936, 80, 283—287).—Deformation of metals is caused by the crystallographic process of translation and mechanical twinning. Examples are given to illustrate how knowledge of the properties of single crystals can help in elucidating and controlling the behaviour of materials.

R. B. C.

**Two forms of phosphorus pentachloride.** H. MOUREU, M. MAGAT, and G. WETROFF (Compt. rend.,

1936, 203, 257—259).— $\text{PCl}_5$  in a sealed vessel under its own v.p. melts over the range 159—160.5°, even when extremely pure. On cooling, crystals form at 157° but the temp. of arrest is always lower (148—154°). This behaviour is attributed to a mol. transformation at the m.p. This view is supported by the fact that the Raman spectrum of fused  $\text{PCl}_5$  shows seven frequencies distinct from those of the solid and not attributable to  $\text{PCl}_3$  or  $\text{Cl}_2$ . J. W. S.

The liquid state and theory of fusion. II. Theory of fusion and crystallisation. J. FRENKEL (Acta Physicochim. U.R.S.S., 1935, 3, 913—938; cf. A., 1935, 1062).—The continuity of the solid, liquid, and gaseous states is stressed, and a theory is outlined which points to a liquid  $\rightarrow$  solid  $pv$  curve of the same form as the van der Waals liquid  $\rightarrow$  gas curve. It is suggested that there is a lower crit. temp. below which the cryst. and amorphous phases cannot coexist. R. S.

Liquid state and the theory of fusion. J. FRENKEL (Acta Physicochim. U.R.S.S., 1935, 3, 633—648).—A detailed mathematical treatment of a theory previously outlined (cf. A., 1935, 1062). C. R. H.

Liquid state. W. H. RODEBUSH (Physical Rev., 1935, [ii], 47, 513). L. S. T.

Fatty acids and their esters. I. Cryoscopy and ebullioscopy of fatty acids. II. Mol. wts. of polymerised esters.—See this vol., 1229.

Electrical resistance of liquid helium. M. WOLFKE and W. H. KEESOM (Physica, 1936, 3, 823—824).—The resistance of liquid helium from 1.28° to 4.22° abs. is  $<10^{15}$  ohm.cm. O. D. S.

Electric conductivity of Rochelle salt single crystals under mechanical stress. F. SEIDL (Z. Physik, 1936, 101, 234—254).—The lowest sp. resistance at 24° is  $10^{13}$  to  $10^{14}$  ohm.cm.; this increases with mechanical strain of the crystal and with defects in the crystal. A. B. D. C.

Micro-resistance of superconductors. P. GRASSMANN (Physikal. Z., 1936, 37, 569—578).—The method of Onnes for the determination of very small resistances has been improved and used to find the resistance of superconductors at temp. below the transition point. The resistance of a film of Sn, 6.5  $\mu$  thick, on Cu is  $<10^{-14}R$  ( $R$ =resistance at room temp.), whilst that of a film of Pb, 3.5  $\mu$  thick, is  $<0.5 \times 10^{-15}R$ . For c.d. up to  $4 \times 10^5$  amp. per sq. cm. there was no perceptible decrease in current in this Pb film. There is, therefore, no additional effect causing loss of energy at high electron velocities. It is calc. that at least one atom in  $10^4$  must furnish a superconducting electron. A. J. M.

Magnetic transition curves of superconductors. R. FEIERLS (Proc. Roy. Soc., 1936, A, 155, 613—628).—Mathematical. An attempt is made to generalise the arguments of Gorter and Casimir (A., 1934, 480) to bodies of different shape, in particular to spheres and ellipsoids. The new feature of such bodies is that in an increasing external field superconductivity disappears gradually, the range of fields over which this process takes place being the greater, the greater

is the demagnetising factor of the body. The existence of a "transition state," intermediate between the superconducting and the normal states, is assumed. L. L. B.

Transition between the superconducting and normal state. I. Magnetic induction in mercury. K. MENDELSSOHN (Proc. Roy. Soc., 1936, A, 155, 558—570).—The change of induction from 0 to its normal val. of long-shaped Hg specimens when passing from the superconducting to the normal state has been found to be discontinuous. A more gradual change is observed on passing from the normal to the superconducting state. L. L. B.

Sound velocity in gas mixtures at high temperatures. H. PORITSKY and C. G. SURTS (Physical Rev., 1935, [ii], 47, 335).—Experimental vals. of the velocity in atm.-pressure arcs in air are interpreted in terms of temp. of the gas. L. S. T.

Sound absorption and velocity in mixtures. D. G. BOURGIN (Physical Rev., 1936, [ii], 50, 355—369; cf. A., 1933, 217).—Mathematical. The effects of collision excitation probabilities dependent on the internal energy specification of the impinging mols., transitions in both colliding members, triple and higher order collisions, and viscosity and conduction are considered with reference to sound propagation. The triple collision hypothesis for H—O—O<sub>2</sub> mixtures is discussed. Formulæ, in convenient form for application, for absorption and velocity in mixtures are deduced. N. M. B.

Dispersion of acoustic velocity in organic liquids. S. PARTHASARATHY (Proc. Indian Acad. Sci., 1936, 4, A, 17—22).—Data for acoustic velocities of 16 org. liquids, determined at about  $7 \times 10^6$  and  $20 \times 10^6$  cycles per sec., are tabulated. No dispersion in velocity was found. N. M. B.

Ultrasonic velocities in organic liquids. IV. Halogen compounds. V. Some related groups. S. PARTHASARATHY (Proc. Indian Acad. Sci., 1936, 3, A, 519—522; 4, A, 59—63; cf. this vol., 929).—IV. Data for ultrasonic velocities, at about  $7.32 \times 10^6$  frequency, for 15 aliphatic and aromatic halogen compounds, and calc. adiabatic compressibilities show, in general, that introduction of a heavier atom lowers acoustic velocity, and the presence of a double linking favours lowering of velocity.

V. Ultrasonic velocities and adiabatic compressibilities are tabulated for 2-, 3-, and 4-methylcyclohexanol, 2- and 4-methylcyclohexanone, *tert*.-C<sub>5</sub>H<sub>11</sub>.OH, *sec*.-octyl alcohol, mesitylene, CH<sub>2</sub>Ph<sub>2</sub>, decahydronaphthalene, *p*-cymene,  $\beta$ -picoline, MeCN, and PhNCS. The relation between sound velocities and chemical constitution is discussed. N. M. B.

Dependence on temperature of the absorption coefficients of ultrasonic waves in liquids. C. SORENSEN (Ann. Physik, 1936, [v], 27, 70—74; cf. this vol., 787).—Data are recorded for frequencies of 530—950 kHz. For COMe<sub>2</sub>, EtOH, PhMe, and xylene the absorption coeff.,  $\alpha$ , increases with  $T$ . For C<sub>6</sub>H<sub>6</sub>  $\alpha$  is independent of  $T$  at 950 kHz. and increases with  $T$  at 530 kHz. For H<sub>2</sub>O  $\alpha$  decreases with  $T$  less rapidly than is predicted by theory. O. D. S.

**Velocity of propagation of ultrasonic waves in colloidal solutions.** A. PASSINSKI (Acta Physicochim. U.R.S.S., 1935, 3, 779—782).—The velocity of propagation of ultrasonic waves in  $\text{Fe}_2\text{O}_3$  sol, a solution of crêpe rubber in  $\text{C}_6\text{H}_6$ , cellulose nitrate in  $\text{COMe}_2$ , and gelatin in  $\text{H}_2\text{O}$  is little different from that in the pure solvents  $\text{H}_2\text{O}$ ,  $\text{C}_6\text{H}_6$ ,  $\text{COMe}_2$ , and  $\text{H}_2\text{O}$ , respectively. R. S.

**Influence of ultrasonic waves on the process of solidification of molten metals.** S. SOKOLOV (Acta Physicochim. U.R.S.S., 1935, 3, 939—944).—The period of const. temp. in the solidification of Zn is diminished by ultrasonic waves and the rate of formation of crystals is accelerated. R. S.

**Constant paramagnetism. I, II. Diamagnetic compounds containing a transition element.** D. P. RAYCHAUDHURI and P. N. SENGUPTA (Indian J. Physics, 1936, 10, 245—251, 253—266).—I. The susceptibilities of  $\text{TiO}_2$ ,  $\text{V}_2\text{O}_5$ ,  $\text{NH}_4\text{VO}_3$ ,  $\text{NaVO}_3$ ,  $\text{KMnO}_4$ , and  $\text{K}_2\text{Cr}_2\text{O}_7$  have been determined. The temp. coeff. of susceptibility is negative for  $\text{V}_2\text{O}_5$  and  $\text{KMnO}_4$ , but is positive for  $\text{K}_2\text{Cr}_2\text{O}_7$ . The const. at. susceptibilities of the elements from V to Mn depend on the no. of electrons in the  $d$  shell in a similar way to the dependence of the Bohr magneton no. for these elements. It is suggested that Fe, Co, and Ni will have const. paramagnetic at. susceptibility.

II. The mol. susceptibilities of a no. of co-ordination compounds containing transition elements have been collected. The at. susceptibility of the magnetogenic atom is not const., but is greater when the attached groups have a high dipole moment.

A. J. M.

**Magnetic properties of antimony.** D. SHOENBERG and M. Z. UDDIN (Proc. Camb. Phil. Soc., 1936, 32, 499—502).—The mass susceptibilities of Sb parallel and perpendicular to the trigonal axis,  $\kappa_3$  and  $\kappa_1$ , have been measured from 4° abs. to room temp.  $\kappa_1$  is independent of  $T$ .  $\kappa_3$  decreases with  $T$ . Both  $\kappa_1$  and  $\kappa_3$  are independent of field. O. D. S.

**Exaltation of the magnetism of ferric oxide by calcination in presence of ashless filter-paper.** C. COURTY (Compt. rend., 1936, 203, 369—371).—Magnetic determinations show the presence of about 0.002 mg. of Fe in the ash of a 50-mm. ashless filter-paper. R. S.

**Magnetism and cold-working in metals. I. Polycrystals.** S. R. RAO (Proc. Indian Acad. Sci., 1936, 4, A, 37—53).—Cold-working causes a marked decrease in the diamagnetic susceptibility of Bi, a small decrease for Zn and Cd, and a decrease in the paramagnetic susceptibility of white Sn with a change of sign below a particular density. The nature of polycryst. metals is discussed and attention is drawn to a deformed boundary between the small crystals in the metal. Explanations of the susceptibility changes are offered on the basis of the distorted layer and the particle sizes of metallic colloidal powders (cf. A., 1935, 19). N. M. B.

**Paramagnetism of the  $\text{Mn}^{++}$  ion in the  $S$  state.** S. S. BHATNAGAR, M. B. NEVGI, and R. L. SHARMA (Phil. Mag., 1936, [vii], 22, 409—414).—From

measurements on anhyd. Mn acetate, formate, lactate, and oxalate, sp., mol., and ionic susceptibilities at 32°, 70°, and 122° are obtained and magneton vals. of  $\text{Mn}^{++}$  and the Mn salts are calc.; the vals. in the two cases are almost the same, and for  $\text{Mn}^{++}$  the simple Curie law is valid. N. M. B.

**Variations of the magnetic moment of the cobalt ion in the anhydrous chloride and in the mixed crystal systems  $\text{CoCl}_2\text{--CdCl}_2$  and  $\text{CoCl}_2\text{--MnCl}_2$ .** G. FOEX and C. FEHRENBACH (Compt. rend., 1936, 203, 307—309).—Data for the magnetic moment show a distinct break in the curves at approx. 137°, the variation in moment being 1 magneton. The transition temp. and variation in moment are independent of the amount of added  $\text{CdCl}_2$  or  $\text{MnCl}_2$ . C. R. H.

**Kelvin temperature of the ice point.** J. R. ROEBUCK (Physical Rev., 1936, [ii], 50, 370—375).—The val. of the ice point is calc. from data on the Joule-Thomson effect and coeffs. of vol. and pressure expansion. Results are: air 273.158, He 273.168,  $\text{N}_2$  273.125, A 273.10, and the most probable val.  $273.16 \pm 0.02$ . N. M. B.

**Comparison of platinum resistance thermometers with the helium gas thermometer in the range 14—90° absolute.** F. HENNING and J. OTTO (Physikal. Z., 1936, 37, 601—609).—The variation of the resistance of Pt with temp. may be expressed by an equation with five consts. A. J. M.

**F.p. of palladium.** F. H. SCHOFIELD (Proc. Roy. Soc., 1936, A, 155, 301—308).—The f.p. of Pd, determined by measuring the ratio of brightness of black-body radiators held at the f.p. of Pd and Au, is  $1554.4 \pm 1^\circ$ , confirming the val.  $1555^\circ$  recommended in the specification for the International temp. scale. L. L. B.

**Representation of specific heats as a function of temperature.** P. DROSSBACH (Z. Elektrochem., 1936, 42, 372—373).—Theoretical. O. J. W.

**Electronic heat capacities of platinum and of copper.** J. A. KOK and W. H. KEESOM (Physica, 1936, 3, 872).—Preliminary. Equations are given for  $C_v$  of Pt and Cu valid for  $T < 14^\circ$  and  $T < 5^\circ$ , respectively. The electronic heat capacity of Pt is several times, and of Cu 1.5 times, the val. calc. for free electrons. O. D. S.

**Effect of rotational distortion on the thermodynamic properties of water and other polyatomic molecules.** E. B. WILSON, jun. (J. Chem. Physics., 1936, 4, 526—528).—Mathematical. Correction terms to be added to the free energy, entropy, and heat capacity,  $C_v$ , calc. for rigid rotation to allow for rotational distortion of the mols. have been calc. for  $\text{H}_2\text{O}$ ,  $\text{H}_2\text{S}$ ,  $\text{NH}_3$ ,  $\text{CH}_4$ , and  $\text{C}_2\text{H}_4$ . The correction for  $\text{H}_2\text{O}$  is approx. 0.5% of  $C_v$  and 0.032 e.u., but for heavy mols. the effect is quite small. J. G. A. G.

**Internal latent heat of vaporisation and orthobaric densities.** B. N. GREBENSCHTSCHIKOV (Bull. Univ. Asie Centrale, 1934, No. 19, 15—22).—The internal latent heat of vaporisation of a liquid is given by  $q - k(d_1 - d_2)^{n-1/3}$ , where  $k$  and  $n$  are consts., and  $d_1$  and  $d_2$  are the orthobaric densities of the liquid and vapour. R. T.

Internal and total latent heats of vaporisation of liquids, and their saturated vapour pressure. N. A. DE KOLOSOVSKI and A. ALIMOV (Bull. Univ. Asie Centrale, 1934, No. 19, 33—40).—Vals. are recorded for COMeEt, COMePr, MeI, EtI, EtBr, Et<sub>2</sub>CO, NH<sub>4</sub>Et, *cyclo*-hexane and -hexanone, and formulae connecting latent heat with v.p. and temp. are derived. R. T.

Application of kinetic theory to the problems of evaporation and sublimation of gases having more than one atom per molecule. H. A. GIDDINGS and P. D. CROUT (J. Math. Phys. Mass. Inst. Tech., 1936, 15, 124—178; cf. this vol., 558).—Mathematical. The conceptions developed previously are extended to polyat. gases, and comprehensive data and tables are furnished. J. W. S.

Volatility of red phosphorus. P. N. RAIKOV (Z. anorg. Chem., 1936, 228, 127—128).—No detectable volatilisation occurs at 100° and 0.5 mm. or on storage at room temp. for 1 year. E. S. H.

Vapour pressure of small drops and crystals. A. FRUMKIN and N. FUCHS (Acta Physicochim. U.R.S.S., 1935, 3, 783—790).—A kinetic derivation of the Kelvin equation for the v.p. of liquid droplets is given and the correction applicable to the equation in the case of cubical crystals has been derived. R. S.

Ruff's method for measurement of vapour pressures at high temperatures. Vapour pressures of zinc, cadmium, magnesium, calcium, strontium, barium, and aluminium fluorides. L. LE BOUCHER (Anal. Fis. Quím., 1934, 32, 1142—1156).—The v.p. of liquid ZnF<sub>2</sub>, CdF<sub>2</sub>, MgF<sub>2</sub>, CaF<sub>2</sub>, SrF<sub>2</sub>, and BaF<sub>2</sub>, and solid AlF<sub>3</sub> at different temp. have been measured by Ruff's spring-balance method. The calc. b.p./760 mm. are 1500°, 1748°, 2260°, 2500°, 2460°, and 2260° for the liquid fluorides, respectively; the calc. sublimation point for AlF<sub>3</sub> is 1260°. The curves log v.p.—1/T are straight lines which, in the case of the liquid fluorides, meet in a point when produced. The vals. of Trouton's const. are calc. L. A. O'N.

Evaporation from irregular surfaces. H. W. MELVILLE (Trans. Faraday Soc., 1936, 32, 1017—1020).—The effect of cracks in a surface on the v.p. (as determined by mol. distillation) is treated theoretically. If the condensation coeff. is 1 there is no increase in the rate of evaporation, but if it is <1 the rate of evaporation is increased by a relatively small factor, e.g., 1.3 for a condensation coeff. of 0.1. O. J. W.

Vapour pressure of red phosphorus. H. W. MELVILLE and S. C. GRAY (Trans. Faraday Soc., 1936, 32, 1026—1030; cf. this vol., 298).—The v.p. of red P has been redetermined by the method of evaporation in a vac. The vals. are given by  $\log_{10} p(\text{mm.}) = -4110/T + 1.1$ , and are about 10<sup>7</sup> times < the vals. obtained by the normal static method. The discrepancy is due to differences in the position of the equilibrium  $P_4 \rightleftharpoons 2P_2$ . O. J. W.

General physical foundations of real thermodynamics. V. JACZYNA, S. DEREVJANKIN, A. OBNORSKI, and T. PARFENTIEV (Z. Physik, 1936, 101,

77—85).—A discussion of the relations of quantum dynamics and thermodynamics. A. B. D. C.

Determination of the coefficient of accommodation from aspects of the temperature drop effect. H. S. GREGORY (Phil. Mag., 1936, [vii], 22, 257—265).—Mathematical. N. M. B.

Quantum theory of the non-ideal gas. I. Deviations from the classical theory. G. E. UHLENBECK and E. BETH (Physica, 1936, 3, 729—745).—Mathematical. An equation of state for a non-ideal gas is developed quantum-mechanically. The deviations from classical theory become important at low temp., below 75° abs. for He. O. D. S.

Proof of the selection theorem. V. JACZYNA (Z. Physik, 1936, 101, 139—140; cf. A., 1934, 1070). A. B. D. C.

Equations of state and thermodynamic functions for substances with variable specific heat. W. P. BOYNTON (Physical Rev., 1935, [ii], 47, 258).—Theoretical. L. S. T.

Time effects in the magnetic cooling method. I. W. HEITLER and E. TELLER. II. Conductivity of heat. H. FROHLICH and W. HEITLER (Proc. Roy. Soc., 1936, A, 155, 629—639, 640—652).—I. The time *t* necessary for the exchange of energy between the spins of a paramagnetic salt and the lattice vibrations has been calc. For the paramagnetic salts used hitherto for the magnetic cooling method, *t* is small enough for the successful application of the method for temp. >0.1—0.2° abs. and magnetic fields >1500 gauss, but rather too large for lower temp. and magnetic fields. For the nuclear spins in a diamagnetic insulating substance *t* is of the order of 10<sup>6</sup> years, whereas in a metal, *t* is, at 0.1° abs., of the order of 1 sec.

II. In paramagnetic salts at very low temp. the heat conductivity  $\lambda$  is due to the spins rather than to the lattice vibrations.  $\lambda$  (for Fe NH<sub>4</sub> alum)  $\propto T^{-2}$  or  $T^{-3/2}$ , approx., and at 0.06° abs. has a val. of the order 3 ergs per cm. sec. deg. L. L. B.

Thermal conductivity of electrets. G. GROETZINGER (Physikal. Z., 1936, 37, 589—592).—The thermal conductivity of beeswax, paraffin, and solid "cable oil" was determined first for the substances in the ordinary state, and then after they had been melted and allowed to cool in an electric field. The electrets formed by the latter process were found to possess a greater conductivity than the unpolarised substance. A. J. M.

Influence of magnetic fields on the heat conductivity of gases. II. Variation with angle between magnetic field and direction of heat flow. III. Variation with pressure at small gas pressures. H. SEFTLEBEN and J. PIETZNER (Ann. Physik, 1936, [v], 27, 108—116, 117—122; cf. A., 1933, 559).—II. The variation of the magnetic effect with the angle between lines of force and the direction of heat flow is found to be in good agreement with theory. The effect is greatest with magnetic field perpendicular to, and least with field parallel to, the direction of flow.

III. At pressures < 10 mm. the magnetic effect decreases with decreasing pressure, falling to zero

when mean free path is comparable with the dimensions of the containing vessel.

O. D. S.

**Dilatometric studies of pure liquids and azeotropic mixtures.** N. A. DE KOLOSOVSKI and E. N. IVANOVA (Bull. Univ. Asie Centrale, 1935, No. 20, 85—98).—The sp. vol.  $v$  at temp.  $t$  of a no. of liquids is given by  $v = v_0(1 + at + bt^2 + ct^3)$ , where  $v$  is the sp. vol. at  $0^\circ$ , and  $a$ ,  $b$ , and  $c$  are consts. Expressions connecting  $v$  with entropy, sp. heat, and thermodynamic potential are derived for a no. of pure liquids and azeotropic mixtures. The vol. changes associated with mixing the constituents of various azeotropic mixtures are shown to be positive or negative, depending on the temp., and are given by an expression in powers of  $t$ .

R. T.

(A) Thermal expansion of the crystal lattices of cadmium, osmium, and ruthenium. E. A. OWEN and E. W. ROBERTS. (B) Thermal expansion of beryllium. E. A. OWEN and T. L. RICHARDS (Phil. Mag., 1936, [vii], 22, 290—304, 304—311).—(A) Investigation by the X-ray method showed that Cd in the cast and sublimated forms has identical close-packed hexagonal structure;  $a$  2.9723<sub>8</sub>,  $c$  1.8853<sub>2</sub> Å. at  $18^\circ$ ,  $d$  8.646; the sublimated crystals showed a preferred orientation, the basal planes being perpendicular to the vapour stream direction. Expansion curves are given for the range 20—280°; the coeff. of expansion parallel to the hexagonal axis reaches a max. at about  $-160^\circ$  and then decreases continuously up to  $280^\circ$ , whilst the coeff. perpendicular to the axis increases over the range  $-220^\circ$  to  $280^\circ$ . At about  $250^\circ$  Cd is isotropic; there was no evidence of an allotropic change at  $60^\circ$ . Data for Os and Ru parallel and perpendicular to the hexagonal axis are given for the temp. range 20—600°. Coeffs. of linear expansion of Cd, Os, and Ru are tabulated.

(B) Be remained close-packed hexagonal over the range 20—550°;  $a$  2.2812<sub>4</sub>,  $c$  1.5682 Å. at  $20^\circ$ . Data for the coeff. of expansion of Be 99.8% pure are given for the range 20—550° along and perpendicular to the hexagonal axis; the coeff. in each case increases with rise of temp. Coeffs. of linear expansion are tabulated.

N. M. B.

**Expansion of copper from absolute zero to its m.p.** W. J. HARING and W. P. DAVEY (Physical Rev., 1935, [ii], 47, 337—338).—Total expansion has been measured from  $75^\circ$  to  $1356^\circ$  abs. and the curve extrapolated to  $0^\circ$  abs. The expansion from  $0^\circ$  abs. to the m.p. is 3.01% of the length at  $0^\circ$  abs. in agreement with the theory of melting of face-centred cubic substances. Expansion over this range is given by  $l_0(1 + \alpha t + \beta t^2)$  where  $\alpha$  and  $\beta$  are  $2.26 \times 10^{-5}$  and  $-2.44 \times 10^{-9}$ , respectively, between  $200^\circ$  and  $500^\circ$  abs., and  $2.08 \times 10^{-5}$  and  $1.66 \times 10^{-9}$ , respectively, between  $700^\circ$  and  $1200^\circ$  abs.

L. S. T.

**Atomic dimensions from the coefficients of compressibility and thermal expansion.** G. F. DJANG (J. Chem. Physics, 1936, 4, 530—532).—The equation of state for liquids and solids,  $p - K(V_T - V_0)/V_0 - RT/(V_T - V_0)$ , leads to  $\alpha/\beta = R/(V_T - V_0)$  where  $\beta$  and  $\alpha$  denote the coeffs. of compressibility and average thermal expansion, respectively,  $V_T$  and  $V_0$  are the mol. vols. at  $T^\circ$  abs. and  $0^\circ$  abs., respectively,  $R$  is the gas const.,  $p$  is the applied external pressure,

and  $K$  is an arbitrary const. The at. radii of a no. of elements calc. by means of the derived equation and the Loschmidt no. accord with vals. calc. from crystal data. The application of the equation to liquids and non-spherical mols. is discussed.

J. G. A. G.

**Compressibility coefficients of crystals.** V. ZDANOV (Z. Physik, 1936, 101, 86—92).—Morse's formula has been used to calculate the compressibility of Al, Fe, Cu, Ni, Ag, Au, Pt, NaCl, KCl, KBr, diamond, and ZnS crystals.

A. B. D. C.

**Viscosity of solids. Absorption frequencies of metals in the acoustic region.** K. BENNEWITZ and H. ROTGER (Physikal. Z., 1936, 37, 578—588).—The theory of viscosity of solids is treated from the point of view of the logarithmic decrement of periodic vibrations in the solid. The theory is tested by experiment over the frequency range 0.5—500 Hz.

A. J. M.

**Specific volume and gravity of solutions.** P. N. PAVLOV (Acta Physicochim. U.R.S.S., 1935, 3, 756—765).—Expressions are derived for the sp. gr. and sp. vol. of a solution and for the partial sp. gr. and sp. vol. of its components, and for the vol. changes which occur on dissolution.

C. R. H.

**Structure of solutions according to X-ray data.** V. DANILOV (Acta Physicochim. U.R.S.S., 1935, 3, 725—740).—X-Ray data for  $H_2O$  and Hg at low temp. are consistent with the view that at such temp. they are more akin to solids than to liquids. From intensity curves for 5*N*-HCl, 8*N*-HF,  $H_2O$ , 4.4*N*- and 8*N*-LiCl, it would seem, however, that in only a few cases do the data throw any light on the structure of solutions.

C. R. H.

**Magnetic susceptibility of aqueous nitric acid solutions.** S. P. RANGANADHAM and M. QURESHI (Z. physikal. Chem., 1936, B, 33, 290—296).—The susceptibility-concn. curve, which has been determined up to 64%  $HNO_3$ , is not linear and exhibits min. at  $HNO_3 \cdot 50H_2O$ ,  $HNO_3 \cdot 6H_2O$ ,  $HNO_3 \cdot 4H_2O$ , and  $2HNO_3 \cdot 5H_2O$ . The g.-ion susceptibility of the  $NO_3^-$  ion is  $-20.83 \times 10^{-6}$ . There is evidence for the depolymerisation of the  $H_2O$  at the higher concns.

R. C.

**Heats of mixing of anhydrous sulphuric and nitric acids.** R. DALMON (Compt. rend., 1936, 203, 250—252).—Data for the complete range of mixtures are recorded. With 1—8 wt.-%  $HNO_3$ , the heat liberated  $\propto$  the wt. of  $HNO_3$  added, indicating that the heat liberated  $\propto$  the quantity of  $N_2O_5$  formed (cf. this vol., 694).

J. W. S.

**Properties of metallic solutions.** V. K. SEMENTSCHENKO (Acta Physicochim. U.R.S.S., 1935, 3, 749—752).—The surface tension of amalgams of Pb, Sn, Ba, Li, Na, K, Rb, and Cs has been measured. The influence of the solute is determined by the difference between the "generalised moments" of solvent and solute.

C. R. H.

**Viscosity of sodium amalgams.** H. E. BENT and N. B. KEEVIL (J. Physical Chem., 1936, 40, 709—714).—The viscosities of liquid Na and Ag amalgams do not vary with time. No scum forms on Na amalgams in glass containers which have been baked

and evacuated. It is therefore improbable that Na amalgams are colloidal. J. W. S.

**Solidification diagram and electric conductivity of potassium-cæsium alloys.** E. RINCK (Compt. rend., 1936, 203, 255—257; cf. this vol., 559).—The liquidus and solidus curves show a sharp min. at  $-37.5^\circ$  for a 1:1 mixture. The conductivity isotherm for  $-39^\circ$  shows a min. at the same composition. The eutectic K+Cs is therefore a mixture and not a compound. No compound analogous to  $\text{Na}_2\text{Cs}$  could be detected. J. W. S.

**Thermal and electrical conductivities of copper alloys.** C. S. SMITH and E. W. PALMER (Amcr. Inst. Min. Met. Eng., Inst. Met. Div., 1935, Tech. Publ. 648, 19 pp.; cf. A., 1932, 157).—Thermal and electrical conductivities at  $20^\circ$  and  $200^\circ$  have been determined for binary alloys with Si, Al, Mn, or Ni and for various ternary alloys. In the binary alloys an increase in the amount of the second element in the  $\alpha$ -solid solution range decreases the conductivity and increases the Lorenz ratio. The thermal conductivity of the alloys increases with temp.

CH. ABS. (e)

**Thermal expansion of copper-beryllium alloys.** P. HIDNERT (J. Res. Nat. Bur. Stand., 1936, 16, 529—548).—The coeff. of expansion ( $\epsilon$ ) of Cu-Be alloys containing 1.33, 2.14, and 3.03% of Be has been determined at  $20$ — $300^\circ$ . In the expansion curves for the 1.33 and 2.14% alloys crit. regions appear due to structural changes which are accelerated by cold-working or tempering. The influence of Be on  $\epsilon$  is much  $<$  that on the tensile strength. R. S. B.

**Optical constants of copper-nickel alloys.** N. F. MOTT (Phil. Mag., 1936, [vii], 22, 287—290; cf. A., 1935, 1063).—The data reported by Lowery (cf. *ibid.*, 1065) are interpreted in terms of electronic configuration and are related to the magnetic properties of the alloys. N. M. B.

**Metals and alloys. XIX. Crystal structure of intermetallic phases MgAu and MgHg.** G. BRAUER and W. HAUCKE (Z. physikal. Chem., 1936, B, 33, 304—310; cf. this vol., 143).—These have the space-centred cubic lattice of  $\beta$ -brass. MgAu cryst. from an alloy with 48.7 at.-% Mg has  $a\ 3.259 \pm 0.001$  Å, and MgHg cryst. from an alloy with 50.8 at.-% Mg has  $a\ 3.443 \pm 0.002$  Å. Both are formed from their components with contraction, the amount of which is apparently related to the hardness of the alloys. MgHg does not obey Hume-Rothery's rule. R. C.

**Thread diagram of lead alloys.** W. HOFMANN (Naturwiss., 1936, 24, 507—508).—A Pb-Sb alloy (—% Sb) heated for 4 days at  $235^\circ$  gave a thread diagram when investigated by the X-ray method. After 2 weeks the Debye-Scherrer curves had become discontinuous, indicating that recrystallisation had occurred. A. J. M.

**Photo-electric effect of metallic alloys. II.** L. BELLADEN and G. GALLIANO (Annali Chim. Appl., 1936, 26, 263—266; cf. this vol., 420).—The photo-electric sensitivity curves of Cd-Sb and Cu-Sb alloys give max. vals. corresponding with  $\text{CdSb}$  and  $\text{Cu}_2\text{Sb}$ , respectively. F. O. H.

**Constitution of cadmium-tin alloys.** D. HANSON and W. T. PELL-WALPOLE (J. Inst. Metals, 1936, 59, Advance copy, 267—290).—The system has been re-examined by micrographic and electric resistance methods. A peritectic reaction occurs at  $223^\circ$  between  $\alpha$  (0.9% Cd) and liquid (3.7% Cd) to form a  $\beta$ -phase (1.9% Cd). At  $176^\circ$  the  $\beta$ -field extends from 3.9 to 5.7% Cd and below this temp. the solubility of both Cd and Sn in  $\beta$  decreases continuously to  $133^\circ$ , at which the  $\beta$  decomposes into the  $\alpha$ - $\gamma$  eutectoid (5% Cd). Thermal arrests previously observed at various intermediate temp. are attributed to hysteresis effects in connexion with the above changes. The solid solubility of Sn in Cd is 0.25% at the eutectic temp. ( $176^\circ$ ) and somewhat less at lower temp. A. R. P.

**Iron-chromium alloy system.** E. R. JETTE and F. FOOTE (Met. and Alloys, 1936, 7, 207—210).—Annealing of alloys approximating to FeCr leads under certain conditions to the formation of a new phase ( $\Sigma$ ), having a very complex structure. The transformation of  $\alpha$  into  $\Sigma$  does not occur when only a very small amount of impurity is present and the alloy is homogenised by a prolonged anneal at  $1300^\circ$ , but if the metal is cold-worked after annealing at high temp. and then reannealed at  $< 800^\circ$ , conversion of  $\alpha$  into  $\Sigma$  is practically complete in 2 days. This transformation is strictly reversible and is considerably accelerated by the presence of 0.09% Si in the alloy. The  $\Sigma$  phase is non-magnetic and very brittle; it appears to be a secondary solid solution and its transformation temp. is between  $775^\circ$  and  $800^\circ$ . A. R. P.

**Solid solutions of indium and lead.** N. AGEEV and V. AGEVA (J. Inst. Metals, 1936, 59, 235—242).—The system has been examined by X-ray and thermal analysis. There is no eutectic but a peritectic horizontal; liquid +  $\beta = \alpha$  at  $154^\circ$  extends from 0 to 38 at.-% Pb. The  $\alpha$ -In-rich solid solution extends to about 15 at.-% Pb at room temp. and to about 32 at.-% Pb at  $154^\circ$ . The  $\beta$ -Pb-rich solid solution extends to 62% In and its composition is unaffected by temp. changes. A. R. P.

**Magnetic susceptibility and change of state of hardenable aluminium-copper alloys.** H. AUER (Z. Metallk., 1936, 28, 164—175).—Measurements of the paramagnetic susceptibility  $\chi$  of Cu-Al alloys in the homogeneous and heterogeneous states afford a means of calculating the proportions of solid solution and  $\text{CuAl}_2$  in the alloy, i.e., of determining the solid solubility of Cu in Al at various temp. The vals. obtained in this way are  $20^\circ$ , 0.3;  $300^\circ$ , 0.5;  $400^\circ$ , 1.3;  $500^\circ$ , 4; and  $548^\circ$  (eutectic temp.) 5.65%. Measurements during ageing of quenched alloys show that the change in  $\chi \propto$  the enrichment of free Cu atoms in the lattice and is not subsequently affected by a remodelling of the lattice. The enrichment of the Cu atoms before and during the pptn. follows a simple exponential law,  $dc/dt = A \cdot D/t$ , where  $dc$  is the amount of Cu separating in time  $dt$  at  $T^\circ$ . The mechanism of pptn. is discussed at length with reference to the  $\chi$ -time, -temp., and -concn. curves obtained in the experimental work. A. R. P.

**Ternary system aluminium-magnesium-zinc ; region aluminium-Al-Mg<sub>3</sub>Zn<sub>3</sub>-MgZn<sub>2</sub>-Zn.** W. KOSTER and W. WOLF (Z. Metallk., 1936, 28, 155—158).—The section Al-Al<sub>2</sub>Mg<sub>3</sub>Zn<sub>3</sub> forms a pseudo-binary system with a eutectic at 489°, Al 39, Mg 17, and Zn 44%; at the eutectic horizontal the solid solution extends to Al 76, Mg 7, and Zn 17% at the Al end and to Al 25, Mg 21, and Zn 54% at the other end. In the Al<sub>2</sub>Mg<sub>3</sub>Zn<sub>3</sub>-MgZn<sub>2</sub> section the ternary compound is formed by a peritectic reaction at 535° and its field of homogeneity extends to Al 13, Mg 21, and Zn 66% on the MgZn<sub>2</sub> side. In the ternary Al-Mg-Zn system the eutectic and peritectic equilibria are displaced to lower temp. and terminate in the 4-phase equilibrium at 375°: liquid (Al 18, Mg 11, Zn 61%) + ternary compound (Al 16, Mg 20, Zn 64%) =  $\alpha$  (Al 71, Mg 4.5, Zn 24.5%) +  $\eta$  (Al 4, Mg 15.5, Zn 82.5%). At the Zn corner the Zn-rich eutectic contains Al 4 and Mg 2% at 350°. In the solid state the reaction  $\alpha' + \eta \rightleftharpoons \alpha + 0$  takes place at 325° and  $\alpha' \rightleftharpoons \alpha + 0 + \text{Zn}$  at 280°. A. R. P.

**Solubility of lithium in magnesium.** W. HOFMANN (Z. Metallk., 1936, 28, 160—163).—X-Ray examination shows the solubility of Li in Mg to be 5.7% irrespective of the temp. The  $d$  of the alloys falls with the Li content from 1.741 to 1.587 with 0—4.85% Li, but the Brinell hardness remains almost const. at 31.5—35. A. R. P.

**Behaviour of two non-miscible liquids illustrated by two wire models.** E. JANECKE (Angew. Chem., 1936, 49, 603—605).—Three-dimensional wire models are described which represent the phase relationships of various types of two-component liquid systems of incomplete miscibility as a function of temp. and pressure. J. W. S.

**Diffusion of hydrogen through iron and palladium.** W. R. HAM and J. D. SAUTER (Physical Rev., 1935, [ii], 47, 337).—The rate of diffusion of H<sub>2</sub> through Fe may be considerably modified by heat-treatment of the Fe in various atm.; e.g., Fe exposed to N<sub>2</sub> may have its diffusion rate for H<sub>2</sub> increased 10 to 15 times, but after baking out at higher temp. the diffusion curve regains its normal character. Diffusion isotherms for Fe and Pd are represented by  $r = A_1 p^{1.0}$  for slow rates and  $r = A_2 p^{0.5}$  for high rates. L. S. T.

**Equilibria in liquid mixtures and solutions. II. Solubility of carbonyl chloride in certain solvents at pressures less than atmospheric.** V. A. KIRIEV, S. I. KAPLAN, and K. I. VASNEVA (J. Gen. Chem. Russ., 1936, 6, 799—805).—Solubility data are recorded for COCl<sub>2</sub> in xylene at -15°, 0°, and 20°, in PhCl at 0°, in C<sub>6</sub>H<sub>6</sub>, PhMe, C<sub>2</sub>HCl<sub>3</sub>, C<sub>2</sub>H<sub>2</sub>Cl<sub>4</sub>, CCl<sub>4</sub>, and paraffin at 20°, for pressures < 1 atm. R. T.

**Influence of pressure on the solubility of gases.** A. MICHELS, J. GERVER, and A. BIJL (Physica, 1936, 3, 797—808).—Data are given for the solubility at 25° of CH<sub>4</sub> in H<sub>2</sub>O and aq. solutions of NaCl, LiCl, KCl, CaCl<sub>2</sub>, NaBr, NaI, sucrose, glucose, and CH<sub>3</sub>O at pressures between 40 and 450 atm. For H<sub>2</sub>O and aq. NaCl vals. are also recorded up to 150°. A general solubility formula is developed and discussed. O. D. S.

**Solubility of thorium in mercury.** W. G. PARKS and G. E. PRIME (J. Amer. Chem. Soc., 1936, 58, 1413—1414).—Hg dissolves about 0.014 at.-% of Th at 25°. E. S. H.

**Solubility of ammonium phosphates and formation of two liquid phases at higher temperatures.** E. JANECKE (Z. physikal. Chem., 1936, 177, 7—16).—Equilibrium conditions for the system NH<sub>3</sub>-H<sub>3</sub>PO<sub>4</sub> have been determined up to 250° and 25% NH<sub>3</sub>. The diagram for the system H<sub>2</sub>O-NH<sub>3</sub>-H<sub>3</sub>PO<sub>4</sub> has been derived up to 225° and 30% NH<sub>3</sub>; at higher temp. and [NH<sub>3</sub>] two liquid phases are present at equilibrium. R. C.

**Solubility in the system KCNS-H<sub>2</sub>O.** F. C. KRACEK (J. Washington Acad. Sci., 1936, 26, 307—313).—Data are recorded from 32° to the m.p., 176.8°, of KCNS. The transition KCNS II  $\rightarrow$  KCNS I occurs at 140.6°, and the calc. metastable m.p. of KCNS II is 171.6°. J. G. A. G.

**Physical studies of non-aqueous solvates. I. Solubility of magnesium bromide in ethyl ether.** H. H. ROWLEY (J. Amer. Chem. Soc., 1936, 58, 1337—1341).—Data for the range -20° to 30° are recorded. The presence of a small amount of H<sub>2</sub>O causes an increase in apparent solubility. The existence of MgBr<sub>2</sub>·3Et<sub>2</sub>O and MgBr<sub>2</sub>·2Et<sub>2</sub>O is confirmed. E. S. H.

**Interaction between ions and molecules in solutions.** P. GROSS (Acta Physicochim. U.R.S.S., 1935, 3, 583—592).—Data for the influence of glycine, CO(NH<sub>2</sub>)<sub>2</sub>, EtOH, COMe., and Pr<sup>o</sup>OH on the solubility in H<sub>2</sub>O of the sparingly sol. salts TiBrO<sub>3</sub>, [Co(NH<sub>3</sub>)<sub>5</sub>Cl]S<sub>2</sub>O<sub>3</sub>, [Co(NH<sub>3</sub>)<sub>5</sub>H<sub>2</sub>O]Fe(CN)<sub>6</sub>·0.5H<sub>2</sub>O, and LaCo(CN)<sub>6</sub>·4.5H<sub>2</sub>O are in agreement with the theory that the addition of neutral mols. alters the chemical potential of the ions by changing the dielectric const. and by solvation; the latter effect is independent of the concn. if the neutral mols. are very dil. and do not react with the ions. Debye's theory was tested by measuring the extinction coeff. of picrate ions in aq. EtOH. The val. of the coeff. increases with addition of H<sub>2</sub>O until in presence of approx. 0.9 mol. H<sub>2</sub>O the coeff. has the same val. as in pure H<sub>2</sub>O. This is attributed to sufficient dipolar mols. of H<sub>2</sub>O being present to surround completely the picrate ion. C. R. H.

**Crystallisation processes in potassium chloride solutions.** R. KOPPEN (Z. anorg. Chem., 1936, 228, 169—174).—In the crystallisation of aq. KCl the no. of nuclei formed varies with the degree of undercooling in a similar way to that observed by Tammann with melts. More nuclei are formed in KCl-NaCl solutions than in KCl for the same degree of undercooling. Spontaneous formation of nuclei is rapid in agitated solutions containing crystals, but very slow or absent in stationary solutions containing no crystals. E. S. H.

**Post-precipitation of zinc sulphide with mercuric sulphide.** I. M. KOLTROFF and R. MOLTZAU (J. Physical Chem., 1936, 40, 779—798).—HgS promotes post-pptn. of ZnS from acid solutions, the effect being  $\gg$  that of CuS. This is explained by a primary adsorption of ZnS on the HgS, with sub-

sequent pptn. of the latter. Substances which replace adsorbed  $\text{H}_2\text{S}$  or ions competing with  $\text{Zn}^{++}$  ions in their adsorption inhibit post-pptn. Very slow post-pptn. occurs in  $2N\text{-H}_2\text{SO}_4$ , although freshly pptd.  $\text{ZnS}$  dissolves at this acidity. Under these conditions the ppt. is of the aged form. Ageing of  $\text{HgS}$  decreases its effect in promoting post-pptn., probably owing to agglomeration of the particles and to the transformation from meta-cinnabar to cinnabar. The temp. of its pptn. has little effect on the activity of the  $\text{HgS}$ .  $\text{ZnS}$  post-pptd. with  $\text{HgS}$  cannot be completely extracted with  $3N\text{-HCl}$  at room temp. The  $\text{ZnS}$  penetrates the  $\text{HgS}$  lattice, yielding limited mixed crystal formation. The extent of post-pptn. diminishes greatly with decreasing partial pressure of  $\text{H}_2\text{S}$ .

J. W. S.

**Absorption of gases by mercury.** S. PRITZL (Tech. Phys. U.S.S.R., 1935, 2, 66—78; 5, 329—342).—Multiple distillation in vac. is necessary to remove all adsorbed gases. Org. compounds and org.  $\text{Hg}$  compounds are not removed by this means. Purified  $\text{Hg}$  in contact with air is freed from adsorbed gases by one distillation.  $\text{Hg}$  at  $150\text{--}200^\circ$  in contact with the vapour of benzene,  $\text{C}_6\text{H}_6$ , or  $\text{PhMe}$  at  $0.001\text{--}0.01$  mm. pressure rapidly forms  $\text{Hg}$  compounds, which are removed by passing the vapour through a hot tube. Adsorption of  $\text{H}_2$  on a  $\text{Hg}$  monocrystal in process of formation gives 0.6 of a unimol. layer.

CH. ABS. (e)

**Adsorption of gases by glass walls. XII. Ammonia on Jena glass.** Kinetics of the adsorption. M. CRESPI and V. ALEXANDRE (Anal. Fis. Quim., 1934, 32, 666—676; cf. A., 1926, 1002).—The apparatus previously used has been made more sensitive. The quantity of  $\text{NH}_3$  adsorbed by 1 sq. cm. of Jena glass at 760 mm. is  $15.4 \times 10^{-5}$  c.c., i.e., about one third the val. for ordinary glass. The correction to be applied to 1 litre of  $\text{NH}_3$  at 760 mm. contained in a spherical Jena glass vessel is  $5.6 \times 10^{-5}$  g. The results for  $p=50$  to 760 mm. agree with those calc. from Freundlich's equation. The velocity of adsorption at const. pressure is given by  $dy/dt = kx_e(y_e - y)/y$ , where  $y$  is the concn. at time  $t$ ,  $x_e$  the pressure, and  $y_e$  the equilibrium concn.  $k$  remains const. from 50 to 760 mm.

L. A. O'N.

**Kinetics of adsorption. II. Equations for the velocity of adsorption and their experimental verification.** M. CRESPI (Anal. Fis. Quim., 1934, 32, 639—657; cf. A., 1935, 587).—Equations for the velocity of adsorption are deduced. The relation between the velocity coeff. and the energy of activation of the gas, and also the derivation of Langmuir's isotherm from the equation of state of the gas in the two phases, are discussed theoretically. The equations are tested by reference to experimental results.

L. A. O'N.

**Sorption equilibria of methane, ethane, and propane with active carbon above and below the critical temperature.** E. WEINGAERTNER (Z. Elektrochem., 1936, 42, 599—606).—Deviations of the isotherms from straight lines in the linear region below the crit. temp. indicate the existence of a two-dimensional condensed phase. Above the crit.

temp., the quotient of the mol. heat of sorption and the abs. crit. temp. is approx. const. E. S. H.

**Adsorption by agate powders in relation to the artificial colouring of agates.** L. HOOK and O. BECKER (Kolloid-Beih., 1936, 44, 238—253).—The adsorption of  $\text{H}_2\text{O}$  vapour by powdered agates after different treatments (extraction with conc.  $\text{HCl}$ , 15%  $\text{NaOH}$ , light petroleum, conc.  $\text{HNO}_3$ , saturated aq.  $\text{Na}_2\text{CO}_3$ ) has been determined. Heats of adsorption have been measured. The surface of the different samples was measured by adsorption of methylene-blue.

E. S. H.

**Adsorption of electrolytes by crystalline surfaces. VI.** (MLLE.) L. DE BROUCKERE (Bull. Soc. chim. Belg., 1936, 45, 353—374; cf. A., 1932, 689; 1935, 359).—The  $\log x\text{-log } c$  curves ( $x$ =electrolyte adsorbed,  $c$ =concn. of solution) at  $25^\circ$  are plotted for  $\text{LiCl}$ ,  $\text{NaCl}$ ,  $\text{KCl}$ ,  $\text{RbCl}$ ,  $\text{CsCl}$ ,  $\text{NaBr}$ ,  $\text{KBr}$ ,  $\text{LiI}$ ,  $\text{NaI}$ , and  $\text{KI}$ , adsorbed on negatively-charged  $\text{BaSO}_4$  (pptd. in presence of excess of  $\text{SO}_4^{--}$ ), and for  $\text{RbCl}$ ,  $\text{CsCl}$ , and  $\text{LiI}$  on positively-charged  $\text{BaSO}_4$  (pptd. in presence of excess of  $\text{Ba}^{++}$ ). These, together with previous results, indicate that positively-charged  $\text{BaSO}_4$  adsorbs anions directly, and cations as a secondary layer, whilst the reverse is true when the  $\text{BaSO}_4$  is negative; the ions directly adsorbed form a unimol. layer. In solutions below  $0.01N$  ( $\text{BaSO}_4$  surface far from saturated) anions are adsorbed by positive  $\text{BaSO}_4$  in the order  $\text{Cl} < \text{Br} < \text{I}$ , whilst for negative  $\text{BaSO}_4$  the order is  $\text{Li} < \text{K}$ ,  $\text{K} < \text{Cs}$ , indicating that ionic deformation comes into play. R. C. M.

**Active oxides. C. Sorptive capacities of the active states through which needle iron ore passes during dehydration.** G. F. HUTTON and K. NEUMANN (Z. anorg. Chem., 1936, 228, 213—231; cf. this vol., 790).—Changes in the sorptive capacity for  $\text{MeOH}$  vapour indicate that the ore passes through four stages on dehydration: (1) homogeneous transformation of a single phase varying between  $\text{Fe}_2\text{O}_3 \cdot \text{H}_2\text{O}$  and  $\text{Fe}_2\text{O}_3 \cdot 0.8\text{H}_2\text{O}$ , (2) separation into two phases of the  $\alpha\text{-Fe}_2\text{O}_3 \cdot \text{H}_2\text{O}$  and  $\alpha\text{-Fe}_2\text{O}_3$  types, between  $\text{Fe}_2\text{O}_3 \cdot 0.8\text{H}_2\text{O}$  and  $\text{Fe}_2\text{O}_3 \cdot 0.6\text{H}_2\text{O}$ , (3) further dehydration from 0.6 to  $0.2\text{H}_2\text{O}$ , (4) recrystallisation to anhyd.  $\alpha\text{-Fe}_2\text{O}_3$ .

E. S. H.

**Adsorption of barium hydroxide by humic acids.** K. I. SISKOV (Kolloid-Z., 1936, 76, 153—159).—Data for different preps. of humic acids show that the adsorptive power for  $\text{Ba}(\text{OH})_2$  can be used to characterise humic acids.

E. S. H.

**Laws governing the cation-exchanging properties of a precipitated aluminium silicate.** R. C. BACON (J. Physical Chem., 1936, 40, 747—761).—It is shown theoretically that the cation-exchange capacity of a colloidal  $\text{Al}$  silicate depends on the  $p_H$  of the solution and on the nature and concn. of the salts present. The conclusions have been tested for a specially prepared silicate. Most of the  $\text{Na}$  in this silicate is replaceable by an equiv. amount of  $\text{Ag}$ , but the remainder is non-exchangeable. The exchange capacity varies with the age of the sample. Its val. has been measured in presence of various salts ( $0.1N$ ) and at various  $p_H$  vals.

J. W. S.

Recovery of vapours of volatile solvents by adsorbents. III. Production of ethyl peroxide in the recovery of ethyl alcohol-ether vapour. E. V. ALEXEEVSKI and G. M. MOSKVIN (J. Appl. Chem. Russ., 1936, 9, 1010—1016).—Formation of Et peroxides does not occur when the vapour is adsorbed by or desorbed from active C in presence or absence of Fe or O<sub>2</sub>; only traces are formed after prolonged exposure of saturated adsorbent to atm. O<sub>2</sub>. R. T.

Study of adsorption in solution by means of cryoscopy. G. ODDO and E. CORSINI (Gazzetta, 1936, 66, 409—417).—By means of f.-p. measurements the adsorption of Pr<sup>2</sup>CO<sub>2</sub>H by animal C from aq. solution has been studied. The results do not agree with any of the usual adsorption formulæ, and the adsorbent manifests hysteresis phenomena. With C<sub>6</sub>H<sub>6</sub>, PhNO<sub>2</sub>, and AcOH as solvents there is no adsorption. The mechanism of the adsorption from H<sub>2</sub>O is considered to depend on the dissociation of adsorbed (H<sub>2</sub>O)<sub>2</sub> mols. O. J. W.

Effect of oxygen on the clean-up of phosphorus vapour by tungsten filaments. H. W. MELVILLE and S. C. GRAY (Trans. Faraday Soc., 1936, 32, 1020—1025; cf. this vol., 298).—When a W filament is covered with a layer of O atoms the dissociation of P<sub>4</sub> mols. on it is completely inhibited. Dissociation on a partly oxidised filament occurs entirely on the clean W surface. In the hetero-homogeneous reaction between P<sub>4</sub> and O<sub>2</sub> in presence of W, the surface of the latter is covered with a layer of P on the top of which are O atoms or O<sub>2</sub> mols. The evaporation of a lower oxide from this composite layer initiates the stable chain reaction. O. J. W.

Theory of the Freundlich isotherm. H. ZEISE (Acta Physicochim. U.R.S.S., 1935, 3, 163—164).—Polemical against Zeldovitch (cf. A., 1934, 1316).

A. J. M.

Statistical theory of adsorption with interaction between the adsorbed atoms. R. PEIERLS (Proc. Camb. Phil. Soc., 1936, 32, 471—476).—Mathematical. O. D. S.

Life period of particles in the adsorbed state. D. BLOCHINZEV and S. SCHECHTER (Acta Physicochim. U.R.S.S., 1935, 3, 767—778).—A formula applicable to light mols. adsorbed on a heavy adsorbent is given and the zero-point energy of the adsorbed particle has been calc. R. S.

Surface spreading and surface dissolution of positively adsorbed substances. T. F. FORD (J. Physical Chem., 1936, 40, 835—836).—All substances which lower the surface tension of H<sub>2</sub>O spread in the surface to form films, this spreading being an intermediate step in the process of dissolution. These materials introduced into a clean talc-dusted surface cause the production of a circular talc-free patch, which quickly contracts and disappears when the sol. material is withdrawn or totally immersed in the H<sub>2</sub>O. This surface spreading is a factor which probably hastens dissolution. J. W. S.

Measurement of molecular areas of cellulose from different sources by surface tension. II. J. K. CROWDHURY and T. P. BARDHAN (J. Indian

Chem. Soc., 1936, 13, 294—300).—Data for the surface tension,  $\gamma$ , of viscose solutions at concns. up to  $c=0.2\%$  have been applied to the calculation of the size of the cellulose mol. Assuming that a unimol. layer exists in the surface after  $\gamma$  has reached a const. val., the mol. area =  $RT \cdot d \log c/N \cdot d\gamma$  sq. cm. For cotton, jute, and bamboo cellulose the areas are respectively 571, 263.1, and 129.5 sq. Å. C. R. H.

Wetting characteristics of solids of low surface tension, such as talc, waxes, and resins. F. E. BARTELL and H. H. ZUIDEMA (J. Amer. Chem. Soc., 1936, 58, 1449—1454).—H<sub>2</sub>O and org. liquids of high surface tension form finite contact angles on waxes and resins in air, showing that the surface tension of the solids is low. The data obtained with talc confirm the Bartell-Osterhof equation relating adhesion tension and interfacial contact angles. E. S. H.

Rearrangement of molecules in plastic unimolecular films: pressure-area and potential relations for polycyclic compounds of the five-ring series. W. D. HARKINS, E. F. CARMAN, and H. E. RIES (J. Amer. Chem. Soc., 1936, 58, 1377—1383).—At const. area the pressure disappears almost entirely on keeping, due to shrinkage of the film. Thus the initial pressure appears to be of more significance than the final pressure. The shrinkage produces little effect on the surface potential. At film pressures of 8 dynes per cm. the apparent thickness of the films is approx. that to be expected if mols. with 5 rings stand on end. E. S. H.

Mechanism of the rise of hydrosols and coloured solutions through porous material. II. Influence of the constitution of hydrosols and coloured solutions on the rate of rise. A. BOUTARIC (Bull. Soc. Chim. biol., 1936, 18, 1147—1166; cf. this vol., 793).—The rise of solvent, sol particles, and coloured ions with time is expressed by  $y=At^m$ , in which  $m=0.5$  for the solvent and for negatively charged ions. For negatively charged particles the rise is independent of the concn., but with positively-charged particles it increases with the concn. Dialysis increases the rate of rise of positive particles, and decreases that of negative particles. A. L.

Electrocapillarity. IV. Interpretation of electrocapillarity data. S. R. CRAXFORD, O. GATTY, and H. A. C. MCKAY. V. Definition of surface tension. O. GATTY and H. A. C. MCKAY (Phil. Mag., 1936, [vii], 22, 359—402, 402—409; cf. A., 1935, 698).—IV. The general equation previously deduced is explained and applied to the typical systems Hg, Tl/NaCl, HCl, H<sub>2</sub>O, EtOH which include all electrocapillarity curves obtained by polarising the interphase; Hg, Tl/NaNO<sub>3</sub>, HNO<sub>3</sub>, Hg<sub>2</sub>(NO<sub>3</sub>)<sub>2</sub>, TiNO<sub>3</sub>, H<sub>2</sub>O, EtOH, in which the restriction of complete polarisability does not apply, and where the potential across the interphase is controlled by altering the composition of the solution; KI, MeNO<sub>2</sub>/KI, H<sub>2</sub>O, where the two solvents are not completely immiscible, and octyl alcohol, C<sub>8</sub>H<sub>17</sub>/octyl alcohol, H<sub>2</sub>O, where a capillary-active solute is distributed between two immiscible solvents. Electrocapillarity curves for NaCl solutions, the structure

of the double layer and the capacities of ions in the layer, dilution shifts, and sp. adsorption are considered. The effect of added non-electrolyte on the electrocapillarity curve and the curves of amalgams are examined.

V. A thermodynamic definition of surface tension is proposed and its relation to the properties of a "physical" surface within the interphase between the two phases is considered. N. M. B.

Adsorption of ovalbumin on collodion membranes. P. DOW (J. Gen. Physiol., 1936, 19, 907—916).—The adsorption of ovalbumin from 4 to 7% aq. solutions by collodion membranes resembles that of gelatin (cf. A., 1925, ii, 1054; 1926, 1100) in reaching apparent saturation vals., which show a max. at  $p_H$  5.0. More conc. solutions yield a different type of adsorption curve. Addition of NaCl to solutions of  $p_H > 5$  tends to diminish the effect of varying the  $p_H$ ; for  $p_H < 5$ , the adsorption is greatly increased. At 25° the adsorption is twice as great as at 1°.

F. A. A.

Saturation of non-volatile substances in aqueous solution. T. KUME (Proc. Imp. Acad. Tokyo, 1936, 12, 164—166).—It is shown that the empirical relation  $p_0/p = (Kn + n_0)/n_0$  where  $p_0$  and  $p$  are the v.p. of water and an aq. solution in which  $n_0$  and  $n$  are the no. of mols. of  $H_2O$  and solute, and  $K$  is a const. characteristic of a given solute, holds for saturated solutions over a large temp. range, and for  $n/n_0 = 0.03$  to 30.0.  $K$  varies with concn. and temp. for unsaturated aq. salt solutions, but becomes independent of temp. for any salt when  $S-X/X_s$  is used instead of concn.,  $X$  representing the concn. and  $X_s$  the corresponding solubility. D. C. J.

Association in solution. II. Determination of mol. wts. of fatty acids in benzene. J. MEISENHEIMER and O. DORNER (Annalen, 1936, 523, 299—301; cf. A., 1930, 1519).—As expected, the apparent mol. wts. of AcOH,  $PrCO_2H$ , stearic and myristic acid, determined cryoscopically in  $C_6H_6$ , decrease towards 1 as the concn. decreases. R. S. C.

Raoult depression in ordinary and heavy water. V. T. CHPLUNKER (Indian J. Physics, 1936, 10, 275—276).—According to Raoult's equation the dissolution of a salt in  $H_2O$  and  $D_2O$  tends to equalise their v.p., the effect being greater at higher temp. and concns. Hence the presence of a sol. salt reduces the efficiency of processes for separating  $H_2O$  and  $D_2O$  which depend on differences of v.p. McKay's theory (A., 1934, 626) of the deficiency of  $D_2O$  in the Dead Sea is criticised, and it is suggested that the high salt content hinders separation of  $D_2O$  and  $H_2O$ . A. J. M.

Fluorescing power of fluorescent solutions excited by ultra-violet radiation. A. BOUTARIC and J. BOUCHARD (Compt. rend., 1936, 203, 167—169).—Data are given for solutions of quinine sulphate, 2:6-OH- $C_{10}H_6SO_3H$ , and aesculin at several  $p_H$  vals. J. G. A. G.

Physico-chemical investigation of iodine solutions. J. A. FIALKOV (Acta Physicochim. U.R.S.S., 1935, 3, 711—724).—Sp. conductivities at 130° and 140° and thermal data for solutions of iodides in

liquid I, have been obtained. Alkali iodides and  $AlI_3$  dissociate to some extent, the simplest scheme being  $(MI)_n \rightleftharpoons (M_xI_{n-m})^m + mI^+$  ( $M$ =metal). The thermal data afford no evidence of polyiodide formation. C. R. H.

Equation of state for strong electrolytes and the virial law. B. N. FINKELSCHEIN (Acta Physicochim. U.R.S.S., 1935, 3, 753—755).—Mathematical. The Gibbs-Helmholtz formula is applied to the derivation of the virial law for strong electrolytes.

C. R. H.

Refraction in solutions of strong electrolytes. A. E. BRODSKI, J. M. SCHERSCHEVER, and N. S. FILIPPOVA (Acta Physicochim. U.R.S.S., 1935, 3, 685—692).—The  $n$  of conc. solutions of strong electrolytes is directly  $\propto$  the concn.,  $c$ . In dil. solutions  $n$  falls below that extrapolated from the data in conc. solutions, and for KCl  $n \propto \sqrt{c}$ . The data are considered to agree with Debye and Hückel's theory. In dil. solutions  $n$  was measured with an interferometer and good agreement with refractometer measurements was obtained. C. R. H.

Dielectric constants of solutions of electrolytes. E. FISCHER (Ann. Physik, 1936, [v], 26, 697—704; cf. A., 1935, 1318).—The dielectric consts. of dil. (0.0001—0.001N) aq. solutions of HCl and  $H_2SO_4$  have been determined. For such solutions the saturation effect plays little or no part.

A. J. M.

Optical behaviour of dissolved ions and its significance for the structure of solutions of electrolytes. IV. Range of validity of Lambert-Beer law in aqueous solutions of inorganic salts. G. KORTUM (Z. physikal. Chem., 1936, B, 33, 243—264; cf. this vol., 1066).—Apart from effects which are attributable to sp. interactions of dissolved ions and mols. with each other, the extinction coeff.,  $\epsilon$ , of a dissolved salt is a function of the  $n$  of the solution. Beer's law is therefore a limiting law valid only for very dil. solutions, the influence of  $n$  being negligible only below  $10^{-2}M$ . The absorption spectra of  $K_3Fe(CN)_6$ ,  $K_4Fe(CN)_6$ ,  $KNO_3$ , and  $K_2Cr_2O_7$  in aq. solution have been determined. For these salts and  $KNO_3$  and  $K_2CrO_4$  Beer's law is valid over a restricted concn. range for  $\lambda\lambda$  within some one absorption band; elsewhere there are notable deviations. With each salt and at all  $\lambda\lambda$ , however,  $\epsilon$  approaches a limiting val. at sufficiently high dilutions, which is determined solely by interaction between the ion and the solvent. This supports the view that the deviations from Beer's law are due, not to the deforming action of Coulomb forces in the ionic atm., but to interionic "chemical" forces or to the perturbed interaction of the ions with the solvent mols.

R. C.

Diffusion of copper sulphate in aqueous solutions of sulphuric acid. A. F. W. COLE and A. R. GORDON (J. Physical Chem., 1936, 40, 733—737).—Measurements at 18° indicate that for a given  $[H_2SO_4]$  the diffusion const.  $k$  of  $CuSO_4$  from aq.  $CuSO_4$  to aq.  $H_2SO_4$  is a linear function of the initial  $[CuSO_4]$ . For low  $[CuSO_4]$ ,  $k$  decreases almost linearly with increasing  $[H_2SO_4]$ , but for more conc.  $CuSO_4$

solutions, increase in  $[H_2SO_4]$  tends to decrease the dependence of  $k$  on  $[CuSO_4]$ . J. W. S.

**Disperse systems in gases.** R. WHYTLOW-GRAY (Trans. Faraday Soc., 1936, 32, 1042—1047).—A summary. J. G. A. G.

**Properties of aerocolloid systems, with regard to their dependence on methods of formation.** K. E. STUMPF and G. JANDER (Trans. Faraday Soc., 1936, 32, 1048—1055).—A crit. survey. J. G. A. G.

**Colloid synthesis by means of gaseous explosions and colloidal-chemical investigations on disperse systems so prepared.** N. SATA (Bull. Chem. Soc. Japan, 1936, 11, 443—455).—The general theory is discussed and some experimental observations are recorded. C. R. H.

**Sedimentation method of finding the number of particles in smokes.** R. WHYTLOW-GRAY, W. CAWOOD, and H. S. PATTERSON (Trans. Faraday Soc., 1936, 32, 1055—1059).—The particles settle on a specially prepared glass surface in a special holder and are counted by means of oblique illumination. The results accord with those given by other methods. J. G. A. G.

**Determination of size distribution in smokes.** H. S. PATTERSON and W. CAWOOD (Trans. Faraday Soc., 1936, 32, 1084—1088).—Circles and discs of different sizes from a graticule in the focal plane of the eyepiece appear superposed on the deposit as seen under a microscope, and permit the size of particles of  $1-25 \times 10^{-5}$  cm. radius to be determined. J. G. A. G.

**Size-frequency of particles in mineral dusts.** H. L. GREEN (Trans. Faraday Soc., 1936, 32, 1091—1098).—The data refer to dusts from flint, sandstone, hæmatite, shale, and asbestos. Most of the particles were of diameter  $< 2 \mu$ , but particles  $< 0.2 \mu$  were not found. The coagulation consts. are  $>$  for heterogeneous smokes. J. G. A. G.

**Cohesion between smoke particles.** R. S. BRADLEY (Trans. Faraday Soc., 1936, 32, 1088—1090).—Theoretical. The conditions under which cohesive forces just balance disruptive forces are considered. Impossibly high temp. would be necessary to disrupt particles of the size usual in smokes, but violent fanning leads to stationary states. J. G. A. G.

**Movement of dust or smoke particles in a temperature gradient.** W. CAWOOD (Trans. Faraday Soc., 1936, 32, 1068—1073).—The clear space observed around a hot body in a smoke is due to the kinetic effect on the smoke particles of the mols. moving in the temp. gradient. At the edge of the space, the smoke as a whole exerts an osmotic pressure opposing the kinetic effect. Experiments support the equations developed. J. G. A. G.

**Nature of the dispersoids in country and town air.** J. H. COSTE (Trans. Faraday Soc., 1936, 32, 1162—1171).—A general discussion. J. G. A. G.

**Determination of the mass and size of atmospheric condensation nuclei.** J. J. NOLAN and V. H. GUERRINI (Trans. Faraday Soc., 1936, 32, 1175—1179; cf., this vol., 425). J. G. A. G.

**Hygroscopic nuclei in formation of fog.** J. C. PHILIP (Trans. Faraday Soc., 1936, 32, 1182—1184; cf. A., 1934, 487).—An air-HCl stream was passed through 0.5N-NaOH containing 0.0009% of  $NEt_3$  and NaCl. When the  $[NaCl]$  was increased, it was found that the free HCl carried over decreases and the quantity of  $NEt_3$  increases slightly. These results confirm the views previously advanced (A., 1930, 855). J. G. A. G.

**Properties and behaviour of disperse systems of aqueous and other volatile particles, i.e., mist, cloud, hygroscopic nuclei, town and country fogs.** G. M. B. DOBSON (Trans. Faraday Soc., 1936, 32, 1149—1152).—A résumé. J. G. A. G.

**Nucleus in and growth of hygroscopic droplets.** H. KOHLER (Trans. Faraday Soc., 1936, 32, 1152—1161).—The  $[Cl^-]$  in rain drops is the same as in the droplets of fogs and clouds. In these the  $[Cl^-]$  is also independent of size, showing that such droplets are not obtained by direct condensation. The thermodynamics of condensation on hygroscopic nuclei are considered. J. G. A. G.

**Sulphuric acid mist.** A. DOOLEY and C. F. GOODEVE (Trans. Faraday Soc., 1936, 32, 1209—1218; cf. A., 1935, 40).—When a  $SO_3$ -air mixture was passed through a tube containing a drop of  $H_2O$ , there was a clear space between the drop and the reaction zone. This confirms a mechanism whereby mist is formed when  $SO_3$  is bubbled through  $H_2O$  or dil.  $H_2SO_4$ .  $H_2O$  and  $SO_3$  form  $H_2SO_4$  so rapidly (*loc. cit.*) that  $SO_3$ , as such, does not reach the  $H_2O$  surface, which is protected by a layer of  $H_2O$  vapour through which only a few  $H_2SO_4$  mols. penetrate. The gas phase therefore becomes supersaturated with  $H_2SO_4$ , and agglomerates or nuclei are formed and carried into a part containing excess of reactant, which is absorbed forming particles of strong light-scattering power. Curves show the manner in which the size of the initial  $H_2SO_4$  nucleus controls the change in droplet size with change of  $H_2O$  v.p. of the medium, and the technical importance is discussed. Pure  $H_2O$  is a better absorbent than conc.  $H_2SO_4$  for  $H_2SO_4$  mist. J. G. A. G.

**Sorption of fogs by liquids.** H. REMY [with W. SEEMANN, A. PANCERAM, and H. FRIEDLAND] (Trans. Faraday Soc., 1936, 32, 1185—1190; cf. A., 1935, 1314).—The dependence of the fall of concn. of a  $H_2SO_4$  fog on the height of the column of  $H_2O$ , KOH, or  $H_2SO_4$  ascended shows that turbulence inside the bubbles is the significant factor, and sedimentation plays no part. The absorptive powers of KOH and  $H_2SO_4$  solutions differ when of equal  $d$ , viscosity, surface tension, or v.p. J. G. A. G.

**Dust-free space surrounding hot bodies.** H. H. WATSON (Trans. Faraday Soc., 1936, 32, 1073—1081).—The thickness of the space increases as the 0.52 power of the temp. difference between the hot body and the ambient air, and inversely as the 0.61 power of the air pressure. The width of the space is independent of the nature and size of the dust particles, but depends on the shape and size of the hot body. The phenomenon is attributed to a differential mol.

bombardment on the particles in the very steep and variable temp. gradient near the hot body.

J. G. A. G.

**Coagulation of smoke by supersonic vibrations.** E. N. DA C. ANDRADE (Trans. Faraday Soc., 1936, 32, 1111—1115).—Theoretical. Spheres at rest in a vibrating medium attract one another if the line of centres is normal to the vibration vector. In the resulting coagulation process, the no. of particles decreases very rapidly initially and then progressively more slowly.

J. G. A. G.

**Experiments on coagulation by supersonic vibrations.** R. C. PARKER (Trans. Faraday Soc., 1936, 32, 1115—1119; cf. preceding abstract).—The rate of coagulation of MgO smoke in air vibrating at a frequency of 220 kc. per sec. accords with Andrade's theory.

J. G. A. G.

**Aggregation of suspended particles in gases by sonic and supersonic waves.** O. BRANDT and E. HIEDEMANN (Trans. Faraday Soc., 1936, 32, 1101—1110).—Photomicrographic and kinematographic observations show that the process of rapid coagulation by sonic waves of frequencies between 5 and 50 kc. per sec. takes place in the sound field. Flowing aerosols are coagulated and pptd. by sufficiently large sound intensities. The process occurs in two stages: in the first, the particles oscillate in the sound waves and aggregate by collision; in the second, the particles are so enlarged as no longer to oscillate, but describe irregular paths. The theory of the processes is discussed.

J. G. A. G.

**Influence of pressure on coagulation of ferric oxide smokes.** W. CAWOOD and R. WHYTLOW-GRAY (Trans. Faraday Soc., 1936, 32, 1059—1064; cf. A., 1933, 460).—The particulate vol.-time curves for the coagulation of  $\text{Fe}_2\text{O}_3$  aerosols prepared photochemically from  $\text{Fe}(\text{CO})_5$  in air at 760, 400, and 200 mm. are linear, but the slope increases as the pressure falls. The smokes formed at the lower pressures originate from primary particles larger than at 760 mm. The limitations of Smoluchowski's theory in these systems are discussed.

J. G. A. G.

**Effectiveness of the collisions of aerosol particles with solid walls.** N. FUCHS (Acta Physicochim. U.R.S.S., 1935, 3, 819—826).—Ultra-microscopic observations indicate that 10—25% of the collisions of aerosol particles with a glass or metal wall appear to be ineffective but it is shown that particles approaching within  $1\ \mu$  are counted as colliding, and that all actual collisions are effective.

R. S.

**Stability and charging of aerosols. II. Experimental.** N. FUCHS and I. PETRANOV (Acta Physicochim. U.R.S.S., 1935, 3, 827—838; cf. A., 1934, 959).—A method of unipolar charging of aerosols is described. The velocity of coagulation of such sols is  $>$  that of uncharged sols although there is an apparent increase in the dispersion due to the more rapid coagulation of the larger, highly charged particles. The coagulation curve of the charged aerosol is approx. linear and the coagulation velocity approx.  $\propto$  the square of the mean particulate charge in accordance with theory. The stability of an

aerosol with a bipolar charge is the same as that of the uncharged sol.

R. S.

**Rate of charging of droplets by an ionic current.** N. FUCHS, I. PETRANOV, and B. ROTZEIG (Trans. Faraday Soc., 1936, 32, 1131—1138).—A narrow cloud jet of oil droplets, 0.5—3  $\mu$  radius, was passed parallel to the axis of a cylindrical electric precipitator and the size and charge of the droplets were determined by the "oscillation" method. Results obtained with c.d. of  $3\text{--}10 \times 10^{-9}$  amp. per sq. cm. and charging times of 0.01—0.02 sec. agree with a theory in which effects due to diffusion of ions and to mirror-forces are neglected.

J. G. A. G.

**Solvation and determination of mol. wt. by the Svedberg ultracentrifuge.** W. D. LANSING and E. O. KRAEMER (J. Amer. Chem. Soc., 1936, 58, 1471—1473; cf. McBain, this vol., 441).—The error due to solvation in binary systems is independent of the partial sp. vols. of the components. The case of ternary systems in which combination occurs between the sedimenting component and one of the other two is discussed.

H. B.

**Solvation phenomena in caseinate and palmitate sols.** B. A. VILENSKI and V. A. PAVLOVA (Kolloid-Z., 1936, 76, 188—191).—The solubility of  $\text{PhOH}$  and  $\text{NH}_2\text{Ph}$  in K caseinate sols increases with the concn. of the sol; the solubility of  $\text{C}_6\text{H}_6$ ,  $\text{CHCl}_3$ , and  $\text{PhCl}$  is unchanged. The solubility of  $\text{C}_6\text{H}_6$  in K palmitate sols increases with the concn. of the sol. The observations are discussed in terms of solvation.

E. S. H.

**Relation between the viscosity and the concentration of cellulose nitrate solutions.** C. DE LEIZAOLA (Anal. Fis. Quim., 1934, 32, 1116—1123).—The  $\eta$  of solutions of cellulose nitrate (I) in  $\text{COMe}_2$  over the concn. range 2—40% is given by  $\log \eta = k \log c + m$ , where  $k$  is approx. const. (4.7—5.4) for all samples of (I), but varies with the temp., and  $m$  is a const. depending on the mol. wt. of the particular sample.

D. R. D.

**Role of dielectric constant, polarisation, and dipole moment in colloid systems. XVI. Swelling and solubility of cellulose acetate in ternary liquid mixtures.** W. L. H. MOLL (Kolloid-Z., 1936, 76, 200—210).—Data for  $d$ ,  $n$ , dielectric const., and mol. polarisation are recorded for the systems  $\text{EtOH-CHCl}_3\text{-H}_2\text{O}$ ,  $\text{EtOH-C}_6\text{H}_6\text{-H}_2\text{O}$ , and  $\text{EtOH-C}_6\text{H}_6\text{-COMe}_2$ . The swelling and solubility of cellulose acetate in the same mixtures have been determined; the results are discussed in the light of the above data.

E. S. H.

**Effect of emulsifier concentration on globule size and viscosity in emulsions.** C. L. WILSON and J. B. PARKE (Quart. J. Pharm., 1936, 9, 188—197).—Vals. of  $\eta$  for homogenised and non-homogenised emulsions of  $\text{C}_6\text{H}_6$  (concn. of 70%; cf. B., 1936, 75) dispersed in aq. Na oleate (vals. of  $\eta$  of which are given for 0.1—10.0%) indicate that homogenisation removes the irregularities occurring in  $\eta$  (excepting with low concns. of emulsifier) due to variations in globule-size of the disperse phase and in the emulsion itself.

F. O. H.

**Spinning properties of liquid systems.** H. ERBRING (Kolloid-Beih., 1936, 44, 171—237).—Apparatus for determining the spinning properties is described and results for different types of colloidal solutions are given. The connexion with  $\eta$ , surface tension, and liquid structure is discussed. In general, the property is at a max. in lyophilic colloid systems when separation of phases is occurring, e.g., in the sol-gel transformation. E. S. H.

**Velocity-gradient methods in rheology.** E. G. RICHARDSON (Physics, 1935, 6, 273—277).—Methods for determining  $\eta$  as a function of shear are discussed. Velocity gradients for starch in a  $\text{CCl}_4$ -paraffin mixture have been studied in a Couette-type viscosimeter with a hot wire. CH. ABS. (e)

**Osmotic pressure of gum arabic.** II. "Mol. wt." with different bases. H. B. OAKLEY (Trans. Faraday Soc., 1936, 32, 1360—1364; cf. A., 1935, 297).—At concns.  $\leq 0.3\%$  of gum the mean particle wt. of the salts formed with Li, Na, K, Ag, or Pb is  $220,000 \pm 10\%$ , and with Ca  $245,000 \pm 2\%$ . At  $< 0.3\%$  of gum, the particle wt. of Na gum increases, reaching 245,000 at  $0.15\%$ . E. S. H.

**Lyophilic colloids. XXVII. Mechanism of antagonism in mixtures of neutral salts in relation to the reversal of charge of phosphatides.** H. G. B. DE JONG, H. L. BOOIJ, and J. G. WAKKIE (Kolloid-Beih., 1936, 44, 254—284; cf. this vol., 29).—The antagonism of several neutral salt pairs in reversing the charge of a sol of EtOH-sol. soya-bean phosphatide (sensitised with triolein) has been examined. Antagonism occurs only when the reversal concn. of one salt is  $\leq 10$  times as great as that of the other neutral salt, and increases with the complexity and valency of the cations. The anion also plays a part. Antagonism is due mainly to the weakening of the adsorption of the more strongly adsorbed cation by the presence of the second salt. E. S. H.

**Highly purified negative reversed sols.** W. PAULI and M. ALPERN (Kolloid-Z., 1936, 76, 130—145).—Negatively-charged hydrosols of  $\text{Fe}(\text{OH})_3$  and  $\text{ThO}_2$  have been prepared by reversing the charge by adding multivalent anions. The charge on  $\text{Al}(\text{OH})_3$  sols cannot be reversed in the same way, but is reversed when NaOH is added. Negatively-charged  $\text{Fe}(\text{OH})_3$  and  $\text{ThO}_2$ , but not  $\text{Al}(\text{OH})_3$ , sols can be purified by electro-decantation. The purified negative sols show the same regularities towards coagulation by electrolytes as are observed with the corresponding positive sols. The interaction of purified positive and negative sols of the same substance has been studied. E. S. H.

**Ageing of hydrosols of ferric phosphate and vanadium pentoxide.** S. GHOSH and S. N. BANERJI (Bull. Acad. Sci. U.P., 1932, 2, 75—78).—On increasing the temp. of a dialysed  $\text{FePO}_4$  sol from  $30^\circ$  to  $60^\circ$  it was observed that  $\eta$  first decreases and then increases. The electrical conductivity increased steadily at a rate  $<$  that due to an electrolyte and the charge on the colloidal particles became lower. At  $60^\circ$  the adsorbed electrolyte is given up by the colloid. On heating  $\text{V}_2\text{O}_5$  sols  $\eta$  falls and the conductivity

and particle charge increase. The sol particles probably give rise to a mol. dispersion.

CH. ABS. (e)

**Relationship between  $\zeta$ -potential and stability in emulsions.** C. ROBINSON (Trans. Faraday Soc., 1936, 32, 1424—1425).—Ions adsorbed by the droplets may be redistributed as two droplets approach each other, leaving comparatively few ions on the opposing faces. The  $\zeta$ -potential may be so lowered at such points that coalescence may occur. E. S. H.

**Exact theory of coagulation of spherical particles arising from thermal agitation.** W. R. HARPER (Trans. Faraday Soc., 1936, 32, 1139—1144; cf. A., 1934, 960; 1935, 700).—Rigorous treatment leads to Smoluchowski's formula but the derivation by Smoluchowski's method is nevertheless open to criticism. The accord between theory and experiment shows that the different cohesive forces for different orientations of oleic acid mols. do not appreciably deform the droplets from the spherical shape. Stearic acid is a supercooled liquid in the early stages of coagulation. J. G. A. G.

**X-Ray studies of the coagulation process of colloidal gold. I. II. X-Ray experimental technique.** J. B. HALEY, K. SOELNER, and H. TERREY (Trans. Faraday Soc., 1936, 32, 1304—1312, 1312—1318).—I. Coagulation under the influence of electrolytes occurs in two stages: (a) formation of irregular agglomerates from the primary particles, (b) secondary crystallisation of the agglomerates. The rate of crystallisation depends on the electrolyte concn. in the region of slow coagulation, but is independent of electrolyte concn. in the region of rapid coagulation.

II. The technique involved in determining the particle size of coagulates in the above work is described. E. S. H.

**Electrolyte coagulation of weakly-solvated sols and electrolyte activity. IV. Arsenious sulphide sols in concentrated acids.** W. OSTWALD and H. A. WANNOW (Kolloid-Z., 1936, 76, 159—166; cf. this vol., 795).—The prep. of sols of  $\text{As}_2\text{S}_3$  in conc.  $\text{H}_2\text{SO}_4$ ,  $\text{H}_3\text{PO}_4$ ,  $\text{AcOH}$ ,  $\text{Ac}_2\text{O}$ , and  $\text{CCl}_3\text{CO}_2\text{H}$  is described. The stability of the sols, especially towards coagulation by  $\text{H}_2\text{O}$ , has been studied; coagulation follows when a certain degree of ionisation of the acid, as determined by conductivity measurements, is reached. The behaviour on adding  $\text{H}_2\text{O}$  is traced to displacement of the equilibrium between the homo- and hetero-polar structures of the acids. E. S. H.

**Change of refractive index in the coagulation of manganese dioxide sol. Step effect.** S. S. JOSHI and S. J. RAO (Kolloid-Z., 1936, 76, 145—149).—Curves representing the change of  $n$  with time in the coagulation of  $\text{MnO}_2$  sols by  $\text{HCl}$ ,  $\text{Li}_2\text{SO}_4$ ,  $\text{NaCl}$ ,  $\text{KCl}$ ,  $\text{NH}_4\text{Cl}$ ,  $\text{BaCl}_2$ ,  $\text{AlCl}_3$ ,  $\text{Ce}(\text{NO}_3)_4$ , and  $\text{Th}(\text{NO}_3)_4$ , respectively, exhibit a series of steps. The actual variation of  $n$  depends on the nature of the coagulant and its concn. E. S. H.

**Coagulation of colloids. XII. "Zonal effect" in the change of refractivity during mutual coagulations.** S. S. JOSHI and K. P. N. PANIKKAR. XIII. "Zonal effect" in the opacity changes in

the coagulation of colloidal manganese dioxide. S. S. JOSHI and S. J. RAO (J. Indian Chem. Soc., 1936, 13, 309—311, 311—314).—XII. Coagulation of mixed colloidal solutions of  $\text{Fe}_2\text{O}_3$  and  $\text{MnO}_2$  or  $\text{As}_2\text{O}_3$  offers further evidence for the existence of "zones of coagulation" (cf. this vol., 795).

XIII. The coagulation of colloidal  $\text{MnO}_2$  has been followed by measuring the increase in opacity by means of a thermopile and a low-resistance galvanometer. Zones of coagulation are practically absent in rapid coagulations, but with increasing dilution and slower coagulation the no. of zones and their duration increase. C. R. H.

Coagulation of alkaline silicic acid sols by lead acetate, copper acetate, lead nitrate, copper sulphate, and ferric chloride solutions. V. N. KRESTINSKAJA, O. S. MOLTSCHANOVA, and I. I. TARANENKO (Kolloid-Z., 1936, 76, 166—170).—Coagulation increases with increasing  $[\text{Pb}(\text{OAc})_2]$ , but decreases with increasing  $[\text{Pb}(\text{NO}_3)_2]$  or  $[\text{Cu}(\text{OAc})_2]$ .  $\text{CuSO}_4$  and  $\text{FeCl}_3$  coagulate the sols only between narrow limits of concn. The rôle of hydrolysis is discussed. E. S. H.

Coagulation of strongly-solvated sols by organic substances and salts. VII. Gelatin and starch sols. B. JIRGENSONS and A. JIRGENSONS (Kolloid-Z., 1935, 76, 182—187; cf. this vol., 426).—In the absence of salts, irregular series are observed in the flocculation of starch sols by  $\text{MeOH}$ ,  $\text{EtOH}$ ,  $\text{Pr}^n\text{OH}$ , or  $\text{Pr}^o\text{OH}$ , and in the flocculation of gelatin sols by  $\text{Pr}^n\text{OH}$  and  $\text{Pr}^o\text{OH}$ . Small amounts of salts ( $\text{NaCl}$ ,  $\text{CaCl}_2$ , etc.) sensitise both sols to flocculation by alcohols and irregular series are no longer observed. With greater salt concn. and low alcohol concn. the sols are stabilised; stability increases with increasing salt concn. and decreasing concn. of colloid. The conditions for stability with definite concns. of alcohol and salts of different valencies have been determined. E. S. H.

Rhythmic turbidity in precipitation of barium sulphate. E. B. R. PRIDEAUX and G. E. L. CARTER (J.C.S., 1936, 1214—1219).—Suspensions of  $\text{BaSO}_4$  were made by adding to a mixture (5 min. old) of 10 c.c. of 0.01N- $\text{BaCl}_2$  and 100 c.c. of 0.01N- $\text{K}_2\text{SO}_4$  200 c.c. of  $\text{H}_2\text{O}$ , buffer solution, or dil. gelatin, mixing, and then adding the remaining 90 c.c. of  $\text{BaCl}_2$  to ensure that pptn. occurs on existing nuclei. With const. conditions, the mean turbidity increases with decrease of  $p_{\text{H}}$  vals. from 8 to 3. The gelatin has no sp. effect. The turbidity of these suspensions varies periodically with time, the amplitude being approx. 20% of the mean vals. The phenomenon is attributed to the periodic reversible transformation of cruciform aggregates of  $\text{BaSO}_4$  into simple prismatic crystals. J. G. A. G.

Liesegang rings in non-gelatinous media. I. V. GORE (Kolloid-Z., 1936, 76, 193—200).—Periodic structures have been obtained by the interaction of  $\text{KI}$  and  $\text{HgCl}_2$ , using as media sols prepared by peptising  $\text{Fe}(\text{OH})_3$ ,  $\text{Al}(\text{OH})_3$ ,  $\text{Cr}(\text{OH})_3$ ,  $\text{Zr}(\text{OH})_4$ ,  $\text{CaCO}_3$ ,  $\text{SrCO}_3$ , or  $\text{BaCO}_3$  ppts. E. S. H.

Rate of electrophoresis and electrical conductivity of hydrophobic colloids. A. J. RUTGERS

and J. T. G. OVERBEEK (Z. physikal. Chem., 1936, 177, 29—39).—The anomaly that for many sols the "free" particle charge,  $e$ , calc. from the rate of electrophoresis,  $v$ , is that calc. from the conductivity,  $\sigma$ , is discussed. A colloid particle is pictured as surrounded by a firmly adhering  $\text{H}_2\text{O}$  envelope ("Smoluchowski layer"), the counterions in which are freely mobile within the envelope; outside are the other counterions in free  $\text{H}_2\text{O}$ . On calculating  $v$  by applying Stokes' law, and correcting for the electrophoresis effect of the counterion atm., the usual Helmholtz-Debye-Huckel equation for  $v$  results,  $v$  being determined solely by the charge of the counterions in the free  $\text{H}_2\text{O}$ . Apparently, however, both groups of counterion participate in conduction with their full mobilities; the anomaly is therefore explained. For sols with high  $e$  almost all the counterions seem to be in the Smoluchowski layer. The various electrophoretic effects and their effect on  $\sigma$  are calc. R. C.

Cataphoretic velocity of colloidal particles during aggregation. I. J. N. MUKHERJEE, S. G. CHAUDHURY, and K. BHABAK (J. Indian Chem. Soc., 1936, 13, 372—389).—The cataphoretic velocity,  $v$ , of colloid particles in presence of electrolyte increases with time, i.e., with increased aggregation, this effect being the greater the higher is the valency of the pptg. ions.  $v$  for the supernatant suspension of a partly coagulated colloid is < that for the original colloid, whilst with  $\text{As}_2\text{S}_3$  sol  $v$  for the coagulate shaken with the supernatant liquid is the same as for the latter alone. These results are not in accord with current theories of cataphoresis, and an explanation based on Mukherjee's theory (A., 1933, 460, 1116; 1934, 729) is put forward. J. W. S.

Characterisation of starch by dispersoid analysis. O. LAMM (Naturwiss., 1936, 24, 508).—Starch is readily dispersed in solutions of  $\text{ZnCl}_2$  and  $\text{NaHgCl}_3$ , giving stable solutions which may be separated from the above reagents by dialysis. The dispersion proceeds to a definite limit, which is the same for both reagents. The diffusion const. and mol. wt. of a starch were determined, the latter amounting to  $4 \times 10^6$ . A. J. M.

Peptisation of wheat starch. A. G. KUHLMANN and O. N. GOLOSOVA (Kolloid-Z., 1936, 76, 223—227).—The degree of peptisation of starch in  $\text{H}_2\text{O}$  by adding the lower fatty acids or  $\text{KOH}$  has been determined. The chain length of the fatty acid has practically no influence, but the introduction of  $\text{OH}$  into the chain increases the degree of peptisation. The relation of peptisation to the behaviour on baking is discussed. E. S. H.

Electro-osmosis as a method of studying the process of peptisation of nickel and cobalt hydroxides. V. G. ZAPROMETOV and L. B. SMOLINA (Bull. Univ. Asie Centrale, 1935, No. 21, 29—37).—Peptisation of  $\text{Ni}(\text{OH})_2$  and  $\text{Co}(\text{OH})_2$  in aq. alkaline sucrose and tartrate is followed by means of electro-osmotic measurements, involving determination of and  $\phi$ -potentials. R. T.

Lyotropic cation series in hydrophilic colloids. E. H. BUCHNER and C. S. B. DE GRUITER (Kolloid-Z.,

1936, 76, 173—175).—The swelling of gelatin in aq. CsCl, RbCl, KCl, NaCl, LiCl, and  $\text{NH}_4\text{Cl}$  and the softening point of gelatin gels containing the same salts have been determined. When the results are plotted against the lyotropic nos. of the cations, the curves show a min. and a max., respectively. It is probable that hydration and adsorption in the series are antibatic. The flocculation vals. of the alkali chlorides for gelatin solutions bear no relation to the lyotropic nos.; mixtures of NaCl and LiCl show antagonism in this respect. E. S. H.

**Influence of addition of sodium chloride on gelation.** R. REIGER and S. BACH (Kolloid-Z., 1936, 76, 178—182).—With increasing addition of NaCl the optical rotation and shear modulus of gelatin solutions are lowered. At concns.  $> 1N$ , the presence of NaCl influences only the initial stages of gelation. E. S. H.

**Lyophilic colloids. IX. Optical rotatory power of gelatin fractions.** S. M. LIEPATOV and I. N. PUTILOVA (Kolloid-Z., 1936, 76, 176—178; cf. A., 1935, 701, 932, 1320).—The fractions of gelatin obtained by extraction with  $\text{H}_2\text{O}$  at different temp. show different sp. rotation and have different temp. coeffs. of optical rotation. The optical differences are traced to different micellar structures; it is unlikely that isomerides of gelatin are present. E. S. H.

**Heat changes of egg-albumin.** B. A. VILENSKI and G. WEISSBERG (Kolloid-Z., 1936, 76, 191—193).—When egg-albumin is heated for about 2 hr. at  $57^\circ$ , the osmotic pressure rises to a max. and then falls to a val.  $<$  the original val. The heat-coagulation process occurs in two stages: (a) decomp. of the micelles with formation of colloidal substances, (b) formation of aggregates leading to visible pptn. E. S. H.

**Adsorption of proteins. Crystallised horse hæmoglobin.** (MLLE.) V. DEUTSCH (Compt. rend., 1936, 203, 182—184).—The absorption spectrum is altered by HCl, NaOH, aq.  $\text{NH}_3$ , and  $\text{Na}_2\text{PO}_4$ , but not by NaCl, KCl,  $\text{BaCl}_2$ , or  $\text{Na}_2\text{SO}_4$ . Three types of isotherms have been found for the adsorption of hæmoglobin by kaolin; according to the nature and concn. of the electrolyte the isotherms conform to the requirements of the Freundlich equation, show a min., or show a max. The adsorption is diminished by the cations in the order  $\text{Ba}^{++} < \text{Na}^+ < \text{K}^+$ . J. G. A. G.

**Adsorption of proteins. Horse serum-albumin.** (MLLE.) V. DEUTSCH (Compt. rend., 1936, 203, 252—254; cf. this vol., 676).— $0.1N$ -NaCl and  $-KCl$  scarcely affect the adsorption of the serum-albumin (I) by kaolin, but  $N$  solutions decrease it considerably.  $\text{BaCl}_2$  increases the adsorption, the effect with  $0.1N$ - $\text{BaCl}_2$  being  $>$  with  $1N$ .  $0.1N$ - $\text{Na}_2\text{SO}_4$  slightly increases the adsorption, but  $N$ - $\text{Na}_2\text{SO}_4$  decreases it. The salts scarcely alter the  $p_H$  of the solutions (initially 5.6). The adsorption of (I) is a max. at  $p_H$  5.1 and a min. at 3.4. The max. almost coincides with the isoelectric point of (I). J. W. S.

**Role of osmotic pressure in the phenomenon of imbibition.** D. KOHLER (Compt. rend. Soc. Biol.,

1936, 122, 1196—1198).—With a low concn. of electrolyte the coeff. of imbibition is increased or diminished according to the nature of the electrolyte; the rate of imbibition is not affected by the concn. H. G. R.

**Thixotropy of a suspension of Japanese acid earth.** B. TAMAMUSHI (J. Chem. Soc. Japan, 1935, 56, 778—780).—The suspension of the natural product is more thixotropic than that which is electrolysed. The effect of electrolytes was studied. CH. ABS. (e)

**Swelling pressure of isinglass in water and aqueous solutions.** H. FREUNDLICH and P. S. GORDON (Trans. Faraday Soc., 1936, 32, 1415—1424).—The swelling pressure,  $p$ , is related to the concn. of gel,  $\gamma$ , by  $p - p_0 = k\gamma^k$ , where  $p_0$  and  $k$  are consts. With  $0.2N$ -salt solutions, swelling in NaI or  $\text{NH}_4\text{CNS}$  is  $>$  in  $\text{H}_2\text{O}$ , but swelling is less in  $\text{Na}_2\text{SO}_4$ ,  $\text{BeCl}_2$ , or  $\text{La}(\text{NO}_3)_3$  than in  $\text{H}_2\text{O}$ . The order of effectiveness of the ions is that of the lyotropic series. The influence of electrolyte concn. is not simple, but  $k$  increases with the concn. Min. swelling is observed at  $p_H$  6.5, near the isoelectric point of isinglass. Swelling is reduced by sucrose or  $\text{CO}(\text{NH}_2)_2$ . E. S. H.

**Equilibrium constant of the system ethyl alcohol-acetic acid.** P. E. CORIA (Rev. Fac. Cienc. Quím. La Plata, 1935, 10, 67—75).—Contrary to Corso *et al.* (A., 1933, 125) the const. at  $120^\circ$  is  $1.31 + 4.86c$  where  $c$  is the initial  $[\text{AcOH}]$  relative to the total concn. F. R. G.

**Chlorination of sulphur by the action of carbon tetrachloride in presence of certain catalysts.** V. A. FOMIN (J. Gen. Chem. Russ., 1936, 6, 852—854).—The equilibrium at  $120^\circ$  in presence of Fe, Cu, or Al, or their anhyd. chlorides corresponds with  $6S + \text{CCl}_4 \rightleftharpoons \text{CS}_2 + 2S_2\text{Cl}_2$ . R. T.

**Hydrogen bridges in ice and liquid water.** M. L. HUGGINS (J. Physical Chem., 1936, 40, 723—731).—The evidence for the existence of H-bridges in liquid and solid  $\text{H}_2\text{O}$  and for their being asymmetrical is discussed. The partial freedom of orientation of the dipole which would be introduced by sufficiently small energy barriers accounts satisfactorily for the dielectric const. data. It is suggested that the  $\text{H}^+$  in  $\text{H}_2\text{O}$  is  $(\text{H}_2\text{O}-\text{H}-\text{OH}_2)^+$ . By slight rearrangement  $\text{H}_2\text{O}$  can be split off at one end of the ion and added at the other, with shift of charge. This, it is suggested, accounts for the high mobility of the  $\text{H}^+$  in aq. solution. It is also inferred that the  $\text{OH}^+$  is not bridged. A shift of the type  $\text{HOH} + \text{OH}^+ \rightarrow \text{HO}^+ + \text{HOH}$  should occur, but less readily than for a  $\text{H}^+$ , thus making the mobility smaller. J. W. S.

**Deuterium exchange equilibria in solution and the quinhydrone electrode.** S. KORMAN and V. K. LA MER (J. Amer. Chem. Soc., 1936, 58, 1396—1403).—Dissociation consts. of salicylic and acetic acids, quinol, and  $\text{H}_2\text{O}$  in  $\text{H}_2\text{O}$  and 92%  $\text{D}_2\text{O}$  have been determined. Except for salicylic acid, the ratio of the dissociation consts. in  $\text{H}_2\text{O}$  and  $\text{D}_2\text{O}$  decreases as the const. increases. Advantages of using the quinhydrone electrode in preference to the  $\text{D}_2$  gas electrode are discussed. E.m.f. temp. coeffs. indicate that the difference in the heats of ionisation of AcOH

and AcOD may change sign at about 25°. The solubilities of benzoquinone, quinol, and deuterobenzoquinone in H<sub>2</sub>O and D<sub>2</sub>O have been determined.

E. S. H.

**Exchange of deuterium between deuterium hydroxide and ethyl alcohol.** W. J. C. ORR (Trans. Faraday Soc., 1936, 32, 1033—1037).—By using CaSO<sub>4</sub> to remove DOH from the reacting mixture the equilibrium const.,  $\alpha_{\text{H}}$ , of the reaction EtOH + HOD  $\rightleftharpoons$  EtOD + HOH has been found to be 1.11 at 25°. The velocity coeffs. for the backward and forward reactions are  $2.4 \pm 0.2 \times 10^{-6}$  and  $2.2 \pm 0.2 \times 10^{-6}$ , respectively (litres/g.-mol. sec.). These vals. indicate that the exchange proceeds ionically. From  $\alpha_{\text{H}}$  the ratio of the dissociation consts. of EtOH to EtOD in presence of 16% HOD is found to be 1.25.

O. J. W.

**Release of protons from molecular hydrogen with the aid of hydroxyl ions.** K. WIRTZ and K. F. BONHOEFFER (Z. physikal. Chem., 1936, 177, 1—6).—Exchange of H for D occurs at 100° between D<sub>2</sub>O and dissolved H<sub>2</sub> in presence of KOH, the OH<sup>-</sup> acting as catalyst, but there is little or no exchange in an acid or neutral medium.

R. C.

**Electrolytic dissociation of heavy water.** W. F. K. WYNNE-JONES (Trans. Faraday Soc., 1936, 32, 1397—1402).—E.m.f. determinations show that the ionic product of D<sub>2</sub>O at 25° is  $1.95 \times 10^{-15}$ . The heat of ionisation, calc. from the temp. coeff., is 940 g.-cal. > that of H<sub>2</sub>O.

E. S. H.

**Chemical theory of electrolytes.** M. USSANOVITSCH (Acta Physicochim. U.R.S.S., 1935, 3, 703—710).—The mass law has been applied to conc. solutions on the assumption that a linear relation exists between electrolyte concn. and electrical conductivity corr. for internal friction, and that the compounds formed between the components of a binary system are the true electrolytes.

C. R. H.

**Concentration and dissociation constant of each acid group in a mixture from the  $p_{\text{H}}$  titration curve.** J. O. BURTON and S. F. ACREE (J. Res. Nat. Bur. Stand., 1936, 16, 525—528).—The approx. calculation of the concn. and dissociation const. for each of the acid groups in a mixture from the titration curve is discussed and applied to experimental data for malonic acid, for which  $K_1 = 2.06 \times 10^{-3}$ . The method is of especial val. with plant and animal products.

R. S. B.

**Dissociation constants of malonic acid in its sodium salt solutions at 25° from electrometric titration measurements.** J. O. BURTON, W. J. HAMER, and S. F. ACREE (J. Res. Nat. Bur. Stand., 1936, 16, 575—593).—The electrometric titration curve has been determined at 25°. Corrections for liquid junction potential and interionic attraction are discussed, and the first and second thermodynamic dissociation consts. of malonic acid are calc. to be  $2.06 \times 10^{-3}$  and  $2.94 \times 10^{-6}$ , respectively. The variation of dissociation const. with ionic strength is discussed.

R. S. B.

**Dissociation constants and the basic titration of acetic acid in relation to water content of solvent.** S. KILPI (Z. physikal. Chem., 1936, 177,
